LANDSTURM, originally a general levy in time of war. The name was later given to certain militia forces of Germany, Austria-Hungary and Switzerland, consisting of all those men of military age not serving in the navy, the first-line army or the Landwehr. The German Landsturm before the World War comprised men of two categories. The 1st Ban was formed of men from 17 to 20 years of age, and of all those men not called up for service in the active army or the Landwehr; most of these men were unfit for active service and received no training. The 2nd Ban consisted of men over 30 years of age who remained fit for service after completion of their period in the landwehr or the 1st Ban of the Landsturm; they continued liable for service up to 45 years of age, but received no further training. During the World War a large number of units of all arms were formed from the Landsturm and some saw service on quiet sectors of the western and eastern fronts; the bulk of them were employed on fortress, garrison or line of communication duties or on labour work.

The Landsturm of Austria-Hungary before the World War was organized on similar lines to the German, men being liable for service between 19 and 20 years of age, and after 10 years' service. Men up to 38 years old formed the 1st Ban, and those from 38 to 42 the 2nd Ban; except for the Tirolese units, no peace-time training took place. During the World War some 72 Landsturm units were raised, several of which took part in operations on the eastern front against the Russians; in 1918 there were nine so-called Landsturm divisions in existence.

The Swiss Landsturm at present comprises all men liable for military service between the ages of 41 and 48, and numbers some 70,000 of all arms and ranks. No training is carried out in peace time. It is intended to use the force in war as frontier guards and for line of communication duties.

LAND TAXES. The taxation of land is one of the oldest forms of direct taxation. As the main source of production in the past and as a definite and visible sign of wealth, land offered a natural subject for taxation and the history of taxation teems with taxes levied by reference to its area, value, or produce.

While land continues to be a fruitful source of tax revenue, it is usually as part of a general scheme for taxation of all property or all income and not as the subject of peculiar taxation levied specially in respect of the land. Thus the value of land comes under charge to British Death Duties in common with the value of all other property, and the income from land comes under charge to British Income Tax in common with all other income; but this taxation is general and is not properly to be considered as falling within the scope of specific Land Taxes.

Land Tax, Great Britain.—The Land Tax is the only form of land taxation in Great Britain. It is an old tax, dating from 1692, having developed from the so-called Monthly Assessments under which Parliament specified for each county the total sum required and each county raised its contribution by a rate upon the yearly value of all property, real and personal, and on the income from certain offices. In intention, the Land Tax was a kind of general property and income tax, but personalty gradually escaped from assessment, and in 1798 Pitt made the quota then due from each area a perpetual charge on the landed property of that area, with provision enabling the owner of the property to redeem the liability by a capital payment. The Land Tax thus became converted into a redeemable rent-charge on landed property, and in its essentials, it remains to the present day as Pitt left it. Each parish has its quota to be raised annually and this is levied by a rate not exceeding 1/– in the £ on the annual value of the land and buildings thereon in the parish. An owner of the land can redeem the charge by payment of a capital sum equal to 25 times the annual tax and where redemption is effected the land is exonerated from the tax and the quota of the parish is correspondingly reduced. As the annual value of any buildings erected on the land comes into the annual value for charge to Land Tax, redemption generally takes place as a preliminary to building operations. The average annual receipt is about £650,000

New Land Taxes.—In modern taxation theory the land tax finds its place in systems of taxation not as part of a general tax applying to all property but as a tax that singles out land as the subject of special taxation, and it is in this sense that the term is now generally used. This development is founded on the theory that land has an additional and special taxable capacity peculiar to itself by reason of the fact that the increase in its value in many places is due not so much to the activities of the owner as to the growth in prosperity of the community. It involves the task of ascertaining the values of the land at different points of time and making allowance for the then value of any improvements (*e.g.*, buildings, timber, crops, etc.) due to the action of the owners, in order to find the unimproved or site value. The determination of values of this kind which differ radically from market price values of the land in its actual condition presents serious difficulties, particularly where the tax is levied on the unearned increment only. These difficulties do not favour clear and unambiguous legislation and afford ground for disputes of all kinds. They are at the root of the failure of the British Land Value Duties, which became practically unworkable after a few years' operation.

The following notes refer very briefly to the modern taxes introduced in the United Kingdom, Australia, New Zealand and Germany.

United Kingdom.—The new land taxes were introduced by Mr. Lloyd George in his 1909 Budget, and were the main cause of the hostility encountered by that Budget in its passage into law by the Finance (1909–10) Act, 1910. There were four duties, viz.:—(i.) *Increment Value Duty,* which was levied on every "occasion" of sale or transfer of land at the rate of 20% on the increase in the site value of the land accruing after 30 April, 1909. Provision was made for periodical assessments every 15th year in the case of land held by corporate bodies: (ii.) *Reversion Duty,* which was levied at the rate of 10% on the value of the benefit accruing to the lessor on the termination of long leases, the benefit being in general the difference between the value at the beginning and at the end of the lease: (iii.) *Undeveloped Land Duty,* an annual duty of ½d. in the £ on the site value of undeveloped land, *i.e.*, land not being used for agriculture, business or building purposes, etc., and was intended to fall on land ripe for building. Gardens, public parks, recreation grounds and woodlands were exempt: (iv.) *Mineral Rights Duty,* an annual duty of 1/– in the £ on mineral royalties, wayleaves, etc. As a preliminary measure it was necessary to ascertain the capital value of all lands, buildings, etc., in the Kingdom as at 30 April, 1909—a colossal task involving the valuation of 11,000,000 units of land—and in particular to determine the "site value" which represented, broadly speaking, the market value of the land when divested of buildings, trees, or other improvements upon it. The work of valuation proceeded for 5 years and was practically completed by the outbreak of the World War. The total of the valuations for Great Britain was about £5,250,000,000.

The first three duties yielded a small though increasing revenue in the early years. Serious difficulties however soon arose in connection with the assessment of the values required by the statute, which ultimately led to the practical suspension of the Undeveloped Land Duty and Reversion Duty and the crippling of the Increment Value Duty. Proposals for remedial legislation were put forward in the Revenue Bill of 1914 but owing to the outbreak of war were not proceeded with. The position was re-

viewed at the end of the war and it was decided to repeal the three duties. This was done by the Finance Act, 1920, and provision was made to repay all the duty collected since their imposition. The Mineral Rights Duty alone remained in force.

Australia.—In Australia the new land taxes have taken the form of taxes on the "unimproved" value of land, the value of buildings and other improvements being excluded from assessment. The taxes were partly designed to break up large holdings and to this end the rates of tax are usually graduated so as to bear heavily on large landowners. Victoria introduced a tax on land values in 1877 and was followed in course of time by the other States. The most important development, however, occurred in 1910, when the Commonwealth instituted a federal land tax (graduated from 1d. to 6d. in the £) throughout Australia, in addition to the existing State taxes. For 1926 the Commonwealth scale ranged from 1d. to 9d. in the £, and there were graduated taxes in Queensland (1d. to 8d.), South Australia (¼d. to 1½d.) and Tasmania (¼d. to 3¼d.). The tax was levied at a flat rate in Victoria (½d. plus 5%), Western Australia (1d. or 2d.) and New South Wales (1d.).

The land tax revenue raised by the Commonwealth and the separate States for 1925–26 contrasted with their total taxation revenue was:—

	Land tax revenue	Total taxation revenue
	£	£
Commonwealth	2,522,000	54,373,000
New South Wales	2,700	8,851,000
Victoria	457,000	5,179,000
Queensland	468,000	4,104,000
South Australia	244,000	2,660,000
Western Australia	145,000	1,418,000
Tasmania	126,000	1,240,000

New Zealand.—As early as 1878 New Zealand instituted a tax of ½d. in the £ on the unimproved value of real estate. Although abolished in 1879 and replaced by a general property tax, the land tax was re-instituted in 1891, and after 1893 was again restricted to the unimproved value. For 1925–26 the tax was graduated from about 1d. to 7½d. in the £. The tax produced £1,266,000 towards the total taxation revenue of £17,254,000.

Germany.—Various towns adopted an increment (*Wertzuwachs*) tax on land beginning with Frankfort in 1904, followed by Berlin, Cologne, Hanover and many others. In 1911 nearly all the local taxes were superseded by a general Imperial tax levied on the increase in the value of land on sale, allowance being made for expenditure on permanent improvements. The rate was graduated from 10% to 30% of the increase in value, according to the proportion which the latter bore to the cost price plus expenditure on permanent improvements. In 1913, however, in view of the introduction of the Defence Contribution and Property Tax, the Imperial Government ceased to levy the increment tax, leaving it to any of the States and communes to continue it locally if they desired. The fact that in Germany the tax was imposed (except for two years) as a local tax and not as a national tax is of some interest in the theory of land values taxation. The increase in value will vary considerably over the whole country according to local conditions, and local land values taxes give the fiscal advantage to the particular area whose local conditions affect the value.

United States.—Land taxes were one of the earliest taxes imposed in America but they were not merged into general property taxes until many years after the formation of the Republic. With the adoption of the Federal Constitution, restrictions were placed upon levy of direct taxes so that land taxes have been preserved for use of State and local governments.

With development of general property taxes, land along with improvements and personal property came to be taxed at a uniform rate in jurisdictions levying this tax. This system became the prevailing method of taxation employed by State and local governments. In 1926 the various States received $375,674,160, or 22·7% of their revenues, from this source. The relative importance of the tax for State purposes has been declining due to the development of other sources of revenue. The cities, however, rely upon the tax for 63·8% of revenues. In 1926, cities of over 30,000 inhabitants collected $1,747,163,136 from this tax. The importance to counties and minor divisions of government is even greater. In 1922 they received 92·1% of revenues from this tax.

The general property tax is primarily a tax upon real estate. In 1926 the total assessment subject to State general property taxes was $142,091,873,725; the assessment of real estate was $108,316,473,975 or 76·2% of the total; the assessment of personal property was $28,548,989,811 or 20·1% of the total. It is impossible to separate the assessment of land from the assessment of improvements except in a few instances. In New York city in 1927 the land valuations amounted to $6,982,333,754; improvements were assessed at $6,729,074,461. This relative equality between land and improvement values will scarcely be found elsewhere in American cities. In 1926 New York city collected $328,165,996, or 70·5% of its revenues from real estate taxes.

The heavy burden upon real estate has been justified (1) by citing the fact that the major portion of public expenditures inure to the benefit of real property; (2) by advancing the doctrine that land taxes are capitalized so that future purchasers buy land tax free; (3) by advancing the argument that land values are social values the greater share of which belong to the State. Objections to the heavy burden on real estate are made by landowners, especially farmers, who cite the fact that these taxes take too large a proportion of income. Other economic groups appear to be taxed less heavily on an income basis than land-owning classes. Moreover, the general property taxes have been condemned from theoretical and operative standpoints by all American scholars of public finance.

A few special land taxes are found in the United States. Minnesota, Montana and Utah, for example, tax mines at rates different from other property. Minnesota taxes farm and urban land at different effective rates. Forests are specially treated in 26 States. The State of Oklahoma has a progressive tax on land based on acreage which has not been enforced. Except for forest taxes, special taxes on land have been opposed in the United States.

LAND TENURE: ECONOMIC AND AGRARIAN ASPECTS. The word "tenure" (Latin, *tenere*, to hold) derives, probably, from the feudal system, the basis of which was that all land was "held" by one individual from another and none was absolutely owned. The system was established in its strictest form by William the Conqueror and in its gradual modification throughout nearly a thousand years may be traced the development of modern land tenure in England.

Feudalism.—At the Norman conquest all land was vested in the king who made grants to his barons, knights and others, to be "held" by them subject to the payment of dues or the rendering of services. So long as the conditions were fulfilled the grantees enjoyed all the rights of ownership but in default the land reverted to the Crown. The unit of a grant was the manor of which the grantee was termed the lord (who might, and frequently did, hold several manors) and he in his turn granted the use of the land to tenants, all of whom held it from him.

The terms of tenure were various and the classes of tenants of the manor numerous. There has been much controversy among economic historians as to the precise status of the individuals forming the manorial community and there appear to have been differences between one district and another and, indeed, between one manor and another. For the present purpose it is sufficient to note the existence from the outset of three classes—"free" tenants, villeins and cottars. Towards the end of the 14th century another class termed "copyholders" appeared.

"Free tenants" held their land on condition of liability to military service, and, in many cases, as time went on, commuted their liability for a quit-rent. They formed the class of "yeomen" which played so large a part in English history. Sometimes their land was in a separate holding exclusively occupied but frequently it was a part of the great manorial farm. "Copyholders" although less independent, frequently had, like them, a status akin to ownership as they held their land subject to the payment of certain "fines" and "heriots" on specified occasions and had usually the right of demising the holding.

"Cottars" were occupiers of a cottage and garden and perhaps from 2 to 5 acres of arable land in the common-field, but they had to depend for their livelihood mainly on labour for the lord—in addition to their obligatory service—or for the tenants.

Much the most numerous class were the villeins. By them practically the whole of the agricultural land was occupied except the lord's demesne, which was a separate and self-contained "home farm." The status of the villeins was at the outset one of modified servitude. They were "unfree," in that they were tied to the manor and were subject to the will of the lord. But each held an allotment in the common-field with rights over the common pasture and on the waste or woodland surrounding the manor. He paid rent to the lord, mainly in the form of labour, being under obligation to give so many days' service on the lord's demesne during the year. The arable land of the manor was divided into strips of an acre, or in some cases, half an acre, separated by "balks" of turf, but otherwise unfenced and open in one large field. Every villein held a number of these "strips" distributed in various parts of the field, and not adjoining. The extent of the holding differed but the "hide" of 120 ac. appears to have been the normal economic unit, although many had no more than 30 or 60 acres. Each villein had a number of working oxen proportionate to his holding, eight being regarded as forming a plough team for a "hide" of land.

The manorial organisation had no sooner been constructed on these apparently rigid lines than it began to be modified. The villeins struggled continually to secure greater freedom. The "custom of the manor" became established and eventually became binding on the lord as well as the tenants. Individuals more enterprising than their fellows not only acquired larger holdings but in many cases secured a commutation of their services for payment in cash or kind.

Leases.—The long story of the slow dissolution of the manorial system and the development of the villein into the tenant cannot be told here. It must suffice to note that by the end of the 15th century a large part of the agricultural land was let to tenants on lease either for a term of years, or for lives, at fixed rents. What was termed a "stock and land" lease was common, the tenant renting not only the land and buildings but also a certain head of live stock. In a well-known instance the land, buildings and a flock of 360 wether sheep were let, in 1528, to a man for the lives of himself, his wife and his son whichever was the last survivor. The rent was fixed partly in produce and partly in cash. It is estimated that by the middle of the 16th century more than half the land in many parts of the country was let on lease.

The letting of farms was generally established on the basis that the owner provided the land, house and necessary buildings, the tenant supplying the live stock and working capital. The terms on which the farm was let were minutely set out in the lease, the landlord, with the object of preventing deterioration of his property, binding the tenant by strict and detailed conditions. These conditions or covenants varied on different estates and they were gradually elaborated by the ingenuity of agents and lawyers jealous to protect in every possible way the interests of the owner.

The main object of these conditions was to maintain the fertility of the land and to bind the tenant to farm in accordance with what were then considered the principles of good husbandry. The average farmer would not regard them as unreasonable. It was not until the latter part of the 18th century that the "new farming" brought improved practice, more enlightened landowners and more intelligent and responsible farmers.

Leases for 7, 14 or 21 years were offered by the new race of "improving" landlords and eagerly taken by the new race of capitalist farmers. The lease for 21 years was popular in the eastern counties and it was also adopted in Scotland. Leases fell into some disfavour during the disturbed period of the Napoleonic wars but when conditions became more stable they again prevailed generally until the depression of the '80s. Many who then held their farms on lease were only saved from ruin by the consideration of landlords, and tenants have ever since been very chary of binding themselves for long periods. Leases are still common in Scotland but throughout England and Wales yearly tenancies are almost universal.

English Tenant Right.—The equitable claim of a tenant to be recouped for his improvements arose as soon as the letting of farms became general. In many districts custom in some degree mitigated the legal position of tenants. By law everything that was put into the soil, or attached to the land became the property of the landlord. Bills to deal with this injustice were introduced by Lord Portman in 1843 and Philip Pusey in 1847. Both were unsuccessful but the latter was referred to a select committee before which evidence was given showing the small amount of protection afforded to tenants by custom. In most districts no allowance could be claimed even for durable improvements such as draining or liming and still less for the use of artificial manures or purchased feeding stuffs

Still parliament refused redress, and it was not until the political influence of farmers was increased by the Reform Act of 1867 and they began to organise in chambers of agriculture that at length, in 1875, the justice of their claim was conceded by the first Agricultural Holdings Act.

Unexhausted Improvements.—The act of 1875 did little more than give statutory recognition to the principle that a tenant was entitled to compensation, on quitting the holding, for the unexhausted value of improvements which he had made at his own expense. As it was not compulsory landlords generally stipulated in leases and agreements that it should not apply and consequently it had little practical effect. In 1883 another act framed on broader lines was passed which provided that no lease or agreement should be valid unless it either embodied the conditions of the act or gave terms not less favourable to the tenant.

By successive enactments the list of improvements for which compensation may be claimed has been much extended and under the act of 1923 the rights of tenants are thus set out:—

"Where the tenant of a holding has made thereon any improvement comprised in the first schedule to this act he shall, subject as in this act mentioned, and, in a case where the contract of tenancy was made on or after the first day of January 1921, then whether the improvement was or was not an improvement which he was required to make by the terms of his tenancy, be entitled, at the termination of the tenancy, on quitting his holding to obtain from the landlord as compensation for the improvement such sum as fairly represents the value of the improvement to an incoming tenant.

"In the ascertainment of the amount of the compensation payable to a tenant under this section there shall be taken into account:

"(a) any benefit which the landlord has given or allowed to the tenant in consideration of the tenant executing the improvement, whether expressly stated in the contract to be so given or allowed or not; and

"(b) as respects manuring as defined by this act, the value of the manure required by the contract of tenancy or by custom to be returned to the holding in respect of any crops grown on and sold off or removed from the holding within the last two years

of the tenancy or other less time for which the tenancy has endured, not exceeding the value of the manure which would have been produced by the consumption on the holding of the crops so sold off or removed.

"Nothing in this section shall prejudice the right of a tenant to claim any compensation to which he may be entitled under custom, agreement or otherwise, in lieu of any compensation provided by this section."

The first schedule of the act, referred to in this section, contains the list of the improvements for which compensation is payable, as follows:

Part I.

Improvements to which consent of landlord is required.

(1) Erection, alteration or enlargement of buildings.
(2) Formation of silos.
(3) Laying down of permanent pasture.
(4) Making and planting of osier beds.
(5) Making of water meadows or works of irrigation.
(6) Making of gardens.
(7) Making or improvement of roads or bridges.
(8) Making or improvement of watercourses, ponds, wells, reservoirs or works for the application of water power or for supply of water for agricultural or domestic purposes.
(9) Making and renewal of permanent fences.
(10) Planting of hops.
(11) Planting of orchards or fruit bushes.
(12) Protecting young fruit trees.
(13) Reclaiming of waste land.
(14) Warping or weiring of land.
(15) Embankments and sluices against floods.
(16) Erection of wirework in hop gardens.
(17) Provision of permanent sheep-dipping accommodation.
(18) In the case of arable land the removal of bracken, gorse, tree roots, boulders or other like obstruction to cultivation

Part II.

Improvement in respect of which notice to landlord is required.

(19) Drainage.

Part III.

Improvements in respect of which consent of or notice to landlord is not required.

(20) Chalking of land.
(21) Clay burning.
(22) Claying of land or spreading blaes upon land
(23) Liming of land.
(24) Marling of land.
(25) Application to land of purchased artificial or other purchased manure.
(26) Consumption on the holding by cattle, sheep or pigs, or by horses other than those regularly employed on the holding of corn, cake or other feeding stuff not produced on the holding.
(27) Consumption on the holding by cattle, sheep or pigs or by horses, other than those regularly employed on the holding, of corn proved by satisfactory evidence to have been produced and consumed on the holding.
(28) Laying down temporary pasture with clover, grass, lucerne, sain-foin or other seeds, sown more than two years prior to the termination of the tenancy in so far as the value of the temporary pasture on the holding at the time of quitting exceeds the value of the temporary pasture on the holding at the commencement of the tenancy for which the tenant did not pay compensation.
(29) Repairs to buildings, being buildings necessary for the proper cultivation or working of the holding, other than repairs which the tenant is himself under an obligation to execute:

Provided that the tenant before beginning to execute any such repairs shall give to the landlord notice in writing of his intention, together with particulars of such repairs, and shall not execute the repairs unless the landlord fails to execute them within a reasonable time after receiving such notice.

The consent of the landlord to improvements in Part I. must be given in writing and may be unconditional or on such terms as regards compensation as he may agree with the tenant.

Compensation for drainage (Part II.) is not payable unless the tenant gives notice, in writing, to the landlord not more than three nor less than two months before beginning to execute the improvement of his intention to do so, and of the manner in which he proposes to do it. The landlord may then agree with the tenant as to the terms of compensation or failing such agreement may execute the improvement "in any reasonable and proper manner which he thinks fit" and increase the annual rent of the farm by a sum sufficient to repay the cost in a period of 25 years with interest at the rate of 3%. The minister of agriculture may by regulation substitute such percentage or period as he thinks fit having regard to the current rates of interest. If the landlord fails to execute this improvement within a reasonable time the tenant may do it himself and he is entitled to compensation.

All claims by the tenant for compensation whether under custom or agreement are settled, unless the landlord and tenant agree, by arbitration. The arbitrator is appointed by mutual agreement, or in default of agreement by the minister of agriculture.

A tenant is not entitled to claim compensation, except in respect of manuring, for any improvement begun by him within one year of his quitting the holding.

The long list of improvements for which compensation may be claimed would appear to afford reasonable security that a tenant will recover on quitting his holding any capital expenditure of which he has not reaped the full benefit during his tenancy. In the Agriculture Act 1920, however, a new principle was introduced which established the right of the tenant to claim compensation not only for specific improvements but also for adoption of a special standard or system of farming. The terms in which this right is given are as follows:—

(1) "Where a tenant who quits a holding after the commencement of this act" (*i.e.*, after Jan. 1, 1921) "on so quitting proves to the satisfaction of an arbitrator appointed under the act of 1908 that the value of the holding to an incoming tenant has been increased during the tenancy by the continuous adoption of a standard of farming or a system of farming which has been more beneficial to the holding than the standard or system (if any) required by the contract of tenancy, the arbitrator shall award to the tenant such compensation as in his opinion represents the value to an incoming tenant of the adoption of that standard or system:

"Provided that:

"(a) This section shall not apply in any case unless a record of the condition of the holding has been made under the act of 1908 or in respect of any matter arising before the date of the record so made; and

"(b) Compensation shall not be payable under this section unless the tenant has, before the termination of the tenancy, given notice in writing to the landlord of his intention to claim such compensation; and

"(c) The arbitrator in assessing the value to an incoming tenant shall make due allowance for any compensation agreed or awarded to be paid to the tenant for any improvement specified in the first schedule to the act of 1908 which has caused or contributed to the benefit.

"(2) Nothing in this section shall entitle a tenant to recover in respect of an improvement specified in the first schedule or the third schedule to the act of 1908 any compensation which he would not have been entitled to recover if this section had not been passed.

"(3) The continuous adoption of such a beneficial standard or system of farming as aforesaid shall be treated as an improvement for the purposes of the provisions of this act relating to the determination of the rent properly payable in respect of a holding."

Rules of Good Husbandry.—The phrase "cultivating in accordance with the rules of good husbandry" is of ancient origin. Stipulations as to conforming with the rules of good husbandry were common in old leases and agreements. Indeed, apart from explicit conditions, conformity with the rules of good husbandry was obligatory, under the common law, on any tenant. There was no definition of the term, and in cases of dispute the rules of good husbandry applicable in a particular case were proved by the evidence of experienced persons familiar with the farming practice of the district in which the farm was situated

In the Agriculture Act 1920, a legal definition was given to the term as follows—

"The expression 'rules of good husbandry' means (due regard being had to the character of the holding) so far as is practicable having regard to its character and position—

"(a) the maintenance of the land (whether arable, meadow or pasture), clean and in a good state of cultivation and fertility, and in good condition; and

"(b) the maintenance and clearing of drains, embankments and ditches; and

"(c) the maintenance and proper repair of fences, stone walls, gates and hedges; and

"(d) the execution of repairs to buildings, being repairs which are necessary for the proper cultivation and working of the land on which they are to be executed; and

"(e) such rules of good husbandry as are generally recognised as

applying to holdings of the same character and in the same neighbourhood as the holding in respect of which the expression is to be applied;

Provided that the foregoing definition shall not imply an obligation on the part of any person to maintain or clear drains, embankments or ditches, if and so far as the execution of the works required is rendered impossible (except at prohibitive or unreasonable expense) by reason of subsidence of any land or the blocking of outfalls which are not under the control of that person, or in its application to land in the occupation of a tenant imply an obligation on the part of the tenant—

"(i.) to maintain or clear drains, embankments, or ditches, or to maintain or properly repair fences, stone walls, gates or hedges where such work is not required to be done by him under his contract of tenancy; or

"(ii.) to execute repairs to buildings which are not required to be executed by him under his contract of tenancy."

Security of Tenure.—Although, as has been said, the practice of letting farms on lease died out in England generally at the end of the last century, the system of yearly tenancies which became almost universal did not, in fact, make any great change in the length of time for which farms were generally occupied. On many estates instances were common of farming families who had occupied the same farm for generations although subject legally to a year's notice. On the other hand instances sometimes occurred of the eviction of old tenants for reasons unconnected with their competence or solvency as farmers. It was felt as a grievance that a man should be turned out of a farm because, for some reason or other, he had become personally objectionable to his landlord, and a demand arose either for "fixity of tenure" or "compensation for disturbance." This demand was strongly opposed as an unreasonable interference with the rights of landowners but the interests of the tenants prevailed and the Agriculture Act of 1920 contained provisions for compensating the tenant if his tenancy is terminated except for certain specific causes. These provisions do not, in terms, give fixity of tenure, but they are designed to penalize the landlord if he unreasonably evicts a competent and solvent tenant.

The reasons for which a tenant may be evicted without payment of compensation are:

(1) That he is not cultivating the holding in accordance with the rules of good husbandry.
(2) That he has failed to pay the rent due, or to remedy any breach of a condition of the tenancy consistent with good husbandry.
(3) That he has materially prejudiced the interests of the landlord by committing a breach which was not capable of being remedied of any condition of the tenancy consistent with good husbandry.
(4) That he has become bankrupt.
(5) That he has refused or failed to agree to a demand by the landlord as to the rent to be paid for the holding.
(6) That he has refused or failed to comply with a demand by the landlord to execute an agreement setting out the terms of the tenancy.

If the tenant is given notice to quit the holding compensation is payable to him by the landlord unless he states that the notice is given for one or more of these reasons.

The landlord may at any time apply to the agricultural committee for the area in which the holding is situated for a certificate that the tenant is not cultivating the holding according to the rules of good husbandry. The committee has to give both landlord and tenant the opportunity of being heard and must grant or refuse the application within one month. Either the landlord or tenant, if he does not accept the decision of the agricultural committee, may require that the question as to whether the holding is being cultivated in accordance with the rules of good husbandry be referred to an arbitrator whose decision is final.

The tenant has a right to demand that the question of the amount of rent to be paid in future shall be referred to arbitration, and if the landlord refuses, the tenant, if he quits the holding for that reason, is entitled to compensation.

The English landlord and tenant system, as developed from feudalism into its present form, is unique. Under no other system has the occupier of land so much control and the owner so little. The liabilities of the landlord for the equipment and upkeep of the farm remain unaffected but the effect of recent legislation is to make him otherwise little more than a rent-receiver.

World Aspects.—Over the greater part of the world the occupiers of agricultural land are the owners of it. Peasant proprietorship is the predominant system and where there is a dual interest in the occupation of land the most common system is that of metayage in one form or another (*see* METAYAGE SYSTEM). But in some countries the tenancy system as developed in England—that is the letting of farms by free contract on money rents—prevails somewhat extensively.

In Belgium, for example, about three-fourths of the farms are let on lease or annual tenancy. Leases for nine years, with option for either party to break the lease at three or six years, are usual and leases for 15 or 18 years are sometimes granted. In the 18th century emphyteutic tenures—*i.e.*, leases of a length varying from 27 to 99 years, giving the tenant the right to erect buildings at his own cost—existed widely but these have greatly diminished. It is said that examples of leases existed in Flanders as early as the 13th century, but the very earliest form of tenure generally adopted was metayage which was gradually replaced by a system known as "cheptal" which was in fact practically the stock and land lease system then common in England. By the end of the 18th century "cheptal" had disappeared and although metayage still survives the landlord and tenant system is now predominant.

Flanders led the way in modern methods of husbandry and in the 16th and 17th centuries was held up, not unjustly, as a model for English farming.

In Denmark over 90% of the agricultural holdings are owned by the occupiers and tenancies are rare. But a new form of tenancy has been created, under an act passed in 1919, which placed in the possession of the State 120,000 acres of land suitable for small holdings. The applicants for these holdings are offered the choice of purchase or tenancy. If they choose tenancy they pay rent to the State equal to $4\frac{1}{2}$ per cent of the value of the land. They have absolute security of tenure subject to the condition that they cultivate the holding satisfactorily. Indeed provided they comply with this condition and pay the fixed rent they have all the rights of ownership including the right of passing on the tenancy of the holding to their heirs.

This novel system of tenancy is avowedly an experiment and is devised with the object of securing to farmers all the advantages of ownership while at the same time ensuring that, in the public interest, full use is made of the land.

The Economic Effect of Tenure.—The conditions under which agricultural land is held—in other words the precise form of tenure—are diverse. A complete description of them as they are found in different countries would be very voluminous and would reveal a wide variety in the terms on which men occupy land.

The large majority of those who occupy and cultivate agricultural land possess the right of ownership. France is typically a country of peasant proprietors who have complete control of their property and are in no way restricted by law or otherwise in dealing with it. Similar conditions exist also in other countries but in some cases the proprietorship of the peasant is modified by communal rules and traditions.

It would appear at first sight that the line of demarcation between ownership and tenancy is well-defined, but in fact ownership may give no more than limited control of the land, and on the other hand the terms of tenancy may be such—as in the case of the new class of State tenants in Denmark above-mentioned—that they confer practically all the rights of ownership.

From the economic, as distinct from the legal, point of view, the tenure of agricultural land falls into two main classes. In the one class the occupier has full possession of, and security in, the holding and control of its use, and in the other class his occupation is dependent on the will of another and his use of the land is subject to limitations.

It is commonly assumed that the ownership of agricultural land by the occupier will ensure its most effective economic use. The dictum of Arthur Young that "the magic of property turns sand into gold" is quoted as expressing an unchallengeable truth of universal application. No such generalisation can be fairly made if facts and not theories are considered. No doubt the assurance that all the fruits of a man's toil and enterprise will accrue to himself and will not be shared with another is a strong incentive to energy, but other factors, psychological, political, racial, or

other, may tend to counteract this influence. In any case, although it is easy to cite instances where the most intensive cultivation of the soil is practised under conditions of ownership, it is equally easy to refer to cases where under the same conditions the land is ill-cultivated and neglected. On the other hand a system of tenancy may, as was the case in England in the last century, before farmers possessed any statutory rights in their holdings, result, as it did, in the highest development of the art of husbandry. Flanders also presents an example of the same fact.

The conclusion is that while conditions of tenure may have a considerable influence on the economic use of land they cannot be regarded as decisive.

THE UNITED STATES

Tenure means the holding of land and the rights that go with such holding. It includes everything from fee simple title, embracing all possible rights within the general limitations imposed by government, down to the most restricted forms of tenancy. Tenancy means holding land under the ownership of another. As so often has been said, property is a bundle of rights, and a study of tenure means partial analysis of these rights.

Indian Land Tenure.—In the United States the earliest tenure is that of the North American Indian. Indian tenure very considerably depended upon whether the Indians were nomadic or whether they had a fixed place of abode. In general we say that their tenure was that of possession rather than of property. Property means that one's rights are developed and safeguarded by a higher authority of a public nature; in modern times briefly, the state. The Indians held title to the land largely by force against outsiders and the tenure was that of the tribe rather than that of the individual. However, in the case of some tribes certain rights of individuals or families in regard to land were recognized and protected. This situation was more likely to be true of some of the sedentary Indians, especially in the southwestern part of the country, where more highly developed agriculture was pursued. Here often particular pieces of land were owned and cultivated by individuals or families and at death these rights went to a member of the clan. The Indians did not develop the right of alienating land by sale until they came into contact with the white race. In treaties with the whites the Indians thought they were giving to the whites the same privileges that they had, rather than giving exclusive rights to the land.

In 1783 the government prohibited individuals from bargaining with the Indians for land, reserving this power to Congress alone. In the case of the public domain the government insisted that the Indian rights to the land must be extinguished by treaties before the land could be surveyed or opened for sale.

According to the latest public reports available in 1929, there were in the United States 35,000,000 ac. in Indian reservations. These were established either by treaty or by order of the president. Until 1887 the Indian land was generally held by the tribe rather than by the individual By an act passed at that time individuals were to be allotted land and after a certain length of time given a title in fee simple.

Land Tenure in Colonial Times.—Except for these Indian beginnings, land tenure is for the most part traced back to England. In Florida and in the southwestern part of the United States the Spanish influence prevailed, but when this land became a part of the United States the English common law was taken over with few exceptions. In Texas the Spanish law in regard to minerals held until 1866. This meant that mineral rights were reserved to the state. In Louisiana the French civil code is still in use.

In the colonial period the highest property was that of the Crown and that obtained in America. The form of settlement was somewhat different in New England from that in the rest of the country. Large grants of land in New England were given to the trading companies by the Crown and these companies in turn granted land to groups of settlers but only occasionally to individuals. In this way the land was settled compactly in village communities. Land was set aside for the church, the school and other community purposes before home lots were transferred to each settler. The remainder of the grant was divided into farm areas. Originally each settler had several different strips. When this was found to be inconvenient, there was a tendency to consolidate each man's holdings into one piece. Primogeniture was modified to the extent that the eldest son inherited only two-thirds of the father's estate. As long as this method of settlement was used there was substantially no speculation in land in New England.

In the remainder of the country the proprietary system of settlement was more general. Pennsylvania derives its name from William Penn to whom a vast territory was awarded, and Baltimore traces back to Lord Baltimore who also had a large grant from the Crown In the selling of land to settlers, the grantees transferred larger holdings than was the case in New England. Especially was this true in the South where it was profitable to farm larger areas. This scattering of settlers in the South postponed the formation of communities, comparable with the compact settlements of New England. Moreover, the title was not so clearly established under the Southern method of colonization. New York was the only colony in which a manor system was built up. Outside of Rhode Island, Massachusetts and Connecticut a quit-rent was demanded of all settlers but was collected often with difficulty, if at all.

When British sovereignty was terminated by the treaty of 1783, lands hitherto belonging to the crown went to the separate states in which, rather than in the federal government, the highest right of eminent domain was vested. Coincidently with the breaking of colonial ties, began the modification of some features of the mother country's system of land tenure. In conformity with public sentiment, allodial tenure was in many instances substituted for the English idea of an overlord, although some traces of the earlier concept lingered long, especially in New York State. The form of freehold tenure was extended by the ordinance of 1787 to all the lands held by the nation.

THE PUBLIC DOMAIN

The Importance of the Public Domain.—The various plans of disposing of the vast public domain form the dominating influence in the development of land tenure in the United States. The fact that the land was disposed of by the national government instead of the states is important since it has meant one land policy instead of 48 possibly different policies. Early in the republic's history the suggestion was made that the land should always remain in the public domain and the rentals therefrom should be paid into the public treasury. Thus it was contended vast sums could be used for public purposes. This policy could not well be sustained scientifically although it is superficially plausible. Since land taxation in the United States is based upon selling value, a substantial proportion of land value is virtually public property. As a matter of fact real estate taxes have grown to such enormous proportions as to indicate that the tax revenues have exceeded what might have accrued from rents of public land. But we cannot enter into the theoretical consideration of the two methods of public versus private ownership of land now and here. Suffice it to say that the American ideal has been that of private property and development has been along that line

Building Up the Public Domain.—At the close of the Revolution the confederated colonies held no land themselves although they had offered to the soldiers military bounties in the form of land. Because of the conflicting claims of the new states some states suggested that all claims be ceded to the confederacy. This marked the beginning of the public domain and was an important factor in holding the states together in the early life of the nation. Tennessee was ceded by North Carolina but never became a part of the public domain because it was already almost entirely covered by private claims. Virginia reserved from its ceded claims the region later made the separate state of Kentucky so that none of the unoccupied lands of Kentucky became part of the public domain. With these two exceptions the land west of the original

states became the nucleus of the public domain although the states reserved some land for their own use, as the Connecticut reserve in Ohio. By purchase, cession and annexation this original public domain was enlarged until, after subtracting prior private claims, it reached an aggregate total of about 2,186,862 square miles or 1,309,591,680 acres which at one time or another was part of the public domain. The last major addition to the public domain was made in 1867 when 378,000,000 acres were added by the purchase of Alaska.

When land was acquired from other countries by the United States, every effort was made to respect the grants given under the previous governments. Some of these grants were extensive, especially in the southwest, and many of them were very indefinite. Some of the effects of these early grants are seen today. In 1917 in the eight counties of southern California approximately 50% of the land not owned by the railroads or the public was owned in holdings of 2,000 acres or more; seven holdings exceeded 50,000 acres each. These large holdings are for the most part a result of Mexican and Spanish grants. The foreign grants in the Ohio section were not so large. But in all these sections the foreign claims made for confusion and obstructed land settlement since the Government attempted to determine these claims before opening up the land for surveying and sale. Because of this delay a good many people settled on the land before it was surveyed and this made the situation still more difficult and confusing.

Alienation of the Public Domain.—The alienation of the public domain may conveniently be discussed by periods: (1) 1785–1800, sales in large tracts; (2) 1800–1820, credit sales; (3) 1820–1841, cash sales; (4) 1841–1871, pre-emption law; (5) 1841–1871, large land grants; (6) 1862 to the present time, homestead law; (7) 1880 to the present, reform and conservation. These periods overlap and some of the characteristics of one period are found in most of the others but certain outstanding features in each period make it possible to mark them off in this way:

(1) *1785–1800.*—The public land policy in the earliest period was dominated by the Federal government's urgent need for money after the Revolution. Since the chief asset was land, the government decided to obtain the needed revenue by selling the public domain, a motive that persisted well into the 19th century. The ordinance of 1785 was the first act passed dealing with the disposal of the public domain. One of the most important features of this act was the establishment of the rectangular survey. Attempts were made to alter this in later acts, but fortunately it was never changed. The great importance of the rectangular survey is its cheapness, quickness and definiteness, with the result that the possibilities of error as to title are reduced to a minimum. Under the ordinance of 1785 land was first to be bought from the Indians, then to be surveyed and sold by townships or by sections of 640 acres for a minimum of $1 an acre. This was a compromise between the New England and southern method of settlement. The land did not sell rapidly and insufficient revenue was obtained. Several companies were ready to buy large tracts and the government sold about 1,500,000 acres to the Ohio Company and to Symmes.

Most of the settlers during this period went on land owned by private companies or reserved by the original state. These tracts could be obtained in smaller units and in more settled parts of the country where there was less fear of attack by the Indians. Some states at this time offered the land at a price even less than that of the national government, and also allowed a longer time in which to pay.

(2) *1800–1820.*—The credit system was introduced when it became clear that actual settlers could not buy land in such large tracts as 640 acres, especially if they had to pay for the land within a year. Either the size of tracts offered or the price of the land had to be reduced or the amount of time allowed for payment had to be lengthened. The minimum price had been raised to $2 an acre in 1796 and was not changed, but in 1800 the amount of time allowed for payment was extended to five years and the minimum area that might be bought was reduced to a half-section. With this extended credit and the more prosperous condition of the country the land was taken up very rapidly. Settlers then needed very little capital. However, speculation was encouraged, for only a small payment down was required; no further payment was required for the first two years and the land was not forfeited until five years after settlement. Thus there was the constant temptation to take up as much land as possible, with the hope that land values would rise or that the government would extend the time for payment. Under the credit system 19,399,158 acres were sold.

From 1800 to 1820 little change was made in the method of settling the public domain. Some further reduction was made in the minimum size of lots but most interest centered around the problems of credit. The government, always inclined to be lenient towards the settlers, passed a number of acts extending the time allowed for payment, but in spite of these relief acts an enormous amount of money was due to the United States. In 1820 the credit system was finally abolished.

(3) *1820–1841.*—The act of 1820 permitted land to be bought in tracts as small as 80 acres and the minimum price was reduced to $1.25 an acre but no credit was allowed. During this period of cash sales the feeling grew that the land should be disposed of to the best advantage of the settler and not mainly for the purpose of deriving revenue. This feeling culminated in the pre-emption law of 1841.

(4) *1841–1891.*—The pre-emption law legalized the vested interests of the squatters on the public domain. Hitherto special pre-emption laws had been passed to meet certain situations. General pre-emption gave the squatter the first opportunity to buy his claim up to a quarter-section, which meant private sales instead of public auctions, and sales at minimum prices or the double minimum if the land lay beside a railroad. The pre-emption law was not repealed until 1891.

In 1854, after 20 years' discussion, another act, known as the graduation law, was passed, in the interest of the settlers who supported it. To hasten the disposal of public land which remained unsold after being put on the market because settlers preferred squatting on land farther west, the act authorized gradual reduction of the price of such land to 12½ cents an acre after being in the market for 30 years. This was in line with the policy of transferring the public domain to individual owners as rapidly as possible. Moreover, it was hoped that the new settlers attracted by these more liberal provisions would make more valuable the land already taken up. During the eight years this law was in effect 25,696,000 acres of land were sold at $1 per acre or less. However, much of this land passed into the hands of speculators instead of settlers as had been hoped.

(5) *1841–1871.*—From 1841 to 1871 is often called the land-grants period in connection with the disposal of the public domain. Grants were made both before and after this period but not on so extensive a scale. Educational and religious grants were made in colonial times and the early grants of the Federal government for education followed the policy of the colonies. In 1827 canal and wagon road grants were first made.

During the land-grants period large grants were made to the states both for internal improvements and for education. In all approximately 99,000,000 ac. were given to the states for education. The early grants were for common schools but later grants were given for higher education also. Especially large grants were given by the government for agricultural and mechanic arts colleges. Sixty-four million acres of swamp land also were given to the states for drainage, some of it being a subsidy to education.

The states made some attempts to lease the school lands at first but found it impracticable, the cost of collecting the rent often exceeding the proceeds. The states then turned to selling the land for the most part although there is still some school land which is leased. The city of Chicago, for example, has very valuable property belonging to the school fund. The states generally have disposed of their land in much the same way as the national government, often competing with the Federal government for settlers and underselling it.

The railroads were other important recipients of land (about 129,000,000 ac.) from the federal government during this period.

Not only did these gifts include the right of way but also every other section along the right of way, the government retaining intervening sections. Mineral rights except for coal and iron were retained by the government, the railroad being given the right to select land elsewhere if minerals were found. The railroads were interested in selling their land as rapidly as possible; in fact, in some instances selling to settlers was stipulated in the grant. However, there are still large amounts of land in the hands of some of the railroads. In general the railroads sold land in small tracts although it is true that there are some large holdings which probably would not be in existence had the land not passed through the hands of the railroads.

(6) *1862–1880.*—After years of agitation the Homestead law giving free land to settlers was passed in 1862. Previously the free land movement had encountered insuperable obstacles in the widely supported policy of deriving revenue from the public domain and in the opposition of the southern states, although in Florida and Oregon free grants of as much as 640 acres had been made to attract frontiersmen. However, by 1862 the movement for free land had gathered such momentum that, after the opposing southern states had seceded, the law was passed even though the country was in special need of revenue for war purposes. The law provided that settlers were entitled to 160 acres of land free if they lived on their land and cultivated it for five years. The residence requirement was afterwards reduced to three years. No land acquired under the Homestead law could be taken in satisfaction of a debt made before the patent was issued. For those who did not wish to fulfill the residence requirements the commutation privilege provided that after fulfilling certain other requirements a person might buy the land at $1.25 or $2.50 an acre and immediately obtain patents thereto. At first this privilege was rarely used but later when the west was settling more rapidly and the value of land was rising rapidly commutation became very common. It was possible for the speculator to obtain land in this way and sell to farmers. This process was facilitated by the fact that a portion of the west was being opened in which 160 ac. was too small an agricultural unit. In North Dakota, for example, grain farming could be done more profitably on a large farm. Indeed, the average size of the North Dakota farm increased from 382 acres in 1910 to 466 acres in 1920.

The problem of adjusting the land system to the arid region of the west was difficult. When the Homestead law was passed, Congress had the humid section of the country east of the 100th meridian in mind, but it was soon seen that 160-ac. tracts were not the proper units for farming on the plains. Accordingly in 1904 an act applying to Nebraska allowed 640 ac. to be taken up under the Homestead law and later 320 ac. was the amount allowed in some other states. Previously, in 1877, a new law had provided that a settler could buy 640 ac. of desert land for $1.25 an acre if he would irrigate it within three years. But the terms of this act were vague and the legislators overlooked the fact that on irrigated land intensive farming was required for which 640 ac. was entirely too much. There was a good deal of fraud in connection with this law. Some of the land was never irrigated but was taken up for grazing. The problem of irrigated land in the arid region was more effectively dealt with in the Carey Act of 1894 under which the states in that region acquired about 4,000,000 ac. for irrigation and settlement. In 1902 the federal government itself undertook some reclamation projects which, in the course of time, included approximately two million acres. However, the expense of irrigation proved greater than was anticipated and many settlers have not been able to meet their payments. In the desire to further farm ownership the government overlooked the fact that high-cost irrigated land is not needed at present.

A proper solution of the disposition of grazing land in the west has not yet been worked out. Many stockmen have simply used the public domain. This worked satisfactorily until farmers wished to settle some of this land which was also suitable for farming. In 1916 an act was passed providing that land for stock-raising could be taken up in 640-acre tracts. This amount is wholly inadequate in most parts of the grazing country. Much larger areas are needed where land is suitable only for grazing and enough cannot be taken up under present laws. In many instances stockmen got control of the land immediately adjacent to a water supply and then used the surrounding country. Some of the states have developed the policy of leasing grazing privileges on state-owned land, a policy which the Federal government also follows with respect to the national forests. Considering these last-discussed classes of land in the aggregate, by 1923, under the homestead, timber culture, desert land and reclamation acts, 256,000,000 ac. had passed into the hands of private owners.

(7) *1880–1929.*—Until the decade of the seventies little distinction among classes of land was made by the government. The gold, silver, lead and copper mines were specifically mentioned in the ordinance of 1785 and the saline lands were reserved in the act of 1796, but no general law applying to minerals was passed until 1866, and this law was nothing more than a confirmation of local customs in regard to mining. Because land was so abundant, little attention was given to the importance of natural resources and classification was not considered necessary. Even in the Civil War decade timber land was so plentiful that forests were regarded more as a liability than an asset. However, when settlement on the plains of the west began in earnest an interest in the forests and their preservation began to grow. In 1873 under the timber culture act a farmer was allowed 160 ac. additional in return for devoting one-fourth of his farm to the growth of trees. This law remained in force until 1891, though it did not bring the expected results. Tree growing of this kind was not suited to the section of the country then being developed and in addition one-fourth of the farm was a good deal to devote to timber culture. However, the law made it possible for men who had already taken up land under the homestead and pre-emption laws to acquire another 160 acres. As a result, about 10,000,000 ac. were alienated.

In 1878 the Timber and Stone act was passed to take care of forested land, not suitable for agriculture. Such land was to be sold at not less than $2.50 an acre and in lots of not more than 160 ac. per person. Large areas of this land came into the hands of lumber companies who announced that they would in turn buy forest land from any one who would buy it from the government. By 1923 over 12 million acres of timber land had become private property under the Timber and Stone act, mainly in large holdings of lumber companies.

Mineral Lands.—Little was done to work out a satisfactory solution regarding mineral lands until the 20th century. In the early disposition of the public domain there are indications that Congress felt mineral lands should be treated differently from agricultural lands. Some attempts were made to lease mineral lands in the first half of the 19th century. This policy was not notably successful as the administration of the leases in some cases cost more than the leases brought in. After 1841 mineral lands were not supposed to be sold to settlers on the same basis as agricultural land; yet most of the valuable mineral land east of the Mississippi passed into the hands of individuals under the general land laws because so little information was available regarding the location of minerals.

Coal lands were not included in the general mineral laws. The first law in regard to coal lands was passed in 1864, and amended in 1873. As people began more fully to realize the value of these lands new laws were passed and in 1905 large amounts of land thought to contain coal were withdrawn from entry until they could be properly classified. Five years later, however, a settler wishing agricultural land might take up coal land, the government reserving the right to the coal. In 1917 a law was passed providing for the leasing of coal lands in Alaska and in 1920 this leasing policy was extended to the United States and to other minerals.

During this period when land classification was making headway, the Homestead law was liberalized in some respects and made more restrictive in others. In 1891 a law which embodied some of the recommendations contained in the 1880 report of the public land commission, reduced the residence requirements under the Homestead law from five to three years and extended the residence requirements for commuted homesteads to 14

months, in order to induce settlers to remain the full three years. This law also authorized the president to withdraw from entry land suitable for forestry. Up to this time it was possible for one person to obtain 1,120 acres from the public domain under the various laws, but after 1891 the total amount one person might acquire was reduced to 320 acres.

Most of the desirable land in the public domain had been alienated by 1900. Coincidently the feeling that more care and thought should be given to the disposal of the remainder had grown to a considerable extent. This marks the beginning of the conservation movement in the United States. There are at present about 161,000,000 acres in the national forests and about 48,000,000 acres have been set aside either as mineral or power reservations.

The freehold system has always been and is an American ideal. So also is it that one who uses the land should own the land. A dread of tenancy was brought to the United States from Europe. To Americans the European peasant suggests a renter and it is a popular slogan that the United States must not be allowed to drift into peasantry. This means that the American farmer cultivating an economic unit sufficient to maintain his family in comfort with no overlord is the ideal. This ideal of the free and independent farmer which has governed most of the legislation under which we have parted with the public domain and which culminated in the Homestead Act of 1862, passed when Abraham Lincoln was president, epitomized the ideal of free and equal opportunity in a democracy. Other acts have been animated by this same thought. In many states are laws called "Homestead Acts" which exempt the homesteads up to a certain value and a certain number of acres from seizure for debt. Here the importance attached to home and farm ownership is again stressed. Moreover, the purpose of the Federal Farm Loan Act passed in 1916 is to give long term credit to farmers and thus make it easier for them to buy farms.

Tenancy.—Nevertheless as time has gone on, tenancy has developed. In 1880, the first year for which tenancy figures are available, 25·6% of the farms of the country were operated by tenants; in 1925 this figure had risen to 38·8%. This is an inevitable outcome of economic evolution, and of the process which in the United States is described by the phrase "climbing the agricultural ladder." When we climb the agricultural ladder from the position of labourers, our purpose ordinarily is that of full ownership. There are various rungs on this ladder. One is tenant partnership—the owner of the land furnishing part of the equipment and the tenant part. This partnership arrangement in one form or another is typical. Frequently the owner of the land will advance all or part of the capital necessary to enable the tenant to enter into the partnership. The age groups of farmers are evidence of this agricultural ladder. Tenants are usually younger than the owners. Another form of tenancy, rarely leading to ownership, is the cropper-tenancy of the South. Under this arrangement the owner supplies all the capital, the tenant furnishing the labour only.

The 1923 *Yearbook* of the Department of Agriculture summarizes the situation in regard to farm ownership and tenancy: "All but a small proportion of the landlords have grown up from the soil and possess direct experience with farming. More than a third are engaged in agricultural occupations, nearly another third are retired farmers, and the remaining third are in non-agricultural occupations, mostly country bankers, merchants and professional men in the country towns and villages who have either come into farm ownership through inheritance or marriage, or have purchased farms for purposes of investment or speculation. Fifteen per cent of the owners of rented farms are women, for the most part widows or daughters of deceased farmers. Corporations do not comprise an important class of landlords. Probably not more than 10% of the rented farms are owned by absentee landlords, and apparently there has been little change in this regard since 1900. There is but little concentration of ownership, except in the plantation region of the South, and apparently for the country as a whole there has been no increase in concentration."

However, as in England and in other older countries generally we find here and there those who prefer tenancy to ownership because the capital put into equipment yields a larger return than that put into the land. American public opinion, however, looks somewhat askance upon tenancy of this sort even if it does yield the farmer a larger income. Generally speaking, when tenants have acquired a sufficient amount of property, they prefer to buy farms rather than to hire them from the owner even though hiring might yield a larger income. Until recently the importance of rising land values in the United States made it desirable and profitable to own the land.

It is beginning to be seen then that a certain amount of tenancy in the United States is a necessary good rather than a necessary evil although this must be qualified somewhat. Since the agricultural depression a new problem in connection with agricultural land has arisen. A large number of farms—no authentic figures are available to indicate how many—have fallen into the hands of trust companies, banks and insurance companies and others because many farmers could not meet the payments on their mortgages. Just what to do with these farms is a problem. The banks and trust companies do not want to sell in a period of depression. It means that some sort of farm management and tenancy must be developed until it is possible to sell more profitably. There is no evidence, however, that tenancy of this sort will displace the American ideal of family-sized, freehold farms.

Urban Land.—Urban land is becoming an increasingly important factor in the United States. In 1890 35·4 per cent of the population lived in cities; by 1920 this had increased to 51·4 per cent. In 1890 there were only 58 cities over 50,000; in 1920 there were 144. With a continually greater proportion of the population of the country living in cities and in larger cities, the problems of urban land tenure and adequate housing have become complicated.

Throughout the development of America home ownership has been and still is the ideal, though there has been a very limited and now passing use of the ground rent system as in the city of Baltimore. But in rapidly growing cities with very mobile populations tenancy must inevitably occupy a large place. It tends to increase as cities grow in size and the character of the population changes. In 1920 the percentage of rented homes in cities of 25,000 to 50,000 was 57·3; this increased with the size of the city until in cities of one million or more 78·8% were rented. For the country as a whole 36·9% of the homes, not on farms, were owned in 1890; in 1920, 40·9% were owned. Of those owned 27·7% were mortgaged in 1890 and 39·7% in 1920. Thus an increase both in home ownership and in the indebtedness on homes has occurred.

For the developments arising out of the problems of urban land tenure and the necessity of providing adequate housing accommodation *see* HOUSING, section *Housing in the United States.*

Recent Tendencies.—Probably in no other country of the world has the development of natural resources proceeded as rapidly as in the United States. Unquestionably this development has been facilitated by the public policies of unrestricted private enterprise and freehold tenure of land, aided by the deliberate alienation of a vast public domain. With the occupation of the best frontier lands accomplished three or more decades ago and with the accelerated growth of cities since then, the problems of land tenure have changed. The option of free land no longer influences the labour movement in an important way. Tenancy, both in country and in city, has taken on new significance. Where formerly tenancy was regarded as an evil, now a certain amount of tenancy is more and more considered a necessary good. As we have rungs on the agricultural ladder as one mounts to farm ownership, so we may have rungs on the ladder toward home ownership in the city. In the case of the City Housing Corporation, a rented apartment is now such a rung. One comes into the community of Sunnyside, hires an apartment and then, following the surrounding home-owners, eventually buys a home. These developments would hardly have been possible had they not been accompanied by an increasing fluidity of landed property. The American population is mobile. When a family's residence

in a community is of uncertain duration, the natural inclination is to lease rather than buy a dwelling unless real estate is easily and quickly transferable. Various developments, of which the Torrens system of registering title is an important one in some localities, have made possible the transfer of landed property with almost as much ease as any other commodity.

Perhaps the most striking tendency in recent decades is the narrowing of the rights that go with land ownership. This is in accordance with economic evolution. As the use of land is intensified, problems of social control become more important. Zoning and subdivision control are representative of many instances of this tendency. The increasingly urban character of the country undoubtedly will accelerate this movement. Withal the ideal of private owner-occupation of land will probably continue to dominate. Measures of social control are designed to enable the great class of freeholders to realize more fully the benefits of this system of land tenure.

LAND TENURE, PRIMITIVE. For primitive as for modern societies the use of a certain area of the earth's surface "is a primary condition of anything that man can do; it gives him room for his own actions, for the enjoyment of the heat and the light, the air and the rain which nature assigns to that area, and it determines his distance from and, in a great measure, his relations to other things and other persons." (Marshall, *Economics of Industry*, 1898.)

Land tenure is affected by the relative density of population. Thus, among the Andamanese, Professor Radcliffe Brown found that "an average local group consisted of from 40 to 50 persons of all ages, the average number of local groups to a tribe being about ten. This would give the average extent of country occupied by each local group as about 16 sq.m., but some groups certainly had a larger territory than this, and some had smaller." (*Andaman Islanders*, 1922.) The areas required by other groups of the food-gatherer type are large. Thus, in Arctic America from 70 to 200 sq m. are required for the support of the hunters. Pastoral nomads require from 2 to 5 sq.m., and agriculture, in its most intensive form, with rice as the staple of cultivation, will support a population of over 1,000 per square mile. (*Census of India*, vol. i., 1921.)

A factor which affects the density of an agricultural population and the tenure of land is the method of cultivation employed. Communities in Assam, such as the Lusheis, practice extensive cultivation by the *jhum*, or fire and axe method, which speedily exhausts the resources of an area, and compels migration. There are in that area villages with permanent fields with temporary or *jhum* cultivation subsidiary thereto. There are also permanent villages with permanent fields, and *jhum* cultivation in set rotation. (Hodson, *Naga Tribes of Namipur*, 1911.) Tenure conditions deal with temporary dwellers with permanent cultivation.

In communities in Africa and India both pastoralism and agriculture are followed. The relations between the groups practising these methods engender problems of land tenure, as do the relations between sections of the community subsisting by hunting, and those practising fixed agriculture. A feature of pastoral life is the periodical movement of communities with their flocks and herds, generally over well defined routes to definite areas which by custom they are entitled to exploit.

Simple Forms.—The study, therefore, of land tenure exhibits simple forms only in communities where a single method of economic exploitation secures the food supply, such as the Andamanese and Australian tribes. Among the former, the hunting grounds of a local group belong to the whole group and all the members have an equal right to hunt over it, and the boundaries are generally recognized. In Australia, "from time immemorial—that is, as far back as their native traditions go—the boundaries of the tribes have been where they are now fixed. Within them their ancestors roamed about hunting and performing their ceremonies, just as their living descendants do at the present day. There has never apparently been the least attempt made by one tribe to encroach upon the territory of another. Now and again they may have intertribal quarrels and fights, but there is no such thing as the acquisition of fresh territory." (Spencer and Gillen, *Northern Tribes of Australia*, 1904.)

Similarly, among the American Indians such as the Creeks, "every individual inhabitant has an equal right to the soil and to hunt and range over its region, except within the jurisdiction of each town or village, which, I believe, seldom extends beyond its habitations and sporting ground. Perhaps the Uches are to be excepted. They claim an exclusive territory by right of contract, and though they have sometimes put the Creeks in mind of this privilege, when their hunters make too free with their hunting grounds, yet the dispute seldom goes further, as the Confederacy are cautious of offending the Uches and yield, to their common interest and safety." (*Report*, Bureau of American Ethnology for 1924–25, 1928.)

Agriculture, Hunting and Pastoralism.—In East Africa the dominance of the Hamitic pastoralists over the earlier agricultural negroid population brought two sets of interests into relationship. Thus, among the Bunyoro, cultivation is avoided by the pastoral people; "it is said to be harmful for the wife of a man belonging to the pastoral clan to till the land, as by doing so, she may injure the cattle." (J. Roscoe, *Northern Bantu*, 1915.) The king was the sole possessor and disposer of land, which was valued for its pastoral rather than for its agricultural qualities. Nevertheless, care was taken to provide some measure of security of tenure for the agriculturalists.

Common Holding and Redistribution.—Within a community land is often held in common; even, as among the Creeks, cultivated in common. Thus, "in the town plantation every family or citizen had his parcel or share according to desire or convenience, or the largeness of his family. These fields were planted and cultivated by the town, working together and attending to the several plots in turn. They harvested at the same time, but each family harvested from its own plot." (Bureau of American Ethnology *Report 1924–25*, p. 336.)

Communities are known which practise the periodical redistribution of land. Thus, among the Marris in Baluchistan, land was divided every ten years. "The tribe welcomed, indeed depended upon, the admission of strangers for the maintenance of its strength, and it was not until after a man or group had been given a share of tribal land that women were given to him or them in marriage. At the time of the decennial division of land, the number of males of whatever age, in every sub-section of each section, is counted. In some cases the division takes place among the married men of the section. . . . Lots are drawn." (*Census of India*, vol. v., 1901.)

Among the Brahuis "Following the distribution of armed men among the clans and sections, came the division of the land which had been acquired under Kacchi. The share of land of each clan was proportionate to the number of armed men it had to produce, and the same system was followed in the case of each Dhagana or section until the individual was reached. Previous to this, however, a portion of land was specially set aside

for the chief, in addition to that to which he was entitled on account of his responsibility for 20 armed men. No individual is allowed to part with his land, and if a section happens to be reduced to such small numbers as to be unable to undertake the burden of supplying the armed men assessed on it, a redistribution of the armed men is made among the remaining sections of the clan. A similar process is followed if a clan becomes extinct." Mention is made of redistribution of clan land among the Lhota Nagas.

In Central Africa, the land held by a community is invested in the chief as its head and representative. He is the *murni-inshi* ("master of the land"). He may not alienate it except by the permission of his people. He receives it with all the taboos attached to it—the sacred groves, the trees, ant-hills, pools, streams, the *matongo,* all of them with taboos attached—and it is his to see that none is violated, and to hand them all to his successor intact. Should a stranger wish to live on the land, a *lubeta* is called and the matter discussed. Many things have to be taken into consideration, including the character of the applicant. There is need for some circumspection in this respect for sometimes an undesirable person gets his head in and ends by turning the rightful owner out, or at least, making himself the master. But unless patently undesirable the chief and his people are not likely to refuse him, because he adds to their number and dignity. The chief points out a place where he may live and cultivate, and informs him of taboos which he needs to know. If he oversteps the borders allotted to him he will get into trouble. (Smith and Dale, *Ila Speaking Peoples,* 1920.)

Where a community or society comprises minor sub-divisions or has certain typical institutions; these often occupy land as distinct units. Thus, among the Lhota Nagas "land can be held either by the village, a *morung,* a clan or an individual. The land close to a village is generally waste land, and common property, as are the rights of "poisoning" in certain pools. Every morung owns land, which is the property of the morung as a whole, and not of individuals. It is worked by the boys of the morung and the produce used to buy meat for ceremonies such as the rebuilding of the morung. . . . A very large proportion of the land in the Lhota country is clan land, which is held in common by all members of that particular clan or village. A man who leaves a village loses all right to clan land in the village. . . . Every year the members of the clan in a Lhota village meet and portion out land which each is to get that year, the senior men getting the bigger share. Strangely enough, this delicate operation never seems to result in a quarrel. . . . When direct heirs fail the land becomes clan land. If this were to go on indefinitely the whole of the land in a village would in time become clan land and no one would then be able to buy or sell land. To prevent this, from time to time when the amount of common land becomes unwieldy, the clan meets and divides it up among the members who thus each become private owners of a portion of it. The process then begins again." Recognition of the *morung* or Man's House as a land holding unit indicates the rudiments of corporate tenure.

Among the Ila the boundaries are well recognised. "No passer-by would know these boundaries. They are purely natural—a tree, an ant heap, a certain direction; all very vague, apparently, but known to all concerned as well as if fenced in with a stone wall. All boundaries are taboo. The chief apportions the land to his people for their fields, but does it in the presence of a company so that there may be no doubt of it. When a person has his field apportioned, he puts in a few stakes, and afterwards clears a line round it. Woe to anyone who moves his neighbour's marks!" (*Ila Speaking People,* vol. i., 1920), the sentiment of the Commination service, where "Cursed is he who moves his neighbour's land mark." The sacred boundary stone, the natural landmark, the hill, the ravine, the river, acquire sanctity.

Religious Sanctity.—In Australia totem groups are associated with definite spots which are therefore sacred, and men belong to a spot because they originated there. The spot is sacred to the men because it is the place of their origin, because it is the place to which at death their spirits return, thence to be reincarnated. So, too, the Birhors of Chota Nagpur regard with reverence the hills from which the ancestor of their clans emerged. Thus the sentiment of sacredness attaches to selected spots which are distinguished from other adjoining or similar spots by the traditional sentiment whose maintenance adds to the solidarity of the society.

Religion colours the attitude of primitive man towards the land area he occupies. The Ila chief manages the land of the community as its head representative. "He receives it with all taboos attached to it—the sacred groves, the trees, the ant-hills, pools, streams, the *matongo*—all of them with taboos attached—and it is his to see that none is violated and to hand them on to his successor intact." Thus the easements attached to land even in primitive communities are of very diverse origin, others related to military service, while corporate tenure is maintained side by side with individual property.

LAND TITLES. The ownership of land, being the ownership of the source and scene of all property and all life, must necessarily be of a complex and in some aspects purely notional character. Its value, its immobility, its permanence, its variety of uses and relationships, give it a totally distinctive character and render it peculiarly liable to complication, doubt and dispute. In the case of goods, for instance, possession may ordinarily be relied on as proof of full ownership; in the case of land, the person in possession is seldom the owner, he is usually only a tenant, paying rent to someone else. Even the person to whom the rent is paid is in many cases—probably, in England, in most cases—not the full owner, but only a life owner, or a trustee, whose powers of disposing of the property are of a strictly limited nature. Again, goods are very seldom the subject of a mortgage, whereas land has from time immemorial been the frequent subject of this class of transaction, which, if left undiscovered, might afterwards deprive the purchaser of a large part or even the whole of the value of his purchase.

Apart from very early and primitive social conditions, there appear to be only two ways in which the required certainty as to title to land can be obtained. Either (1) the purchaser must satisfy himself, by an exhaustive scrutiny and review of all the deeds, wills, marriages, heirships and other documents and events by which the property has been conveyed, mortgaged, leased, devised or transmitted during a considerable period of time, that no loophole exists whereby an adverse claim can enter or be made good—this is called the system of Private Investigation of Title—or (2) the Government must keep an authoritative list or register of the properties within its jurisdiction, together with the names of the owners and particulars of the encumbrances in each case, and must protect purchasers and others dealing with land, on the faith of this register, from all adverse claims. This second system is called Registration of Title. It would seem fairly obvious that the latter system, if efficiently and economically administered, would be safer, cheaper and more expeditious than the former, and so in fact it has proved in all cases where it has been established on an adequate scale to afford a proper comparison. The Private Investigation system may or may not be assisted by the Government setting up a Register of Deeds. This is done in nearly all civilized countries except England, where it is confined to two counties—Yorkshire and Middlesex It consists in the establishment of public offices in which all documents affecting land are to be recorded—partly to preserve them in a readily accessible place, partly to prevent the possibility of any material deed or document being dishonestly concealed by a vendor Where registration is effected by depositing a full copy of the deed, it also renders the subsequent falsification of the original document dangerous. In some countries registration is essential to the legal validity of a deed; in others registration only confers priority over an unregistered one.

Another expedient for getting over some of the worst drawbacks of the Private Investigation system has been adopted on a large scale in the United States, namely Insurance of Title (*q.v.*). An insurance company investigates in the ordinary way, charging a premium for the trouble and risk of error.

One other matter of principle—recognized in some form or other by all systems—is that title can be acquired (or lost) by the mere fact of possession (or the want of it) continued for a considerable time. This is called Prescription (*q.v.*). In English law it takes mostly a negative rather than a positive form, and is called Limitations of Actions. This consists in the deprivation one after another of the rights of possible adverse individual claimants rather than the acquisition by the possessor of an independent right, good against all the world, to which alone the term prescription exactly applies. Where there are dormant rights (*e.g.*, the remainder on an estate tail or on a long term of years) it may be a very long time before all such claims are effectively barred. Scotland, South Africa and most European countries recognize prescription in the more exact sense.

Practical Developments.—In very early times, and in small and simple communities, the difficulty afterwards found in establishing title to land does not arise, owing to the primitive habit of attaching ceremony and publicity to all dealings. The parties meet on the land, with witnesses; symbolical acts (such as handing over a piece of earth, or the bough of a tree) are performed; and a set form of words is spoken, expressive of the intention to convey. By this means the ownership of each estate in the community becomes to a certain extent a matter of common knowledge, rendering fraud and mistake difficult. But witnesses die, and memory is short; and one of the earliest improvements consists in the establishment of a sort of public record kept by the magistrate, lord or other local authority, containing a series of contemporary notes of the effect of the various transactions that take place. This book becomes the general title-deed of the whole community, and as long as transactions remain simple, and not too numerous, the results are quite satisfactory. Of this character are the Manorial Court Rolls, which were in the middle ages the great authorities on title, both in England and on the Continent. In the land registry at Vienna there is (or till lately was) a continuous series of registers of this kind going back to 1368, in Prague to 1377, in Munich to 1440. No doubt there are extant manorial records in England of equal or greater antiquity; since the abolition of the manorial courts in 1925–26, these are passing gradually into the keeping of local authorities under the superintendence of the master of the rolls. Where dealings become more numerous and complicated, written instruments are required to express the intentions of the parties, and afterwards to supply evidence of the landowner's title. It appears, too, that as a general rule the public books already described continue to be used, notwithstanding this change; only (as would be expected) the entries in them, once plain and simple, either grow into full copies of the long and intricate deeds, or consist of mere notes stating that such and such deeds have been executed, leaving the persons interested to enquire for the originals, in whose custody soever they may be found. Here we have, in effect, the system of Private Investigation of Title, assisted by Registration of Deeds. It prevails in France, Belgium, parts of Switzerland, in Italy, Spain, India, in almost all the British dominions and colonies (except where superseded by a formal Registration of Title), in most of the States of the American Union, in the South American republics, in Scotland and Ireland, and in the English counties of Yorkshire and Middlesex. Where it exists, there is generally a law to the effect that in case of dispute a registered deed shall prevail over an unregistered one. The practical effect is that a purchaser can, by searching the register, find out exactly what deeds he ought to enquire for, and receives an assurance that if, after completion, he registers his own conveyance, no other deeds—even if they exist—will prevail against him.

The more perfect system of Registration of Title consists in collecting the transactions affecting each separate estate under a separate head, keeping an accurate account, generally by means of a map, of the parcels of which each such estate is composed, and summarizing authoritatively, as each fresh transaction occurs, the subsisting rights of all parties in relation to the land itself. This system prevails in Germany, Austria, and in most other parts of the former Austro-Hungarian empire, in parts of Switzerland, Australia, New Zealand, nearly the whole of Canada, some of the states of the American Union, to a certain extent in Ireland, and is in course of establishment in England and Wales. On a sale the purchaser can see in a few minutes from the register (or from an authorized copy of it called a land certificate) who is the owner, what are the burdens (if any) and who owns them, and can at once prepare a transfer, usually in a short clear-printed form. The vendor executes this in exchange for the purchase money, the purchaser presents it at the registry, the necessary alterations are made in the books, a new certificate is issued to him and all is over.

England and Wales.—Private investigation, assisted in Middlesex and Yorkshire by Registration of Deeds, is still the prevalent system. The purchaser has a right to demand a perfect title, beginning with a good root, at least 30 years old, but this right is frequently much modified by special contract. On an average, an investigation of title takes about a month. The cost is *ad valorem*, on a sliding rate, the rate diminishing as the value increases. At typical values—say £500, £2,000 and £20,000, it is £10, £33 6s. 8d. and £126 13s. 4d. respectively. Both parties pay these costs, so the total cost is double these amounts. In Middlesex and Yorkshire a few shillings more for registration and searches are paid by the purchaser. Owing to the absence of a register, fraud by suppression of deeds, though rare, is not unknown—especially in regard to mortgages.

About 1855 the superior merits of Registration of Title began to be ventilated: in 1857 a Royal Commission reported in favour of it; in 1859 a government was introduced and in 1862 the lord chancellor (Westburn) carried an act establishing it, but on a voluntary basis only. The act of 1862 was replaced by another in 1875 (passed by Lord Cairns with the support of Lord Selborne) still on voluntary lines. The House of Lords passed strong compulsory bills in three successive years. The opposition came in the Commons, where the professional interest was sufficient to secure a "block," which was only finally removed in 1897, at the price of very heavy concessions. Under the Land Transfer Act of that year, coupled with orders in council made under it, registration of the title has been compulsory on every sale and long lease in the county of London ever since 1899. By the end of 1927 upwards of 352,000 titles had been registered under it, representing a value of over 350 millions sterling. Compulsory orders have also been made as to Eastbourne (1925) and Hastings (1928). Particulars can be obtained from the circulars issued *gratis* by the Land Registry (Lincolns' Inn Fields, London, W.C. 2) or (for a few pence) from the chief Registrars' Annual Reports.

In 1922, Lord Birkenhead carried a Land Registration Act founded on the report of a royal commission under Lord St. Aldwyn (1909–11) and a committee of enquiry (1919) under Sir Leslie Scott. There is thus every probability that the system will, in due course be gradually applied by orders in council under the new scheme of 1922 (which took permanent shape, in Lord Cave's Land Registration Act of 1925) to the whole of England and Wales. To give a few typical figures—the cost of a sale (both parties' solicitors' and registry fees) under registration of title at £500, £2,000 and £20,000 value is £11 10s. 0d., £29 6s. 8d. and £39 6s. 8d. respectively, with state guarantee of title thrown in. The registry produces an annual surplus, out of which £160,000 of capital expenditure on site and building has been defrayed and an insurance fund valued at £133,000 has been built up and is increasing.

Pari passu with these developments of registration of title, considerable improvements of detail have, during the last half century, been made in the private investigation system itself—notably the shortening (in 1874) of the period of investigation on sales from 60 to 40 years and (in 1922) to 30—and the establishment (in 1882) of an *ad valorem* fee scale for solicitors' remuneration instead of the old system of item costs. Also, in 1926, a new scheme of a far-reaching, but highly technical, character called the "curtain" scheme came into operation, by which the titles to settled estates will ultimately be much simplified.

Scotland and Ireland.—The Scottish system is private investigation, assisted by a very complete and efficient registry of deeds, called the Register of Sasines. After 20 years on the

register a good title is conferred, by prescription, on the grantee and accordingly the investigation made on sales is for that period only. But it is not the practice, as in England, to curtail this by contract: the full legal title for 20 years is invariably shown. The register for the whole of Scotland (except certain royal burghs which are gradually being brought into line) is at Edinburgh and was established in 1617. The Register of Sasines is among the most complete and efficient deed registries in existence. Its distinctive features are the "minute" and the "search sheet." The former is a précis or abstract of each deed, officially made and filed: the latter is a mode of arranging these minutes, according to the property affected, so that the register contains a ready-made abstract of title for each estate, enabling a full investigation to be made without difficulty or delay, in the office itself. In 1906 the question of Registration of Title was mooted and a royal commission under Lord Dunedin produced a report showing much difference of opinion on the main issue, but containing sundry suggestions which have been carried out under an act of 1924. The minimum purchaser's costs are £5: at £100,000 they are £532 10s. 0d. The vendor's scale is two-thirds of the purchaser's—the latter also pays the registry fee (ranging from 5s. to £6). Fraud by suppression of deeds is unknown.

Till 1891 the system in Ireland was private investigation, assisted (since 1708) by a deed registry in Dublin. There are now about 300,000 titles on the register and 10,000 first registrations and 30,000 dealings registered annually. The registry is a department of the High Court. The fees are *ad valorem*, and average 18s. or 19s. in the Free State and 10s. in Northern Ireland. Unlike the deed registry, Registration of Title is administered to some extent locally: in Northern Ireland there are five local offices.

British Dominions and Colonies.—Registration, either of deeds or of title, is universal. Registration of Title, generally known outside the British Isles as the "Torrens system" after Sir Robert Torrens, who first successfully introduced it into South Australia in 1857, is almost universal in the Australian states and in New Zealand and has been partially adopted in Canada and elsewhere. In South Africa a mixed system prevails, conferring most of the benefits of registration of title.

The Australian states, with New Zealand, now furnish the most conspicuous examples in the British empire of the success of registration of title. But prior to the year 1857 they had only registration of deeds, and the expense, delay and confusion resulting from the frequent dealings appear to have been a crying evil. Sir Robert Torrens, then registrar of deeds in South Australia, drew up and carried an act establishing a register of title similar to the shipping register. The act rapidly became popular, and was adopted (with variations) in all the other Australian states in the years 1861, 1862 1870 and 1874. Consolidating and amending acts have since been passed in most of these states. Only absolute title is registered.

As regards Canada, registration of title was introduced in Vancouver island in 1861, was extended to the rest of British Columbia in 1870, and was in 1885 adopted by Ontario, Manitoba and the North-West Territories, and in 1903 (partially) by Nova Scotia. Only Quebec, New Brunswick and Prince Edward island retain the old English system, plus registration of deeds. The provinces which have adopted registration of title have adopted it in somewhat different forms. In British Columbia it is similar to Lord Westbury's act of 1862. The North-West Territories follow closely the Torrens acts. The Ontario act is almost a transcript of Lord Cairns's act of 1875.

France.—In France registration of deeds is universal. Sales, mortgages, gifts and successions; easements, leases of over 18 years and transactions affecting the land to the extent of three years' rent may lose priority if not registered. Wills need not be registered. Mortgages must be re-registered every ten years. Purchase deeds are registered by filing full copies. Registries are established in all the considerable towns. The title can usually be fully investigated from the documents in the registry. Official searches for mortgages are commonly resorted to. Under the monarchy the land system was practically copyhold tenure, but greater validity was attached to the Court Rolls than was the case in England. The present system was established by a law of 1790 after the abolition of seignorial institutions in 1789. This was modified by the Code Napoleon, and further perfected by a law of 1855 which is still in force. With regard to cost, the outstanding feature is the government duty, which is now permanently fixed at rates ranging from 15% in low values to 18½% in high values. Besides this there is a temporary tax of 7% on the first sale after 1926. Before the War it was about 6½%. There are also small charges for registration. The combined cost of duty and professional help works out on a general average at about 25 to 30% on the value and is paid by the purchaser. The vendor as a rule has no costs.

Germany and Austria.—By far the most important examples of registration of title at present existing—because they show how the system works when applied to large European communities, with all the intricacies and complications of modern civilized life—are to be found in Germany, Austria, Hungary and the other states formerly parts of the Austrian empire. In some parts of these countries registration of title has been established for several centuries—notably in Bohemia; in most parts it has existed for the greater part of the 19th century; in some districts, again, notably Tirol and the Rhine Provinces, it is of comparatively recent introduction. In all cases it appears to have been preceded by a system of deed registration, which materially facilitated its establishment. In some cases, Prussia, for instance, the former registers were kept in such a way as to amount in themselves to little short of a registry of title. Very low scales of fees suffice to pay all official expenses. In case of error, the officials are personally liable; failing these, the state. Other states are very similar. Owing to the ease and simplicity of the registers, it is not always necessary to employ professional help. When such help is required, the fees are low. In Vienna (prior to the War) £1 was a very usual fee for the purchaser's lawyer, £10 being seldom reached. In Germany the register is private. In Austria it is open to public inspection. The systems are usually administered in districts, about 20 to 30m. across, attached to the local law courts. In Baden and Württemberg every parish (commune) has its own registry. All ordinary dealings are transacted with the greatest expedition. Security is absolute. Very full information as to the German and Austrian systems is given in the parliamentary report (C. 8,139) of 1896. There has been no change of importance since that date. (C. F.-Br.)

United States.—"The characteristics of the American recording system which distinguish it from other systems are these: The document recorded is a deed, not a memorandum of a transfer or an agreement for a transfer; the deed is operative without record, the title passing before the deed is recorded; the record is not a mere device for preserving evidence, but gives a legal priority to the grantee of the recorded deed. In the first particular it differs from the mediaeval registry system; in the second from the continental registry systems and the American Torrens system of registration; in the third from the recording system in England under local customs, like those of Middlesex and Yorkshire," Joseph H. Beale, "The Origin of the System of Recording Deeds in America," 19 *Green Bag*, 335 (1907). Land registration in America antedates the English system established by the statute of 7 Anne c. 20. It began in Plymouth Colony in 1626 and in Virginia and Connecticut in 1639. The first legislation, however, that established the principle of preferring a recorded deed to a prior unrecorded one was the Massachusetts statute of 1841. Since that time recording has been inaugurated in every State as its aid in facilitating commerce in land became apparent. The basic principles of the American recording system are two: registration gives absolute notice of the contents of every deed properly recorded to every person subsequently dealing with the property, whose duty it is to examine the record, and, secondly, gives all persons the right to rely upon the records as containing a complete catalogue of every outstanding estate that could affect their rights as purchasers of the land. Consequently, though registration is not mandatory, a failure to register gives subsequent parties dealing with the property in good faith superior rights.

The basic principle is easily illustrated by the following case: A, the owner of Blackacre, conveys in fee simple to B who fails to record. A thereafter conveys to C, who has no actual notice of the prior conveyance to B. C's title is superior to the earlier title of B, though in some States this is true only if C records his deed before B records his prior deed. It should be noticed that recording is not necessary for the acquisition of title. Upon the conveyance to B, he immediately acquires title, but this is subject to be divested by a subsequent conveyance to another purchaser having no notice of the earlier deed. An unregistered deed may also be ineffective as against creditors of the grantor who had no notice of the conveyance.

The registration of deeds, stretching back in the Eastern States to the early colonial period, makes necessary a voluminous system of records. Each county of a State has its central registry system, but the extensive indexes make an examination of title a lengthy and expensive process. Complaints are continually made as to the accuracy of the indexes. The dangers inherent in the recording system have led to the use of title guarantee companies, the activities of which have increased enormously in the past two decades. Also wide efforts for reform in land registration have been directed toward the establishment of the Torrens system to function side by side with the older recording system. Ohio passed legislation establishing the Torrens system in 1896, and Illinois and California followed in 1897. (The Ohio act was later declared to be unconstitutional in *State* v. *Guilbert*, 55 Ohio St. 575, and was superseded in 1913 by an act free from the invalidating defects.) By 1915 similar legislation had been enacted by 12 States and by Hawaii and the Philippine Islands. The constitutionality of such legislation had been established by the leading case of *Tyler* v. *Judges*, 175 Mass. 68, 179 U.S. 405. In 1912 the matter was taken up by the National Conference of Commissioners on Uniform State Laws and, as a result of their efforts, a uniform statute to establish the Torrens system of registration was recommended to the various States in 1915. The adoption of this statute by three States and the adoption of similar statutes by other States indicates the extent to which the Torrens system has fastened itself upon the legal systems of the various American States. (J. M. La.)

Bibliography.—A very complete list of some 114 English publications from 1653–1895 will be found in R. Burnett Morris, *Land Registration* (1895). For parliamentary publications see *Second Report of the Real Property Commissioners* (1831); *Report of the Registration and Conveyancing Commission* (1850); *Report of the Registration of Title Commission* (1857); *Report of the Land Transfer Commission* (1870); *Reports on Registration of Title in Germany and Austria-Hungary* (1896); *Report of the Registration of Title (Scotland) Commission* (1908); *Report of Commission on Land Transfer Acts* (1911); *Fourth Report of the Acquisition and Valuation of Land Committee, on the Transfer of Land in England and Wales* (1919). For general reviews of land registration in the British Isles, the colonies, and in foreign countries; R. Burnett Morris, as above, and C. F. Brickdale, *Methods of Land Transfer* (1913). LANDUMAN, a small tribe of light-skinned folk, about 1m.65cm. in height, who file their teeth into points and tattoo their arms. They live between the upper Nunez and Pongo rivers in French Guinea, and are organized as a monarchy. Marriage is polygamous, the first wife being the senior. The eldest daughter of the first wife marries the brother of the second wife. Inheritance is matrilineal, and both family and personal ownership of goods exist. The dead are exposed, then buried in sacred groves, and sacrifices take place on the grave. They are animists and have secret societies (*Sebe* and *Basondji*).

See Arcin, *La Guinée Française* (1907).

LANDWEHR, that part of the organized forces of which continuous service is required only in time of war. The Prussian Landwehr was first formed during the War of Liberation against Napoleon and after the unification of Germany became the recognized second-line army. On termination of their service in the active army, all reservists passed into the Landwehr, with which they served for eleven years, up to the age of 39, then passing to the Landsturm. At the opening of the World War the bulk of the Landwehr were absorbed into the active army, and from the residue there were formed a number of independent Landwehr brigades, which later in the war were combined to form divisions. These were at first utilized for line of communication duties, but later took part in operations on the eastern front and held quiet sectors of the line in the west. A total of 34 Landwehr divisions were organized at various periods during the war.

In Austria-Hungary the pre-war Landwehr was a totally different organization, being in reality a cadre force existing alongside the regular army. Into it were passed not only those men who had completed their term of service in the active army, but also those who for want of vacancies could not be placed in the latter. Peace-time training was limited to a few weeks every two years. At the opening of the World War Austria mobilized eight Landwehr (Schutzen) divisions and Hungary eight Honved divisions, and three additional Schutzen and nine Honved divisions had been raised before its termination in 1918.

The Swiss Landwehr consists of men who serve for eight years between the ages of 33 and 40; the force includes units of all arms and numbers some 70,000 men. Training at present consists only of a few repetition courses and arms inspections.

LANE, EDWARD WILLIAM (1801–1876), English Arabic scholar, son of Dr. Theophilus Lane, prebendary of Hereford, was born on Sept. 17, 1801. He was educated at Bath and Hereford grammar schools. In 1825 he started for Egypt in search of health. There he spent three years, twice ascended the Nile, proceeding as far as the second cataract, and composed a complete description of Egypt, with a portfolio of 101 drawings. He again visited Egypt in 1833–35, residing mainly in Cairo, but retiring to Luxor during the plague of 1835. Lane took up his residence in the Mohammedan quarter, and under the name of Mansur Effendi lived the life of an Egyptian scholar. His *Account of the Manners and Customs of the Modern Egyptians* appeared in 1836, and became a classic. The translation of the *Arabian Nights*, with notes and illustrations, designed to make the book a sort of encyclopaedia of Eastern manners, appeared between 1838 and 1840. In 1840 Lane married a Greek lady. A useful volume of *Selections from the Kur-ān* was published in 1843, but before it passed through the press Lane was again in Egypt, where he spent seven years (1842–49) collecting materials for a great Arabic lexicon, which the munificence of Lord Prudhoe (afterwards duke of Northumberland) enabled him to undertake. The most important of the materials amassed during this sojourn was a copy in 24 thick quarto volumes of Sheikh Murtadā's great lexicon, the *Tāj el 'Arūs*, which, though itself a compilation, is so extensive and exact that it formed the main basis of Lane's subsequent work.

Returning to England in 1849, Lane devoted the remaining 27 years of his life to digesting and translating his Arabic material in the form of a great thesaurus of the lexicographical knowledge of the Arabs. He worked at this *Arabic-English Lexicon* with unflagging diligence till a few days before his death at Worthing on Aug. 10, 1876. Five parts appeared during his lifetime (1863–74), and three posthumous parts were afterwards edited from his papers by S. Lane-Poole. Lane's scholarship was recognized by many learned European societies. He was a member of the German Oriental Society, a correspondent of the French Institute, etc. In 1863 he was awarded a small civil list pension, which was after his death continued to his widow.

A Memoir, by his grand-nephew, S. Lane-Poole, was prefixed to part vi. of the *Lexicon*. It was published separately in 1877.

LANE, FRANKLIN KNIGHT (1864–1921), American public official, was born near Charlottetown, P.E.I., Canada, July 15, 1864. He graduated at the University of California in 1886. Beginning his career as a newspaper reporter, he later studied law, was admitted to the bar in 1889, and practised in San Francisco. In 1897 he was elected city attorney, to which office he was twice re-elected. In 1905 he was appointed by President Roosevelt a member of the Interstate Commerce Commission and was retained by President Taft, serving for eight years. In 1913 he entered the cabinet of President Wilson as secretary of the interior. During his term of office the wealth of Alaska was made more accessible by the construction of a government railway. To the Indians he gave special attention, maintaining that perpetual tutelage was wrong. He advocated development of national resources without waste as being reasonable conservation, and earnestly urged the reclamation of land. In 1920 he resigned his post. He died at Rochester, Minn , May 18, 1921.

Lane was the author of *The American Spirit* addresses delivered in war time (1918).

See also A. W. Lane and L. H. Wall, *The Letters of Franklin K. Lane, Personal and Political* (1923).

LANE, SIR HUGH PERCY (1875–1915), Irish art collector, was born in Co. Cork on Nov. 9, 1875, the son of the Rev. J. W. Lane. He entered the firm of Colnaghi and Company in 1893 and rapidly made a name as a connoisseur of extraordinary perception. In 1898 he began dealing on his own account. He took a prominent part in the revival of an interest in art in Ireland, especially in establishing a gallery of modern art in Dublin. A fine collection was ultimately made, and housed in Harcourt street, Dublin, where it was opened in 1906. He was knighted in 1909. He acted as adviser on the formation of the Johannesburg Municipal Gallery of Modern Art (1909), and brought together the Cape Town National Gallery collection of 17th century Dutch pictures (1912). He was in 1914 appointed director of the National Gallery of Ireland. He was drowned in the sinking of the "Lusitania," May 7, 1915. After his death a controversy arose about a collection of pictures, mostly of the French Impressionist school, which he had lent to Dublin in 1906 and had offered to give if a permanent gallery were provided. As this condition was not complied with he withdrew the loan and lent these pictures to the National Gallery in London, to which he bequeathed them in 1913. However, before sailing to America in 1915, he made a codicil to his will restoring the pictures to Dublin; but this codicil was unwitnessed, and on Lane's death the National Gallery became possessed of the pictures. On Dublin protesting, a committee was set up in 1924 to consider the question, and its report (1926) affirmed that Lane thought he was making a legal disposition in his codicil, but that an act of parliament was necessary to put it into force, and that it would not be proper to modify his will by act of parliament. The pictures are now in the Tate Gallery.

See Lady Gregory, *Hugh Lane's Life and Achievements: with some account of the Dublin Galleries* (1920).

LANE, JAMES HENRY (1814–1866), American soldier and politician, was born at Lawrenceburg, Ind., on June 22, 1814. The son of an Indiana politician, he was admitted to the bar, served in the Mexican War, was lieutenant-governor of Indiana, a Democratic representative in Congress, and in 1855 emigrated to Kansas. There he soon became prominent in the Free State forces, both in a political and military way, being second-in-command in Lawrence during the "Wakarusa War," senator-elect under the Topeka constitution, one of the Free State leaders indicted for treason, and a participant in the domestic feuds of 1856–57. After Kansas became a State, Lane was elected in 1861 to the U.S. Senate as a Republican. As a result of the president's favour he exercised vague military powers in Kansas during the Civil War, in spite of the protests of the governor and the regular departmental commanders. In the autumn of 1861 he conducted a devastating campaign on the Missouri border, and in July 1862, he was appointed commissioner of recruiting. Accused of being implicated in Indian contracts of a fraudulent character, in a fit of depression he took his own life, dying near Ft. Leavenworth, Kan., on July 11, 1866. Ambitious, unscrupulous, rash and impulsive, and generally regarded by his contemporaries as an unsafe leader, Lane was a man of great energy and personal magnetism, and possessed oratorical powers of a high order.

See L. W. Spring, "The Career of a Kansas Politician," in the *Amer. Hist. Rev.* (vol. iv., Oct. 1898) and the too laudatory biography by John Speer (Garden City, Kan., 1898).

LANE-POOLE, STANLEY (1854–), British historian and archaeologist, was born in London on Dec. 18, 1854, and was educated at Corpus Christi college, Oxford, and Dublin university. His first post was in the coin department of the British Museum (1874–92), where he compiled a catalogue in 14 volumes of the oriental and Indian coins. During this period he went on archaeological missions organized by the Government to Egypt (1883) and Russia (1886). He also visited Australia. From 1895 to 1897 he was engaged on archaeological research at Cairo, under the direction of the Egyptian Government, and on his return to England was appointed professor of Arabic at Trinity college, Dublin, a post which he held until 1904. His numerous publications include: *Histories of the Moors in Spain* (1887, 9th ed., 1915); *Turkey* (1888, 6th ed , enlarged, 1908); *The Barbary Corsairs* (1890, 3rd ed., 1915); *Egypt in the Middle Ages* (1901); *Mediaeval India* (1902, 9th ed., 1915); *Essays in Oriental Numismatics* (3 vols., 1874, 1877 and 1892); *The Thousand and One Nights* (3 vols., 1906); *Mediaeval India from Contemporary Sources* (1916); *A Short History of India in the Middle Ages* (1917); and biographies of Lord Stratford de Redcliffe (1888), Sir G. F. Bowen (1889), Sir Harry Parkes (1894), Sir R. Church (1890), E. W Lane (1877), Aurangzib (1892), Saladin (1898), Babur (1899), and Watson Pasha (1919).

LANESSAN, JEAN MARIE ANTOINE DE (1843–1919), French statesman and naturalist, was born at Sainte-André de Cubzac (Gironde) on July 13, 1843. Elected to the Municipal Council of Paris in 1879, he declared in favour of communal autonomy, and joined with Henri Rochefort in demanding the erection of a monument to the Communards; but after his election to the Chamber of Deputies for the 5th arrondissement of Paris in 1881 he gradually veered from the extreme Radical party to the Republican Union, and identified himself with the cause of colonial expansion. A government mission to the French colonies in 1886–1887, in connection with the approaching Paris exhibition, gave him the opportunity of studying colonial questions, on which, after his return, he published three works: *La Tunisie* (Paris, 1887); *L'Expansion coloniale de la France* (*ib.*, 1888); *L'Indo-Chine française* (*ib.*, 1889). In 1891 he was made civil and military governor of French Indo-China; he consolidated French influence in Annam and Cambodia, and secured a large accession of territory on the Mekong river from the kingdom of Siam. He was recalled in 1894, and published a defence of his much-criticised administration (*La Colonisation française en Indo-Chine*) in the following year. In the Waldeck-Rousseau cabinet of 1899 to 1902 he was minister of marine, and in 1901 he secured the passage of a large naval programme. At the general election of 1906 he was not re-elected; he retired from politics in 1914 and died at Ecouen (*Seine-et-Oise*) on Nov. 8, 1919.

LANETT, a city of Chambers county, Ala., U.S.A., on the Chattahoochee river (eastern boundary of the State), 30m above Columbus, Georgia. It is on Federal highway 29 and is served by the Chattahoochee Valley and the Western of Alabama railways. The population was 4,976 in 1920 (19% negroes). It has cotton mills, dye works, and a bleachery.

LANFRANC (d. 1089), archbishop of Canterbury, was born early in the 11th century at Pavia, where his father, Hanbald, was a magistrate. Lanfranc studied law, and tradition links him with Irnerius of Bologna as a pioneer in the renaissance of Roman law. After his father's death he crossed the Alps to found a school in France. About 1039 he became the master of the cathedral school at Avranches, where he taught for three years. But in 1042 he entered the newly founded house of Bec. Until 1045 he lived at Bec in absolute seclusion. He was then persuaded by Abbot

Herluin to open a school in the monastery. His pupils were drawn not only from France and Normandy, but also from Gascony, Flanders, Germany and Italy. Many of them afterwards attained high positions in the Church; one, Anselm of Badagio, became pope as Alexander II. Lanfranc set the seal of intellectual activity on the reform movement of which Bec was the centre. The favourite subjects of his lectures were logic and dogmatic theology. He was therefore naturally invited to defend the doctrine of transubstantiation against the attacks of Berengar of Tours. He took up the task with the greatest zeal, although Berengar had been his personal friend; he was the protagonist of orthodoxy at the councils of Vercelli (1050), Tours (1054) and Rome (1059). To his influence we may attribute the desertion of Berengar's cause by Hildebrand and the more broad-minded of the cardinals. Our knowledge of Lanfranc's polemics is chiefly derived from the tract *De corpore et sanguine Domini* which he wrote many years later (after 1079) when Berengar had been finally condemned.

In the midst of his scholastic and controversial activities Lanfranc became a political force. While merely a prior of Bec he led the opposition to the uncanonical marriage of Duke William with Matilda of Flanders (1053), and incurred a sentence of exile. But the quarrel was settled, and he undertook to obtain the pope's approval of the marriage. This he accomplished at the same council which witnessed his third victory over Berengar (1059), and he thus acquired a lasting claim on William's gratitude. In 1066 he became the first abbot of St. Stephen's at Caen, founded by the duke as a penance for his disobedience to the Holy See. William adopted the Cluniac programme of ecclesiastical reform, and obtained the support of Rome for his English expedition in the character of a crusader against schism and corruption. Alexander II., the former pupil of Lanfranc, gave the Norman Conquest the papal benediction.

When the see of Rouen next fell vacant (1067), Lanfranc declined the honour, and he was nominated to the English primacy as soon as Stigand had been canonically deposed (1070). The new archbishop at once began a policy of reorganization and reform. Thomas of Bayeux, archbishop-elect of York, asserted that his see was independent of Canterbury and claimed jurisdiction over the greater part of midland England. Lanfranc, during a visit to Rome to receive the pallium, obtained an order from Alexander that the disputed points should be settled by a council of the English Church. This was held at Winchester in 1072. Thanks to a skilful use of forged documents, the primate carried the council's verdict upon every point. Although the school of Bec was firmly attached to the doctrine of papal sovereignty, he still assisted William in maintaining the independence of the English Church; and appears at one time to have favoured a neutral attitude in the quarrels between papacy and empire. In the domestic affairs of England Lanfranc sought to extricate the Church from the fetters of the state and of secular interests. He was a generous patron of monasticism. He endeavoured to enforce celibacy upon the secular clergy. He obtained the king's permission to deal with the affairs of the Church in synods which met apart from the Great Council, and were exclusively composed of ecclesiastics. His influence shaped the famous ordinance which separated the ecclesiastical from the secular courts (*c.* 1076). But he acknowledged the royal right to veto the legislation of national synods. In the cases of Odo of Bayeux (1082) and of William of St. Calais, bishop of Durham (1088), he used his legal ingenuity to justify the trial of bishops before a lay tribunal. He accelerated the process of substituting Normans for Englishmen in all preferments of importance.

Lanfranc's greatest political service was rendered in 1075, when he detected and foiled the conspiracy which had been formed by the earls of Norfolk and Hereford. He interceded for Waltheof's life and to the last spoke of the earl as an innocent sufferer for the crimes of others; he lived on terms of friendship with Bishop Wulfstan. On the death of the Conqueror (1087) he secured the succession for William Rufus, in spite of the discontent of the Anglo-Norman baronage; and in 1088 his exhortations induced the English militia to fight on the side of the new sovereign against Odo of Bayeux and the other partisans of Duke Robert. He exacted promises of just government from Rufus, and was not afraid to remonstrate when the promises were disregarded. In 1089 he was stricken with fever and he died on May 24 amidst universal lamentations. As a statesman Lanfranc did something to uphold the traditional ideal of his office; as a primate he elevated the standards of clerical discipline and education. Of all the Hildebrandine statesmen who applied their teacher's ideas within the sphere of a national church he was the most successful.

The chief authority is the *Vita Lanfranci* by Milo Crispin, who was precentor at Bec and died in 1149. Milo drew largely upon the *Vita Herluini,* composed by Gilbert Crispin, abbot of Westminster. The *Chronicon Beccensis abbatiae,* a 14th-century compilation, should also be consulted. The first edition of these two sources, and of Lanfranc's P. Jaffé, Berlin, 1865). Of modern works A. Charma's *Lanfranc* (Paris 1648). Another edition, slightly enlarged, is that of J. A. Giles, *Lanfranci opera* (2 vols, Oxford, 1844). The correspondence between Lanfranc and Gregory VII. is given in the *Monumenta Gregoriana* (ed P. Jaffé, Berlin, 1865). Of modern works A. Charma's *Lanfranc* (Paris 1849), H. Boehmer's *Die Fälschungen Erzbsichof Lanfranks von Canterbury* (Leipzig, 1902), and the same author's *Kirche und Staat in England und in der Normandie* (Leipzig, 1899) are useful. *See* also A. S. Macdonald, *Lanfranc* (1926), and the authorities cited in the articles on WILLIAM I. and WILLIAM II. (H. W. C. D.; X.)

LANFREY, PIERRE (1828–1877), French historian and politician, was born at Chambéry (Savoie). His father had been one of Napoleon's officers. The son studied philosophy and history in Paris and wrote historical works of an anti-clerical and rationalizing tendency. These included *L'Eglise et les philosophes du XVIIIe siècle* (1855; new edition, with a notice of the author by E. de Pressensé, 1879); *Essai sur la révolution française* (1858); *Histoire politique des papes* (1860); *Lettres d'Evérard* (1860), a novel in the form of letters; *Le Rétablissement de la Pologne* (1863). His *magnum opus* was his *Histoire de Napoléon Ier* (5 vols., 1867–75 and 1886), in which he unduly minimized Napoleon's military and administrative genius. A staunch republican, he was elected to the National Assembly in 1871, became ambassador at Berne (1871–73), and life senator in 1875. He died at Pau on Nov. 15, 1877.

His *Oeuvres complètes* were published in 12 vols. (1879 *seq.*), and his *Correspondance* in 2 vols. (1885).

LANG, ANDREW (1844–1912), Scottish scholar and man of letters, was born at Selkirk on March 31, 1844. He was educated at Selkirk Grammar school, Edinburgh academy, the University of St. Andrews and Balliol college, Oxford. He held a fellowship of Merton until he married in 1875, when he removed to London. Lang was one of the greatest journalists of his time, always fresh and original, and writing from a mind overflowing with all kinds of out-of-the-way knowledge. He wrote leaders for the *Daily News,* literary and critical articles for the *Morning Post* and other papers; he also wrote articles on ballads, crystal gazing, poltergeist, totemism and many other questions for the 9th edition of the *Encyclopædia Britannica.*

He was keenly interested in Scottish history, especially in the history of the Stuarts; it would be almost fair to call him the last of the Jacobites. He had a passion for unravelling mysterious intrigues and Scottish history gave him plenty of opportunities. Among his works in this field were *The Mystery of Mary Stuart* (1901; rev. ed. 1904); *The Portraits and Jewels of Mary Stuart* (1906); *John Knox and the Reformation* (1905); *Pickle the Spy* (1897); a *History of Scotland from the Roman Occupation to the Suppression of the last Jacobite Rising* (4 vols., 1900–07), a work containing many entertaining digressions; and other monographs on Scottish questions. He also took a keen interest in French history; he wrote a book on the "Man in the Iron Mask," which he called *The Valet's Tragedy* (1903), and a counterblast to Anatole France's work on Joan of Arc in *The Maid of France* (1908).

Lang was an incurable romantic, and this is one of the reasons for his great success in writing for children. Generations of them were delighted with the long series of fairy books, beginning with the *Blue Fairy Tale Book* (1889), and going on with the *Red, Green* and the *Yellow,* and then with true stories equally enchanting. Lang's first ambition had been towards poetry. He published many pleasant volumes of verse, beginning with the *Ballads and Lyrics of Old France* (1872), in which he experi-

mented in various metres. He was disappointed by the reception of his narrative poem on *Helen of Troy* (1882). His serious Homeric studies bore fruit in his collaboration with S. H. Butcher in a prose translation (1879) of the Odyssey, and with E. Myers and Walter Leaf in a prose version of the *Iliad* (1883). Of his separate books on classical subjects the best is *The World of Homer* (1910).

Lang's other main preoccupation was with myth and folklore. He made solid contributions to the subject in his *Custom and Myth* (1884); *Myth, Literature and Religion* (2 vols., 1887; rev. ed., 1899); *The Making of Religion* (1898). Many academic honours were conferred on him. His biographer (G. S. Gordon) in the *Dictionary of National Biography* calls him the "greatest bookman of his age." He died at Bunchory, Aberdeenshire, on July 20, 1912.

LANG, COSMO GORDON (1864–), Anglican divine, was born in Aberdeen on Oct. 31, 1864, the son of John Marshall Lang, sometime moderator of the Church of Scotland. Educated at Glasgow university and Balliol college, Oxford, he graduated in 1886 and two years later was elected a fellow of All Souls. In 1890 he was ordained and was appointed curate of the parish church of Leeds. From 1893 to 1896 he was fellow and dean of divinity of Magdalen college, Oxford, and from 1894–96 vicar of the university church of St. Mary's. In 1896 he became vicar of Portsea, and in 1901 suffragan bishop of Stepney, London, and canon of St. Paul's cathedral. In 1908 he was appointed archbishop of York. His eloquence and clear common sense made him an influential member of the House of Lords, and in 1909 he was appointed a member of the royal commission on divorce. He took a leading part in the support of the Prayer Book measure in Parliament in 1928. On Nov. 12, 1928, he succeeded Dr. Davidson as archbishop of Canterbury, at a critical point in the Church's history, the revised Prayer Book having been twice rejected by Parliament. The great feature of his career has been his social work in industrial centres, Portsea, the East End, and the manufacturing towns of the north.

His published works include *The Miracles of Jesus as Marks of the Way of Life* (1901); *Thoughts on some of the Parables of Jesus* (1906); *The Opportunity of the Church of England* (1905); *Prayer Book Revision* (Speeches by the archbishops of Canterbury and of York, 1927).

LANG, KARL HEINRICH, RITTER VON (1764–1835), German historian, was born on June 7, 1764, at Balgheim, near Nördlingen. At intervals from 1793 to 1801 Lang was closely connected with the Prussian statesman Hardenberg, who employed him as his private secretary and archivist, and in 1797 he was present with Hardenberg at the congress of Rastadt as secretary to the legation. He was occupied chiefly with affairs of the principalities of Anspach and Bayreuth, newly acquired by Prussia, and especially in the settlement of disputes with Bavaria as to their boundaries. He was archivist at Munich from 1810 to 1817, and devoted himself to the study of Bavarian history. He died on March 26, 1835.

Lang is best known through his *Memoiren* (Brunswick, 2 vols. 1842) which must, however, be read with caution on account of their satirical tone.

LANGDELL, CHRISTOPHER COLUMBUS (1826–1906), American jurist, was born in New Boston, N.H., May 22, 1826. He studied at Phillips Exeter academy in 1845–48, at Harvard college in 1848–50 and in the Harvard law school in 1851–54. He practised law in 1854–70 in New York city, but he was almost unknown when, in Jan. 1870, he was appointed Dane professor of law, and soon afterwards dean of the law faculty of Harvard university. He resigned the deanship in 1895, in 1900 became Dane professor emeritus, and on July 6, 1906, died in Cambridge. He received the degree of LL.D. in 1875; in 1903 a chair in the law school was named in his honour; and after his death one of the school buildings was named Langdell Hall. He remodelled the administration of the Harvard law school and introduced the "case" system of instruction.

Langdell wrote *Selection of Cases on the Law of Contracts* (1870, the first book used in the "case" system; enlarged, 1877); *Cases on Sales* (1872); *Summary of Equity Pleading* (1877, 2nd ed., 1883); *Cases in Equity Pleading* (1883); and *Brief Survey of Equity Jurisdiction* (1905).

LANGDON, JOHN (1741–1819), American statesman, was born in Portsmouth, N.H., on June 25, 1741. After an apprenticeship in a counting-house, he led a sea-faring life for several years, and became a shipowner and merchant. In Dec. 1774 as a militia captain he assisted in the capture of Ft. William and Mary at New Castle, N.H., one of the first overt acts of the American colonists against the property of the Crown. He was elected to the last royal assembly of New Hampshire and then to the second Continental Congress in 1775, but he resigned and in June, 1776, became Congress's agent of prizes in New Hampshire, and in 1778 continental (naval) agent of Congress in this State, where he supervised the building of John Paul Jones's "Ranger," and other vessels. He was a judge of the New Hampshire court of common pleas in 1776–77, a member (and speaker) of the New Hampshire house of representatives from 1776 until 1782, a member of the State Constitutional Convention of 1778 and of the State senate in 1784–85, and in 1783–84 was again a member of Congress. He contributed largely to raise troops in 1777 to meet Burgoyne; and he served as a captain at Bennington and at Saratoga. He was president of New Hampshire in 1785–86 and in 1788–89; a member of the Federal Constitutional Convention in 1787; a member of the State convention which ratified the Federal Constitution for New Hampshire; a member of the U.S. Senate in 1789–1801, and its president *pro-tem.* during the first Congress and the second session of the second Congress; a member of the New Hampshire house of representatives in 1801–05 and its speaker in 1803–05; and governor of the State in 1805–09 and in 1810–12. He refused the naval portfolio in Jefferson's cabinet, and received nine electoral votes for the vice-presidency in 1808. He died in Portsmouth on Sept. 18, 1819.

Alfred Langdon Elwyn has edited *Letters by Washington, Adams, Jefferson and Others, Written During and After the Revolution, to John Langdon of New Hampshire* (Philadelphia, 1880).

LANGE, FRIEDRICH ALBERT (1828–1875), German philosopher and sociologist, was born on Sept. 28, 1828, at Wald, near Solingen, the son of the theologian, J. P. Lange. He was educated at Duisburg, Zürich and Bonn, where he distinguished himself by gymnastics as much as by study. He taught in various places for some time, but gave up teaching when schoolmasters were forbidden political activity. He wrote: *Die Leibesübungen* (1863), *Die Arbeiterfrage* (1865, 5th ed. 1894), *Geschichte des Materialismus und Kritik seiner Bedeutung in der Gegenwart* (1866; 7th ed. with biographical sketch by H. Cohen, 1902; Eng. trans., E. C. Thomas, 1877), and *J. S. Mill's Ansichten über die sociale Frage* (1866). In 1866, discouraged by affairs in Germany, he moved to Winterthur, near Zürich, to write for the democratic newspaper, *Winterthurer Landbote*. In 1869 he was *Privatdozent* at Zürich, and next year professor. The strong French sympathies of the Swiss in the Franco-German War led to his resignation. In 1872 he became professor at Marburg, where he died on Nov. 23, 1875. His *Logische Studien* was published by H. Cohen in 1877 (2nd ed., 1894).

See O. A. Ellissen, *F. A. Lange* (Leipzig, 1891); and in *Monatsch. d. Comeniusgesell.* iii., 1894, 210 ff.; H. Cohen in *Preuss. Jahrb.* xxvii., 1876, 353 ff.; Vaihinger, *Hartmann, Dühring und Lange* (Iserlohn, 1876); J. M. Bösch, *F. A. Lange und sein Standpunkt d. Ideals* (Frauenfeld, 1890); H. Braun, *F. A. Lange, als Socialökonom* (Halle, 1881).

LANGEAIS, a town of west-central France in the department of Indre-et-Loire, on the right bank of the Loire, 16 m. W.S.W. of Tours by rail. Pop. (1926) 1,847. Langeais has a church of the 11th, 12th and 15th centuries but is chiefly interesting for the possession of a large château built soon after the middle of the 15th century by Jean Bourré, minister of Louis XI. In the park are the ruins of a keep of late 10th century architecture, built by Fulk Nerra, count of Anjou. It has a small trade in bricks and tiles and potted meat.

LANGENSALZA, a town in the Prussian province of Saxony, on the Salza, about 20 m. N.W. from Erfurt. Pop. (1925) 11,969. Langensalza became a town in 1211 and was afterwards

part of the electorate of Saxony. In 1815 it came into the possession of Prussia. Near it are the remains of the old Benedictine monastery of Homburg or Hohenburg, where the emperor Henry IV. defeated the Saxons in 1075. The manufacture of cloth is the chief industry; lace, machines, cigars and leather are also produced, while spinning, dyeing, brewing and printing are carried on. There is a sulphur bath in the neighbourhood.

LANGENTHAL (1,558 ft.), a town in the canton of Berne, Switzerland. The place has a population of 6,280, mainly German-speaking Protestants, who engage in agriculture and a few industries such as weaving, dyeing and machine making. It is on the railway Berne-Zürich, with branches to Huttwil, Oensingen and Melchnau.

LANGHAM, SIMON (d. 1376), archbishop of Canterbury and cardinal, was born at Langham in Rutland, becoming a monk in the abbey of St. Peter at Westminster, and later prior and then abbot of this house. He was treasurer of England (1360), bishop of Ely (1361), chancellor of England (1363) and archbishop of Canterbury (1366). He drove the secular clergy from their college of Canterbury Hall, Oxford, and filled their places with monks. The expelled head of the seculars was a certain John de Wiclif, who has been identified with the reformer Wycliffe. Langham was made a cardinal by Pope Urban V. in 1368. Two months later he was compelled to resign his archbishopric and went to Avignon. He was made cardinal-bishop of Praeneste in 1373. In 1374 he was elected archbishop of Canterbury for the second time; but he withdrew his claim and died at Avignon on July 22, 1376. Langham's tomb is the oldest monument to an ecclesiastic in Westminster Abbey; he left the residue of his estate—a large sum of money—to the abbey, and has been called its second founder

LANGHOLM, burgh and parish, Dumfriesshire, Scotland, on the Esk, 16 m. N.E. of Annan, and is the terminus of a branch line connecting with the L.N.E.R. system at Riddings Junction. Pop. (1921) 2,653. Its prosperity depends on the numerous woollen mills. Distilling, dyeing and tanning are also carried on, and sales of cattle and sheep held. The Esk and Liddell are favourite fishing streams.

LANGHORNE, JOHN (1735–1779), English poet and translator of Plutarch, was born at Kirkby Stephen, Westmorland. He was appointed (1766) to the rectory of Blagdon, Somerset, where he died on April 1, 1779. His poems (original and translations), and sentimental tales are now forgotten, but his translation of Plutarch's *Lives* (1770), in which he had the co-operation of his elder brother William (1721–1772), is not yet superseded. His poems were published in 1804 by his son, J. T. Langhorne, with a memoir of the author.

LANGIEWICZ, MARYAN (1827–1887), Polish patriot, was born at Krotoszyn, in the province of Posen, on Aug. 5, 1827, his father being the local doctor. Langiewicz was educated at Posen, Breslau and Prague, and was compelled to earn his daily bread by giving lectures. He subsequently entered the Prussian *Landwehr* and served for a year in the royal guard. In 1860 he migrated to Paris and was for a time professor in the high school founded there by Mieroslawski. The same year he took part in Garibaldi's Neapolitan campaign, and was then a professor in the military school at Cuneo till the establishment was closed. In 1862 he entered into communication with the central Polish committee at Warsaw, and on the outbreak of the insurrection of Jan. 22, 1863, took the command of the armed bands and inflicted several defeats on the Russians, which encouraged him to proclaim himself dictator (March 10). On March 18, however, his army was almost annihilated at Zagosc, whereupon he took refuge in Austrian territory and was interned at Tarnow, and afterwards at the fortress of Josephstadt, from which he was released in 1865. He then lived at Solothurn as a citizen of the Swiss Republic, and subsequently entered the Turkish service as Langie Bey. He died at Constantinople on May 11, 1887.

See Boleslaw Limanowski, *The National Insurrection of 1863–64* (Pol.) (Lemberg, 1900); Paolo Mazzoleni, *I Bergamaschi in Polonia nel 1863* (Bergamo, 1893).

LANGLAND, WILLIAM (*c.* 1332–*c.* 1400), the supposed English poet, generally regarded as the single author of the 14th-century poem *Piers the Plowman.* Its full title is—*The Vision of William concerning Piers the Plowman, together with Vita de Do-wel, Do-bet, et Do-best, secundum Wit et Resoun;* usually given in Latin as *Visio Willelmi de Petro Plowman, etc.;* the whole work being sometimes briefly described as *Liber de Petro Plowman.* We know nothing of William Langland except from the supposed evidence of the mss. of the poem and the text itself.

The Vision of Piers Plowman.—The poem exists in three forms. If we denote these by the names of A-text (or Vernon), B-text (or Crowley), and C-text (or Whitaker), we find, of the first, ten mss, of the second, fourteen, and of the third, seventeen, besides seven others of a mixed type. A complete edition of all three texts was printed for the Early English Text Society as edited by W. W. Skeat, with the addition of *Richard the Redeless,* and containing full notes to all three texts, with a glossary and indexes, in 1867–85. The Clarendon Press edition, by the same editor, appeared in 1886.

The A-text dating from about 1362 contains a prologue and 12 passus or cantos (i.–iv., the vision of the Lady Meed; v.–viii., the vision of Piers the Plowman; ix.–xii., the vision of Do-wel, Do-bet and Do-best), with 2,567 lines. The B-text (*c.* 1377) is much longer, containing 7,242 lines, with additional passus following after xi. of A, the earlier passus being altered in various respects. The C-text (*c.* 1395–98) with 7,357 lines, is a revision of B.

The general contents of the poem may be gathered from a brief description of the C-text. This is divided into twenty-three passus, nominally comprising four parts, called respectively Visio de Petro Plowman, Visio de Do-wel, Visio de Do-bet and Visio de Do-best. Here *Do-bet* signifies "do better" in modern English; the explanation of the names being that he who does a kind action *does well,* he who teaches others to act kindly *does better,* whilst he who combines both practice and theory, both doing good himself and teaching others to do the same, *does best.* But the visions by no means closely correspond to these descriptions; and Skeat divides the whole into a set of eleven visions, which may be thus enumerated: (1) Vision of the Field Full of Folk, of Holy Church, and of the Lady Meed (passus i.–v.); (2) Vision of the Seven Deadly Sins, and of Piers the Plowman (pass. vi.–x); (3) Wit, Study, Clergy and Scripture (pass. xi., xii.); (4) Fortune, Nature, Recklessness and Reason (pass. xiii., xiv.); (5) Vision of Imaginative (pass. xv.); (6) Conscience, Patience and Activa-Vita (pass. xvi., xvii.); (7) Free-will and the Tree of Charity (pass. xviii., xix.); (8) Faith, Hope and Charity (pass. xx.); (9) The Triumph of Piers the Plowman, *i.e.,* the Crucifixion, Burial and Resurrection of Jesus Christ (pass. xxi.); (10) The Vision of Grace (pass. xxii.); (11) The Vision of Antichrist (pass. xxiii.).

The *vision* is formless and full of digressions. It shows no French influence in its verse which is based on alliterative stresses and is unrhymed, on the other hand the use of allegory as a vehicle of satire reminds one of the *Roman de la Rose.* The book is a document of primary importance for the social history of the time. The author describes the hard condition of the poor, inveighs against clerical abuses and the rapacity of the friars; tells of the miseries caused by the great pestilences then prevalent and by the hasty and ill-advised marriages consequent thereupon; and denounces lazy workmen and sham beggars, the corruption and bribery in the law courts, and the numerous forms of falsehood which are at all times the fit subjects for satire and indignant exposure. In describing the seven deadly sins, Glutton and Sloth are portraits rather than abstractions and great power of descriptions is shown throughout the work. The numerous allegorical personages introduced, such as Scripture, Clergy, Conscience, Patience and the like, are generally mouthpieces of the author himself though they sometimes speak purely "in character."

Skeat's View of Langland.—The traditional view, accepted by Skeat and Jusserand, that a single author—and that author Langland—was responsible for the whole poem, in all its versions, has been disputed. Skeat's statement may be summarized as follows. The author's name was William (and probably Langland), and he was born about 1332, perhaps at Cleobury Mortimer in Shropshire. His father, who was doubtless a franklin or farmer, and his other friends put him to school, made a "clerk" or scholar

of him, and taught him what Holy Writ meant. In 1362, at the age of about thirty, he found himself wandering upon the Malvern hills, and fell asleep beside a stream, and saw in a vision a field full of folk, *i.e.*, this present world, and many other remarkable sights which he duly records. From this supposed circumstance he named his poem *The Vision of William*, though it is really a succession of visions, since he mentions several occasions on which he awoke, and afterwards again fell asleep; and he even tells us of some adventures which befell him in his waking moments. In some of these visions there is no mention of Piers the Plowman, but in others he describes him as being the coming reformer who was to remedy all abuses, and restore the world to a right condition. His conception of this reformer changes from time to time, and becomes more exalted as the poem advances. At first he is a ploughman, one of the true and honest labourers who are the salt of the earth; but at last he is identified with the great reformer who has come already, the regenerator of the world in the person of Jesus Christ; in the author's own phrase—"Petrus est Christus." If this be borne in mind, it will not be possible to make the mistake into which so many have fallen, of speaking of Piers the Plowman as being the author, not the subject, of the poem.

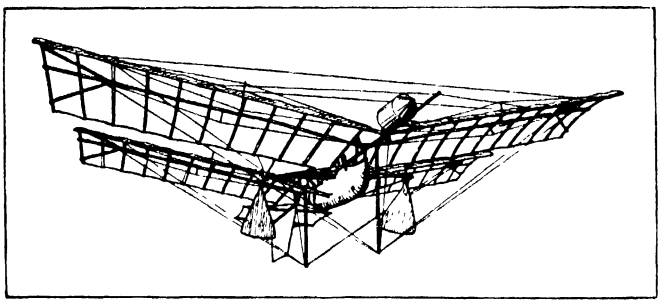
The author once alludes to the nickname of Long Will bestowed upon him from his tallness of stature—just as the poet Gascoigne was familiarly called Long George. Though there is mention of the Malvern hills more than once near the beginning of the poem, the poet lived for "many years in Cornhill (London), with his wife Kitte and his daughter Calote." He seems to have come to London soon after the date of the first commencement of his work, and to have long continued there. He describes himself as being a tall man, one who was loath to reverence lords or ladies or persons in gay apparel, and not deigning to say "God save you" to the sergeants whom he met in the street, insomuch that many people took him to be a fool. He was very poor, wore long robes, and had a shaven crown, having received the clerical tonsure. But he seems only to have taken minor orders, and earned a precarious living by singing the *placebo, dirige* and seven psalms for the good of men's souls. The fact that he was married may explain why he never rose in the church. But he had another source of livelihood in his ability to write out legal documents, and he was extremely familiar with the law courts at Westminster. His leisure time must have been entirely occupied with his poem, which was the work of a lifetime. He was not satisfied with re-writing it once, but he actually re-wrote it twice, and from the abundance of the MSS. which still exist we can see its development from the earliest draught (A-text), written about 1362, to its latest form (C-text), written about 1393[1].

In 1399, just before the deposition of Richard II., appeared a poem addressed to the king, who is designated as "Richard the Redeless," *i.e.*, devoid of counsel. This poem, occurring in only one MS. [of the B-text] in which it is incomplete, breaking off abruptly in the middle of a page, may safely be attributed to Langland, who was then in Bristol. As he was at that time about sixty-seven years of age, we may be sure that he did not long survive the accession of Henry IV. It may here be observed that the well-known poem entitled *Pierce Ploughman's Crede*, though excellently written, is certainly an imitation by another hand; for the Pierce Ploughman of the *Crede* is very different in conception from the subject of "William's Vision."

Professor Manly's View.—On the other hand, the view taken by Professor J. M. Manly, which has obtained increasing acceptance among scholars, is that the early popularity of the *Piers Plowman* poems has resulted in "the confusion of what is really the work of five different men," and that Langland himself is "a mythical author." The argument for the distinction in authorship rests on internal evidence, and on analysis of the style, diction and "visualizing" quality within the different texts. Whereas Skeat, regarding the three texts as due to the same author, gives most attention to the later versions, and considers B the intermediate form, as on the whole the best, Manly recognizes in A the real poet, and lays special stress on the importance of attention to the A-text, and particularly pass. i.–viii. In this A-text the two first visions are regarded as by a single author of genius, but the third is assigned to a continuator who tried to imitate him, the whole conclusion of the 12th passus being, moreover, by a third author, whose name, John But, is in fact given towards the end, but in a way leading Skeat only to credit him with a few lines. The same process of analysis leads to crediting the B-text and the C-text to separate and different authors, B working over the three visions of the A-text and making additions of his own, while C again worked over the B-text. The supposed references to the original author A, introduced by B and C, are then to be taken as part of the fiction. Who were the five authors? That question is left unsolved. John But, according to Professor Manly, was "doubtless a scribe" or "a minstrel." B, C and the continuator of A "seem to have been clerics, and, from their criticisms of monks and friars, to have been of the secular clergy," C being "a better scholar than either the continuator of A or B." A, who "exempts from his satire no order of society except monks," may have been himself a monk, but "as he exhibits no special technical knowledge or interests" he "may have been a layman." As regards Richard the Redeless, Professor Manly attributes this to another imitator; he regards identity of authorship as out of the question, in consequence of differences in style and thought, apart from the conclusion as to the authorship of *Piers the Plowman*.

[1] According to Jusserand, 1398.

See the editions already referred to: *The Deposition of Richard II.*, ed. T. Wright (Camden Society), which is the same poem as *Richard the Redeless;* Warton, *Hist. of Eng. Poetry;* Rev. H. H. Milman, *Hist. of Latin Christianity;* G. P. Marsh, *Lectures on English;* H. Morley, *English Writers;* B. ten Brink, *Early English Literature;* J. J. Jusserand, *Observations sur la vision de P. P.* (Paris, 1879); *Les Anglais au moyen âge: L'Épopée mystique de William Langland* (1893, Eng. trans. *Piers Plowman*, revised and enlarged by another 1894); J. M. Manly in *Cambridge Hist. of English Lit.*, vol. ii. and bibliography. A long and careful summary of the whole poem is given in Morley's *English Writers*, and is repeated in his *Illustrations of English Religion*, ch. iii.



LANGLEY, SAMUEL PIERPONT (1834–1906), American physicist and astronomer who first demonstrated the practicability of mechanical flight (May 6, 1896), was born at Roxbury, Mass., Aug. 22, 1834. He was educated in the Boston Latin School and in Europe. After a few years of practising architecture and civil engineering and holding assistant professorships in Harvard College Observatory and the U S. Naval Academy, he became director of the Allegheny Observatory and professor of physics and astronomy in what was then known as the Western university of Pennsylvania (1867). He held this position until his election in 1887 as secretary of the Smithsonian Institution at Washington.

Langley's name became especially associated with two main branches of investigation—aeronautics and the exploration of the infra-red portions of the solar spectrum. When he took up the study of the distribution of energy in the solar spectrum he found the most delicate existing instrument, the thermopile, far too sluggish for his needs and invented the bolometer, which depends on the fact that the electrical conductivity of a metallic conductor is decreased by heat. This instrument has no superior to-day. In its most refined form it is believed to be capable of detecting a change of temperature amounting to less than one-hundred-millionth of a degree. By its aid Prof. Langley pushed his investigations of the solar spectrum into previously unexplored regions in the infra-red radiations, discovering unsuspected extensions of the invisible infra-red rays which he called the "new spectrum."

He began his work in aeronautics by a preliminary inquiry into the principles upon which flight depends, as he doubted the soundness of the prevailing theories as to how birds fly. After he had satisfied himself, by experiment with a huge "whirling table," that "it was possible to construct machines that would give such velocity to inclined surfaces that bodies definitely heavier than air could be sustained upon it and moved through it with great velocity," and after studying the irregularities of the winds, he began the construction of several model flying-machines.

He succeeded (May 6, 1896) in launching his "aerodrome," weighing 26 lb. and about 16 ft in length, with wings measuring between 12 and 13 ft. from tip to tip It twice sustained itself in

the air for about 1½ minutes (the full time for which it was supplied with fuel and water) and traversed on each occasion a distance of over half a mile, falling gently into the water of the Potomac over which it had been launched, when the engines stopped. Later in the same year (Nov. 28) a similar aerodrome flew about three-quarters of a mile, attaining a speed of 30 m. an hour. Never in the history of the world, previous to these attempts, had any such mechanism, however actuated, sustained itself in the air for more than a few seconds. He thus paved the way for others who have achieved success with man-carrying machines.

BY COURTESY OF THE SMITHSONIAN INSTITUTION

LANGLEY'S STEAM-DRIVEN "AERODROME," WHICH IN 1896 FLEW HALF A MILE ABOVE THE POTOMAC RIVER, THE LONGEST FLIGHT THEN RECORDED

Although Langley announced soon after these experiments that he had brought to a close the portion of the work which seemed to be especially his, "the demonstration of the practicability of mechanical flight," he experimented, in 1903, with the aerodrome capable of carrying a man. This attempt was accompanied by repeated failures and a chorus of ridicule and attack from an unsympathetic press, so that the further Government financial support which was necessary was not given. This was a severe blow to Langley, then 70 years old, but he never wavered in his confidence that ultimately success would be certain to result from his work, and it is true that the principles which he discovered have gained steadily in importance. Years later a test of his man-carrying machine made at the Curtiss shops demonstrated its inherent stability and remarkable ease of control.

Langley died on Feb. 27, 1906. His published works, covering a wide range of topics, include nearly 200 titles.

A complete bibliography of his work may be found in the *Biog. Memoirs of the Nat. Acad. of Sciences,* vol. vii. *See* this source for complete biography. Also *Aircraft,* vol. vii., pp. 5–6 (New York, 1916); *Proceedings of the Royal Society of Edinburgh,* vol. 26, pp. 546–549 (1907); C. P. Adler in *Bulletin of the Philosophical Society of Washington,* vol. 15, pp. 1–26; Henry Feffman "A Tribute to Samuel P. Langley," *Annual Report of the Smithsonian Institution, 1917–18,* pp. 157–167.

LANGLOIS, HIPPOLYTE (1839–1912), French general, was born at Besançon in 1839, and, after passing through the École Polytechnique, was appointed to the artillery as sub-lieutenant in 1858, attaining the rank of captain in 1866. He served in the army of Metz in the war of 1870. In 1888 he became professor of artillery at the École de Guerre, and he there worked out the tactical principles of the employment of field artillery under the new conditions of armament. His great treatise *L'Artillerie de campagne* (1891–1892) is an artillery classic.

In 1907 Langlois began the publication of a monthly journal of military art and history, the *Revue militaire générale.* The most important of his other works are *Enseignements de deux guerres récentes* and *Conséquences tactiques du progrès de l'armement.* He died in Feb. 1912, in Paris.

LANGMUIR, IRVING (1881–), American chemist, was born in Brooklyn, N.Y., on Jan. 31, 1881. He studied at the Columbia school of mines, (M.E., 1903) and at the University of Goettingen (Ph.D., 1906). He taught chemistry at Stevens Institute, Hoboken, N.J. (1906–09). From that date he was engaged in physico-chemical research for the General Electric Company, Schenectady, New York. He invented the gas-filled tungsten lamp and the condensation pump for producing high vacua; his researches in the field of electric discharges are largely responsible for the modern vacuum tube used in radio. In 1911 he discovered the atomic form of elementary hydrogen, and subsequently developed a process for welding metals by flames of atomic hydrogen. In recognition of his achievements in chemistry and physics he has been awarded many scientific distinctions, among them the Hughes, Nichols, Faraday, Rumford and Perkin medals and the Cannizaro prize.

See B. Harrow, *The Romance of the Atom* (1927).

LANGNAU (2,244 ft.), a town in the canton of Berne, Switzerland, in the middle of the Emmenthal and at the junction of the railways Berne-Luzern (Lucerne) and Burgdorf-Langnau. The place has 8,667 inhabitants, mostly German-speaking Protestants, and engaged chiefly in cattle breeding and cheese making.

LANGO. The Lango (sometimes incorrectly called Miro and Bakedi) are a Nilotic tribe of Uganda, combining agriculture with animal husbandry. A well-built, tall, upstanding race, they live in the marshy and lowland country north and east of Lakes Kwanya and Kioga, arriving there after a series of migrations from the north-east dating from the 17th century. They remove the lower middle incisors and in their primitive conditions are unclothed, the women only wearing small aprons of metalwork or fibre suspended from a belt. Both sexes, however, are inordinately fond of bead and wire ornaments, and cicatrise their bodies with fantastic and often charming designs.

They live in compact villages varying from ten to 150 huts, the village representing an aggregate of families which have united for mutual support. Their dome-like huts exhibit the flounced thatching typical of the Nilotics, and the diminutive bachelors' huts raised from the ground on piles are a distinctive feature of the culture. In each village there is a communal girls' hut supervised by an aged duenna.

They cultivate a large variety of millets both for food and for making the beer, which is their staple drink, and numerous vegetables are also grown in the vicinity of the village. Men and women share the agricultural duties, but men have the sole custody and management of the cattle, while women concern themselves with the domestic duties of the village. Men manufacture pots, but women make baskets and mats. Their weapons are spears and light hide shields of a rectangular pattern.

The tribe is divided into a number of exogamous clans with totemic or pseudo-totemic characteristics, inheritance and descent being through the male. Polygyny is practised. Society is also classified by a system of age-grades, which has been borrowed from their Nilo-Hamitic neighbours, probably before their final migrations. These grades have their special functions which are chiefly religious and are concerned with the magical processes of rainmaking. They are governed by hereditary clan leaders, who have gradually acquired a territorial status and might be called petty chiefs, with powers and duties in regard to all who dwell in their vicinity irrespective of clan allegiance. Above these are the chiefs, who control from three to six clan chiefs, winning their position by personal merit, generosity and ability. Their title (*rwot*), however, is not hereditary, and their tenure of office is precarious and depends largely on their success in war and on the conduct of their civil responsibilities.

The Lango are skilful hunters, and though all land is held communally by the tribe, or in a few cases by the clan, the whole country is divided into a number of hunting areas, in which the rights of hunting are vested in an individual and pass to his heir on his death.

They believe that every human being (and a few animals) has a guardian spirit called *winyo* or "bird" which attends him during life and has to be liberated from the corpse by certain rites. There is also the shadow-self or immaterial soul called *tipo,* which after death may be renamed *chyen* and is eventually merged into a vague entity named *jok,* found in one form or another in all the Nilotics. *Jok* and the ancestors, of whom *jok* is thus the universal sublimation, are worshipped at shrines and sacred trees by prayer and sacrifice, and *jok* manifests himself in a diversity of forms, to each of which a specific name is given as to a divinity, some of them being anthropomorphic in conception, and all having special

functions and individual spheres of activity appropriate to the different needs of humanity.

See J. H. Driberg, *The Lango* (1923). (J. H. D.)

LANGPORT, a market town in Somersetshire, England, 13½ m. E. of Taunton by the G.W. railway. Pop. (1921) 781. Langport owed its origin to its defensible position on a hill, and its growth to its facilities for trade on the chief river of Somerset. It occupies the site of the British town of Llongborth, and was important during the Roman occupation. It was a royal borough in Saxon times, and in 1086 had 34 resident burgesses. The first charter (1562) recognized that Langport was a borough of great antiquity, which had enjoyed considerable privileges, being governed by a portreve. It was incorporated by James I. in 1617, but the corporation was abolished in 1883. Langport was represented in parliament in 1304 and 1306. The charter of 1562 granted three annual fairs to Langport, on June 28, Nov. 11 and the second Monday in Lent. One fair only is now held, on Sept. 3, which is a horse and cattle fair. A Saturday market was held under the grant of 1562, but in the 19th century the market day was changed to Tuesday. It lies on the bank of the river Parret, where it enters the plain through which it flows to the Bristol channel. The church of All Saints is Perpendicular. Close to this an archway crosses the road, bearing a Perpendicular building known as the hanging chapel. After serving this purpose it housed first the grammar-school (founded 1675), then the Quekett museum, named after John Thomas Quekett (1815–1861) the histologist, a native of the town, whose father was master of the school. The hanging chapel afterwards became a masonic hall. Not far distant is the church of Huish Episcopi, with one of the finest of the Somersetshire Perpendicular towers. Langport has a considerable general and agricultural trade.

LANGREO, a town of northern Spain, in the province of Oviedo, in very hilly country, on the left bank of the river Nalon, and on a branch railway from Oviedo to Laviana. Pop. (1920) 34,033. In the neighbourhood large quantities of wheat, hemp, fruit and cider are produced; and there are important coal and iron mines, foundries and factories for the manufacture of cloth.

LANGRES, a town of eastern France, capital of an arrondissement in the department of Haute-Marne, 22 m. S.S.E. of Chaumont on the eastern railway to Belfort. Pop. (1926) 5,860. Langres stands at a height of some 1,550 ft. on a promontory of the plateau de Langres, overlooking the valleys of the Marne and its tributary the Bonnelle, with fine views from its cathedral tower and ramparts. The cathedral of St. Mammès, for the most part 12th century Transitional, has a Graeco-Roman west front (18th cent.) and a fine Renaissance chapel. The church of St. Martin (13th, 16th and 18th centuries) possesses a figure of Christ of the 16th century, one of the finest wood carvings known. The ramparts are protected by several towers, mostly 16th century. The Gallo-Roman gate, one of four entrances in the Roman period, is preserved, but is walled up. The town possesses a museum of Gallo-Roman antiquities, and an important library. Langres is the seat of a bishop under the archbishop of Lyons and a sub-prefect, and has tribunals of first instance and of commerce. It manufactures well-known cutlery and grind-stones.

Langres, the ancient *Andematunum,* was capital of the *Lingones.* Under Roman rule it was at first to some extent autonomous, but was reduced to the rank of colony after the revolt of the chief Sabinus in A.D. 71.

LANGTOFT, PETER (d. *c.* 1307), English chronicler, took his name from the village of Langtoft in Yorkshire, and was a canon of the Augustinian priory in Bridlington. His name is also given as Langetoft and Langetost. He wrote in French verse a *Chronicle* dealing with the history of England from the earliest times to the death of Edward I. in 1307. The earlier part of the *Chronicle* is taken from Geoffrey of Monmouth and other writers; for the period dealing with the reign of Edward I. Langtoft is a valuable authority. The latter part of the *Chronicle* was translated into English by Robert Mannyng, sometimes called Robert of Brunne, about 1330. It has been edited for the Rolls Series by T. Wright (1866–68).

See Wright's preface, and also O. Preussner, *Robert Mannyng of Brunne's Übersetzung von Pierre de Langtofts Chronicle und ihr Verhältniss zum Originale* (Breslau, 1891).

LANGTON, JOHN (d. 1337), chancellor of England and bishop of Chichester, was a clerk in the royal chancery, and became chancellor in 1292. Owing to the resistance of Pope Boniface VIII. he failed to secure the bishopric of Ely in 1298, although he was supported by Edward I. and visited Rome to attain his end. Resigning his office as chancellor in 1302, he was chosen bishop of Chichester in 1305, and again became chancellor shortly after the accession of Edward II. in 1307. Langton was one of the "ordainers" elected in 1310, and lost the office of chancellor about this time. He mediated between the king and Earl Thomas of Lancaster in 1318, and attempted to do so between Edward and his rebellious barons in 1321. He died in June or July 1337. Langton built the chapterhouse at Chichester, and was a benefactor of the University of Oxford.

LANGTON, STEPHEN (d. 1228), English cardinal and archbishop of Canterbury, the first great Englishman in the primacy since Dunstan, was the son of Henry, lord of the manor of Langton-by-Wragby, Lincolnshire, but the date of his birth is unknown. He became early in his career a prebendary of York, and his brother Simon (d. 1248) was elected to that see in 1215. Stephen, however, migrated to Paris, and having graduated in that university became one of its most celebrated theologians. He spent some 25 years in Paris. This was probably the time when he composed his voluminous commentaries (many of which still exist in manuscript). He divided the Old Testament books of the Vulgate into chapters, and was probably responsible for the grouping of the historical apocryphal books. To this period belong his *Questiones,* dealing with subjects of current debate, such as the limits of obedience to episcopal authority and the papal power of dispensation. At Paris also he contracted the friendship with Lothar of Segni, the future Innocent III., which played so important a part in shaping his career. Upon becoming pope, Innocent summoned Langton to Rome, and in 1206 designated him as cardinal-priest of S. Chrysogonus. Immediately afterwards Langton was drawn into the vortex of English politics.

Pope Innocent III. and King John.—Archbishop Hubert Walter had died in 1205. The suffragans of Canterbury claimed a share in choosing the new primate, although that right had been exclusively reserved to the monks of Canterbury by a papal privilege; and John supported the bishops since they were prepared to give their votes for his candidate, John de Gray, bishop of Norwich. A party of the younger monks, to evade the double pressure of the king and bishops, secretly elected their sub-prior Reginald and sent him to Rome for confirmation. The rest of the monks were induced to elect John de Gray, and he too was despatched to Rome. After hearing the case Innocent declared both elections void; and with John's consent ordered that a new election should be made in his presence by the representatives of the monks. The latter, having confessed that they had given John a secret pledge to elect none but the bishop of Norwich, were released from the promise by Innocent; and at his suggestion elected Stephen Langton, who was consecrated by the pope June 17, 1207.

On hearing the news the king banished the monks of Canterbury and lodged a protest with the pope, in which he threatened to prevent any English appeals from being brought to Rome. Innocent replied by laying England under an interdict (March 1208), and excommunicating the king (November 1209). As John still remained obstinate, the pope at length invited the French king Philip Augustus to enter England and depose him. It was this threat which forced John to sue for a reconciliation; and the first condition exacted was that he should acknowledge Langton as archbishop. During these years Langton had been residing at Pontigny, formerly the refuge of Becket. He had addressed to the English people a dignified protest against the king's conduct, but he had consistently adopted towards John as conciliatory an attitude as his duty to the church would allow, and had more than once entered upon negotiations for a peaceful compromise. Immediately after entering England (July 1213) he showed his desire for peace by absolving the king.

The Archbishop.—Langton was associated with the baronial opposition. He encouraged the barons to formulate their demands, and is said to have suggested that they should take their stand upon the charter of Henry I. It is uncertain what further share he took in drafting Magna Carta. At Runnymede he appeared as a commissioner on the king's side, and his influence must therefore be sought in those clauses of the Charter which differ from the original petitions of the barons. Of these the most striking is that which confirms the "liberties" of the church; and this is chiefly remarkable for its moderation.

Soon after the issue of the charter the archbishop left England to attend the Fourth Lateran Council. At the moment of his departure he was suspended by the representatives of Innocent for not enforcing the papal censures against the barons. Innocent confirmed the sentence, which remained in force for two years. During this time the archbishop resided at Rome. He was allowed to return in 1218, after the deaths of Innocent and John. From that date till his death he was a tower of strength to the royal party. Through his influence Pandulf was recalled to Rome (1221) and Honorius III. promised that no legate should be sent to reside in England during the archbishop's lifetime. In 1222, in a synod held at Oseney, he promulgated a set of Constitutions still recognized as forming a part of the law of the English Church. He may be said to have accomplished the transition from the feudal church of Lanfranc to the national church of later days. He died on July 9, 1228, and was buried in Canterbury Cathedral, where his tomb, unless tradition errs, may still be seen.

Dr. Gore, speaking at Canterbury at the seventh centenary celebrations in 1928 justly defined Langton's position as "mediate between excessive nationalism and excessive papalism, leaving both parties unsatisfied, but always the just moderator and harmonizer."

The authorities are mainly those for the reign of John. No contemporary biography has come down to us. Some letters, by Langton and others, relating to the quarrel over his election are preserved in a Canterbury Chronicle (ed. W. Stubbs in the "Rolls" edition of *Gervase of Canterbury*, vol. ii.). There are many references to him in the correspondence of Innocent III. (Migne's *Patrologia Latina*, vols. ccxiv.–ccxvii.). Of modern works *see* F. Hurter, *Geschichte Papst Innocenz III.* (Hamburg, 1841–44); W. F. Hook, *Lives of the Archbishops of Canterbury* (London, 1860–76); W. Stubbs's preface to the second volume of *Walter of Coventry* ("Rolls" ed.), which devotes special attention to Langton; and F. M. Pourcke, *Stephen Langton* (1928). The mss. of Langton's writings are noticed in J. Bale's *Index Britanniae scriptorum* (ed. R. L. Poole, 1902); his Constitutions are printed in D. Wilkin's *Concilia*, vol. ii. (London, 1737). (H. W. C D.)

Another English prelate who bore the name of Langton was THOMAS LANGTON, bishop of Winchester, chaplain to Edward IV. In 1483 he was chosen bishop of St. Davids; in 1485 he was made bishop of Salisbury and provost of Queen's College, Oxford, and he became bishop of Winchester in 1493. In 1501 he was elected archbishop of Canterbury, but he died on Jan. 27, 1501, before his election had been confirmed.

LANGTON, WALTER (d. 1321), bishop of Lichfield and treasurer of England, was probably a native of Langton West in Leicestershire. He became treasurer in 1295, and in 1297 bishop of Lichfield. Later he became chief adviser of Edward I., and principal executor of his will. His position, however, was changed by the king's death in July 1307. The accession of Edward II. and the return of Langton's enemy, Piers Gaveston, were followed by the arrest of the bishop and his removal from office. His lands and movable wealth were seized. Langton, accused again by the barons in 1308, remained in prison till Jan. 1312, when he again became treasurer. Excommunicated by Winchelsea, he appealed to the pope, visited him at Avignon, and returned to England after the archbishop's death in May 1313. He died in November 1321, and was buried in Lichfield cathedral.

LANGTRY, LILY (1852–1929), English actress, was the daughter of the Rev. W. C. le Breton, dean of Jersey, and married in 1874 Edward Langtry (d. 1897). For many years she was famous as one of the most beautiful women in England, being known as "the Jersey Lily." In 1881 she definitely went on the stage, appearing from that time under her own management both in London and in America. In 1899 she married Sir Hugo de Bathe, Bart. She died at Monte Carlo, Feb. 12, 1929.

LANGUAGE. By language in the widest sense of the word is meant any means of communication between living beings. The question whether "lower animals" have something that can be rightly compared with human language must still be left open, though there can be no doubt that many animals have various means of communicating thoughts and feelings, which at any rate approach human speech. But in its developed form language is decidedly a human characteristic, and may even be considered the chief distinctive mark of humanity. No human race, not even the most primitive and backward tribe, lacks language, and the language of each nation or tribe must have behind it a history of a great many thousand years. An attempt has been made to prove from the anatomical structure of the skulls of the earliest prehistoric men that they could not yet have possessed the faculty of speech; but this conclusion is certainly drawn from insufficient premises and has no foundation in fact.

Ear Language and Eye Language.—We may distinguish two kinds of language according to the sense affected, ear-language and eye-language, of which the former is by far the more important. Among the various species of eye-language we must first mention gestures, made by means of the hands and the muscles of the face. Some of these are perfectly natural and spontaneous, being generally performed by the individual unconsciously, while others are much more conventional and have to be learned consciously. A specially developed variety of the latter kind is the gesture-language of some American Indians; others are found among criminals of different countries. More or less conventional eye-languages are the "language" of flowers, pictures, flag-signalling, optical telegraphy and finally—the most important of all—written and printed language. But. as soon as writing has disengaged itself from ideographic picture-writing, it becomes dependent on the spoken language and develops into a more or less faithful representation of the sounds of speech; the written languages with which we are most familiar, are thus secondary languages in relation to the ear-languages underlying them. The same is true of the artificial alphabetic finger-language sometimes taught to deaf-mutes, whose natural sign-language is a species of picture-writing in the air, totally independent of spoken language. When, however, deaf-mutes are taught lip-reading, the spoken language is perceived visually and ear-language thus becomes eye-language.

The paramount importance of an ear-language as compared with any kind of eye-language is, of course, due to the facts that the speech-organs (lungs, vocal chords, soft palate, tongue and lips) are capable of producing an immense variety of easily distinguished sounds, which can be pronounced without preventing arms and hands and the rest of the body from being simultaneously active in various ways, and that speech-sounds can be perceived at a reasonable distance without any regard to light or darkness or to the position of the hearer or hearers in relation to the speaker. The development of speech has not, however, been completely independent of the eye-language, and even now among civilized, and still more among uncivilized people, gestures and mimic play are a great assistance to the right understanding of spoken words; it is often asserted that there are some races who cannot dispense with this aid to comprehension and who therefore cannot carry on a conversation in the dark. This, however, may be an exaggeration. In the rest of this article, language is always understood to mean ear-language.

Social Importance.—Language is purposive activity on the part of one human being in order to come in mental contact with a fellow-man or fellow-men. But we should not one-sidedly think of the purpose of language as being predominantly, or even exclusively, the intellectual one of communicating thoughts; not even if we include volition (commands, wishes, prayers, imprecations, etc.) is that definition sufficiently comprehensive. Language often serves as an outlet for intense feeling, but very often also people speak for the mere pleasure of speaking without having anything really to communicate, and there is no doubt that this enjoyable exercise of the vocal organs has played a very great rôle in the development of speech. Language is likewise important in social intercourse; when two friends meeting in the

street ejaculate their "Good-morning!" their intention is not to communicate ideas to one another, but merely by means of language to give vent to their feeling of good will. This point of view is emphasized by B. Malinowski as important, if we would understand the attitude towards language of primitive people.

Language is one of the most potent forces in social life; it welds together smaller or greater communities and makes them something more than a number of isolated individuals. Language always presupposes two, or generally a much greater number of individuals, who agree in connecting approximately the same ideas with approximately the same sounds. It is necessary to add "approximately," for complete agreement between even two individuals does not exist, and language can fulfil its function in practical life without it. The number of individuals thus connected by means of the same language varies considerably, from small tribes of savages often counting only a few hundred people so that villages a few miles apart can hardly understand one another, to the great civilized speech communities. English is spoken by at least 150 millions distributed over five continents. As the possession of a common language is an extremely potent factor in all spiritual life and fosters feelings of fellowship and solidarity, and as linguistic boundaries do not always coincide with political frontiers, it is quite natural that linguistic questions should play a great part in national rivalries. But the terms "nation" and "language" are not co-extensive, for the feeling of national coherence has as its main source community of outlook occasioned by historical events, which may be independent of language; thus the Swiss, though speaking four distinct languages, consider themselves one nation, and on the other hand the inhabitants of Great Britain and the United States of America are two nations, though speaking essentially the same language.

THE LANGUAGE OF THE INDIVIDUAL

The Child.—The screaming and babbling of the first period of a child's life may be considered preliminary exercises of the organs of speech; gradually the baby learns how to control the movements of his lips, tongue, etc., and produce what sounds he likes, and little by little he acquires the power to imitate the sounds he hears from his parents and others. The tongue is for a long time his dearest plaything, but at first nothing but a plaything; he does not as yet associate any ideas with the sounds he utters. The order in which speech sounds are acquired is not the same with all children, though among consonants lip sounds are probably always the first to appear, no doubt because the labial muscles used to produce them are the same that the baby has exercised in sucking the breast or the bottle. Some of the sounds produced by means of the tongue do not appear till the muscles of the tongue have been exercised by eating more solid things than milk, but *t* and *d* are almost universally substituted for *k* and *g* in one period. Otherwise no rules can be given for the first very inexact imitations of speech sounds, which vary from individual to individual, even among children of the same family. Even after most sounds have been learnt, some combinations of sounds will present difficulties; transpositions (like *efelant* for elephant) and assimilations and partial reduplications are frequent, *e.g.*, *capm* for *captain, goggi* for *doggie, bikykle,* etc. But gradually the agreement between the child's and the community's pronunciation becomes practically perfect.

As with the sounds, so with the meanings of words, the child is often very wide of the mark. It hears a word and ascribes to it a meaning that seems to fit the situation and combination in which it is heard. One girl said *soldier* of any man, and everybody who was not a man was a *baby*. Bobbie said *abuz* for apples, but called cherries *tiny abuz* and oranges *big abuz*. Some children use the words, *dinner, breakfast* and *tea* interchangeably—each word to them means "meal." The ideas connected with numerals and such expressions as *yesterday, last week,* or *on Tuesday* are necessarily very vague in the beginning. Such words as *old* present difficulty; a boy knew he was three years, but could not be induced to say "three years old"; no, he was three years *new*. Even more difficult are pronouns like "I," whose application shifts from person to person.

The child has to pick up in an unsystematic way not only sounds and isolated words, but also the way in which words are inflected and put together to form sentences, and here too it takes some time before he acquires full familiarity with all the intricacies of language. After he has discovered that the plural is generally indicated by the addition of *s,* he will feel tempted to use the same mode everywhere and say *gooses* and *tooths* instead of *geese* and *teeth*. In the same way he will use analogy-formations in adjectives (*gooder, baddest* for better, worst), and verbs (*buyed, frowed* for bought, threw and thrown), or mix up regular and irregular formations (*drunked, boughted* for drank, bought), etc. Some of these formations may be used invariably for quite a long time, while others are only momentary slips made even after the correct forms have been long known and used. It is not only forms that have to be learnt in this way, but also all those intricate syntactical rules for the use of cases, tenses, moods, etc., which, when set forth by learned grammarians, may fill whole volumes, and which the foreigner seldom learns to perfection; after comparatively few years the native child handles all these things with nearly unfailing accuracy.

The whole process of the child's acquisition of its mother-tongue may be described as a progressive socialization; it starts with sounds and meanings that are so individualistic that they are often comprehensible only to the narrowest family circle, and gradually, chiefly under the influence of other children, especially playmates a little older than the child itself, everything comes into greater and greater harmony with common usage—and only through this general agreement is the individual's language capable of fulfilling its purpose.

Individual and Society.—It is a simple consequence of the intrinsic nature of all language and the way in which each individual gradually learns his own language that no one's linguistic education is ever finished. The form of correct speech is not given in the form of a set of fixed rules, but has to be worked out in the subconscious mind of the individual from what he hears every day from other individuals who have acquired it in the same way One never hears the "average," but always individual utterances adapted to the needs of each moment. A sharp distinction is made by some linguists (de Saussure, Palmer) between "speech" (*parole*), *i e*, the individual's linguistic activity, of which he is sole master, and "language" (*langue*), which belongs to the community and is independent of the individual, to whom it gives the norm from without, but this sharp distinction cannot be maintained in the face of a realistic linguistic psychology, which sees the social side of speech-activity in the constant action and reaction of individuals on one another. Every adult person retains some traces of the imperfection of his early acquisition of his native language, however imperceptible they may be to a superficial observer, and everyone is apt to be influenced by the speech of those who surround him, though the strength of influence varies very considerably, some people being easily affected and quickly adopting new turns of expression, nay even catching the infection of another dialect after a short stay in a new district, while others are in such respects very conservative.

Size of Vocabulary.—How many words does the vocabulary of an individual comprise? On this question erroneous beliefs are curiously current, even among psychologists. Careful enumerations have been made of the words used by children at various ages; but it is evident that the difficulties of counting increase as the child grows older, and an exact calculation of a grown-up person's vocabulary is practically impossible. Still we have some data to go on. One six-year-old boy used more than 2,600 words. A Swedish peasant, according to the minute investigation of Smedberg, possesses at least 26,000 words

Much, however, depends on what is counted as a word. Are *I, me, we, us* one word or four? Is *teacup* a new word for those who already know *tea* and *cup?* And so for all compounds. Is *box* (a place at a theatre) the same word as *box* (workbox) or as a *box* on the ear? Investigators do not always distinguish between words that are understood and words that are actually used by the individual examined—two entirely different things. So all such statistics should be used with some diffidence

Prof. E. H. Babbitt found that most of his (American) college students reported a little below 60,000, and thinks that people with an ordinary school education would possess from 25,000 to 35,000 words. The vocabulary of savage tribes is also surprisingly rich; a missionary in Tierra del Fuego was able to compile a dictionary of 30,000 words in the Yaagan language. Such indications are easily reconciled with the fact that the concordances to Shakespeare's and Milton's dramas and poetical works give only 20,000 and 8,000 words respectively; a vast number of words of daily life are seldom or never required by a poet, especially by a poet with such a comparatively narrow range of subjects as Milton; as a matter of fact, every page of his prose works show words not found in his poetry (Jespersen, *Growth and Str. of the Eng. Language*, c. ix.).

VARIETIES OF LANGUAGE

Dialects.—Whenever a language is spoken by a great number of people, it is inevitable that there should be within its boundaries greater or lesser differences, partly of a local and partly of a non-local character. The former constitute what is generally understood by the word dialects. The existence of sharp dialect boundaries has been denied by some philologists (Schuchardt, Gaston, Paris and others), who maintain that there are boundaries for each separate linguistic phenomenon (each sound law or morphological peculiarity, etc.), but that each of these boundaries ("isoglosses," as they are called) is independent of the boundaries for other phenomena; a village will thus always in some respects go with its neighbour to the North, in others with that to the East, etc. There is some truth in this, but only where one and the same population has been living for a long time in the same district in a flat country, where there have been no natural hindrances to continued intercourse, and where no great migrations have ever taken place. But as a matter of fact conditions have very seldom been so simple, and consequently we do find sharp dialect boundaries here and there. This is one of the indisputable facts that have been brought to light especially by so-called linguistic geography, which has of late years flourished more particularly in France, where a great *Atlas linguistique de la France* consisting of 2,000 maps has provided scholars with incomparable material for these studies.

Dialect boundaries are very often due to natural obstacles to free intercourse; not infrequently these consist in great forests which in olden times were impenetrable, though they may have disappeared later; or again marshy districts, etc., whereas rivers form boundaries only where the stream is so rapid that it is not navigable; in mountainous countries the boundaries do not always follow the highest ranges of mountains, as there is often much traffic through defiles which connect places on either side of the watershed. On the whole we see that it is not physical, but human geography that is decisive. An instructive case has been studied by Gauchat in Switzerland. The two villages La Ferrière and Les Bois are situated on about the same level and only an hour's walk distant; yet their dialects are mutually unintelligible, one agreeing with Franco-Provençal, the other with North French. The inhabitants of one village are Protestants and live by industry; those of the other are Catholics and chiefly pastoral. They therefore look askance at one another, and no marriages take place between them. Now the difference of dialect dates further back than the religious difference, and it is possible to show that Les Bois was founded in the 14th century through immigration from Franche Comté, while La Ferrière was founded a couple of centuries later, when some villagers from Chaux-de-Fonds cleared the forest here to obtain pasturage for their cattle. Only recently the two neighbouring villages have been joined administratively, and they are now beginning to have a little intercourse.

The chief law of linguistic biology is this, that intercourse breeds similarity, and want of intercourse dissimilarity. In former times a great many splittings took place, because means of communication were inferior to those of our own day; it was not long after the colonization of Iceland, that Icelandic began to show traces of differentiation from Norwegian. Nowadays linguistic agreement can be much better preserved, accordingly the English spoken in Australia and New Zealand is not widely different from that of the mother country, and the difference in speech between Boston and San Francisco is much less than what may be observed between two villages in Great Britain that are only a few miles apart. There is no definite point at which we may say that "a dialect" has developed such great differences as to have become a "language"; some will use the former, others the latter term of "Afrikaans," the Dutch "Taal" of South Africa.

When we say that one language is "related" to another, or that two languages belong to the same "family" of languages, what we mean is that they are uninterrupted continuations of what was once one and the same language, but which in course of time has been differentiated, *i.e.*, has developed in one way here and in another way there. On the basis of the greater or less similarity of languages, especially in their oldest shapes, philologists are able to group them together in a way that resembles, but is no exact parallel to the "pedigrees" of living beings. English is more closely related to Frisian than to German and Dutch—all these, together with the Scandinavian languages and the extinct Gothic, form the Germanic (or Gothonic) branch or sub-family of the great Indo-European family of languages (*see* PHILOLOGY).

Non-local Varieties.—Besides these local provincialisms other varieties of speech are independent of locality, and are therefore as it were perpendicular varieties as distinct from the horizontal local dialects. People moving in the same set will always tend to develop forms of speech not known to others, not only technical terms such as those peculiar to each kind of artisans or to each branch of science, but also words and expressions of a more general character. Some of these varieties are designated by the names *argot* and *jargon*, but while the latter term may be loosely used as a contemptuous word for any variety of language that is hard to understand or unnecessarily technical, *argot* should be restricted to the language used by criminals with the express purpose of not being understood by outsiders. The elements of such a thieves' language may be taken from the most heterogeneous sources (gypsy and others) or made up quite artificially by distorting ordinary words (back-slang, etc). The English name for argot in this sense was *cant*, which some philologists still use with that meaning.

Slang also to some extent belongs here, though that word should be reserved for the playful production of new expressions, where, properly speaking, nothing new is required, but where the normal expression has grown trite, so that speakers, especially young people, eagerly seize anything fresh that is offered to them, until that again has become trite. It is evident that the varieties with which we are dealing here, are of slighter character than dialects proper, because they chiefly affect parts of the vocabulary and not the whole phonetic and morphological structure of the language.

Where the social stratification is strongly marked, it will leave its stamp on language, so that we may speak of an upper-class language and a lower-class language, even if the distinction is not always so pronounced as in the old Indian drama, where gods, kings, brahmans, etc., spoke Sanskrit, while the lower orders, to which most female characters belonged, spoke a simpler and less refined form called Prakrit.

In his daily life every single individual to some extent modifies his language according to the position of the person he is addressing. In many languages there are two or three forms of the pronoun of the second person to indicate different degrees of familiarity (*thou, you* in earlier English, *tu, vous* in French, *tu, voi, lei* in Italian), but this is nothing to the complicated linguistic ceremonial of some oriental languages, where several degrees of politeness and humility or condescension have found expression in the whole style of address.

In contradistinction to the easy-going speech of everyday life it is natural to use a more solemn style on grave occasions, in poetry, etc., and for such purposes expressions are often chosen which were formerly in current use, but have now grown more or less unfamiliar. This is still more marked in the language of religious ritual, and very often we find a sacred language used exclusively in this connection and partially or wholly unintelli-

gible to the laity. Latin, as used in the Roman Catholic Church, and Church Slavonic in the Russian Church, are two examples; several similar ones are found among savages. The angakoks (heathen priests) of Greenland in their incantations of the mighty spirits use a great many strange words not found in ordinary Eskimo. Similar things are reported from many places with regard to the ceremonies by which the young men are solemnly admitted among the adults. The Isneg-negritos of northern Luzon, who ordinarily speak a corrupt Ibanag (Filippino-Indonesian), have in their secret nightly ceremonies a totally different language, which they do not understand, but say that they have learnt from their ancestors (Vanovergh and W. Schmidt).

It is common for savages and primitive people to ascribe magical or mystical powers to words, or to some words. Survivals of this superstition are found in our own days even in civilized countries. J. Jakobsen discovered that the Shetlanders on their fishing expeditions used a number of words for fish and implements which were different from their everyday Scottish words, and which he was able to identify with old Norse words; if they did not use these they believed that their fishing would be unsuccessful. Jutland peasants at Christmas time are not allowed to use the ordinary words for mice, lice, etc., for then these animals will multiply. It is more and more recognized that similar reasons for the tabu of certain words have operated in making old words disappear, as when the old word for "bear" corresponding to Greek ἄρκτος has given way to words originally meaning "brown" (as English *bear*) or "honey-eater" (as Russian *medvet*). Names of gods and goddesses are often interdicted in a similar way, *e.g.*, Jahveh among the Jews; it is a kindred half-religious fear that makes people shy of the proper word for "die," "death," "be killed" and leads to such euphemisms as "pass away," "go West," etc.

Tabu customs also underlie a phenomenon which is found in numerous countries, namely that women have a great many separate words and expressions not used by men; in some places this is carried to such an extent that we may speak of a distinct women's language.

Standard Languages.—One of the most important events in the linguistic evolution of historical times is the springing up of the great national common-languages, standard languages, which are driving out the local dialects; those who speak them do not betray by their speech where they come from. Several factors have operated to bring about that sociable intercourse between people hailing from different districts which makes them drop specific local peculiarities, not only such traits as are easily noticed and therefore often ridiculed by people from other parts, but also those indescribable and hardly perceptive variations which go together to constitute a local idiom.

Religious festivals and likewise athletic gatherings—some of these, like the Olympic games in Greece, had also a religious significance—have been very important agencies for rubbing off local peculiarities; and so have the wandering minstrels who, long before written literature began, visited successively the courts of petty kings and naturally wanted their songs or recitals to be understood everywhere. The language of Homer does not represent the speech of one district, but is highly composite, and the same is true with regard to common poetical languages among savage tribes. In recent times theatrical companies touring from one place to another have had a unifying influence on language in some countries, notably in Germany, where "Bühnendeutsch" (German of the stage) is largely considered the best German. Political unity is, of course, a factor of the utmost importance; among its unifying consequences must be mentioned common military service and the moving of officials from one part of the realm to another. The common language is often in a marked degree an upper-class language, because the upper classes travel a good deal and mix with their equals from other districts; at school and in the universities their children have much intercourse with young people from all over the country. As a final factor of very great importance must be mentioned the creation of big cities; in these, and especially in the capital of the country, immigrants from different parts get their dialect rubbed down in intercourse with one another. This, however, does not mean the same thing as adopting the local dialect of that particular town. The common French language, though largely developed in Paris, is not in the strict sense Parisian. Similar phenomena are to be observed in other countries; standard English has to a great extent come into existence in London, but has not been created by born Londoners.

The upshot of all this is that the rise of great standard languages is due to a great many forces at play at the same time. And it is important to notice that several of these have never been so strong as they are nowadays—and we are now witnessing the rise of one new factor which may prove one of the most potent of them all, wireless broadcasting. We may therefore look forward to a great process of unification in the future.

The common language has two forms, one spoken and one written. At first people everywhere wrote their own local dialect, but the tendency towards unity quickly acts upon the way in which people write, and through the influence of schools the common language often makes greater progress in writing than in speaking. In languages with alphabetic systems of writing no one at first could think of anything else but trying to represent spoken words as phonetically as possible; but soon tradition tended to fix accustomed spellings and to keep them in use even where the sound had changed; thus the gap between the spoken and the written form of words grew wider and wider from generation to generation. In some languages the discord is further increased through the fact that numerous foreign words are taken over with their native spelling unchanged, as has been the case in English with French words. Time after time spelling reformers endeavour to bridge over the gulf, but some nations are extremely conservative in this respect, while in some other countries (Spain, Germany, Scandinavia) more or less thorough-going reforms have been successfully carried through.

THE HISTORY OF LANGUAGES

While in the case of the vast majority of languages we know only their present stage or quite recent stages, as these languages have only been noted down in recent periods by missionaries and philologists, there are fortunately other languages whose history we can trace back for centuries, some even for a few thousand years. But we must remember that even with regard to those languages in which writing goes furthest back, the period thus known to us is extremely short in comparison with those thousands of years which have left no record. Besides, writing is at best a very imperfect medium for language-study, and its deficiencies are especially glaring in the oldest systems of writing. The Egyptian hieroglyphs and the early Semitic alphabets leave us almost entirely in the dark as to the vowels of these languages. Chinese writing is even worse, and the nature of the sounds of early Chinese is only now slowly revealing itself to the patient researches of B. Karlgren and other scholars. We are of course much better informed with regard to such old languages as Sanskrit, Greek, Latin, Old Turkish, etc., where not only consonants, but also vowels are indicated. But even the best of these alphabets are incapable of denoting a great many nuances—in the qualities of the sounds, in quantity, stress, tone, etc.—which are of importance in the spoken language and which may exercise a far-reaching influence on the development of speech. Speaking and writing are really incompatibles because they address themselves to two distinct senses, and even the neatest phonetic script is nothing but a makeshift contrivance for the study of the real, *i.e.*, the spoken language. Our descendants will be better off in that respect as they will have gramophone records for the study of *our* speech.

A great difficulty is created for the historian by the conservatism of people who persist in writing words in a customary spelling, even where the sounds have changed greatly from what they were (*see* above "Standard Languages"). Sometimes this disadvantage is remedied by the express statements of early phonetic observers who describe the pronunciation of their own times and call attention to the discrepancies between spelling and pro-

nunciation; in other cases we must draw our conclusions as to earlier pronunciation in a more indirect way, through loan-words to and from the language concerned, through rhymes and rhythms in poetical works, and through mistakes in spelling. When we find, for instance in the Shakespeare folio, spellings like *solembe,* we are justified in inferring, both that *n* in *solemn* and that *b* in words like *comb,* had at that time disappeared from actual pronunciation. Mistakes made by illiterate spellers have proved a very fruitful source in the hands of recent investigators (H. C. Wyld and others).

In writing people will tend to be more conservative than in speaking, not only in their spelling, but also in their grammar and in their choice of words. The verbal forms in *-th* (*goeth, hath*) were kept in writing long after the forms in *s* (*goes, has*) had become universal in speech; thus also forms like *mine own,* etc. The subjunctive in "If he come" is much more frequent in writing than in actual speech. Some literary words have practically disappeared from the spoken language, e.g., *abode, wax* (=grow), *anent, belike.* Such things are found in all languages that have a long literary tradition, though their extent and character may vary considerably between one language and another. In Swedish and Dutch the old word-genders survive only in the written language. In Modern Greek the tendency to preserve as much as possible of the old glorious language has led to an extreme artificiality in the written language, which creates infinite difficulties for all its users, and the same is the case in some of the Southern Indian languages, such as Telugu. The first requirement of a linguistic historian must therefore be that he is constantly on his guard against false impressions due to the way in which languages are written.

In the course of time we see languages changing, though the rate of change varies a good deal. But why do languages change? The ultimate cause must be the same as that of the mutability of all human customs and institutions, namely human nature. In the case of languages we are able to specify some causes of change, chief among which are the nature of the speech-material itself (sounds and the ideas to be expressed) and the way in which language is transmitted from generation to generation or rather from older contemporaries to each new individual; a further cause of change is the influence of persons speaking or writing other languages.

Some deviations from the norm are of such a momentary and fleeting character that they have no influence whatever; but others show by the frequency of their occurrence in the mouths of different speakers that they are deeply motived by human nature or by the structure of the particular language in which they occur; these will therefore tend to persist and finally become so universal that they can no longer be considered lapses, but form part and parcel of the language in its new stage. These changes then are the chief objects of study for the linguistic historian.

Changes of Sounds.—Speech sounds are not invariable quantities. Each "phoneme," *i.e.,* distinctive sound in the language, has a certain latitude of correctness, within which it may be pronounced, now with the mouth a little more open, now a little more closed, now with the tip of the tongue a little more advanced, etc., without being unrecognisable or causing any confusion with neighbouring sounds. The speaker in some moods will be tempted to pronounce in a more careless way, and may thereby here and there overshoot the mark or omit a sound which in other moods he will produce correctly.

Human laziness plays its part in the phonetic changes of languages, which very often follow the line of least resistance; but there will always be a curbing influence in the mere fact that one speaks to be understood by others who will ask one to repeat one's words if they are not clearly recognized. Here the whole structure of a language comes into consideration, for some indistinct pronunciations are more apt to cause confusion and misunderstanding than others; in English a great many words are kept apart by distinction of the final voiced and unvoiced stop (*b, p; d, t; g, k*); consequently these sounds are pronounced carefully, while in German, where the same sounds serve only in a few cases to distinguish words, there has not been the same check on the natural tendency to unvoice final consonants, the result being that *-b, -d,* and *-g* are pronounced as *p, t, k* (or *ch*) in *Grab, Geld, Tag,* etc. Whenever a sound is significative in a language it resists change much more effectively than corresponding sounds which are not used to distinguish words. A correlated principle is seen in "stump-words," those clippings of words which abound especially in school and college slang, *e.g., gym* for *gymnastics, lab(oratory), undergrad(uate),* but which in some cases have penetrated into normal language, *e.g., brig* for *brigantine, cab* for *cabriolet, photo* (*cf.* also numerous Christian names like *Fred*). In all such cases the beginning of the word has sufficed to convey the sense, and speakers have therefore accustomed themselves to drop the rest.

In these last mentioned cases the phonetic change affects only one word at a time; but linguistic history abounds in cases in which a sound is changed, not in one word only, but in all the words, or a majority of the words, in which it occurs, or at any rate in which it occurs in the same position or under similar conditions. Here we speak of "sound-laws" or "phonetic laws," and some of these are of the utmost importance in linguistic science in determining the relationship between various languages and the etymology of particular words.

In dealing with these sound-laws we should never lose sight of the fact that a speech-sound always exists as a part of the whole sound-system or sound-pattern of that language; all the important sound-changes therefore affect more than one sound; and not infrequently we see that a sound-change is conditioned by the whole structure of a language; similar changes will therefore take place independently in languages of similar structure. This is the case with mutation ("umlaut"), of which there is no trace in Gothic, but which took place in subsequent periods in all the other Germanic languages, though not exactly in the same way everywhere.

When initial *k* was dropped in the beginning of *knight,* all words with the same group of sounds were affected in the same way; *know, knowledge, knock, knit,* etc., but *k* was retained after a vowel, *acknowledge.* Very often two or more sounds possessing some articulatory elements in common are affected at the same time in the same way; thus *g* in *gn* was dropped simultaneously with *k* in *kn; gnaw, gnat.* The English vowel-shift which probably began about 1400, modified all long vowels (which had formerly had their "continental" values), *e g.,* in *bite, beet, beat, abate, foul, fool, foal;* the vowels were diphthongised or raised, but generally speaking they kept the same distance, so that no confusion was produced and no clashings occurred, until finally the vowel in the *beat*-group was raised and so fused with that of the *beet*-group. In the great prehistoric Germanic consonant-shift, which affected all the stopped consonants of primitive Aryan, the various sub-classes were similarly kept distinct, though the distinctions were made in a different way from that of the old Aryan system.

Sometimes one and the same phonetic change is gradually extended to a greater and greater number of combinations. Such is the case with the dropping of the first element of the English "long u," phonetically written (ju), after consonants. This happened first after *r,* as in *true;* then after *l* when preceded by another consonant (*blue*)—in these cases the sound-law is carried through consistently. Next came *l* with no consonant before it, as in *Lucy,* and *s* as in *Susan, suit,* where there is a good deal of vacillation; after *t, d, n,* as in *tune, due, new,* the tendency has prevailed only among vulgar British speakers and some Americans. As regards these speakers the "law" must be said to affect all consonants produced by the point of the tongue, while it will have to be formulated in various less comprehensive terms for other speakers. It is probable that many of the comprehensive prehistoric sound changes, of which we see only the final results, may have similarly spread from more modest beginnings.

While some phonetic changes bring about a convergence of two or more forms of the same word, which were previously distinct, as when the different Old English (Anglo-Saxon) case-forms *sunu* and *suna* became Middle English *sune* and modern *son,* other sound changes lead to divergences between forms of the same

word, as when *keep* and *kept*, which had formerly the same vowel, now have distinct vowels; a still greater divergence is seen in *seek, sought*, which in prehistoric times had the same vowel (*o*).

When philologists speak, as they usually do, of sound-laws or phonetic laws, it must never be forgotten that the word "law" is not used exactly as in the physical sciences, but always refers to historical occurrences restricted to one particular language or dialect and to one definite period of its existence. But from all these particular "laws" we may hope some day to be able to find out some more general laws determining linguistic development everywhere and at all times, though the result may be only comparatively vague statements of universal "tendencies."

Among these we must mention the tendency toward assimilation of neighbouring sounds so as to save some particular articulation. Thus, the *s* is voiced, *i.e.*, has acquired the sound of *z*, before a voiced stop in *husband* (a compound of *hus*, house), *gooseberry*, etc. The place of articulation is shifted, when *n* becomes *m* before a labial, as in *Stamford* from *Stanford, vamp* (upper leather) from French *avant-pied*, and when *n* is pronounced with the back of the tongue before a back consonant, *e.g.*, in *handkerchief;* inversely *m* has become *n* before a *t*, because that is pronounced with the tip of the tongue, in *ant* from *æmette, count* from Latin, *comit-;* similar examples abound in many languages, though the extent to which such assimilatory forms are tolerated varies a good deal between one language and another.

Analogy.—Irregularities in forms, whether due to such phonetic changes as have just been mentioned, or to other causes, will always tend to disappear. This is brought about by the springing up of *analogy-formations*, which have played and still play an enormous rôle in the development of all languages. They have led to the English genitive being now always formed by means of *s*, while Old English had a variety of formations; *fæder* father's, *manna* men's, *cwene* queen's, *haran* hare's, etc. The *s*-ending of the plural has been also extended by analogy to nearly all words; many verbs which in earlier times had a preterite of the "strong" or irregular form now form their preterite with the regular "weak" ending *-ed*. The same thing happens in all departments of grammar. Irregular forms may indeed hold their own against all levelling influences, but this can only be if they are in very frequent use, so that a child hears them and has occasion to utter them constantly from a very early age, *e.g.*, the plural *men*, the case forms *I, me, she, her*, the comparative *better*, verb forms like *see, saw, stand, stood*, etc.

In these various ways form-systems constantly tend towards simplification; we see how the languages belonging to the Indo-European family have reduced the number of cases, etc., independently of one another, though with varying rapidity, and in some languages, *e.g.*, Celtic, the process has been countered by the development of new complications.

Meanings.—The meanings of words are just as subject to change as are their sounds. Changes of meaning are often termed semantic changes, and the science of such changes is called *semantics* or *semasiology* (from Greek *sēma* "sign"), but though a very great many semantic changes have been collected and classified from various points of view, it must be confessed that this "science" has not acquired the same fixity or high standing as that which deals with sound-changes. This is a natural consequence of the essential vagueness of meanings and the extremely complicated nature of the phenomena and ideas that have to be denoted by words. In some cases we must ascribe the change in meaning to the ordinary man's want of precise thinking or punctuality, as when *soon*, which at first meant "at once" has come to mean "in a short time," in others to the desire to express a new notion or to vary the expression of an old one by means of existing speech material; *i.e.*, by means of metaphors or metonymy, as when we speak of the *eye* of a needle, a *fountain* pen, or say the *Crown* or the *crowned head* for the king.

Nearly all everyday words have more than one meaning, and it is only the context or whole situation that shows the hearer how a particular word is to be taken. *Man* in one sentence may mean human being without regard to sex or age, in another it may be used in contrast to "woman," in a third in contrast to "boy," and in a fourth with the meaning "husband" (man and wife). *Tea* may according to circumstances mean the plant, the dried leaves of the plant, the drink made from them, or the meal taken with that drink ("She had a substantial tea of bread and butter"). We see then that changes of meaning are often caused by the syntactical combinations into which words enter. "Go to chapel" at first had reference to the place, but *chapel* in that connection came to mean the service ("There is no chapel on the day on which they hang a man"). *Board* from meaning a thin slab of wood came to mean table, and then what is put on the table (hence "board and lodging"), and then again a committee sitting round the table ("Board of Trade"), etc. These necessarily cursory remarks may serve to show the infinite variety of possibilities attending the development of meanings in a language.

In this field philologists must crave the assistance of psychologists and philosophers. How difficult it is to realize and define what exactly is in our minds when we say that such and such a word "means" this or that, is shown in "The Meaning of Meaning" by C. K. Ogden and I. A. Richards (1923), and K. O. Erdmann, "Die Bedeutung des Wortes" (1910, much more easily understandable than the English book). It is very important to notice how different words have their own emotional colouring, so that though intellectually they may mean the same thing, they nevertheless produce quite different impressions on the hearer or reader—a fact which naturally affects their applicability in poetry and higher prose. Such differences may depend on various things which cannot be comprised in one formula; but among the most potent factors one must mention the impression produced by the sound as such. Some vowels and consonants, and some combinations of sounds, are more apt to produce agreeable associations than others; while the sound of short *i* (or *ē*) is often suggestive of small or graceful things, as in *little, pretty, twig, kid, slip, chick* (*cf.* French *petit*, Italian *piccino*, German *winzig*, Danish *bitte* and a great many other words meaning "little" in various languages), the opposite idea is expressed in such sounds as *clumsy, blunder, bungle, muddle, slubber, sloven*, etc. Sound symbolism must not be overlooked if we would understand the development of languages; in many cases, however, it is not the ultimate source of a word, but rather something that determines the fate of an already existing word in its competition with others.

Etymology.—By etymology is understood both the process of tracing words back to their origin and the ultimate source of a word found by that process. In contradistinction to the etymologising of earlier times, which was mere guesswork, philologists nowadays claim—and with good reason—that in making their etymologies they are much more scientific, since they take into account all the sounds of the words, and moreover give proper attention to the way in which the meanings may have developed in all those cases in which these things are not obvious.

One example may illustrate the method pursued in etymological investigations. English *tooth* means the same thing as Latin *dens*, accusative *dentem*, and Greek *ὀδούς*, accusative *ὀδόντα*: all three words go back to one and the same form in the parent language (apart from the difference between Lat. *e* and Gr. *o*, and the initial *o* in Gr.). The discrepancies in the consonants are accounted for, when we notice that Eng. *t* here corresponds to original *d* in the same way as in *tear* (Gothic *tagr*); Gr. *δάκρυ*, *ten* (Gothic *taihun*, ai=e); *δέκα*; *teach*, *δείκ*(*νυμι*); *tame*, Lat. *domo*, Gr. *δαμάω*, etc. Before *th* an *n* has disappeared in English: this is a regular phenomenon, comparing *other* with German *ander, sooth* with Norse *sann;* before *s* and *f* the same thing happened, *cf. goose*, German *gans; soft*, German *sanft*. Finally *th* corresponds to original *t* as in *three*, Lat *tres; thin*, Lat. *tenuis*. In this way philologists have been able to build up a complete set of correspondences, by means of which even seemingly distant forms may be connected etymologically with perfect certainty.

Where etymologies are not obvious, the chief thing is to find out all the available historical facts as to the use and occurrence of the words. These may sometimes reveal curious circuitous

ways in which words have come to be used. Thus the word *chapel,* of which we have just seen one change of meaning, owes its origin to Latin *cappella,* "a little cloak or cape." The cloak of St. Martin was preserved by the Frankish kings as a sacred relic under the care of its *cappellani* or "chaplains"; hence *cappella* was used for the sanctuary in which the cloak was kept, and afterwards transferred to similar places of worship. Another interesting case in point is *check,* in some of its uses spelt *cheque,* which is now used in a variety of meanings having seemingly no connection with the name of the Persian king, *shah,* from which it is nevertheless derived (through the game of *chess,* which is ultimately nothing but the plural of the same word). Though a great many words have thus been explained in a most satisfactory way, many others even in the best known languages have resisted all the attempts of linguistic historians, among them such comparatively recent words as *put, pull, pun, job, rococo, zinc.*

Speech-mixture.—No nation lives entirely isolated from others, and contact between nations has always some linguistic consequences. No language is therefore free from foreign elements, though the degree of speech-mixture varies very considerably.

The simplest case is the adoption of a foreign name of an animal or product hitherto unknown; thus *kangaroo* is from some Australian tongue, *zebra* from an African, *tea* from Chinese, *coffee* from Arabic, *chocolate* from Mexican, and *punch* from Hindustani. A certain type of carriage was introduced from Hungary and is known in most European languages by its Magyar name, English *coach,* German *kutsche,* etc. While such loan-words are isolated, there are others which come in larger quantities and bear witness to the cultural superiority of some nation in some one specified sphere of activity or branch of knowledge; such are the Arabic words relating to mathematics and astronomy, *algebra, zero, cipher, zenith;* the Italian words relating to music, *piano, allegro, soprano,* etc., and to commerce, *bank, balance, ducat, florin.* It is possible to read whole chapters of the cultural history of the English nation out of the successive strata of important loan-words. Before the migration from the continent came commercial and domestic words from Latin, *mint, monger* (fishmonger, etc.), *pound, inch, wine, dish, cook, kitchen, pear, plum.* Next came words connected with the Christian religion, *pope, bishop, nun, shrive.* Then we have Scandinavian words connected with law and with peaceful settlement, *law, by-law, thrall, crave, wapentake, egg, skirt,* numerous place names in *-by, -thorp,* etc. The Norman French words show the conquerors as the ruling and refined upper class, *crown, reign, sovereign, duke, court, judge, jury, summon, grace, beauty, flower, dinner, supper,* etc. And finally we have the learned words from the classical tongues after the revival of learning, *intellect, abstract, educate, preternatural, biology, heterodox, metamorphosis, encyclopaedia* and innumerable others. In the same way we are able to draw inferences from loan-words with regard to the nature of prehistoric contacts between various races, *e.g.,* Scandinavian and Baltic words in Finnic.

The study of loan-words is important in other respects as well. As phonetic development does not follow the same lines in all languages, loans often retain traces of a pronunciation which is lost in the country from which they came. English *w* in *wine* shows the old Latin pronunciation, which has been given up in all the Romanic languages; *vine* from French *vigne* shows the later French development into *v.* English words often preserve consonants which have been dropped in French, *beast, feast* from old French, *beste, feste,* now *bête, fête; ch* in *chief, chair, charm,* etc., shows the Old French sound, which in Modern French has been simplified through dropping of the first element; *chef, champagne* are later loans after the change in French pronunciation. In this way Finnic loans from their western neighbours show us forms that are older than the oldest runic inscriptions and than the Gothic translation of the Bible, *e.g., kuningas* for "king."

Indirect loans are found when a compound term is translated from one language to another; this is the case with some words of ethical or religious import; Greek *συνείδησις* and *συμπάθεια* were translated into Latin *conscientia* and *compassio* and those again into German *Gewissen* (ge=*con*), and *Mitleid,* Danish *samvittighed* and *medlidenhed.* Again phraseological and syntactical combinations are in this way transferred from one language to another. Very intricate borrowings of this kind in the Balkans have been studied by Sandfeld; thanks to them, Greek, Bulgarian, Rumanian and Albanian, despite their different origins, present a certain homogeneity in syntactical structure. It is highly probable that certain peculiarities in the flection of Armenian and Tokharian must be similarly ascribed to the neighbourhood of Turkish.

Contact between races with mutually unintelligible languages has given rise to makeshift languages of a curiously similar type in various parts of the globe, however different the underlying language may be. Such are Pidgin English and Bêche-de-Mer in the East, various Creole languages such as Creole French of Mauritius, Negro-Portuguese, Negro-Dutch, "El Papiamento" in Curacao and the Chinook trade language in North America. In all these is an extreme simplicity of grammatical structure, which together with a minimum of vocabulary gives them a pronouncedly childish character. Such languages are not mixed languages, properly speaking, but arise from the first bungling attempts at learning a difficult language, the Europeans having very often met the natives half-way by using broken English, etc., themselves. Generally these minimum languages are in a very fluctuating state, but under favourable circumstances they may become more fixed and even be used for expressing all the ideas of a cultured mind.

SUBSTRATUM

In recent discussions about the origin of dialects and linguistic differences the so-called *substratum theory* has played a great rôle. The starting point is the undoubtedly correct observation that when an adult learns a new language he will nearly always transfer sounds and such general phonetic qualities as tones, stress, etc., from his first to his second language. The differences between the development of Latin in Gaul, in Spain, etc., are then explained as chiefly due to the influence of the original language of each country; the old Germanic sound shift is said to be due to phonetic habits of an aboriginal population, etc. In most cases, however, we know nothing at all about the pronunciation of the languages thus conjectured to be substrata of European languages (Iberian, Rhaetian, pre-Germanic), and though there may be some truth in the theory in a general way, it cannot explain everything that it has been supposed to explain by writers like Meillet, Hirt and Feist. Before resorting to the hypothesis of a prehistoric substratum one should always try to explain linguistic changes in the same way as those which happen before our eyes in historic times in countries where the same population has been living for centuries.

THE ORIGIN OF LANGUAGE

On the ultimate origin of language speculation has been rife, more, however, among philosophers than among philologists, who have very often been too matter-of-fact to take an interest in this problem. Some scholars (among them quite recently W. Schmidt) see the insufficiency of the usual theories, and giving up all attempts at explaining it in a natural way fall back on the religious belief that the first language was directly given to the first men by God through a miracle.

Greek philosophers were divided into two groups on this question, some thinking that there is from the beginning a natural connection between sound and meaning and that therefore language originated from nature (*φύσει*), while others denied that connection and held that everything in language was conventional (*θέσει*). The same two opposite views are represented among the linguistic thinkers of the 19th century, the former in the nativism of W. v. Humboldt, Max Müller, Steinthal and others, the latter in the empiricism of Madvig, Whitney, Marty, etc.

Some of the chief theories are best known under the nicknames invented by Max Müller, the *bow-wow, pooh-pooh,* and the *yo-he-*

ho theories. According to the first, language began with the imitation of the characteristic sounds of animals; according to the second, with interjections, instinctive utterances called forth by pain or other intense sensations or feelings, and according to the third, with the natural phonetic accompaniments of acts performed in common; these sounds would thus come to stand as verbs denoting the acts themselves; *e.g., heave, haul.*

Each of the theories thus succinctly sketched explains part of our human language, and there is nothing to hinder us from combining them, but even when combined they do not explain everything, and especially fail to explain the central parts of language and its whole complex structure. Moreover, they all tacitly assume that up to the creation of language man had remained mute and silent, but it is much more probable that he had already exercised his organs through something that was not yet speech, but might lead to speech.

The latest attempt at solving the mystery is that of Jespersen, who thinks that the problem may be approached in a quite new way by starting from languages as we find them nowadays and tracing their history back as far as our material allows, in order from a comparison of present English with Old English (and similarly in the case of as many languages as possible) to find out the great laws governing linguistic development; by lengthening this system of lines on a larger scale backwards beyond the reach of history we may be able to arrive at uttered sounds of such a description that they can no longer be called a real language.

As regards the phonetic structure of the most primitive language, we shall in that way arrive at long conglomerates of sounds forming a striking contrast to those monosyllables with which philologists of the 19th century imagined that language must necessarily have begun. These long strings of syllables were probably characterised by marked tone movements with great intervals, and thus more like singing than is our comparatively monotonous civilised speech. The further back we go in the history of languages the greater is the number of irregularities that we find, not only in morphology, and syntax, but also in vocabulary; the same thing is not always denoted in the same way, and instead of general terms as in our languages we find words with highly specialised and concrete meanings. The bigger and longer the words, the thinner the thoughts. The first framers of speech were not taciturn beings, but lively men and women babbling or singing merrily on for the mere pleasure of producing sounds with or without meaning; as an instrument for expressing thoughts their utterances were clumsy, unwieldly and ineffectual, but they served to give vent to their emotions, and that was all they cared for. One string of syllables sung to some kind of melody may have been so characteristic of a certain individual, that it came to be repeated by others to signalise his approach, thus denoting him and becoming a proper name for him—the most concrete of all words. Another song might serve to remind the tribe of some occasion when it was first intoned and might thus become an undifferentiated expression for what happened then. When a multitude of utterances of this kind had developed, each with some sort of special meaning, they might be combined in various clumsy ways and thus give rise to something that was more like the long intricate sentence-conglomerates which we find, for instance, in Eskimo. But even the most primitive language heard to-day has an evolution of many thousand years behind it, and a modern mind cannot hope to be able to enter into the workings of a mind that was only beginning to be human.

LANGUEDOC, one of the old provinces of France, the name of which dates from the end of the 13th century. In 1290 it was used to refer to the country in whose tongue (*langue*) the word for "yes" was *oc,* as opposed to the centre and north of France, the *langue d'oil* (the *oui* of to-day). Territorially Languedoc varied considerably in extent, but in general from 1360 until the French Revolution it included the territory of the following departments of modern France; part of Tarn et Garonne, Tarn, most of Haute-Garonne, Ariège, Aude, Pyrénées-Orientales, Hérault, Gard, Lozère, part of Ardèche and Haute-Loire. The country had no natural geographical unity. Stretching over the Cevennes into the valleys of the upper Loire on the north and into that of the upper Garonne on the west, it reached the Pyrénées on the south and the rolling hills along the Rhône on the east. Its unity was entirely a political creation, but none the less real, as it was the great state of the Midi, the representative of its culture and, to some degree, the defence of its peculiar civilization.

While it corresponded exactly to no administrative division of the Roman empire, Languedoc was approximately the territory included in *Gallia Narbonensis,* one of the 17 provinces into which the empire was divided at the death of Augustus. It was rich and flourishing, with great and densely populated towns, Nîmes, Narbonne, Béziers, Toulouse; with schools of rhetoric and poetry still vigorous in the 5th century. In the 5th century this high culture was an open prize for the barbarians; and after the passing of the Vandals, Suebi and Visigoths into Spain, the Visigoths returned under Wallia, who made his capital at Toulouse in 419. This was the foundation of the Visigothic kingdom which Clovis dismembered in 507, leaving the Visigoths only Septimania —the country of seven cities, Narbonne, Carcassonne, Elne, Béziers, Maguelonne, Lodève and Agde—that is, very nearly the area occupied later by the province of Languedoc. At the council of Narbonne in 589 five races are mentioned as living in the province, Visigoths, Romans, Jews—of whom there were a great many—Syrians and Greeks. The repulse of the Arabs by Charles Martel in 732 opened up the country for the Frankish conquest, which was completed by 768. Under the Carolingians, Septimania became part of the kingdom of Aquitaine, but it became a separate duchy in 817.

Until the opening of the 13th century there is no unity in the history of Languedoc. The feudal régime did not become at all universal in the district, as in the north of France. By the end of the 11th century the house of the counts of Toulouse began to play the predominant rôle; but their court had been famous almost a century before for its love of art and literature and its extravagance in dress and fashions, all of which denoted its wealth. Under Raymond of Saint Gilles, at the end of the 11th century, the county of Toulouse began its great career, but Raymond's ambition to become an Oriental prince, which led him away on the first crusade left a troubled heritage to his sons Bertrand and Alphonse Jourdain (1109–48). The latter successfully beat off William IX., duke of Aquitaine, and won from the count of Barcelona the part of Provence between the Drôme and the Durance. By the opening of the 13th century the sovereignty of the counts of Toulouse was recognized through about half of Provence, and they held the rich cities of the most cultured and wealthiest portion of France.

The prosperity of this region was ruined by the great crusade directed against the popular heresy which had developed there by the early 13th century. The whole county of Toulouse, with its fiefs of Narbonne, Béziers, Foix, Montpellier and Quercy, was in open and scornful secession from the Catholic Church, and the suppression of this Manichaean or Cathar religion was the end of the brilliant culture of Languedoc. (*See* ALBIGENSES, CATHARS, INQUISITION.) The crusade against the Albigenses, as the Cathars were locally termed, in 1209, resulted in the union to the crown of France in 1229 of all the country from Carcassonne to the Rhône, thus dividing Languedoc into two. The western part, left to Raymond VII., by the treaty of 1229, included the Agenais, Quercy, Rouergue, the Toulousain and southern Albigeois. He had as well the Venaissin across the Rhône. From 1229 to his death in 1249 Raymond VII. worked tirelessly to

bring back prosperity to his ruined country, encouraging the foundation of new cities, and attempting to gain reconciliation with the Church. He left only a daughter, Jeanne, who was married to Alphonse of Poitiers. Alphonse, a sincere Catholic, upheld the Inquisition, but, although ruling the country from Paris, maintained peace. Jeanne died without heirs four days after her husband, in 1271, and her lands were promptly seized by King Philip III. Thus the county of Toulouse passed to the crown, though Philip III. turned over the Agenais to Edward I. of England in 1279. In 1274 he ceded the county of Venaissin to Pope Gregory X., the papacy having claimed it, without legal grounds, since the Albigensian crusade (*see* AVIGNON).

Such was the fate of the reduced county of Toulouse. At the division of Languedoc in 1229 Louis IX. was given all the country from Carcassonne to the Rhône. This royal Languedoc was at first subject to much trickery on the part of northern speculators and government officials. In 1248 Louis IX. sent royal *enquêteurs*, much like Charlemagne's *missi dominici*, to correct all abuses, especially to enquire concerning peculation by royal agents. On the basis of their investigations the king issued royal edicts in 1254 and 1259 which organized the administration of the province. Two *sénéchaussées* were created—one at Nîmes, the other at Carcassonne—each with its lesser divisions of *vigueries* and *baillages*. During the reign of Philip III. the *enquêteurs* were busily employed securing justice for the conquered, preventing the seizure of lands, and in 1279 a supreme court of justice was established at Toulouse. In 1302 Philip IV. convoked the estates of Languedoc, but in the century which followed they were less an instrument for self-government than one for securing money, thus aiding the *enquêteurs*, who during the Hundred Years' War became mere revenue hunters for the king. Under Charles V., Louis of Anjou, the king's brother, was governor of Languedoc, and while an active opponent of the English, he drained the country of money. But his extortions were surpassed by those of another brother, the duc de Berry, after the death of Charles V. In 1382 and 1383 the infuriated peasantry, abetted by some nobles, rose in a rebellion—known as the Tuchins—which was put down with frightful butchery, while still greater sums were demanded from the impoverished country. In the anarchy which followed brigandage increased. Redress did not come till 1420, when the dauphin, afterwards Charles VII., came to Languedoc and re-formed the administration. Then the country he saved furnished him with the means for driving out the English in the north. For the first time, in the climax of its miseries, Languedoc was genuinely united to France. But Charles VII. was not able to drive out the brigands, and it was not until after the English were expelled in 1453 that Languedoc had even comparative peace. Charles VII. united Comminges to the crown; Louis XI. Roussillon and Cerdagne, both of which were ceded to Aragon by Charles VIII. as the price of its neutrality during his expedition into Italy. From the reign of Louis XI. until 1523 the governorship of Languedoc was held by the house of Bourbon. After the treason of the constable Bourbon it was held by the Montmorency family with but slight interruption until 1632.

The Reformation found Languedoc orthodox: persecution had succeeded. The Inquisition had had no victims since 1340, and the cities which had been centres of heresy were now strongly orthodox. But Calvinism gained ground rapidly in the other parts of Languedoc, and by 1560 the majority of the population was Protestant. This was, however, partly a political protest against the misrule of the Guises. The open conflict came in 1561, and there was intermittent civil war thenceforward until the Edict of Nantes (1598). By this, the Protestants were given ten places of safety in Languedoc; but civil strife did not come to an end, even under Henry IV. In 1620 the Protestants in Languedoc rose under Henri, duc de Rohan (1579–1638), who for two years defied the power of Louis XIII. When Louis took Montpellier in 1622, he attempted to reconcile the Calvinists by bribes of money and office, and left Montauban as a city of refuge. By 1629 Protestantism was crushed in the Midi as a political force. After the rebellion of Henri II., duc de Montmorency, Languedoc lost its old provincial privilege of self-assessment until 1649. During Louis XIV.'s reign Languedoc prospered until the revocation of the Edict of Nantes. Industries and agriculture were encouraged, roads and bridges were built, and the great canal giving a water route from the Atlantic to the Mediterranean increased the trade of its cities. The religious persecutions which accompanied the revocation of the Edict of Nantes resulted in a guerrilla warfare known as the rebellion of the Camisards (*q.v.*).

BIBLIOGRAPHY.—The one monumental history of Languedoc is that of the Benedictines, Dom Claude Devic and Dom J. J. Vaissete, *Histoire générale de la province de Languedoc* (1730–45). This has been re-edited, and continued and increased by the addition of important monographs (Toulouse, 1872–92). The fine article "Languedoc" in *La Grande Encyclopédie* is by A. Molinier, perhaps the greatest modern authority on Languedoc.

LANGUET, HUBERT (1518–1581), French Huguenot writer and diplomat, was born at Vitteaux in Burgundy, of which town his father was governor. He received his early education from a distinguished Hellenist, Jean Perelle, and studied law, theology and science at the University of Poitiers (1536–39); then, after some travel, attended the universities of Bologna and Padua, receiving the doctorate from the latter in 1548. At Bologna he read Melanchthon's *Loci communes theologiae* and was so impressed by it that in 1549 he went to Wittenberg to see the author, and shortly afterwards became a Protestant. He made his headquarters at Wittenberg until the death of Melanchthon in 1560. In 1557 he declined the invitation of Gustavus I. to enter the service of Sweden, but two years later accepted a similar invitation of Augustus I., elector of Saxony. He showed great ability in organizing the Protestants. He represented the elector at the French court from 1561 to 1572 except when troubles in France occasionally compelled him to withdraw. In 1567 he accompanied the elector to the siege of Gotha. He delivered a harangue before Charles IX. of France in 1570 on behalf of the Protestant princes, and escaped death on St. Bartholomew's Day (1572) only through the intervention of Jean de Morvilliers, bishop of Orleans. He represented the elector of Saxony at the imperial court from 1573 to 1577. Financial embarassment and disgust at the Protestant controversies in which he was forced to participate caused him to seek recall from the imperial court. His request being granted, Languet spent the last years of his life mainly in the Low Countries, and though nominally still in the service of the elector, he undertook a mission to England for John Casimir of Bavaria, and was a valuable adviser to William the Silent, prince of Orange. Languet died at Antwerp on Sept. 30, 1581. For his relations with Sidney, *see* SIDNEY, SIR PHILIP.

Collections of Languet's letters, which are important for the history of his time, are: *Arcana seculi decimi sexti*, ed. Ludovicus (Halle, 1669); *Langueti epistolae ad Joach. Camerarium, patrem et filium* (Groningen, 1646); and the correspondence with Sir Philip Sidney (Eng. trans. by S. A. Pears, 1845). His acknowledged work includes *Historica descriptio* (Gotha, 1568), dealing with the siege of Gotha. His fame rests on the attribution to him of the *Vindiciae contra tyrannos* (Basle, 1579; Eng. trans., 1689), which purported to be published at Edinburgh and written by Stephanus Junius Brutus, a Celt. The work upholds the doctrine of resistance, but maintains that resistance itself must originate in properly constituted authority; that is to say, it was directed against tyranny on the one hand and the excesses of anabaptism on the other.

See Ph. de la Mare, *Vie d'Hubert Languet* (Halle, 1700); H. Chevreul, *Hubert Languet* (1852); J. Blasel, *Hubert Languet* (Breslau, 1872); O. Scholz, *Hubert Languet als kursächsischer Berichterstatter u. Gesandter in Frankreich während 1560–1572* (Halle, 1875); G. Touchard, *De politica Huberti Langueti* (1898). There is a good article on Languet by P. Tschackert in Hauck's *Realencyklopädie*, 3rd ed., xi. 274–280.

LANGUR or HANUMAN, the sacred Indian monkey scientifically known as *Semnopithecus entellus*. An extremely long tail, beetling black eyebrows, black ears, face, feet and hands, and a general greyish-brown colour of the fur are its distinctive characteristics. These monkeys roam at will in the bazaars of Hindu cities, where they help themselves freely from the stores of the grain-dealers. They are also kept at various temples. The

term is often extended to embrace all the genus *Semnopithecus*, which includes a large number of species, ranging from Ceylon, India and Kashmir to southern China and the Malay countries as far east as Borneo and Sumatra. These monkeys are characterized by their lank bodies, long slender limbs and tail, well-developed thumbs, absence of cheek-pouches, and complex stomachs.

LANG VON WELLENBURG, MATTHÄUS (1469–1540), German statesman and ecclesiastic, was the son of a burgher of Augsburg. After studying at Ingolstadt, Vienna and Tübingen he entered the service of the emperor Frederick III. He was a trusted adviser of Maximilian I., and was made provost of the cathedral at Augsburg and bishop of Gurk. In 1511 he was made a cardinal by Pope Julius II., and in 1514 he became coadjutor to the archbishop of Salzburg, whom he succeeded in 1519. He also received the bishopric of Cartagena in Murcia in 1521, and that of Albano in 1535. Lang's arrogance made him very unpopular in his diocese of Salzburg; in 1523 he was involved in a serious struggle with his subjects, and in 1525, during the Peasants' War, he had again to fight hard to hold his own. He was one of the chief ministers of Charles V.; he played an important part in the tangled international negotiations of his time; and he was always loyal to his imperial masters. He has been compared with Cardinal Wolsey. He died on March 30, 1540.

LANIER, SIDNEY (1842–1881), American poet, was born at Macon, Ga., on Feb. 3, 1842. He was of Huguenot descent on his father's side, and of Scottish and American on his mother's. From childhood he was passionately fond of music. When 14 years old he entered Oglethorpe college, where, after graduating with distinction, he held a tutorship. He served from 1861–65 in the Civil War, returning home in broken health. In 1867 he visited New York in connection with his novel *Tiger Lilies*—an immature work, dealing in part with his war experiences. The next year he began to study and practise law with his father. In 1872 he went to Texas for his health, but was forced to return, and he secured an engagement as first flute in the Peabody concerts at Baltimore (Dec 1873). He wrote a guide-book to Florida (1876), and tales for boys from Froissart, Malory, the Mabinogion and Percy's *Reliques* (1878–82). His reputation gradually increased, and he was enabled to study music and literature, especially Anglo-Saxon poetry. In 1876 he wrote his ambitious cantata for the Centennial Exhibition, and returned north. A small volume of verse appeared in the next year. In 1879 he was made lecturer on English literature at Johns Hopkins university. His lectures became the basis of his *Science of English Verse* (1880)—his most important prose work, and an admirable discussion of the relations of music and poetry—and also of his *English Novel* (1883). Work had to be abandoned on account of growing feebleness, and in the spring of 1881 he was carried to Lynn, N C., to try camp life, and died there on Sept. 7. An enlarged and final edition (1884) of his poems was prepared by his wife, his *Letters, 1866–1881* (1899) and several volumes of miscellaneous prose assisted in keeping his name before the public. A posthumous work on *Shakspere and his Forerunners* (London, 2 vols., 1902) was edited by H. W. Lanier. Among his more noteworthy poems are "Corn," "The Revenge of Hamish," "Song of the Chattahoochee" and "The Marshes of Glynn." By some his genius is regarded as musical rather than poetic, and his style is considered hectic; by others he is held to be one of the most original and most talented of modern American poets.

See a "Memorial," by W. H. Ward, prefixed to the *Poems* (1884); *Letters of Sidney Lanier 1866–1881* (1899), edited by H. W. Lanier and Mrs. Sidney Lanier; E. Mims, *Sidney Lanier* (1905). There is a bibliography of Lanier's scattered writings in *Select Poems* (New York, 1896; Toronto, 1900) edited by M. Callaway. (W. P. T.)

LANIIDAE: *see* SHRIKE.

LANJUINAIS, JEAN DENIS, COMTE (1753–1827), French politician, was born at Rennes (Ille-et-Vilaine) on March 12, 1753. He studied law and became in 1775 professor of ecclesiastical law at Rennes. His two important works of this period, *Institutiones iuris ecclesiastici* and *Praelectiones iuris ecclesiastici*, remained unpublished owing to the chaotic state of public affairs. Elected to the States General in 1789 he demanded the abolition of nobility and helped to establish the civil constitution of the clergy. In the Convention (1792) his views became more moderate, and while adhering to his republican principles, he made repeated attacks on the Mountain, which resulted (April 15, 1793) in a demand for his exclusion from the Assembly. Arrested with the Girondins, he escaped to Rennes where he drew up a pamphlet, *Le Dernier Crime de Lanjuinais*, denouncing the constitution of 1793. He was re-admitted to the Convention on March 8, 1795. He maintained his liberal and independent attitude in the Conseil des Anciens, the senate and the chamber of peers, being president of the upper house during the Hundred Days. Following the Restoration most of his time was given to religious and political subjects. He died in Paris on Jan. 13, 1827. His writings include: *Constitutions de la nation française* (1819); *Appréciation* and *Études biographiques et littéraires sur Antoine Arnauld, P. Nicole et Jacques Necker* (1823).

For the life of the comte de Lanjuinais *see* also A. Robert and G. Cougny, *Dictionnaire des parlementaires*, vol. ii. (1890); and F. A. Aulard, *Les Orateurs de la Législative et de la Convention* (1885–86). For a bibliography of his work *see* J. M Quérard, *La France littéraire*, vol. iii. (1829).

LANKESTER, SIR EDWIN RAY (1847–), British biologist, was born in London on May 15, 1847, and was educated at St. Paul's School, Downing College, Cambridge, and Christ Church, Oxford In 1872 he was elected to a fellowship at Exeter College, Oxford. During 1874–90 he was professor of zoology and comparative anatomy at University College, London, and from 1891–8 Linacre professor of comparative anatomy at Oxford. From 1898 to 1907 he was director of the natural history department of the British Museum, and from 1898–1900 he held the Fullerian professorship of physiology and comparative anatomy at the Royal Institution, London. He did valuable research work on the comparative structure of animals, both living and extinct. To the general public he became known owing to his successful presentation of scientific subjects in a popular form. He was elected F.R S. in 1875, and was awarded the Royal Medal in 1885 and the Copley Medal in 1913. In 1884 he founded the Marine Biological Association, becoming its president in 1892.

His numerous publications include *Comparative Longevity* (1871); *Degeneration* (1880); and the several editions of *Science from an Easy Chair* (1908, 15th ed., 1922); *Diversions of a Naturalist* (1915, 3rd ed. 1919); *Science and Education* (1919); *Secrets of Earth and Sea* (1920, 2nd ed., 1923); and *Great and Small Things* (1923). He was editor of *The Quarterly Journal of Microscopical Science*.

LANMAN, CHARLES ROCKWELL (1850–), American Sanskrit scholar, was born in Norwich, Conn., on July 8, 1850. He graduated at Yale in 1871, was a graduate student there (1871–73) and in Germany (1873–76), was teacher of Sanskrit at Johns Hopkins university in 1876–80 and subsequently professor of Sanskrit at Harvard. In 1889 he travelled in India and bought for Harvard university Sanskrit and Prākrit books and manuscripts, which, with those subsequently bequeathed to the university by Fitzedward Hall, make the most valuable collection of its kind in America. In 1879–84 he was secretary and editor of the *Transactions*, and in 1889–90 president of the American Philological Association; he was successively corresponding secretary, vice president and president of the American Oriental Society, in addition to being joint editor of its journal and proceedings for many years. In the Harvard oriental series, which he edited, he translated (vol. iv.) into English Rājaçekhara's Karpūra-Mañjarī (1900), a Prākrit drama, and (vols. vii. and viii) revised and edited Whitney's translation of, and notes on, the *Atharva-Veda* (1905); he published *A Sanskrit Reader: with Vocabulary and Notes* (1884–88); and he wrote on noun-inflection in the Veda and on early Hindu pantheism and contributed the section on Brahmanism to *Messages of the World's Religions*.

LANNES, JEAN (1769–1809), duke of Montebello, marshal of France, was born at Lectoure (Gers) on April 11, 1769. He was apprenticed to a dyer and had little education. He joined the army and rose to the rank of *chef de brigade* during the war with Spain (1793–4). In 1795, on the reform of the army by the Thermidorians, he was dismissed from his rank. He re-enlisted as a volunteer in the army of Italy, and in the campaign of 1796 he again fought his way up to the rank of general of brigade. He

accompanied Napoleon to Egypt as commander of one of Kléber's brigades. Returning to France he assisted at the 18th Brumaire and was appointed general of division, and commandant of the consular guard. He commanded the advanced guard in the crossing of the Alps in 1800, winning the battle of Montebello, from which he afterwards took his title. In 1801 Napoleon sent him as ambassador to Portugal. On the establishment of the empire he was created a marshal of France, and commanded the left of the grand army in the campaign of Austerlitz. He fought with distinction through the campaign of 1806–7 and in 1808 Napoleon made him commander-in-chief of a detached wing of the army in Spain. On Feb. 21, 1809, he captured Saragossa, after one of the most stubborn defences in history. Napoleon then created him duc de Montebello, and in 1809, for the last time, gave him command of the advanced guard. He took part in the engagements around Eckmühl and the advance on Vienna. With his corps he led the French army across the Danube, and bore the brunt, with Masséna, of the terrible battle of Aspern-Essling (*q.v.*). During the retreat on May 22 Lannes was wounded and died at Vienna on May 31.

Lannes ranks with Davout and Masséna as the ablest of all Napoleon's marshals, and consciously or unconsciously was the best exponent of the emperor's method of making war. Hence his constant employment in tasks requiring the utmost resolution and daring, and more especially when the emperor's combinations depended upon the vigour and self-sacrifice of a detachment or fraction of the army.

See R. Périn, *Vie militaire de Jean Lannes* (1809).

LANNION, a town of north-western France, capital of an arrondissement in the department of Côtes-du-Nord, on the right bank of the Léguer, 45 m. N.W. of St. Brieuc by rail. Pop. (1926) 5,540. Lannion is 5 m. in direct line from the mouth of the Léguer; its port does a small trade (exports of agricultural produce, flax and hemp, imports of wine, salt, coal, timber, etc.), and there is an active fishing industry. It has much commerce in horses, grain, cattle, butter, flax and wool. The town contains many houses of the 15th and 16th centuries and the church of St. Jean-du-Baly (16th and 17th centuries). On an eminence close to Lannion is the church of Brélevenez of the 12th century, restored in the 15th century; it has an interesting 16th-century Holy Sepulchre. Some 6 m. S.E. of the town are the imposing ruins of the Château of Tonquédec (*c.* 1400) styled the "Pierrefonds of Brittany."

LANOLIN, the commercial name of the preparation styled *adeps lanae hydrosus* in the British Pharmacopoeia, which consists of 7oz. of neutral wool-fat (*adeps lanae*) mixed with 3 fluid oz. of water. The wool-fat is obtained by purification of the "brown grease," "recovered grease," or dégras extracted from raw sheep's wool in the process of preparing it for the spinner. It is a translucent unctuous substance which has the property of taking up large quantities of water, and forming emulsions which are very slow to separate into their constituents. Owing to the ease with which it penetrates the skin, wool-fat both in the anhydrous form and as lanolin, sometimes mixed with such substances as vaseline or fatty oils, is largely employed as a basis for ointments. It is slightly antiseptic and does not become rancid. (*See* OILS AND FATS.)

LA NOUE, FRANÇOIS DE (1531–1591), called Bras-de-Fer, Huguenot captain, was born near Nantes in 1531, of an ancient Breton family. His first great exploit was the capture of Orleans at the head of only 15 cavaliers in 1567, during the second Huguenot war. At the battle of Jarnac in March 1569 he commanded the rearguard, and at Moncontour in the following October he was taken prisoner; but he was exchanged in time to resume the governorship of Poitou, and to defeat the royalist troops before Rochefort. At the siege of Fontenay (1570) his left arm was shattered by a bullet; but a mechanic of Rochelle made him an iron arm (hence his sobriquet) with a hook for holding his reins. When peace was made in France in the same year, La Noue carried his sword against the Spaniards in the Netherlands, but was taken at the recapture of Mons by the Spanish in 1572. He was commissioned by Charles IX., after the massacre of St. Bartholomew, to reconcile the inhabitants of La Rochelle, the great stronghold of the Huguenots, to the king. But La Noue gave up his royal commission, and from 1574 till 1578 acted as general of La Rochelle.

When peace was again concluded La Noue once more went to aid the Protestants of the Low Countries. He took several towns and captured Count Egmont in 1580; but a few weeks afterwards he fell into the hands of the Spaniards, who kept him in close imprisonment at Limburg for five years. In prison he wrote his *Discours politiques et militaires* (Basel, 1587, and many other editions). La Noue wrote of war as a human drama, before it had been elaborated and codified. In June 1585, La Noue was exchanged. In 1589, he joined Henry of Navarre against the Leaguers. He was present at both sieges of Paris, at Ivry and other battles. He died at Moncontour on Aug. 4, 1591.

He wrote, besides the Discourses, *Déclaration pour prise d'armes et la défense de Sedan et Jamets* (1588); *Observations sur l'histoire de Guicciardini* (2 vols., 1592); and notes on *Plutarch's Lives*. His *Correspondance* was published in 1854. See *La Vie de François, seigneur de la Noue,* by Moyse Amirault (Leiden, 1661); Brantôme's *Vies des Capitaines français;* C. Vincen's *Les Héros de la Réforme, Fr. de la Noue* (1875); and Hauser, *François de La Noue* (Paris, 1892).

LANREZAC, CHARLES LOUIS (1852–1925), French soldier, was born at Pointe-à-Pitre, Guadeloupe on July 31, 1852. While at the École de Guerre, the new French doctrine of strategy and tactics was being established under the influence of Maillard, Langlois and Bonnal. To this doctrine Lanrezac himself contributed in his study *La manoeuvre de Lützen.* He became colonel in 1902, general of brigade in 1906, and general of division in 1911. In 1912 he commanded the XI. Corps, and on April 10, 1914 succeeded Galliéni as a member of the Conseil Supérieur de la Guerre and commander-designate of the V. Army. His theories as summarized in the article *Stratégie* of the *Dictionnaire militaire* were not in accordance with the modern theory of an incessant and universal offensive, of which plan 17 was an example. This plan assumed that the V. Army would attack east of the Meuse towards Neufchâteau. Lanrezac pointed out in his report of July 31, 1914, that if the extreme German right crossed the Meuse north of Givet the V. Army at Neufchâteau would be turned. Neither he nor Joffre anticipated the magnitude of the German attack, though he feared an enemy attack between Namur and Givet aimed at Chimay and the sources of the Oise and the direct road to Paris. He therefore sought and obtained permission on Aug. 12 to place the I. Corps (left) in the Dinant region, and to make preliminary arrangements for moving the rest of his army towards the northwest. On Aug. 15 the Germans having endeavoured to cross the Meuse at Dinant, General Joffre ordered the transfer of the army on the left bank.

On Aug. 21 Lanrezac asked Joffre whether he should attack the following day, but was then violently attacked by Von Bülow's army, and the battle of Charleroi began. The arrival of the III. German Army forced the I. French Corps to fall back on the Meuse, while the III. Corps had to yield. On the evening of the 23rd Lanrezac was obliged to order a retreat, which lasted from Aug. 24 to Sept. 5. On Aug. 27 orders were given to renew the offensive at Saint-Quentin in order to assist the British. This order provoked a violent disagreement between Joffre and Lanrezac. Nevertheless Lanrezac renewed his offensive on the 29th and at the battle of Guise, won a brilliant tactical success. But the retreat continued, and on Sept. 3, Gen. Lanrezac was relieved of his command. In 1917 he was offered the post of Major General of the armies by M. Painlevé, but he refused and suggested Gen. Pétain. "He is one of my own children," he said, "and I can answer for him." On July 3, 1917 he was made grand officer of the Legion of Honour and on Aug. 29, 1924 was given the grand cross of the same order. He died on Jan. 18, 1925.

See Lanrezac, *Le plan de campagne français et le premier mois de la guerre* (1920); Jules Isaac, *Joffre et Lanrezac* (1922); F. Engerand, *Lanrezac* (1926). (H. Bi.)

LANSBURY, GEORGE (1859–), British labour leader, was born on Feb. 21, 1859, in Suffolk. He worked as a checker on the Great Eastern railway, emigrated to Queensland in 1884, returned in 1885, and eventually went into the timber business in

London. Until 1892 he was an ardent Liberal, assisting greatly in the return of J. Murray MacDonald as M.P. for Bow in that year, but he then joined the Social Democratic Party of which he was one of the earliest propagandists. As a member of the royal commission on the poor law he signed the minority report in 1909. He was elected M.P. for Bow in 1910, and was a strong supporter of women's suffrage. He resigned his seat in 1912 to test opinions on this subject and failed to carry it again. He became editor of the *Daily Herald* in 1912 which he carried on as a weekly during the war and again as a daily until 1922, when it was taken over by the whole labour movement. In 1920 he visited Soviet Russia, being the first newspaper editor to get direct wireless messages through from that country (*see* his book *What I saw in Russia*, 1920). In 1922 he was elected M.P. for Bow, a seat which he has since held continuously. He refused a seat in the Labour Government of 1924, criticizing its "right wing" policy and in 1925–27 edited an independent journal, *Lansbury's Labour Weekly*. He is, however, best known for his direction of the municipal affairs of the Poplar borough council of which he was mayor 1919–20 and on which he since has had a dominating influence. His policy of generous relief to the unemployed received the name of Poplarism and, in 1921, together with the majority of the council he served a short term of imprisonment rather than modify it. He was chairman of the national Labour Party in 1927–28.

See his book *My Life* (1928).

LANSDALE, a borough of Montgomery county, Pa., U.S.A., 25m. N. of Philadelphia, on the Reading railroad. The population was 4,728 in 1920 (95% native white) and was estimated locally at 7,800 in 1928. It is in a fertile agricultural district, and has a large number of varied manufactures, of which the most important are pottery, stoves, glue, hosiery and radiators. The borough was incorporated in 1872.

LANSDOWNE, WILLIAM PETTY FITZMAURICE, 1ST MARQUESS OF (1737–1805), British statesman, better known under his earlier title of earl of Shelburne, was born at Dublin, on May 20, 1737. He was a descendant of the lords of Kerry (dating from 1181), and his grandfather Thomas Fitzmaurice, who was created earl of Kerry (1723), married the daughter of Sir William Petty (*q.v.*). On the death without issue of Sir William Petty's sons, the first earls of Shelburne, the estates passed to his nephew John Fitzmaurice (advanced in 1753 to the earldom of Shelburne), who in 1751 took the additional name of Petty. His son William spent his childhood "in the remotest parts of the south of Ireland," and, according to his own account, when he entered Christ Church, Oxford, in 1755, he had both "everything to learn and everything to unlearn." He served in Wolfe's regiment during the Seven Years' War, and was raised to the rank of colonel and appointed aide-de-camp to the king (1760). In 1761 he succeeded his father as earl of Shelburne. Though he declined to take office under Bute he tried to induce C. J. Fox to gain the consent of the Commons to the peace of 1763. Fox affirmed that he had been duped. Shelburne joined the Grenville ministry in 1763 as president of the Board of Trade, but resigned office in a few months, and retired for a time to his estate. After Pitt's return to power in 1766 he became secretary of State, but during Pitt's illness his conciliatory policy towards America was completely thwarted by his colleagues and the king, and in 1768 he was dismissed from office. In 1782 he took office under the marquess of Rockingham on condition that the king would recognize the United States. On Lord Rockingham's death he became premier; but the secession of Fox and his supporters led to the famous coalition of Fox with North, which caused his resignation, Feb. 1783, his fall being perhaps hastened by his plans for the reform of the public service. He had also in contemplation a bill to promote free commercial intercourse between England and the United States. When Pitt acceded to office in 1784, Shelburne was created marquess of Lansdowne. Though giving a general support to the policy of Pitt, he from this time ceased to take an active part in public affairs. He died on May 7, 1805. John Henry Petty Fitzmaurice (1765–1809), his son by his first marriage with Lady Sophia Carteret, succeeded as 2nd marquess.

HENRY PETTY FITZMAURICE, 3rd marquess of Lansdowne (1780–1863), son of the 1st marquess by his second marriage, was home secretary under Canning (1827–28); he was lord president of the council under Earl Grey and then under Lord Melbourne (1830–41) and under Lord John Russell (1846–52); and, having declined to become prime minister, sat in the cabinets of Lord Aberdeen and of Lord Palmerston, but without office. In 1857 he refused the offer of a dukedom, and he died on Jan. 31, 1863. Lansdowne married Louisa (1785–1851), daughter of the 2nd earl of Ilchester, and was succeeded by his son Henry, the 4th marquess (1816–66). The latter, who was member of parliament for Calne for 20 years and chairman of the Great Western railway, married for his second wife Emily (1819–95), daughter of the comte de Flahaut de la Billarderie, a lady who became Baroness Nairne in her own right in 1867. By her he had two sons, the 5th marquess and Lord Edmond Fitzmaurice (Baron Fitzmaurice of Leigh).

HENRY CHARLES KEITH PETTY FITZMAURICE, 5th marquess of Lansdowne (1845–1927), was educated at Balliol, Oxford, where he became one of Jowett's favourite pupils. In 1869 he married the daughter of the 1st duke of Abercorn. He joined the Liberal Party, and was a lord of the Treasury (1869–72), under-secretary of war (1872–74), and under-secretary of India (1880). He resigned from the India Office within a few months, because he disapproved of the Irish Compensation for Disturbance bill. From 1883 to 1888 he was governor-general of Canada, where he suppressed the Indian rising under Riel. From 1888 to 1893 he was viceroy of India. He had joined the Liberal Unionist Party when Gladstone proposed Home Rule for Ireland, and on returning to England from India became one of its most influential leaders. He was secretary of State for war from 1895 to 1900, and foreign secretary from 1900 to 1906. Lord Lansdowne's tenure of the Foreign Office covered an extremely important period in the history of British foreign relations, for it covered the conclusion of the Anglo-Japanese alliance (1902), and the beginning of the *entente cordiale* with France. (*See* EUROPE: *History.*) When the duke of Devonshire resigned from Balfour's Government in 1903 Lord Lansdowne became leader of the Unionist Party in the House of Lords, and when the question of the powers of the House of Lords became urgent after 1906 he put forward a reform scheme of his own. In 1915 he joined the Asquith coalition Government without portfolio; at the close of that ministry he retired. In Nov. 1917, he published the famous letter in the *Daily Telegraph,* asking for a precise statement of the Allied peace terms with a view to the early termination of the World War. The letter aroused a storm of protest, and brought on him fierce accusation of *défaitisme,* though even those who deprecated it were compelled to admire Lansdowne's courage and unimpeachable sincerity. Lansdowne died on June 13, 1927.

Lord Lansdowne was succeeded as 6th marquess by his son HENRY WILLIAM EDMUND (b. 1872). The 6th marquess had commanded the 3rd (reserve) Irish Guards (1914–16), and sat in the House of Commons for West Derbyshire from 1908 to 1918; and was a senator of the Irish Free State from 1922. He was the author of various works, among them being *The First Napoleon* (1925), based on unpublished papers at Bowood.

LANSDOWNE, a hill cantonment in India, in Garhwal district of the United Provinces, about 6,000 ft. above the sea, 19 m. by cart road from the station of Kotdwara on the Oudh and Rohilkhand railway. The cantonment, founded in 1887, extends for more than 3 m. through pine and oak forests, and accommodates three Garhwali battalions.

LANSDOWNE, a borough of Delaware county, Pa., U.S.A., on the Pennsylvania railroad, 5m. S.W. of Philadelphia. It is a residential suburb, with a population in 1920 of 4,797.

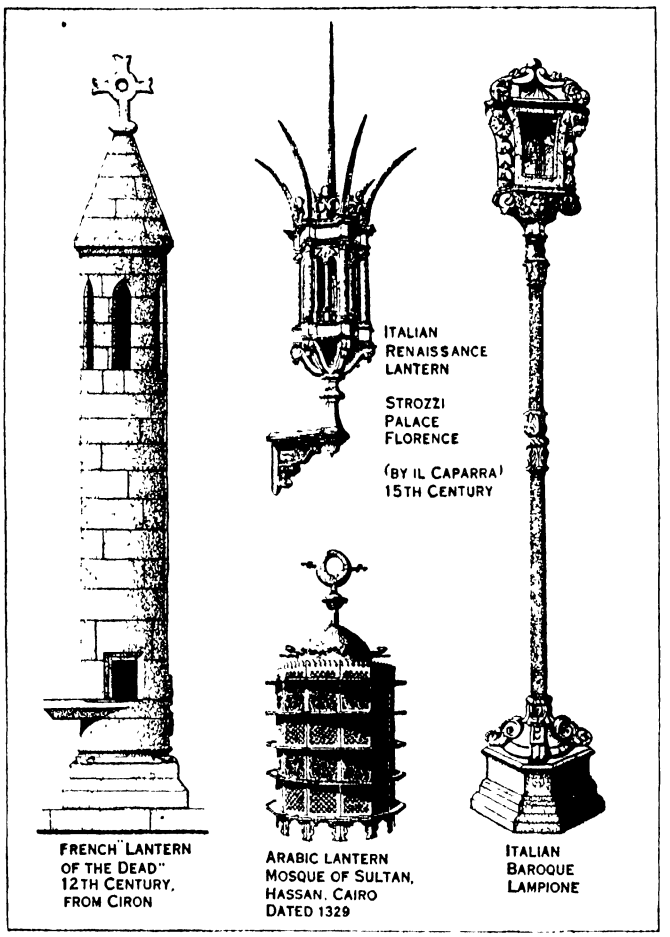
LANSFORD, an anthracite-mining borough of Carbon county, Pa., U.S.A., 5om. S. of Wilkes-Barre. The population was 9,625 in 1925 (28% foreign-born white) and was estimated locally at over 11,000 in 1928. The borough was incorporated in 1876. It is served by the Central of New Jersey and the Lehigh and New England railways.

LANSING, ROBERT (1864–1928), American diplomatist, was born at Watertown, N.Y., on Oct. 17, 1864. He graduated at Amherst in 1886, was admitted to the bar in 1889, and for the next 18 years practised at Watertown. In 1892 he was associate counsel for the United States on the Bering Sea Commission, and later was American counsel before several important arbitral tribunals, including the Alaskan Boundary Tribunal (1903), and the Hague Tribunal for the arbitration of the North Atlantic fisheries (1910). In 1914 he was appointed counsellor of the Department of State. When W. J. Bryan resigned (June 8, 1915), Mr. Lansing was appointed secretary of State. In his attempts to uphold American rights he was called upon to direct notes to all the countries at war. In reply to a note addressed by Britain to neutrals, asking that all belligerent submarines be excluded from neutral waters, he said that the nature of each submarine must govern the decision. He thus drew an important distinction between the "Deutschland," which had peacefully brought a cargo to America, and the U53, which had raided several ships off the New England coast, Oct. 7, 1916. In 1917 he notified President Carranza, of Mexico, that the United States would not adopt his proposed Pan-American plan of stopping the shipment of food and munitions to all the European belligerents. In Nov. 1917 he signed an agreement with Japan (The Lansing-Ishii agreement) which, while recognizing Japan's special interests in China, provided for a continuance of the "open door" policy for commerce.

Lansing was a member of the American commission to negotiate peace at Paris, 1918–19. On Feb. 13, 1920, he resigned as secretary of State and soon after opened a law office in Washington. He was the author of *The Peace Negotiations* (1921); and *The Big Four and Others* (1921). He died at Washington on Oct. 30, 1928.

LANSING, capital city of Michigan, U.S.A., Ingham county, on the Grand river at the mouth of the Cedar, 85 m. W.N.W. of Detroit. It is on Federal highways 16, 27 and 127; has a municipal airport; and is served by the Grand Trunk, the Michigan Central, the New York Central, and the Pere Marquette railways, and by electric interurban railways and motor coach and motor truck lines in every direction. The population was 57,327 in 1920 (88% native white) and was estimated locally at 85,000 in 1928. The centre of the city is a small plateau, surrounded on three sides by a bend of the Grand river. Here, in a 10-acre park, stands the State capitol, erected in 1873–8. Near by is the fine state office and library building, completed in 1927 at a cost of $3,000,000. The State industrial school for boys and the state school for the blind occupy spacious grounds within the city limits. At East Lansing, a beautiful residential suburb, is the State college of agriculture and applied science, the oldest agricultural college in the United States, provided for by the State constitution in 1850 and opened in 1857. Water power from the Grand river has been an important factor in the development of Lansing throughout its history, and is still used to some extent. There are about 200 manufacturing establishments, employing 22,000 men and women, of whom 17,000 work in 18 plants, including those of the Reo Motor company, the Durant Motor company, the Olds Motor works, now a subsidiary of the General Motors corporation, and the Motor Wheel corporation. Among other important manufactures are automobile bodies, wheelbarrows and factory trucks, gasoline engines, Diesel engines, hoists, pumps, air compressors and screw machine products. The aggregate annual output is valued at $200,000,000 The city's assessed valuation of property in 1927 was $149,780,599

Lansing was settled in 1837, and in 1847, when still isolated and covered with forests, was chosen as the site of the state capital, on the decision of the legislature to move the seat of government from Detroit to a more central spot. A plank road to Detroit was finished in 1852; the city was chartered in 1859; and in 1860 it had a population of 3,074. Between 1863 and 1873 five railroads entered the city, and soon the areas along the river marked on the first plats of the city as designed for "hydraulic manufacturing" were fully occupied. Between 1900 and 1910 the population of the city nearly doubled, and between 1910 and 1920 the increase was almost as great (84%).



LANSING MAN, the term applied by American ethnologists to certain human remains discovered in 1902 during the digging of a cellar near Lansing, Kan., and by some authorities believed to represent a prehistoric type of man. They include a skull and several large adult bones and a child's jaw. They were found beneath 20 ft. of undisturbed silt, in a position indicating intentional burial. The skull is preserved in the U.S. National Museum at Washington. It is similar in shape to those of historic Indians of the region. Its ethnological value as indicating the existence of man on the Missouri in the glacial period is doubtful, it being impossible accurately to determine the age of the deposits.

See *Handbook of American Indians* (Washington, 1907); and A. Hrdlicka, "Skeleton Remains in North America," *Bur. Amer. Ethnol., Bulletin 33* (1907).

LANSQUENET, the French corrupted form of the German *Landsknecht* (*q.v.*), a mercenary foot-soldier of the 16th century. It is also the name of a card game said to have been introduced into France by the *Landsknechte*. The pack of 52 cards is cut by the player at the dealer's right. The dealer lays the two first cards face upwards on the table to his left; the third he places in front of him, and the fourth, or *réjouissance* card, in the middle of the table. The players, usually called (except in the case of the dealer) *punters,* stake any sum within the agreed limit upon this réjouissance card; the dealer, who is also the banker, covers the bets, and then turns up the next card. If this fails to match any of the cards already exposed, it is laid beside the réjouissance card and then punters may stake upon it. Other cards not matching are treated in the same manner. When a card is turned which matches the réjouissance card, the banker wins everything staked on it, and in like manner he wins what is staked on any card (save his own) that is matched by the card turned. The banker pays all stakes and the deal is over as soon as a card appears that matches his own; excepting that should the two cards originally placed at his left both be matched before his own, he is then entitled to a second deal. In France matching means winning, not losing, as in Great Britain. There are other variations of play on the continent of Europe.

LANTERN, a metal case filled in with some transparent material, and used for holding a light and protecting it from rain or wind. (An adaptation of the Fr. *lanterne* from Lat. *lanterna* or *laterna,* supposed to be from Gr. λαμπτήρ, a torch or lamp, λάμπειν, to shine, *cf.* "lamp"; the 16th- and 17th-century form "lanthorn" is due to a mistaken derivation from "horn," as a material frequently used in the making of lanterns.) The appliance is of two kinds—the hanging lantern and the hand lantern—both of which are ancient. At Pompeii and Herculaneum have been discovered two cylindrical bronze lanterns, with ornamented pillars, to which chains are attached for carrying or hanging the lantern. Plates of horn surrounded the bronze lamp within, and the cover at the top can be removed for lighting and for the escape of smoke. The hanging lantern for lighting rooms was composed of ornamental metal work, of which iron and brass were perhaps most frequently used. Silver, and even gold, were, however, sometimes employed, and the artificers in metal of the 17th and 18th centuries produced much exceedingly artistic work of this kind. Oriental lanterns in open-work bronze were often very beautiful. The early lantern had sides of horn, talc, bladder or oiled paper, and the primitive shape remains in the common square stable lantern with straight glass sides, to carry a candle. The hand lantern was usually a much more modest appliance than the hanging lantern, although in great houses it was sometimes richly worked and decorated. As glass grew cheaper it gradually ousted all other materials, but the horn lantern which was already ancient in the 13th century was still being used in the early part of the 19th. By the end of the 18th century lanterns in rooms had been superseded by the candlestick. The collapsible paper lanterns of China and Japan, usually known as Chinese lanterns, are globular or cylindrical in shape, and the paper is pleated and when not in use folds flat. For illuminative and decorative purposes they are coloured with patterns of flowers, etc. The lanterns carried by the ordinary foot passenger

are made of oiled paper. In China the "Feast of Lanterns" takes place early in the New Year and lasts for four days. In Japan the festival of Bon is sometimes known as the "feast of lanterns." It is then that the spirits of the dead ancestors return to the household altar. The festival takes place in July. The "bull's-eye" lantern has a convex lens which concentrates the light and allows it to be thrown in the shape of a diverging cone.

LANTERN OF THE DEAD FROM VIOLLET-LE-DUC, "DICTIONNAIRE RAISONNE DE L'ARCHITECTURE FRANCAISE"

(LEFT) LANTERN IN ARCHITECTURE, (RIGHT) LANTERNS USED FOR ILLUMINATION AND DECORATION

The "dark lantern" has a shutter or slide arrangement by which the light can be shut off at will. Ships' lanterns are used as masthead or other signal lights. On Trajan's column is a representation of a heavy poop-lantern on a ship. The ships' lanterns of the 16th and 17th centuries were highly ornamental, especially when placed on the poop. At the Armeria Real in Madrid is a collection of these 16th-century ships' lanterns. The protected cages which contain the lights used in lighthouses are also known as "lanterns" (*see* LIGHTHOUSES).

In architecture a lantern is primarily a framework of timber, with windows all round, to admit ample light, placed on the top of a roof. In a broader sense, it is applied to those portions of buildings which are largely perforated with windows, and more especially to the upper part of the towers of cathedrals and churches, as in the octagon of Ely cathedral, or the tower of Boston church, Lincolnshire. The term is also applied to the entire church, as in the case of Bath Abbey church, which was called the "lantern of England," from the number of its windows, and St. John's Priory at Kilkenny, the "lantern of Ireland," on account of the window on the south side of the choir which was 54 ft. long. In the Renaissance style the lantern was looked upon as a decorative feature surmounting the dome, as in St. Peter's, Rome, the Invalides, Paris, and St. Paul's, London.

Magic or Optical Lantern.—The magic or optical lantern, more scientifically called a projecting lantern, is an instrument for projecting on a white wall or screen largely magnified representations of transparent pictures painted or photographed on glass, or of objects both opaque and transparent. If the light traverses the object, the projection is said to be diascopic, if by reflected light, episcopic. By its means, diagrams, physical and chemical experiments, movements of living organisms, and so on, can be shown, greatly magnified to large audiences.

The invention of the magic lantern is usually attributed to Athanasius Kircher, who described it in the first edition (1646) of his *Ars magna lucis et umbrae,* but it is very probably of earlier discovery. Another application of the optical lantern is found in the cinematograph (*q.v.*).

The optical lantern, in its simpler forms, consists of the following parts: (1) the lantern body, (2) a source of light, (3) an optical system for projecting the images. The lantern body is usually made of iron, provided with the openings necessary to the insertion of the source of light, windows for viewing the same, a chimney for conveying away the products of combustion, fittings to carry the slides and the optical system. Petroleum oil lamps, gas, light from a cylinder of lime rendered incandescent by an impinging oxy-hydrogen or oxy-gas flame (the lime-light) and incandescent thorium mantles served as sources of light in the earlier optical lanterns, but these have been superseded—except in remote districts—by electrical illuminants. Various types of the electric arc—more especially the carbon arc—are undoubtedly among the best illuminants for use in the projecting lantern, and of recent years wire filament lamps have been introduced for this purpose.

Optical System.—In the ordinary projecting lantern the rays are transmitted through a lens termed the "condenser," then through the object, and finally through another lens termed the "objective." In another type the light, after passing through the condenser, is reflected vertically by a plane mirror inclined at 45° to the direction of the light; it then traverses another lens, then the object, then the objective, and is finally projected horizontally by a plane mirror inclined at 45°, or by a right angled glass prism. In episcopic projection, the light, having traversed the condenser, is reflected on to the object, placed horizontally, by an inclined mirror. The rays reflected from the object then traverse the objective, and are then projected horizontally by a mirror or prism. The object of the condenser is to collect as much light as possible from the source, and pass it through the object in a uniform beam. For this purpose the condenser should subtend as large an angle as possible at the source of light. To secure this, it should be tolerably large, and its distance from the light, that is, its focal length, small. Since effective single lenses of large diameter are necessarily of long focus, a really good condenser of considerable diameter and yet of short focus must be a combination of two or more lenses. It is essential that the condenser be white and limpid and free from defects or striae.

In the earlier lanterns, as still in the cheaper forms, only a single plano-convex lens or bull's-eye was employed as a condenser. A good compound condenser for ordinary work is that proposed by Herschel, consisting of a biconvex lens and a meniscus mounted together with the concave side of the meniscus next the light. Other types make use of two plano-convex lenses, with the curved surfaces nearly in contact; or a concavo-convex and a plano-convex lens. Or it may be a triple combination, the object always being to increase the aperture. The focus must not be so short as to bring the lens too near the light, and render it liable to crack from the heat. This is sometimes guarded against by a plate of thin glass between the condenser and the light

The function of the objective is to produce a magnified inverted image of the picture on the screen. The best objective is the portrait combination lens usually of the Petzval type as used in ordinary photographic cameras. (*See* PHOTOGRAPHY: *Apparatus.*) These are carefully corrected both for spherical and chromatic aberration, which is absolutely essential in the objective, although not so necessary in the condenser. The photographic lantern slide used for projection in an optical lantern consists of a photograph printed in glass and the films used in motion picture (*q.v.*) work

are photographs printed on a transparent film.

The projecting lantern has been considerably improved of recent years both in general construction and in design of the optical system. As examples of modern projecting lanterns the Epidiascope and Cinematograph may be instanced. The Epidiascope is a projection lantern designed for both episcopic and diascopic projection and is constructed so as to permit easy projection of lantern slides, book illustrations, scientific experiments and apparatus, microscopic slides and so on. The intention of the designers of the Epidiascope is to flood the object which is to be projected with light and so effect better projection and obtain more detail in the image on the screen. To accomplish this a powerful carbon arc fitted with a self-regulating device is used. A large glass cell containing water for absorbing the heat rays from the arc is attached to the lamp house. The cinematograph is a projecting lantern fitted with a mechanical device whereby the light issuing from the objective is interrupted periodically (*see* MOTION PICTURES: *Technology*).

LANTERN-FLY, the name given to insects belonging to the homopterous division of the Hemiptera, and referable to the genus *Fulgora* and allied forms. They are mostly of large size, with a superficial resemblance to Lepidoptera due to their brilliant and varied coloration. Characteristic of the group is the presence on the front of the head of a hollow process, simulating a snout, which is sometimes inflated and as large as the rest of the insect, sometimes elongated, narrow and apically upturned. It was believed that this process, the so-called "lantern," was luminous at night, but subsequent observations have failed to establish this contention which is now generally rejected. In *Laternaria lucifera,* the lantern has been modified to produce a resemblance to the head of a miniature crocodile or reptile-like monster. This would possibly be of biological advantage in scaring certain enemies.

LANTERNS OF THE DEAD, small stone structures, with windows in the upper part, in which were placed lanterns to mark, at night, the position of a cemetery. (*See* illustration under LANTERN.) Their use, which seems limited to western and central France, is probably due to a traditional survival of primitive Celtic, rather than Christian, ideas. The lantern of the dead usually takes the form of a column or a clustered column, or a small turret, often with a conical cap and a cross at the top. The lamp was hoisted into position by means of a pulley, and at the bottom was an opening to allow access. Twelfth century examples exist at Cellefrouin, Charente; and at Ciron, Indre. One from the 13th century is at Antigny, Vienne. At a later date lanterns of the dead were usually superseded by small chapels. *See* Viollet-le-Duc, *Dictionnaire raisonné,* art. "Lanterne des Morts."

LANTHANUM, the second commonest metallic element belonging to the rare-earth group, was discovered in 1839 by Mosander. (Symbol La, atomic number 57, atomic weight 138·9.) It occurs with other members of the group in monazite, cerite, allanite, etc. It is best purified by the fractional crystallization of the double ammonium nitrate. The oxide, La_2O_3, is white and the strongest base of the group. It will slake with water to give the hydroxide and is violently attacked by acids, giving colourless salts. Solutions of lanthanum show no absorption spectrum but give a brilliant spark spectrum. The metal is prepared by the electrolysis of its fused anhydrous chloride. It is ductile, melts at 810° C, oxidizes in air, and is attacked slowly by cold water and rapidly by hot water. (*See* RARE EARTHS.)

LANUVIUM, ancient city of Latium (mod. *Civita Lavinia*), some 19 m. south-east of Rome, a little south-west of the Via Appia, on an isolated southern projection of the Alban Hills, and commanding an extensive view over the low country between it and the sea. It remained independent until conquered by Rome in 338 B.C., and even in imperial times its chief magistrate and municipal council kept the titles of *dictator* and *senatus* respectively. It was especially famous for its rich and much venerated temple of Juno Sospes, the possessions of which extended as far as the sea-coast. Remains of theatre and city walls exist in the modern village, and above it is an area surrounded by a portico, upon the north side of which is a rectangular building, probably connected with the temple of Juno. Here archaic decorative terra-cottas, and marble sculptures of a later period (2nd cent. A.D.), belonging to an equestrian group (*see* A. M. Woodward in *Papers of the British School at Rome,* vii. 63 *sqq.*) were discovered in excavations carried on by Lord Savile. The objects are partly in the British Museum, partly at Leeds.

See G. B. Colburn in *American Journal of Archaeology,* xvii. (1914); Galieti in *Monumenti Antichi,* 1922, 292.

LANZAROTE, an island forming part of the Spanish archipelago of the Canary islands (*q.v.*). Pop. (1900) 17,546; area, 326 sq.m. Lanzarote, the most easterly of the Canaries, has a length of 31 m. and a breadth varying from 5 to 10 m. It is naked and mountainous, bearing everywhere marks of its volcanic origin. Montaña Blanca, the highest point (2,000 ft.), is cultivated to the summit. In 1730 the appearance of half the island was altered by a volcanic outburst. In 1825 another volcanic eruption was accompanied by earthquakes. A short distance inland is the town of Arrecife (pop. 3,082). The climate is hot and dry. Dromedaries are used as beasts of burden. A strait about 6 m. in width separates Lanzarote from Fuerteventura.

Graciosa, a small uninhabited island, is divided from the north-eastern extremity of Lanzarote by a channel 1 m. in width, which affords a capacious and safe harbour for large ships; but basaltic cliffs, 1,500 ft. high, prevent intercourse with the inhabited part of Lanzarote.

LANZI, LUIGI (1732–1810), Italian archaeologist, was appointed (1773) keeper of the galleries of Florence, and studied Italian painting and Etruscan antiquities and language. His most important works are his *Storia Pittorica della Italia* (2 parts, 1792–96; Eng. trans. by Roscoe) *Saggio di lingua Etrusca* (1789); *Saggio delle lingue Ital. antiche* (1806); and *Dei vasi antichi dipinti volgarmente chiamati Etruschi* (1806). Lanzi perceived the Greek origin and characters of the so-called Etruscan vases. What was true of the antiquities would be true also, he argued, of the Etruscan language, and the object of the *Saggio di lingua Etrusca* was to prove that this language must be related to that of the neighbouring peoples—Romans, Umbrians, Oscans and Greeks. He died on March 30, 1810.

LAO, the term used in Siam for hillmen of the Shan (*q.v.*) race.

LAOAG, a municipality (with administration centre and 34 *barrios* or districts), a port for coasting vessels and capital of the province of Ilocos Norte, Luzon, Philippine Islands, on the Laoag river, about five miles from its mouth, and 290 m. from Manila. Pop. (1918) 38,469. It lies on an extensive coast plain behind which is a picturesque range of hills, and is noted for its fine climate. Rice is shipped in large quantities, as well as corn, tobacco and sugar. Cotton is grown in the vicinity and is woven by the women into fabrics which find a ready sale among the peoples of the mountains. In 1918, there were 14 manufacturing establishments, and 122 household industry establishments with output valued at 47,000 and 46,000 pesos respectively. Of the 20 schools, 19 were public. The language spoken is Ilocano.

LAOCOON (lā-ŏk'ŏ-ŏn), in Greek legend a brother of Anchises, who had been a priest of Apollo, but having profaned the temple of the god he and his two sons, or one of them (*Iliou Persis* in Proclus' *Chrestomathia*) were destroyed by serpents while preparing to sacrifice a bull at the altar of Poseidon, in whose service Laocoon was then acting as priest. An additional motive for his punishment consisted in his having warned the Trojans against the wooden horse left by the Greeks. The most famous expressions in literature and art respectively of this legend are in Virgil (*Aeneid,* ii. 109 et seq.) and in the Laocoon group of the Vatican. The group of the Vatican is of interest, not only for its great merits, but from the circumstance that Lessing's *Laocoon,* a landmark in art criticism, is written around it. Its date being now fixed (*see* AGESANDER) at 40–20 B.C., there can be no question of copying Virgil. The group represents the extreme of a pathetic tendency in sculpture (*see* GREEK ART).

LAODICEA, the name of at least eight cities, founded or renovated in the later Hellenic period. Most of them were founded by the Seleucid kings of Syria. Seleucus, founder of the dynasty, is said by Appian to have named five cities after his mother

Laodice. Thus in the immense realm of the Seleucidae from the Aegean Sea to the borders of India we find cities called Laodicea, as also Seleucia (*q.v.*). So long as Greek civilization held its ground, these were the commercial and social centres. The chief are Laodicea *ad Lycum* (*see* below); *Combusta* on the borders of Phrygia, Lycaonia and Pisidia; a third in Pontus; a fourth, *ad mare*, on the coast of Syria; a fifth, *ad Libanum*, beside the Lebanon mountains; and three others in the far east—Media, Persia and the lower Tigris valley. In the latter countries Greek civilization was short-lived, and the last three cities disappeared; the other five continued great throughout the Greek and Roman period, and the second, third and fourth retain to the present day the ancient name under the pronunciation Ladik, Ladikiyeh or Latakia (*q.v.*).

LAODICEA AD LYCUM (mod. *Denizli, q.v.*) was founded probably by Antiochus II. Theos. (261–246 B.C.) and named after his wife Laodice. Its site is close to the station of Gonjeli on the Anatolian railway. Here was one of the oldest homes of Christianity and the seat of one of the seven churches of the Apocalypse. Pliny states (v. 29) that the town was called in older times Diospolis and Rhoas; but at an early period Colossae, a few miles to the east, and Hierapolis, 6 m. to the north, were the great cities of the neighbourhood, and Laodicea was of no importance till the Seleucid foundation (Strabo, p. 578). A favourable site was found on some low hills of alluvial formation, about 2 m. S. of the river Lycus (Churuk Su) and 9 m. E. of the confluence of the Lycus and Maeander. The great trade route from the Euphrates and the interior passed to it through Apamea. There it forked, one branch going down the Maeander valley to Magnesia and thence north to Ephesus, a distance of about 90 m., and the other branch crossing the mountains by an easy pass to Philadelphia and the Hermus valley, Sardis, Thyatira and at last Pergamum. St. Paul (Col. iv. 15) alludes to the situation of Laodicea beside Colossae and Hierapolis; and the order in which the last five churches of the Apocalypse are enumerated (Rev. i. 11) is explained by their position on the road just described. Placed in this situation, in the centre of a very fertile district, Laodicea became a rich city. It was famous for its money transactions (Cic. *Ad. Fam.* ii. 17, iii. 5), and for the beautiful soft wool grown by the sheep of the country (Strabo 578). Both points are referred to in the message to the church (Rev. iii. 17, 18).

Little is known of the history of the town. It suffered greatly from a siege in the Mithradatic war, but soon recovered its prosperity under the Roman empire. The Zeus of Laodicea, with the curious epithet Aseis, is a frequent symbol on the city coins. He is represented standing, holding in the extended right hand an eagle, in the left a spear, the *hasta pura*. Not far from the city was the temple of Men Karou, with a great medical school; while Laodicea itself produced some famous Sceptic philosophers, and gave origin to the royal family of Polemon and Zenon. The city fell finally into decay in the frontier wars with the Turkish invaders. Its ruins are of wide extent. The district is subject to severe earthquakes (Strabo 580; Tac. *Ann.* xiv. 27).

LAODICEA, SYNOD OF, held at Laodicea in Phrygia, at a date in the second half of the 4th century, adopted a number of canons, chiefly disciplinary, of which the most significant are those affecting the clergy, who appear as a privileged class with carefully graded orders within itself. The canons were confirmed by the Council of Chalcedon in 451.

See article "Councils and Synods, Christian," in Hastings' *Encyclopaedia of Religion and Ethics;* also Hefele, *History of Councils*, Eng. trans., vol. ii.

LAOMEDON, in Greek legend, son of Ilus, king of Troy, and father of Podarces (Priam). Apollo and Poseidon served him for hire; when Laomedon refused to pay the reward agreed upon, Apollo visited the land with a pestilence, and Poseidon sent a sea-monster which could only be appeased by the sacrifice of one of the king's daughters. The lot fell upon Hesione; Heracles, on his way back from the land of the Amazons, offered to slay the monster and release her on condition that he should receive the divine horses of Tros. Again Laomedon broke his word; whereupon Heracles returned with a band of warriors, took Troy, and slew Laomedon and all his sons except Priam. Laomedon was buried near the Scaean gate, and it was said that so long as his grave remained undisturbed, so long would the walls of Troy remain impregnable.

See Homer, *Iliad*, v. 265, 640, vii. 452, xxi. 443; Apollodorus ii., 103 ff. Diod. Sic. iv. 32, 42, 49; Hyginus, *Fab.* 89; Ovid, *Metam.* xi. 194.

LAON, a town of northern France, capital of the department of Aisne, 87 m. N.E. of Paris on the Northern railway. Pop. (1926) 13,982. The hilly district of Laon (Laudunum) has always had some strategic importance. Laon was fortified by the Romans, and successively checked the invasions of the Franks, Burgundians, Vandals, Alani and Huns. St. Remigius, the archbishop of Reims who baptized Clovis, was born in the Laonnais, and at the end of the 5th century, he instituted the bishopric of the town. Thenceforward Laon was one of the principal towns of the kingdom of the Franks, and the possession of it was often disputed. Charles the Bald had enriched its church with the gift of very numerous domains. After the fall of the Carolingians Laon took the part of Charles of Lorraine, their heir, and Hugh Capet only succeeded in making himself master of the town by the connivance of the bishop, who, in return for this service, was made second ecclesiastical peer of the kingdom. In the early 12th century the citizens profited by a temporary absence of Bishop Gaudry to secure from his representatives a communal charter, but he, on his return, purchased from the king of France the revocation of this document; the consequence was a revolt, in which the episcopal palace was burnt and the bishop and several of his partisans were put to death. The fire spread to the cathedral, and reduced it to ashes. After 1239 the liberties of Laon were no more contested till 1331, when the commune was abolished. During the Hundred Years' War it was taken by the Burgundians, who gave it up to the English, and it was retaken by the French after the consecration of Charles VII. Under the League Laon took the part of the Leaguers, and was taken by Henry IV. During the campaign of 1814 Blücher successfully defended it against Napoleon. In 1870 an engineer blew up the powder magazine of the citadel at the moment when the German troops were entering the town. Many lives were lost; and the cathedral and the old episcopal palace were damaged. At the Revolution Laon permanently lost its rank as a bishopric. Laon could not resist Von Kluck's attack in August 1914, and was held by the Germans until Gen. Mangin took it in Oct. 1918, when he succeeded in breaking the German salient south of the Aisne.

The town is situated on an isolated ridge some 330 ft. above the surrounding plain and the little river of Ardon. The suburbs of St. Marcel and Vaux extend along the foot of the ridge to the north. From the railway station, situated in the plain to the north, a straight staircase of several hundred steps leads to the gate of the town, and all the roads connecting Laon with the surrounding district are cut in zigzags on the steep slopes, crowned by promenades on the site of the old ramparts. The 13th century gates of Ardon, Chenizelles and Soissons, the latter in a state of ruin, have been preserved. At the eastern extremity of the ridge rises the citadel; at its apex is the parade-ground of St. Martin, and at the southern end stands the ancient abbey of St. Vincent. The cathedral of Laon, which was very little damaged during the World War, is very important artistically. It took the place of the old cathedral, burned in 1111 at the beginning of the communal struggles. The building is cruciform, and the choir terminates in a straight wall instead of in an apse. Of the six towers flanking the façades, only four are complete to the height of the base of the spires, two at the west front with huge figures of oxen beneath the arcades of their upper portion, and one at each end of the transept. A square central tower forms a lantern within the church. The west front, with three porches, the centre one surmounted by a fine rose window, ranks next to that of Notre-Dame at Paris in purity. The cathedral has stained glass of the 13th century and a choir grille of the 18th century. The chapter-house and the cloister are of the 13th century. The old episcopal palace is now used as a court-house. The front, flanked by turrets, is pierced by great pointed windows. There is

also a Gothic cloister and an old chapel of two storeys, of a date anterior to the cathedral. The church of St. Martin dates from the middle of the 12th century. The old abbey buildings of the same foundation are now used as the hospital. The museum of Laon has collections of sculpture and painting. In its garden there is a chapel of the Templars belonging to the 12th century. The church of the suburb of Vaux near the railway station dates from the 11th and 12th centuries. Laon is the seat of a prefect and a court of assizes, and possesses a tribunal of first instance. Sugar-making and metal-founding are carried on, but neither industry nor trade, which is in grain and wine, is of much importance.

LAOS, a territory of French Indo-China, covering about a third part of the Laotian country, bounded north by the Chinese province of Yun-nan, west by the British Shan states and Siam, south by Cambodia and Annam, east by Annam and north-east by Tong-king. Northern Laos is traversed by the Mekong (*q.v.*) which from Chieng-Khan to a point below Stung-Treng forms the boundary between Laos (on the left bank) and Siam and Cambodia (on the right). French Laos constitutes a strip of territory with an approximate area of 82,604 sq m. and a population of 837,364. The sandstone and limestone country of lower Laos changes to the north into a confused mountain knot of Palaeozoic rocks and granites. The culminating point exceeds 6,500 ft. in height. The plateaux reach an altitude of 1,200 to 1,300 metres in some places as at Tran-Ninh. The valley of the Mekong traversing this region of poor soil gives a belt of better land with pastures and also rubber-vines.

Laos is inhabited by a mixed population of Thais (including the Laotians; various aboriginal peoples who are classed as Khas; and the inhabitants of neighbouring countries, *e.g.*, China, Annam, Cambodia, Siam, Burma, etc.

Laos has a rainy season lasting from June to October and corresponding to the south-west monsoon and a dry season coinciding with the north-east monsoon and lasting from November to May. It is the least rainy part of Indo-China (900 mm. of rain at Savannaket). The climate is of the continental type and the monthly averages of temperature have a range of some 35°. Winter fogs are a cause of a forest fever which is often dangerous. The plateau of Tran-Ninh and, in the south, that of the Bolovens formed of volcanic rock are distinguished by the wholesomeness of their climate.

The forests contain bamboo and many valuable woods amongst which only the teak of north Laos and rattan are exploited to any extent. Rice, maize, cotton, indigo, tobacco, sugar-cane and cardamoms are among the cultivated plants. The forests are inhabited by tigers, panthers, bears, deer, etc. Hunting and fishing are leading occupations of the inhabitants. The reptiles include crocodiles, turtles, pythons and cobras.

Scarcity of labour and difficulty of communication hinder the working of the gold, tin, copper, argentiferous lead, precious stones and other minerals of the country and the industries in general are of a primitive kind and satisfy only local needs.

The buffalo, the ox, the horse and the elephant (numerous in this region) are domesticated, and these together with cardamoms, rice, tobacco and the products of the forests form the bulk of the exports. Imports are inconsiderable, comprising chiefly cotton fabrics, garments and articles for domestic use. Trade is mainly with Siam and is in the hands of Chinese and of old established native carriers and hawkers. The Mekong is the chief artery of transit; elsewhere communication is afforded by tracks sometimes passable only for pedestrians. Two roads have been made, one from Vinh to Thakhek and one from Quang-Tri to Savannaket. Luang-Prabang (*q.v.*) is the principal commercial town. Before the French occupation of Laos, it was split up into small principalities (*muongs*) of which the chief was that of Vien-Tiane. Vien-Tiane was destroyed in 1828 by the Siamese who annexed the territory. In 1893 they made it over to the French, who grouped the *muongs* into provinces. Of these there are twelve each administered by a French commissioner and, under his surveillance, by native officials elected by the people from amongst the members of an hereditary nobility. At the head of the administration there is a resident-superior stationed at Vien-Tane. The modern economic development of Laos is less than that of other French possessions in Indo-China because of the difficulties of transport and of the less complete penetration of French influences.

See M. J. F. Garnier, *Voyage d'exploration en Indo-Chine* (1873); C. Gosselin, *Le Laos et le protectorat français* (1900); L. de Reinach, *Le Laos* (1902) and *Notes sur le Laos* (1906); and bibliography under INDO-CHINA, FRENCH.

LÂO-TSE (properly LAO-TZŬ), the designation of Li Êrh, a pre-Confucian philosopher and metaphysician of China. The *Tâo-tê-king* or Classic of Reason and Virtue, commonly ascribed to him was obviously not from his brush although it embodies his precepts and speculations. Lao-tze means the "Old Philosopher." According to the *Shăn Hsien Chüan* the mother of Lao-tze, after a supernatural conception, carried him in her womb sixty-two years (or seventy-two, or eighty-one), so that, when he was born at last, his hair was white as with age.

All that Isŭ-ma Ch'ien tells us about Lao-tze goes into small compass. His surname was Lî, and his name Êrh. He was a native of the state of Ch'û, and was born in a hamlet not far from the present prefectural city of Kwei-te in Ho-nan province. He was one of the recorders or historiographers at the court of Chow, his special department being the charge of the whole or a portion of the royal library. He must thus have been able to make himself acquainted with the history of his country. The year of his birth is often said, though on what Chinese authority does not appear, to have taken place in the third year of King Ping, corresponding to 604 B.C. That date cannot be far from the truth. That he was contemporary with Confucius is established by the concurrent testimony of the *Li Kî* and the *Kiâ Yü* on the Confucian side, and of Chwang-tsze and Sze-ma Ch'ien on the Tâoist. The two men whose influence has been so great on all the subsequent generations of the Chinese people—Kung-tsze (Confucius) and Lâo-tse—had perhaps one interview, in 517 B.C., when the former was in his thirty-fifth year. Lâo was in a mocking mood; Kung appears to the greater advantage. If it be true that Confucius, when he was fifty-one years old, visited Lâo-tse as Chwang-tsze says (in the *Tien Yun*, the fourteenth of his treatises), to ask about the *Tâo*, they must have had more than one interview. There may have been several meetings between the two in 517 B.C., but we have no evidence that they were together in the same place after that time: Ch'ien adds:—"Lâo-tse cultivated the *Tâo* and virtue, his chief aim in his studies being how to keep himself concealed and unknown. He resided at (the capital of) Chow; but after a long time, seeing the decay of the dynasty, he left it, and went away to the Gate (leading from the royal domain into the regions beyond—at the entrance of the pass of Han-kû, in the north-west of Ho-nan). Yin Hsî, the warden of the Gate, said to him, 'You are about to withdraw yourself out of sight; I pray you to compose for me a book (before you go).' On this Lâo-tse made a writing, setting forth his views on the *tâo* and virtue, in two sections, containing more than 5,000 characters He then went away, and it is not known where he died." The historian then mentions the names of two other men whom some regarded as the true Lâo-tse. One of them was a Lâo Lâi, a contemporary of Confucius, who wrote fifteen treatises (or sections) on the practices of the school of *Tâo*. Subjoined to the notice of him is the remark that Lâo-tse was more than one hundred and sixty years old, or, as some say, more than two hundred, because by the cultivation of the *Tâo* he nourished his longevity. The other was "a grand historiographer" of Chow, called Tan, one hundred and twenty-nine (?one hundred and nineteen) years after the death of Confucius The introduction of these disjointed notices detracts from the verisimilitude of the whole narrative in which they occur.

Finally, Ch'ien states that "Lâo-tse was a superior man, who liked to keep in obscurity," traces the line of his posterity down to the 2nd century B.C., and concludes with this important statement:—"Those who attach themselves to the doctrine of Lâo-tse condemn that of the literati, and the literati on their part condemn Lâo-tse, thus verifying the saying, 'Parties whose principles are different cannot take counsel together.' Lî Êrh taught that

SCULPTURES AND PAINTING RELATING TO LAO-TSE, AND TAOISM, FOUNDED BY HIM

1. Screen by Sansetsu, 17th century. Lao-tse being welcomed by the official Yin Hsi. 2. Marble triad. Lao-tse in centre as Bodhisattva with Lotus and Taoist cap. 3. Portrait of Lao-tse, founder of Taoism, by Keichiya Yamada. This forms the frontispiece of "Tai-Shang-Kan-Ying Pien," Taoist work of piety and ethics. 4. Porcelain tile with figure of Lao-tse, 16th century, Chinese. 5. Soapstone figure. Lao-tse after visit to Hsi-Wang-Mu, The Western Queen Mother. 6. Porcelain figure of Shên-Lao (the divine) in yellow robe with long beard. 7. Dish painting of immortals visiting the God of Longevity; about 1600, Chinese

transformation follows, as a matter of course, the doing nothing (to bring it about), and rectification ensues in the same way from being pure and still."

The Tâo-Tê-King.—The book for so long ascribed to Lâo-tse is small in size, slightly over 5,000 characters. The condensed style, with the mystic tendencies and poetical temperament of its inspiring genius, make its meaning extraordinarily obscure. Divided at first into two parts, it has subsequently and conveniently been subdivided into 82 chapters. The chief difficulty is to determine what we are to understand by the *Tâo*, for *Tê* is merely its outcome, especially in man, and is rightly translated by "virtue." Julien translated *Tâo* by "la voie." Chalmers leaves it untranslated. "No English word," he says, "is its exact equivalent. Three terms suggest themselves—the way, reason and the word; but they are all liable to objection. Were we guided by etymology, 'the way' would come nearest the original, and in one or two passages the idea of a way seems to be in the term; but this is too materialistic to serve the purpose of a translation. 'Reason,' again, seems to be more like a quality or attribute of some conscious being than *Tâo* is. It might even be translated by 'the Word' in the sense of Λογος."

Analysis of Tâo.—The character 道 (*Tâo*) was, primarily, the symbol of a way, road or path; and then, figuratively, it was used, as we also use *way*, in the senses of means and method—the *course* that we pursue in passing from one thing or concept to another as its end or result. It is the name of a quality. Sir Robert Douglas has well said (*Confucianism and Tâoism*, p. 189): "If we were compelled to adopt a single word to represent the *Tâo* of Lâo-tse, we should prefer the sense in which it is used by Confucius, 'the way,' that is, μέθοδος."

What, then, was the quality which Lâo-tse had in view, and which he thought of as the *Tâo*? It was the simplicity of spontaneity, action (which might be called non-action) without motive, free from all selfish purpose, resting in nothing but its own accomplishment. This is found in the phenomena of the material world. "All things spring up without a word spoken, and grow without a claim for their production. They go through their processes without any display of pride in them; and the results are realized without any assumption of ownership. It is owing to the absence of such assumption that the results and their processes do not disappear" (chap. ii.). It only needs the same quality in the arrangements and measures of government to make society beautiful and happy. "A government conducted by sages would free the hearts of the people from inordinate desires, fill their bellies, keep their ambitions feeble and strengthen their bones. They would constantly keep the people without knowledge and free from desires; and, where there were those who had knowledge, they would have them so that they would not dare to put it in practice" (chap. iii.). A corresponding course observed by individual man in his government of himself becoming again "as a little child" (chaps. x. and xxviii.) will have corresponding results. "His constant virtue will be complete, and he will return to the primitive simplicity" (chap. xxviii.).

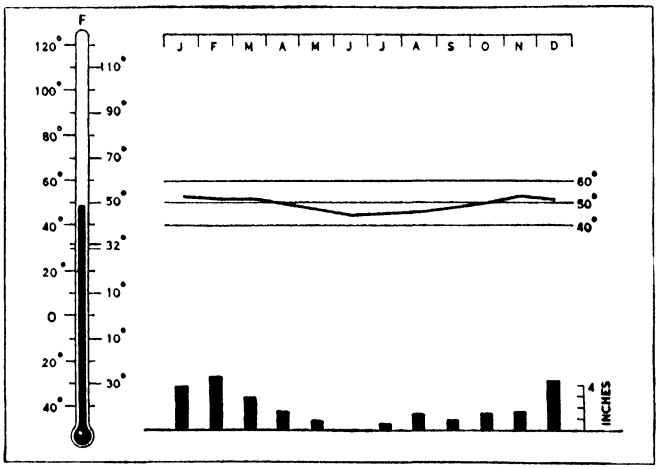
Such is the subject matter of the *Tâo-Tê-King*—the operation of this method or *Tâo*, "without striving or crying," in nature, in society and in the individual. Much that is very beautiful and practical is inculcated in connection with its working in the individual character. The writer seems to feel that he cannot say enough on the virtue of humility (chap. viii., etc.). There were three things which he prized and held fast—gentle compassion, economy and the not presuming to take precedence in the world (chap. lxvii.). His teaching rises to its highest point in chap. lxiii.:—"It is the way of *Tâo* not to act from any personal motive, to conduct affairs without feeling the trouble of them, to taste without being aware of the flavour, to account the great as small and the small as great, to recompense injury with kindness." This last and noblest characteristic of the *Tâo*, the requiting "good for evil," is not touched on again in the treatise; but we know that it excited general attention at the time, and was the subject of conversation between Confucius and his disciples (*Confucian Analects*, xiv. 36).

Lâo-tse was for the most part a dreamer and his conception of the *Tâo* is mystical, comprising both "way" and "waygoer." He had a tremendous power of thought and was far ahead of his age. His metaphysics did not appeal to the omnipresent materialism and he was not practical enough to see means to combat it. *Tâo* is an eternal abstraction, beyond the reach of mere word or definition, but he who is possessed of it knows its force and its beauty. It is the supreme paradox, it is all and nothing; containing all it gives all, possesses all for ever and is not wasted or used. All things begin in *Tâo*, exist only in *Tâo* and end therein.

Tâo and Deity.—It is quite clear that there must have been some vague connection between *Tâo* and the sublime Intelligence, for while Lâo-tse "cannot tell whose son it is" yet he admits that "it might appear to have existed before God." May not God Himself have appeared to the mystic as a crystallized production of the inner essence of *Tâo*? Lâo-tse implicitly accepts the fact of a Divine Ruler but He too lives in, through and by *Tâo*, even as He originated therein.

Modern Tâoism.—The religion of Tâoism did not take shape until five centuries after the death of Lâo-tse who now occupies the second place in its trinity of "the three Pure or Holy Ones." There is hardly a word in his treatise that savours either of superstition or religion. In the works of Chwang-tsze, his earliest follower of note, we find abundance of grotesque superstitions; but his beliefs (if indeed we can say that he had beliefs) had not become embodied in any religious institutions. When we come to the Ch'in dynasty (221–206 B.C.), we meet with a Tâoism in the shape of a search for the fairy islands of the eastern sea, where the herb of immortality might be gathered. In the 1st century A.D. a magician, called Chang Tâo-ling, comes before us as the chief professor and controller of this Tâoism, preparing in retirement "the pill" which renewed his youth, supreme over all spirits, and destroying millions of demons by a stroke of his pencil. He left his books, talismans and charms, with his sword and seal, to his descendants, and one of them, professing to be animated by his soul, dwells on the Lung-hû mountain in Kiang-si, the acknowledged head or pope of Tâoism. But even then the system was not yet a religion, with temples or monasteries, liturgies and forms of public worship. It borrowed all these from Buddhism, which first obtained public recognition in China between A.D. 65 and 70, though at least a couple of centuries passed before it could be said to have free course in the country.

Even still, with the form of a religion, Tâoism is in reality a conglomeration of base and dangerous superstitions. Alchemy, geomancy and spiritualism have dwelt and dwell under its shadow. Each of its "three Holy Ones" has the title of *Tien Tsun*, "the Heavenly and Honoured," taken from Buddhism, and also of *Shang Ti* or God, taken from the old religion of the country. The most popular deity, however, is not one of them, but has the title of *Yü Wang Shang Tî*, "God, the Perfect King." But it would take long to tell of all its "celestial gods," "great gods," "divine rulers" and others. Modern Tâoism is a system of the wildest polytheism. The science and religion of the West meet from it a most determined opposition. The "Venerable Philosopher" himself would not have welcomed them; but he ought not to bear the obloquy of being the founder of the Tâoist religion. (*See* CHINA.)



In recent years a superficial study of the writings of the early Tâo philosophers has brought into being a cult of what may be called Tâoist metaphysics and psychology, which is just as remote from the principles of Lâo-tse's original teaching as are the debased practices of the modern Tâoist temple. The fact that Lâo-tse and his followers did actually anticipate modern applied psychology in several of its more solid aspects, has led to much unscientific speculation as to the esoteric interpretation of the more obscure passages in Tâoist writings, and to very incautious and dogmatic pronouncements on the early mystics and their teachings. For this reason the welter of books on Lâo-tse and his teaching which appeared during the first quarter of the 20th century should be carefully sorted before the assertions contained in them are taken seriously. In spite of the existence of an excellent Manchu translation of the *Tâo-Tê-King*, there still remain several passages in the text of which the original meaning is obscure. The Manchu, easier of comprehension than the highly

elliptical style of the literary Chinese of Lâo-tse's time, does at best, in these passages, give a clue in the form of a paraphrase which may or may not accord with the original intention of the writer. All we can say with certainty is that the Manchu version gives the accepted meaning of the text as it was understood at that time (nearly 2,000 years after the original work had been written.

The whole of the period for several centuries before and after Lâo-tse was filled with metaphysical speculation and philosophic discussion. Lâo-tse marked out a new path and his unique gesture was one of strength in complete inactivity. His passivity was to be more potent than activity and in the restless age in which he was an almost voiceless prophet his mission was foredoomed to failure. (*See* CHINA.) (J. LE.; A. N. J. W.)

LA PAZ, a western department of Bolivia. Pop. (1915 estimate) 726,357, the majority of whom are Indians. Area 40,686 sq.m. The department belongs to the great Bolivian plateau, and its greater part to the cold, bleak, *puna* climatic region. The Cordillera Real crosses it N.W. to S.E. and culminates in the snow-crowned summits of Sorata and Illimani. The west of the department includes a part of the Titicaca basin with about half the lake. This elevated plateau region is partially barren and inhospitable, its cold summers permitting the production of little besides potatoes, quinoa (*Chenopodium quinoa*) and barley, with a little Indian corn and wheat in favoured localities. Much attention is given to the rearing of llamas and alpacas, while cattle, sheep and mules are in common use. The bulk of the population in this region is Indian, living chiefly in small hamlets on the products of their own industry. In the deep valleys of the eastern slopes, where climatic conditions range from temperate to tropical, wheat, Indian corn and oats, as well as many fruits and vegetables, are cultivated. Farther down, coffee, cacao, coca, rice, sugar cane, tobacco, oranges, bananas and other tropical fruits are grown, and the forests yield cinchona bark and rubber. The mineral wealth of La Paz includes gold, silver, tin, tungsten, copper and bismuth. Tin and copper are the most important of these, the principal tin mines being in the vicinity of the capital and known under the names of Huayna-Potosí, Milluni and Quimza Cruz. The chief copper mines are the famous Corocoro group, about 75 m. S.S.E. of Lake Titicaca near the Desaguadero river. The output of the Corocoro mines, which also includes gold and silver, finds its way to the coast via the Arica–La Paz railway. There are no modern roads in the department except a few short ones leading into the capital, though stage-coach communication with some other points has been maintained by the national government. The railway opened in 1905 between Guaqui and La Paz (54 m.), and that to Oruro inaugurated in 1908 have largely superseded these stage lines. A short railway also leads over the Cordillera Real and down into the Yungas valleys. The capital of the department is the national seat of Government La Paz. Corocoro, near the Desaguadero river, about 50 m. S.S.E. of Lake Titicaca and 13,353 ft. above sea-level, has a variable population of from 5,000 to 15,000 chiefly made up of Aymará Indians.

LA PAZ (officially La Paz de Ayacucho), the *de facto* capital of Bolivia since 1898, the see of a bishopric created in 1605 and capital of the department of La Paz, 42 m. S.E. of Lake Titicaca in 16° 30′ S., 68° W. Pop. (1926 estimate) 109,750. The city is built in the deeply-eroded valley of the La Paz river which, a few miles below, cuts its way eastward through the Cordillera Real to join the Beni. The valley is about 10 m. long and 3 m. wide. Its precipitous sides, deeply gullied by torrential rains and diversely coloured by mineral matter, rise 1,500 ft. above the city to the margin of the great plateau surrounding Lake Titicaca, and above these, on the east are the snow-capped summits of Illimani and other giants of the Cordillera. The elevation of La Paz is 11,800 ft. above sea-level, which places it within the *puna* climatic region, in which the temperatures are low throughout the year. Pneumonia and bronchial complaints are common, but consumption is rare. The valley's surface is very uneven, and the city's transverse streets are steep and irregular. Near the centre of the city is the Prado, a handsome public promenade with parallel rows of exotic trees, shrubs and flowers, which are maintained with no small effort in so inhospitable a climate. The trees which thrive best are the willow and eucalyptus. The older streets are narrow and roughly paved; a great many of the newer ones are spacious avenues. There are numerous bridges across the river. The dwellings of the poorer classes are commonly built with adobe

walls and covered with tiles, but stone and brick are used for the better structures. The cathedral, which was begun in the 17th century when the mines of Potosí were at the height of their productiveness, is still unfinished. It faces the Plaza Mayor and is distinguished for the fine stonework of its façade. Facing the same plaza are the Government offices and legislative chambers. Other notable edifices and institutions are the old university of San Andrés, the San Francisco church, a national college, a seminary, a public library and a museum rich in relics of the Inca and pre-Inca periods.

La Paz, important commercially, has three railway connections with the coast. A Peruvian line runs from Mollendo to Puno (via Arequipa), and a Bolivian extension, from Huaqui to the Alto de La Paz (Heights of La Paz), the two lines being connected by a steamship service across Lake Titicaca. An electric railway 5 m. long extends from the Alto de La Paz to the city, 1,500 ft. below. This route is 528 m. long, and is expensive because of the elevations crossed, the trans-shipments at the lake, and the cost of handling cargo at Mollendo. A second railway 719 m. long connects La Paz with the port of Antofagasta in Chile, its steam locomotives descending into the city itself. The newest and shortest line is that constructed by the Chilean Government from Arica to Viacha, which affords La Paz an outlet to the sea, 273 m. in length. Two railways connect La Paz also with the interior of the country, the branch of the Bolivia-Antofagasta line which runs from Oruro to Cochabamba, and the recently built line from La Paz to the Yungas, on the eastern slope of Illimani. The vicinity of La Paz abounds in mineral wealth; most important are the tin deposits of Huayna-Potosí, Milluni and Quimza Cruz. The La Paz valley is auriferous and since long before the foundation of the city gold has been taken from the gravel washed down from the mountain sides.

La Paz was founded in 1548 by Alonzo de Mendoza on the site of an Indian village called Chuquiapu (Heritage of Gold) and was called the Pueblo Nuevo de Nuestra Señora de la Paz in commemoration of the reconciliation between Pizarro and Almagro, and soon became an important colony. At the close of the war of independence (1825) it was rechristened La Paz de Ayacucho, in honour of the last decisive battle of that protracted struggle. It was made one of the four capitals of the republic, but the revolution of 1898 permanently established the seat of government here because of its accessibility, wealth, trade and political influence. (G. M. McB.)

LAPEER, city of south-eastern Michigan, U.S.A., 60m. N.N.W. of Detroit; the county seat of Lapeer county. It is served

by the Grand Trunk and the Michigan Central railways, and by motor coach lines and trucking fleets. The population was 4,723 in 1920 (90% native white) and was estimated locally at 6,000 in 1928. It is the seat of the Michigan Home and Training school for the feeble-minded and epileptics, which has nearly 3,000 patients and 500 attendants, nurses, doctors and teachers. The city is the commercial and social centre of a rich agricultural district, and has several factories. It was founded about 1833; incorporated as a village in 1857 and as a city in 1869; and in 1919 adopted a city-manager form of government.

LA PÉROUSE, JEAN-FRANÇOIS DE GALAUP, COMTE DE (1741–*c.* 1788), French navigator, was born near Albi, on Aug. 22, 1741. As a lad of 18 La Pérouse was wounded and made prisoner on board the "Formidable" when it was captured by Admiral Hawke in 1759; and during the war with England between 1778 and 1783 he served on the eastern coasts of Canada and in Hudson's bay, where he captured Fts. Prince of Wales and York (Aug. 8 and 21, 1782). In 1785 (Aug. 1) he sailed from Brest in command of the French government expedition of two vessels ("La Boussole" under La Pérouse himself, and "L'Astrolabe," under de Langle) for the discovery of the North-West passage, vainly essayed by Cook on his last voyage, from the Pacific side. He was to explore the Pacific coasts, to collect information as to the whale fishery in the southern oceans and as to the fur trade in North America. He reached Mt. St. Elias, Alaska, on June 23, 1786. He was driven from these regions by bad weather; and after visiting the Hawaiian islands, and discovering Necker island (Nov. 5, 1786), he crossed over to Asia (Macao, Jan. 3, 1787). Thence he passed to the Philippines, and so to the coasts of Japan, Korea and "Chinese Tartary," where his best results were gained. Touching at Quelpart, he reached De Castries bay, near the modern Vladivostok, on July 28, 1787; and on Aug. 2, following discovered the strait, still named after him, between Sakhalin and the Northern island of Japan. On Sept. 7, he put in at Petropavlovsk in Kamchatka; thence he sent home Lesseps, overland, with the journals, notes, plans and maps recording the work of the expedition. At Mauna in the Samoan group de Langle and ten of the crew of the "Astrolabe" were murdered. He quitted Samoa on Dec. 14, touched at the Friendly islands and Norfolk island and arrived in Botany bay on Jan. 26, 1788. After a letter written from Australia on Feb. 7, no more was heard of him and his squadron till in 1826 Captain Peter Dillon found the wreckage of what must have been the "Boussole" and the "Astrolabe" on the reefs of Vanikoro, an island to the north of the New Hebrides.

See Milet Mureau, *Voyage de la Pérouse autour du monde* (Paris, 1797) 4 vols.; Gérard, *Vies . . . des . . . marins français* (Paris, 1825), 197–200; Peter Dillon, *Narrative . . . of a Voyage in the South Seas for the Discovery of the Fate of La Pérouse* (London, 1829), 2 vols.

LAPIDARY and **GEM CUTTING.** The earliest examples of gem cutting and carving known (*see* also GEM) are the ancient engraved seals, which are of two principal types, the cylindrical or "rolling" seals of Babylonia and Assyria, suggested by a joint of the bamboo or the central whorl of a conch-like shell, and the peculiar scarabaeoid seals of Egypt. (*See* also SEALS.) Recent researches make it appear that both these types were in use as far back as 4500 B.C., though with some variations. The jewels of Queen Zer, and other jewels consisting of cut turquoise, lapis lazuli and amethyst, found by the French mission, date from 4777 B.C. to 4515 B.C. Until about 2500 B.C., the cylinder seals bore almost wholly animal designs; then cuneiform inscriptions were added. In the 6th century B.C., the scarabaeoid type was introduced from Egypt, while the rolling seals began to give place to a new form, that of a tall cone. These, in a century or two, were gradually shortened; the hole by which they were suspended was enlarged until it could admit the finger, and in time they passed into the familiar form of seal-rings.

500 B.C. to Renaissance.—The date of about 500 B.C. marks the beginning of a period of great artistic taste and skill in gem carving, which extended throughout the ancient civilized world, and lasted until the 3rd or 4th century A.D. Prior to this period, all the work appears to have been done by hand with a sapphire point, or else with a bow-drill; thenceforward the wheel came to be largely employed. The Greek cutters, in their best period, the 5th and 6th centuries B.C., knew the use of disks and drills, but preferred the sapphire point for their finest work, and continued to use it for two or three hundred years. Engraving by the bow-drill was introduced in Assyrian and Babylonian work as early as perhaps 3000 B.C., the earlier carving being all done with the sapphire point, which was secured in a handle for convenient application. This hand-work demanded the utmost skill and delicacy of touch in the artist. The bow-drill consisted of a similar point fastened in the end of a stick, which could be rotated by means of a horizontal cross-bar attached at each end to a string wound around the stick; as the cross-bar was moved up and down, the stick was made to rotate alternately in opposite directions. This has been a frequent device for such purposes among many peoples, both ancient and modern, civilized and uncivilized. The point used by hand, and the bow-drill, were afterwards variously combined in executing such work Another modification was the substitution for the point, in either process, of a hollow tube or drill, probably in most cases the joint of a hollow reed, whereby very accurate circles could be made, as also crescent figures and the like. This process, used with fine hard sand, has also been widely employed among many peoples.

The Egyptian scarabs were an early and very characteristic type of seal cutting. The Greek gem cutters modified them by adding Greek and Etruscan symbols and talismanic signs; many of them also worked in Egypt and for Egyptians. Phoenician work shows a mixture of Assyrian and Egyptian designs; and Cypriote seals, principally on the agate gems, are known that are referred to the 9th century B.C.

In the later Roman period, the 3rd and 4th centuries, a great decline in the art is seen—so great that Castellani terms it "the idiotic age." Numbers of gems of this kind have been found together, as though they were the product of a single manufacturer, carved in the crudest manner, both in design and execution. The decline of the art went on until in the Byzantine period, especially the 6th century, it had reached a very low point. Most of the gems of this period show drill-work of poor quality, although hand-work is occasionally seen.

The Renaissance.—With the Renaissance, the art of gem carving revived, and the engravers from that time have produced results that equal the best Greek and Roman work; copies of ancient gem carvings made by some of the 18th-century masters are only distinguishable from true antiques by experts of great proficiency.

Until the 14th century, almost all the gems were cut *en cabochon* —that is, smoothly rounded, as carbuncles and opals are still— or else in the form of beads drilled from both sides for suspension or attachment, the two perforations often meeting but imperfectly. These latter may be of Asiatic origin, brought into Europe by commerce during the Crusades. Some of the finest gems in the Austrian, Russian and German crowns are stones of this perforated or bead type. An approach, or transition, to the modern facetting is seen in a style of cutting often used for rock-crystal in the 10th and 11th centuries: an oval cabochon was polished flat, and the sides of the dome were also trimmed flat, with a rounded back, and the upper side with a ridge in the centre, tapering off to the girdle of the stone below.

The plane facetted cutting is altogether modern; and hence the pictures which represent the breastplate of the ancient Jewish high-priest as set with facetted stones are wholly imaginary and probably incorrect, as we have no exact knowledge of the forms of the gems. The Orientals polish gems in all sorts of irregular, rounded shapes, according to the form of the piece as found, and with the one object of preserving as much of its original size and colour as possible. The greatest ingenuity is used to make a speck of colour, as in a sapphire, tone up an entire gem, by cutting it so that there is a point of high colour at the lower side of the gem.

In later times a few facets are sometimes cut upon a generally rounded stone. The *cabochon* method is still used for opaque or translucent stones, as opal, moonstone, turquoise, carbuncle, etc.; but for transparent gems the facetted cutting is almost

always employed, on account of its fine effect in producing brilliancy, by reflection or refraction of light from the under side of the gem. Occasionally the ancients used natural crystals with polished faces, or perhaps at times polished these to some extent artificially.

MODERN METHODS

Numerous facets, geometrically disposed to bring out the beauty of light and colour to the best advantage, are now cut. This is done at the sacrifice of material, often to the extent of half the stone or even more—the opposite of the Oriental idea. There are various forms of such cutting, but three are specially employed, known as the brilliant, the rose and the table-cut. The last, generally made from cleavage pieces, usually square or oblong, with a single facet or edge on each side, and occasionally four or more facets on the lower side of the stone, is used chiefly for emeralds, rubies and sapphires; the two former for diamonds in particular. The brilliant is essentially a low, double cone, its top truncated to form a large flat eight-sided face called the table, and its basal apex also truncated by a very small face known as the *culette* or *cullet*. The upper and lower slopes are cut into a series of triangular facets, 32 above the girdle, in four rows of eight, and 24 below, in three rows, making 56 facets in all. The rose form is used for diamonds not thick enough to cut as brilliants; it is flat below and has 12 to 24, or sometimes 32, triangular facets above, in three rows, meeting in a point. Stones thus cut are also known as "roses couronnées"; others with fewer facets, twelve or even six, are called "roses d'Anvers," and are a specialty, as their name implies, at Antwerp. These, however, are only cut from very thin or shallow stones

Modern gem cutting and engraving are done by means of the lathe, which can be made to revolve with extreme rapidity, carrying a point or small disk of soft iron, with diamond-dust and oil. The disks vary in diameter from that of a pin-head to a quarter of an inch. Better than the lathe, also, is the S. S. White dental engine, which the present writer was the first to suggest for this use. The flexibility and sensitiveness of this machine enable it to respond to the touch of the artist and to impart a personal quality to his work not possible with the mechanical action of the lathe, and more like the hand-work with the sapphire point.

DIAMOND CUTTING

On account of its extreme hardness, the treatment of the diamond in preparation for use in jewellery constitutes a separate and special branch of the lapidary's art. Any valuable gem must first be trimmed, cleaved or sawed into suitable shape and size, then cut into the desired form, and finally polished upon the faces which have been cut. The stages in diamond working are, therefore, (1) cleavage or division; (2) cutting; (3) polishing; but in point of fact there are four processes, as the setting of the stone for cutting is a somewhat distinct branch, and the workers are classed in four groups—cleavers, setters, cutters and polishers.

1. **Cleaving or Dividing.**—Diamonds are always found as crystals, usually octahedral in form, though often irregular or distorted. The problem involved in each case is twofold: (1) to obtain the largest perfect stone possible, and (2) to remove any portions containing flaws or defects. These ends are generally met by cleaving the crystal, *i.e.*, causing it to split along certain natural planes of structural weakness, which are parallel with the faces of the octahedron. The stone is first examined closely, to determine the directions of the cleavage planes, which are recognizable only by an expert. The cleaver then cuts a narrow notch at the place selected, with another diamond having a sharp point; a rather dull iron or steel edge is then laid on this line, and a smart blow struck upon it. If all has been skilfully done, the diamond divides at once in the direction desired.

When the stone is large and very valuable, the cleaving is a most critical process. Wollaston in 1790 made many favourable transactions by buying very poor-looking flawed stones and cleaving off the good parts. In the case of the immense Excelsior diamond of 971 carats, which was divided at Amsterdam in 1904, and made into ten splendid stones, the most elaborate study extending over two months was given to the work beforehand, and many models were made of the very irregular stone and divided in different ways to determine those most advantageous. This process was in 1908 applied to the most remarkable piece of work of the kind ever undertaken—the cutting of the gigantic Cullinan diamond of 3,025¾ English carats. The stone was taken to Amsterdam to be treated by the old-fashioned hand method, with innumerable precautions of every kind at every step, and the cutting was successfully accomplished after nine months' work (see *The Times*, Nov. 10, 1908). (*See* DIAMOND.)

This process of cleavage is the old-established one, still used to a large extent, especially at Amsterdam. But a different method has recently been introduced, that of sawing, which is now generally employed in Antwerp.

After the cleaving or sawing, however, the diamond is rarely yet in a form for cutting the facets, and requires considerable shaping. This rough "blocking-out" of the final form it is to assume, by removing irregularities and making it symmetrical, is called "brutage." Well-shaped and flawless crystals, indeed, may not require to be cleaved, and then the brutage is the first process. Here again, the old hand methods are beginning to give place to mechanism. In either case two diamonds are taken, each fixed in cement on the end of a handle or support, and are rubbed one against the other until the irregularities are ground away and the general shape desired is attained. The old method was to do this by hand—an extremely tedious and laborious process. The machine method, invented about 1885 and first used by Field and Morse of Boston, is now used at Antwerp exclusively.

At Amsterdam a hand-process is employed, which lies between the cleavage and the brutage. This consists in cutting or trimming away angles and irregularities all over the stone by means of a sharp-edged or pointed diamond, both being mounted in cement on pear-shaped handles for firm holding.

2. **Cutting and Setting.**—The next process is that of cutting the facets; but an intervening step is the fixing or "setting" of the stone for that purpose. This is done by embedding it in a fusible alloy, melting at 440° Fahr., in a little cup-shaped depression on the end of a handle, the whole being called a "dop." Only the portion to be ground off is left exposed; and two such mounted diamonds are then rubbed against each other until a face is produced. This is the work of the cutter; it is very laborious, and requires great care and skill. The hands must be protected with leather gloves. The powder produced is carefully saved, as in the former processes, for use in the final polishing. When one face has been produced, the alloy is softened by heating, and the stone re-set for grinding another surface; and as this process is necessary for every face cut, it must be repeated many times for each stone. An improved dop has lately been devised in which the diamond is held by a system of claws so that all this heating and resetting can, it is claimed, be obviated, and the cutting completed with only two changes.

3. **Polishing.**—The faces having thus been cut, the last stage is the polishing. This is done upon horizontal iron wheels called "skaifs," made to rotate up to 2,500 revolutions per minute. The diamond-powder saved in the former operations, and also made by crushing very inferior diamonds, here comes into use as the only material for polishing. It is applied with oil, and the stones are fixed in a "dop" in much the same way as in the cutting process. Again, the utmost skill and watchfulness are necessary, as the angles of the faces must be mathematically exact, in order to yield the best effects by refraction and reflection of light, and their sizes must be accurately regulated to preserve symmetry.

The rapid development of mechanical and electrical devices for the several stages of diamond cutting has already greatly influenced the art. (G. F. K.)

LAPIDOTH-SWART, HÉLÈNE (1859–), Dutch poet, was born at Amsterdam on Oct. 25, 1859. She was brought up in Brussels, and her first poems were written in French. The poetry of Pol de Mont showed her the beauty of the Flemish language, and she then began to write in her own native allied language, Dutch. Her poems were collected in the volumes

Poezie (1892), *Verzen* (1893), and *Gedichten* (1902). Her work ranks high in modern Dutch literature. She also wrote a number of prose works, including *Van Vrouwenleed* and *Van Vrouwenlot* (1896).

LAPILLI, a name applied to small fragments of lava ejected from a volcano (pl. of Ital. *lapillo,* from Lat. *lapillus,* dim. of *lapis,* a stone). They are generally subangular in shape and vesicular in structure, varying in size from a pea to a walnut. In the Neapolitan dialect the word becomes *rapilli*—a form sometimes used by English writers on volcanoes. (See VOLCANO.)

LAPIS LAZULI, a mineral substance valued for decorative purposes in consequence of its deep blue colour. It is opaque and takes a good polish, and since ancient times it has been much used for small ornaments and for inlaying. Its beautiful colour led to its employment, when ground and levigated, as ultramarine (*q.v.*), a valuable pigment now displaced by a chemical product (artificial ultramarine). Lapis lazuli occurs as compact masses, with finely granular structure, its specific gravity is 2·38 to 2·45, and its hardness about 5·5, so that being comparatively soft it tends, when polished, to lose its lustre rather readily. Chemical analyses show considerable variation in composition, and thin sections under the microscope show blue particles and various minerals embedded in a white matrix. The main constituents are minerals of the sodalite group, principally lazulite, which has chemical formula: $Na_4(NaS_3Al)Al_2(SiO_4)_3$, and is occasionally found as deep blue crystals of rhombic-dodecahedron form. In addition to the blue cubic minerals in lapis lazuli the following have also been found: diopside, amphibole, felspars, mica, apatite, sphene, zircon, calcite and pyrite.

Lapis lazuli usually occurs in crystalline limestone, and is a product of contact metamorphism near granite masses. The best known and probably the most important locality is in Badakshan, Afghanistan, where it occurs in limestone, in the valley of the Kokcha, a tributary to the Oxus south of Firgamu. The mines were visited by Marco Polo in 1271. Another important locality is in Siberia near the western end of Lake Baikal. Fine masses of paler blue lapis lazuli occur in the Andes, near Ovalle, Chile. In Europe it is found as a rarity in the peperino of Latium, near Rome, and in the ejected blocks of metamorphosed limestone on Monte Somma, Vesuvius. Much of the material now sold as "lapis" is an artificially coloured hornstone or jasper from Germany. This shows colourless specks of clear crystallized quartz; and never the gold-like specks of pyrite, so characteristic of true lapis lazuli, and fancifully compared with stars in the deep blue firmament. (L. J. S.)

LAPITHAE, a mythical race, whose home was said to be in Thessaly in the valley of the Peneus. The genealogies make them a kindred race with the Centaurs, their king, Peirithous, being the son, and the Centaurs the grand-children (or sons) of Ixion. The best known legends with which they are connected are those of Ixion (*q.v.*) and the battle with the Centaurs (*q.v.*). One Lapith was Caeneus, said to have been originally a girl named Caenis, loved of Poseidon, who changed her into a man and made her invulnerable (Ovid, *Metam.,* xii. 146 ff).

In the Centaur battle, having been crushed by rocks and trunks of trees, he was changed into a bird; or he disappeared into the depths of the earth unharmed. According to some, the Lapithae are representatives of the giants of fable, or spirits of the storm; more likely they are a semi-legendary, semi-historical race, like the Myrmidons and other Thessalian tribes. The Greek sculptors of the school of Pheidias conceived of the battle of the Lapithae and Centaurs as a struggle between mankind and mischievous monsters, and symbolical of the great conflict between the Greeks and Persians.

LAPLACE, PIERRE SIMON, MARQUIS DE (1749–1827), French mathematician and astronomer, was born at Beaumont-en-Auge, in Normandy, on March 28, 1749. His father was a small farmer and Laplace owed his education to the interest taken in him by some rich neighbours. He attended the military school at Beaumont, where he became mathematical teacher. In 1767 he went to Paris with letters of recommendation and approached D'Alembert, who was then at the height of his fame. These producing no result, he wrote a letter on the principles of mechanics which evoked the reply: "You needed no introduction, you have recommended yourself; my support is your due." Accordingly D'Alembert obtained for him an appointment as professor of mathematics at the École Militaire in Paris. Laplace had a mastery of analysis, which he proceeded to apply to problems in celestial mechanics. In a paper read before the Academy of Sciences on Feb. 10, 1773 (*Mém. présentés par divers savants,* tom. vii.) he announced the invariability of planetary mean motions. This was the first step in the establishment of the stability of the solar system. It was followed by a series of profound investigations, contributed by Laplace and Lagrange alternately, and ending in a brilliant memoir by Laplace (in three parts, vols. of the Academy, 1784–85–86). In various memoirs he demonstrated the cause of the long inequality of Jupiter and Saturn; completed the theory of the Jovian system; and announced the dependence of the lunar acceleration on the secular changes in the eccentricity of the earth's orbit.

The time had now come when the work of three generations of illustrious mathematicians on gravitation could be systematized. Laplace devoted himself to this task and produced his famous *Mécanique célèste* (5 vols., 1799–1825), a monument of mathematical genius. The declared aim of the author was to offer a complete solution of the mechanical problem presented by the solar system. In 1796 he published *Exposition du système du monde,* a more popular work; the summary of astronomical history with which it ends being one of the masterpieces of the French language. Laplace's nebular hypothesis made its appearance in a note in this work.

Laplace studied the figure of equilibrium of a rotating fluid mass, his first memoir on this subject being communicated to the Academy in 1773 and the last in 1817. The results of these papers are embodied in the *Mécanique Céleste.* In a celebrated memoir, "Théorie des attractions des sphéroids et de la figure des planètes" (published in Paris, *Memoirs,* 1785), he gave a complete solution of the general problem of the attraction of a spheroid on an external particle, and introduces the potential function and Laplace's coefficients. (*See* SPHERICAL HARMONICS.)

Laplace also displayed his genius in the theory of probabilities, publishing in 1812 his *Théorie analytique des probabilités,* and in 1814 *Essai philosophique,* a more popular exposition on the same subject.

He received many honours from various scientific societies, and during his later years retired to Arcueil where he was visited by distinguished people from all parts of the world. He died on March 5, 1827.

His complete works were published by the French Government: *Oeuvres complètes de Laplace* (7 vols., 1843–47). A second edition containing additional matter was completed in 1912.

LAPLACE'S EQUATION AND INTEGRAL: *see* SPHERICAL HARMONICS.

LAPLAND, a region of northern Europe inhabited by the Lapps, though not applied to any administrative district. It stretches across the north of Norway, Sweden, Finland and Russia, from the Norwegian coast to the White Sea.

Most of the Scandinavian portion of Lapland presents the usual characteristics of the mountain plateau of that peninsula—on the west side the bold headlands and fjords, deeply-grooved valleys and glaciers of Norway, on the east the mountain lakes and great lake-fed rivers of Sweden. All the eastern part, in Sweden, Finland and Russia, is part of the ancient worn-down Scandinavian land mass of Archaean rocks, comparatively low-lying and with innumerable lakes and swamps infested with mosquitoes. In the uplands of Swedish Lapland, and to some extent in Russian Lapland, the lakes afford the principal means of communication.

In Sweden the few farms are on the lake shores, and the traveller must be rowed in summer from one to another. Sailing is rarely practised, and squalls are often dangerous to the rowing-boats. On a few of the lakes wood-fired steam-launches are used in connection with the timber trade, which is considerable, as almost the whole region is forested. Between the lakes all journeying is made on foot. In winter sledge tracks serve as roads. Much

of the Kola peninsula is north of the forest belt and is tundra land with the bleak and barren Murman coast. Further west the influence of the warm Atlantic drift is sufficient to keep the ports (Vadsö, Vardö, Katarina, etc.) free from ice. The heads of the Swedish valleys are connected with the Norwegian fjords by passes generally traversed only by tracks; though from the head of the Ume a driving road crosses to Mo on Ranen fjord. Each principal valley has a village at or near the tail of the lake-chain, up to which a road runs along the valley. The village consists of wooden cottages with an inn, a church, and frequently a collection of huts without windows, closed in summer, but inhabited by the Lapps when they come down from the mountains to the winter fairs. Sometimes there is another church and small settlement in the upper valley, to which, once or twice in a summer, the Lapps come from great distances to attend service.

More than half of Lapland is within the Arctic Circle and the climate is Arctic. Temperatures are low all the year round; *e.g.*, at Karasuanda there are only five months with an average above freezing point. The hottest month is August (average 56·2° F) and the coldest Feb. (5·2°) with temperatures frequently below zero for long periods. In the northern parts unbroken daylight in summer and darkness in winter last from two to three months each. All preparations for winter are made during September and October, and full winter has set in by November.

Though Lapland gives little scope for husbandry, a bad summer being commonly followed by a winter famine, it has great wealth in its minerals. There are copper mines at the mountain of Sulitelma, and the iron deposits in Norrland of both magnetite and hematite with an average of 65% of iron in the ore, are among the most extensive in the world. Their working is facilitated by the railway from Stockholm to Gellivara, Kirunavara and Narvik on the Norwegian coast, which also connects them with the port of Luleå on the Gulf of Bothnia. The supply of timber (pine, fir, spruce and birch) is unlimited. There is an abundance of edible berries; the rivers and lakes abound with trout, perch, pike and other fish, and in the lower waters with salmon; and the cod, herring, halibut and Greenland shark in the northern seas attract numerous Norwegian and Russian fishermen. The Lapps keep great herds of reindeer, the total number in the district being estimated at over 350,000, and their skins, meat and horns form important articles of trade. There are great numbers of birds, including grouse, capercailzie, ptarmigan, etc , and eider down is collected off the coast.

See Homén, *East Carelia and Kola Lapmark*, 1921, *Kihlman Pflanzenbiologische Studien aus Russisch Lappland, Helsingfors*, 1890. (X.)

HISTORY

The people known as "Lapps," *i.e.*, nomads, which is the name the Swedes gave them, call themselves Samelats. They were in occupation of their present territory when first mentioned in history, having come like the Ugro-Finns, and, for the matter of that, the Slavs, as colonizers rather than as conquerors. The first reliable identification of them is in Procopius (*Goth* ii. 15) where the "Skritiphinoi" exhibit certain customs characteristic of the Lapps. Brachycephalic, with high cheek bones, flat noses and chestnut hair, they are racially, linguistically and by their demonology almost as closely allied to the Karelians as these in their turn are to the Finns. By the form of their crania a Mongolian tribe, they have been driven to the furthest north by successive migrations of kindred Ugro-Finns, as of Goths and Slavs, but cherish the memory of the hospitable southern lands traversed in their pristine wanderings.

They incurred the ordinary fate of a primitive people who, driven off the main arteries of civilization, remained isolated huntsmen and fishermen, with the reindeer as the only domestic animal (apart from the dog) capable of withstanding the severity of the climate. This fact precluded town settlements, even in the 20th century, because the reindeer feeds on lichens and mosses and requires an extensive pasturage. Consequently there was little cohesion among this people; they spread over a wide area, and, without knowledge of the use of iron, fell a prey to powerful neighbours: to Norsemen in the 9th century, thereafter to the Karelians, and, in the 11th century, to the princes of Novgorod. In 1326, by a treaty between Norway and Russia, the supremacy of the former was recognized as far east as Voljo, beyond Kandalaksha on the White sea, of the latter as far as Lyngen and Målself. After the disruption of the Kalmar Union (1523), Sweden began to assert its rights until, in 1595, by the Treaty of Teusina, the Lapps between eastern Bothnia and Varanger became subjects of the king of Sweden. In this capacity occurred their one intervention in the affairs of Europe, when they formed part of the armies of Gustavus Adolphus. By the peace of Knäröd (1613) this king gave up the Swedish claim to Finmark; in 1751, mutual renunciations brought the relations of Swedish and Norwegian (Danish) Lapland to their present (1928) position. In 1809, Alexander I. of Russia obtained the cession of Finland, and added to it the whole of Finnish Lapland to the east of the Muonio and the Köngäma. At the dissolution of the union between Norway and Sweden, in 1905, the migratory rights and pasturage privileges of the Lapps were respected in the desert lands between these two countries, which arrangement was confirmed in Feb. 1917 by a congress held between Norwegian and Finnish Lapps.

Of the many masters which the Lapps have had to bear, the Swedes and Russians left the strongest imprint, forcing upon them their respective creeds; the Russians through St. Tryphon, the Greek Orthodox religion, the Swedes, through Gustavus Adolphus, the Lutheran faith. In their wake came exploiters who farmed the Lapps and even owned them. In such circumstances the philanthropic legislation of a later age could do little to arrest the gradual decline of the population, which was largely absorbed by neighbouring races and assumed Swedish, Norwegian, Finnish and Russian family names.

In Sweden, the railway leading to the famous mining town of Gellivare and in Russia the Murman railway making for the ice-free port of Alexandrovsk (completed during the World War) opened up tracts of country hitherto almost inaccessible. In Sweden the Lapps have abandoned their nomadic habits; in the Kola peninsula they still live by fishing and fur-trapping.

Rae, *The White Sea Peninsula* (1882); Fries, "Det Forsta Naturvetenskapliga Forsknings färden i Sverige" (in the *Nordisk Tidsk*, 1898). (W. L. B.)

LA PLATA, a city of Argentina and capital of the province of Buenos Aires, 5 m. inland from the port of Ensenada, or La Plata, and about 31 m. south-east of the city of Buenos Aires, with which it is connected by rail. Pop. (1922 estimate) 151,000. La Plata was founded in 1882, two years after Buenos Aires had been constituted a federal district and made the national capital. This necessitated the selection of another provincial capital, which resulted in the choice of an open plain near the former port of Ensenada de Barragán, on which a city was laid out after the plan of Washington. The streets are so wide that they seem out of proportion to the low brick buildings. The principal public buildings, constructed of brick and stucco, are the government-house, assembly building, treasury, municipal hall, cathedral, courts of justice, police headquarters, provincial museum and railway station. The museum, originally presented by Dr. Moreno, has become one of the most important in South America, its palaeontological and anthropological collections being unique. There are also a university, national college, public library, astronomical observatory, several churches, hospitals and theatres. A noteworthy public park is formed by a large plantation of eucalyptus trees, which have grown to a great height and present an imposing appearance on the level, treeless plain. Electricity is in general use for public and private lighting, and tramways are laid down in the principal streets and extend eastward to the port. The harbour of the port of La Plata consists of a large artificial basin, 1,450 yd. long by 150 yd. wide, with approaches, in addition to the old port of Ensenada, which are capable of receiving the largest vessels that can navigate the La Plata estuary. Up to the opening of the new port works of Buenos Aires a large part of the ocean-going traffic of Buenos Aires passed through the port of La Plata. It has good railway connections with the interior, and exports cattle and agricultural produce.

It has become an important centre of the meat packing industry, two large plants being located here.

LAPOINTE, ERNEST (1876–), Canadian statesman, was born on Oct. 6, 1876, and educated at Rimouski college and Laval university, Quebec. He was called to the bar in 1898, and after some years in practice was elected to the House of Commons for Kamouraska in 1904. He held his seat until 1919, and in that year was returned for Quebec East. Two years later he became minister of marine and fisheries. In this capacity he signed a treaty with the United States regarding the Pacific fisheries. This was the first time that a treaty was signed by a Canadian with full powers from the king. In 1922 Lapointe represented Canada at the League of Nations Assembly. In 1924 he became minister of justice, and in 1926 accompanied Mackenzie King to the Imperial Conference. In that year he was also leader of the government in the lower house.

LAPORTE, ROLAND (1675–1704), Camisard leader, better known as "Rowland," was born at Mas Soubeyran (Gard) in a cottage which still contains relics of the hero. He was a nephew of Laporte, the Camisard leader who was hunted down and shot in Oct. 1702, and he himself became the leader of a band of a thousand men which he formed into a disciplined army with magazines, arsenals and hospitals. For daring in action and rapidity of movement he was second only to Cavalier. These two leaders in 1702 secured entrance to the town of Sauve under the pretence of being royal officers, burnt the church and carried off provisions and ammunition for their forces. Roland, who called himself "general of the children of God," terrorized the country between Nîmes and Alais, burning churches and houses, and slaying those suspected of hostility against the Huguenots, though without personally taking any part of the spoil. Cavalier was already in negotiation with Marshal Villars when Roland cut to pieces a Catholic regiment at Fontmorte in May 1704. A parley with Villars led to nothing, but Roland was betrayed to his enemies, and on Aug. 14, 1704, was shot while defending himself against his captors.

See A. Court, *Histoire des troubles des Cévennes* (Villefranche, 1760); H. M. Baird, *The Huguenots and the revocation of the Edict of Nantes* (1895), and other literature dealing with the Camisards.

LA PORTE, a city of northern Indiana, U.S.A., 59m. E. of Chicago and 12m. S. of Lake Michigan, at an altitude of 812ft.; the county seat of La Porte county. It is served by the New York Central, the Nickel Plate, and the Pere Marquette railways, and by motor-bus, truck and inter-urban trolley lines, and has a landing field for aeroplanes. The population was 15,158 in 1920 (84·5% native white) and was estimated locally at 17,500 in 1928. It is in a region of rich farmlands and beautiful lakes, adjacent to the Calumet-Gary district. Its manufactures (valued in 1925 at $23,694,450) are important and diversified, including water heaters, steel doors, door-holding devices, bread and meat slicers, flour, woollen goods, furniture, machinery, artificial flowers, band instruments and baby carriages. La Porte was settled in 1830 and was chartered as a city in 1852.

LAPPA, an island off the south coast of China (22° 15′ N. and 113° 30′ E.), on the left side of the entrance to the Canton river, where it forms the western flank of the inner harbour of Macao (Portuguese). It is notable as being a Chinese Customs station which supervises the junk traffic between Chinese ports (mainly around the Canton River) and Macao. This station bears the same relation to Macao as Kowloon to Hongkong, and came into being in 1887 as a preventive measure to check smuggling (of opium and salt particularly) at the free port of Macao, where trade was free from customs duties or supervision. The Lappa customs station is controlled by the Inspectorate-General of Customs and has its head office in Macao. It is merely a "toll-gate" in the trade of the Canton area.

The total Maritime Customs revenue at Lappa in 1924 amounted to Hk.Tls. 270,932. In 1924 the Net Foreign Imports were 21,886,173; Net Chinese Imports, 506,506; Exports, 5,005,788; Total Hk. Tls. 27,398,467. (*See* MACAO.)

LAPPARENT, ALBERT AUGUSTE COCHON DE (1839–1908), French geologist, was born at Bourges on Dec. 30, 1839, and died in Paris on May 5, 1908. He studied at the École Polytechnique (1858–60), became *ingénieur au corps des mines,* and helped to draw up the geological map of France; in 1875 he became professor of geology and mineralogy at the Catholic institute, Paris. In 1879 he prepared an important memoir for the geological survey of France on *Le Pays de Bray,* and in 1880 he served as president of the French Geological society. In 1881–83 he published his *Traité de géologie* (5th ed., 1905), the best European text-book of stratigraphical geology.

His other works include *Cours de minéralogie* (1884, 3rd ed., 1899), *La Formation des combustibles minéraux* (1886), *Le Niveau de la mer et ses variations* (1886), *Les Tremblements de terre* (1887), *La Géologie en chemin de fer* (1888), *Précis de minéralogie* (1888), *Le Siècle du fer* (1890), *Les Anciens Glaciers* (1893), *Leçons de géographie physique* (1896), *Notions générales sur l'écorce terrestre* (1897), *Le Globe terrestre* (1899), and *Science et apologétique* (1905).

LAPPENBERG, JOHANN MARTIN (1794–1865), German historian, was born on July 30, 1794 at Hamburg, and died there on Nov. 28, 1865. From 1823 to 1863 he was keeper of the Hamburg archives; an office in which he had the fullest opportunities for laborious and critical research work. In 1850 he represented Hamburg in the German parliament at Frankfort. Lappenberg had studied at Edinburgh and London, and his most important work is his *Geschichte von England* (Hamburg, 2 vols., 1834–37), which deals with the history of England from the earliest times to 1154. It was translated into English by B. Thorpe as *History of England under the Anglo-Saxon Kings* (1845) and *History of England under the Norman Kings* (Oxford, 1857). His other works deal mainly with the history of Hamburg. For the *Monumenta Germaniae historica* he edited the *Chronicon* of Thietmar of Merseburg, the *Gesta Hammenburgensis ecclesiae pontificum* of Adam of Bremen and the *Chronica Slavorum* of Helmold, with its continuation by Arnold of Lübeck. Lappenberg, who was a member of numerous learned societies in Europe, wrote many other historical works.

See E. H. Meyer, *Johann Martin Lappenberg* (Hamburg, 1867); and R. Pauli in the *Allgemeine deutsche Biographie,* Band xvii. (Leipzig, 1883).

LAPRADE, PIERRE MARTIN VICTOR RICHARD DE (1812–1883), known as VICTOR DE LAPRADE, French poet and critic, was born at Montbrison (Loire). After completing his studies at Lyons, he produced in 1839 a small volume of religious verse, *Les Parfums de Madeleine.* This was followed in 1840 by *La Colère de Jésus,* in 1841 by the religious fantasy of *Psyché,* and in 1844 by *Odes et poèmes.* In 1845 Laprade visited Italy on a mission of literary research, and in 1847 he was appointed professor of French literature at Lyons. In 1857 he was elected to the Academy. In 1861 he lost his post at Lyons on account of a political satire in verse (*Les Muses d'État*), and in 1871 took his seat in the National Assembly on the benches of the Right. He died on Dec. 13, 1883. Laprade wrote *Poèmes évangéliques* (1852), *Pernette* (1868), *Le Livre d'un père* (1877), *Varia* and *Livre des adieux* (1878–79); and other volumes of verse, which were collected as *Oeuvres poétiques* in 1878–81 (6 vols.). His *Questions d'art et de morale* (1861) was followed by other works on aesthetics. As a poet Laprade belonged to the school of Chateaubriand and Lamartine.

See J. Condamin, *La vie et les oeuvres de Victor de Laprade* (1886).

LAPSE, in law, a term used in several senses. (1) In ecclesiastical law, when a patron has neglected to present to a void benefice within six months next after the avoidance, the right of presentation is said to lapse (*see* ADVOWSON). (2) The failure of a testamentary disposition in favour of any person, by reason of the decease of its object in the testator's lifetime, is termed a lapse. (*See* LEGACY; WILL.)

LAPWING, GREEN PLOVER or PEEWIT (*Vanellus vanellus*), a common bird of the plover family, breeding throughout the temperate Old World; it is migratory in the northern part of its range, reaching India and N. Africa in winter. The plumage is bottle-green above and white below, with a black erectile crest and bay tail-coverts. The wings are broad and rounded, and the flight rapid but leisurely. It runs swiftly.

The nest is a mere scrape on the ground, and in it are placed four pointed brown eggs, spotted with black. So closely do they resemble the surroundings, that only an expert can find them without a long search. These are the "plovers' eggs" of commerce, though the eggs of the redshank, golden plover and black-headed gull are also sold under this name. During courtship the male makes a number of nest-scrapes and also performs a special flight ending in an aerial somersault. The lapwing is now protected in many parts of Great Britain by act of Parliament. The food consists very largely of wireworms, leather-jackets and other injurious insects, so that this bird is one of the best friends of the farmer.

LARA, western State of Venezuela, lying in the angle formed by the parting of the N. and N.E. ranges of the Cordillera de Mérida and extending N.E. with converging frontiers to the Caribbean. Pop. (1926) 271,369. The greater part of its surface is mountainous, with elevated fertile valleys which have a temperate climate. The Tocuyo river rises in the S.W. angle of the State and flows N.E. to the Caribbean with a total length of 287 miles. A narrow-gauge railway, the "South-western," owned by British capitalists, runs from the port of Tucacas 55 m. S.W. to Barquisimeto by way of the Aroa copper-mining district. Lara produces wheat and other cereals, coffee, sugar, tobacco, cattle and sheep and various mineral ores, including silver, copper, iron, lead, bismuth and antimony. The capital, Barquisimeto, pop. (1926) 23,100, is one of the most progressive of the inland cities of Venezuela. Carora is also prominent as a commercial centre. Tocuyo (pop. 23,109 in 1926), 40 m. S.W. of Barquisimeto, is an important commercial and mining town, over 2,000 ft. above sea-level, in the midst of a rich agricultural and pastoral region. Yaritagua (pop. about 12,000), 20 m. E. of Barquisimeto, and 1,026 ft. above the sea, is known for its cigar manufactories.

LARACHE (EL ARAISH—THE VINE-ARBOURS), a port in northern Morocco, on the Atlantic coast, in the Spanish zone, in Lat. 35° 13′ N., in Long. 6° 9′ W., 43 m. by sea S. by W. of Tangier, on the left bank of the estuary of the Lukkos. The old town, surrounded by ruins, rises in terraces up to forts which dominate it on the north and south. The Spanish quarter has grown both towards the port and on the coastal plateau to the south-west and on the north-west. Gardens and orchards stretch along above the left bank of the Lukkos, which describes wide meanders in its valley. The most interesting buildings are the ancient fortress of the Kibibat (the little domes) and the fort of La Cigogne (late 16th century) built by the Portuguese. The port has a jetty that prolongs the right bank of the river, quays with modern equipment and warehouses, and a lighthouse at the end of the jetty. The water at the entrance varies in depth at high water from 10 to about 20 ft., according to the magnitude of the tide. Cork, beans, bird-seed, wool, etc., are exported and European goods imported.

The town is the centre of a Spanish circumscription; it has some 15,000 inhabitants, of whom 7,000 are Muslim, 3,000 are Jews, and 5,000 are Europeans, nearly all Spanish. A narrow gauge light railway connects the town with El Kasr (Kasr-el-Kebir).

Larache corresponds to the ancient Lixus, of which the ruins are to be seen at Tchemmich, 3 km. above the port, on the right bank of the Lukkos. The ancients placed there the garden of the Hesperides, the golden apples of which may have been oranges. It was an important Phoenician settlement and, under the Romans, an imperial colony which reached its zenith in the days of Claudius. Larache belonged to Spain from 1610–89 and was later reconquered by Moulay-Ismaïl. It was bombarded by the French in 1765 and by the Spaniards in 1860. Spain regained possession of it in 1912.

LARAMIE (lăr′ą-mĭ), city, south-eastern Wyoming, U.S.A., on the Laramie river, 40 m. W.N.W. of Cheyenne; county seat of Albany county and the seat of the State university. It is a district division point on the Union Pacific, and is served also by the Laramie, North Park and Western railway; is on the Lincoln and the Rocky Mountain highways; and has a lighted aviation field. The population in 1925 (State census) was 9,629. The city lies on the Laramie plains, 7,145 ft. above sea-level, surrounded on three sides by picturesque mountains. It is a supply and shipping point for a wide area, with varied industries: cattle-raising (notably registered Herefords), sheep husbandry, lumbering (in the Medicine Bow national forest), general farming, mining and (since 1919) the production of oil, in the Rock Creek, Rex Dome and other fields. In the city are oil refineries, cement and plaster mills, railroad shops, a tie-preserving plant, the largest icing plant on the Union Pacific system and many smaller industries. Freight handled here by the Union Pacific amounts to 5,600,000 tons annually. Receipts at the stock-yards (the largest on the Union Pacific lines) include 2,500,000 sheep, 1,000,000 cattle and 150,000 hogs. Ten miles south is the State fish hatchery; 30 m. W. is the Medicine Bow national forest (552,174 ac.); 12 m. E. is the Pole Mountain Military reservation (a part of the forest). In every direction are opportunities for fishing and hunting, including big game and wild ducks, in their respective seasons. The University of Wyoming (established 1886) includes the State colleges of agriculture, engineering and education, and the agricultural experiment station, as well as the colleges of liberal arts, law, commerce and music. Its summer school is especially popular (enrolment, 1,500) because of the climate and delightful surroundings.

City, river, plains and mountains take their name from Jacques de La Ramie, a fur trader of the region (d. 1821). Laramie was on the Overland Trail and the route of the Pony Express. It was settled in 1868; chartered by Dakota the same year and by Wyoming in 1873. Bill Nye here established his *Boomerang,* and wrote the articles for the Cheyenne and Denver newspapers which made his reputation as a humorist.

LARBAUD, VALERY (1881–), French novelist and critic, made his reputation with *A. O. Barnabooth* (1913), the story of a South American millionaire in search of the absolute, who wants to find the means whereby the outer and the inner man may be at peace. This gives the frame for the description of a whimsical and ironical personage, and for much acute comment on contemporary life, art and mannerisms in various countries. Larbaud himself admits that in his *Amants, heureux amants* (10th ed. 1923), he was greatly influenced by James Joyce. *Enfantines* (1918) is a study of childhood, *Fermina Marquez* (1920) of adolescence.

His other works include: *Ce Vice impuni, la lecture* (1925); *Notes sur Maurice Scève* (1926); *Notes sur Antoine Héroët* (1927).

LARBERT, parish and town, Stirlingshire, Scotland. Pop. (1921), 4,568. The town is situated on the Carron, 8 m. S. by E. of Stirling by the L.N.E. and L.M.S. railways, an important junction for traffic from the south by the West Coast (L.M.S.) route. Coal-mining is the chief industry and there are iron-foundries and saw mills. The principal buildings are the church, finely placed overlooking the river, the Stirling district asylum and the Scottish National Institution for imbecile children. In the churchyard is a monument to James Bruce, the Abyssinian traveller, who was born and died at Kinnaird House, 2½ m. N.E. Two miles N. by W. are the ruins of Torwood castle and the remains of Torwood forest, to which Sir William Wallace retired after his defeat at Falkirk (1298). The fragment of an old round building is said to be the relic of one of the very few "brochs," or round towers, found in the Lowlands.

LARCENY, in English law, is the unlawful taking and carrying away of things personal with intent to deprive the rightful owner of the same, and is now described by the statute in force as "stealing." The term *theft,* sometimes used as a synonym of larceny, is in reality a broader term, applying to all cases of depriving another of his property whether by removing or withholding it, and includes larceny, robbery, cheating, embezzlement, breach of trust, etc.

Larceny is, in modern legal systems, universally treated as a crime, but the conception of it as a crime is not one belonging to the earliest stage of law. To its latest period Roman law regarded larceny or theft (*furtum*) as a delict *prima facie* pursued by a civil remedy—the *actio furti* for a penalty, the *vindicatio* or

condictio for the stolen property itself or its value. In later times, a criminal remedy to meet the graver crimes gradually grew up by the side of the civil, and in the time of Justinian the criminal remedy, where it existed, took precedence of the civil.

Under the common law of England larceny was a felony. It was affected by numerous statutes. A very large number of the old acts are named in the repealing act of 1827. An act of the same date removed the old distinction between grand and petit larceny. The former was theft of goods above the value of 12 pence, in the house of the owner, not from the person, or by night, and was a capital crime. It was petit larceny where the value was 12 pence or under, the punishment being imprisonment or whipping. In 1861 the Larceny Act of that year was passed, but many of its sections have been superseded by the Larceny Act, 1916.

Larceny Act of 1916.—By its first section it defines the offence of stealing (larceny). This definition makes no change in the law, but for the first time it puts into statutory form the various definitions that have been given of the offence, both at common law and in some acts of parliament. It provides:

"(1). A person steals who, without the consent of the owner, fraudulently and without a claim of right made in good faith, takes and carries away anything capable of being stolen with intent, at the time of such taking, permanently to deprive the owner thereof: Provided that a person may be guilty of stealing any such thing notwithstanding that he has lawful possession thereof, if, being a bailee or part owner thereof, he fraudulently convèrts the same to his own use or the use of any person other than the owner. (2). (i.) The expression 'takes' includes obtaining the possession—(*a*) by any trick; (b) by intimidation; (*c*) under a mistake on the part of the owner with knowledge on the part of the taker that possession has been so obtained; (*d*) by finding, where at the time of the finding the finder believes that the owner can be discovered by taking reasonable steps; (ii.) the expression 'carries away' includes any removal of anything from the place which it occupies, but in the case of a thing attached, only if it has been completely detached; (iii.) the expression 'owner' includes any part owner, or person having possession or control of, or a special property in, anything capable of being stolen. (3). Everything which has value and is the property of any person, and if adhering to the realty then after severance therefrom, shall be capable of being stolen: Provided that—(*a*) save as hereinafter expressly provided with respect to fixtures, growing things, and ore from mines, anything attached to or forming part of the realty shall not be capable of being stolen by the person who severs the same from the realty, unless after severance he has abandoned possession thereof; and (*b*) the carcase of a creature wild by nature and not reduced into possession while living shall not be capable of being stolen by the person who has killed such creature, unless after killing it he has abandoned possession of the carcase."

Forms of Larceny.—By the second section, stealing, for which no special punishment is provided under any act, is declared to be simple larceny and a felony punishable with penal servitude for any term not exceeding five years, and the offender, if a male under the age of 16 years, may be once privately whipped. Then follows a catena of sections (3–17) dealing with various forms of larceny and prescribing the punishments. They deal with larceny of horses and cattle; killing animals with intent to steal; larceny, after previous summary conviction, of dogs; larceny of wills; larceny of documents of title to lands and other legal documents; damaging fixtures, trees, etc., with intent to steal; larceny of goods in process of manufacture; abstracting of electricity; larceny of ore from mines; larceny of postal packets, etc.; larceny in dwelling-houses; larceny from the person; larceny from ships, docks, etc.; larceny by tenants or lodgers; larceny by clerks or servants. All, with the exception of larceny of dogs, after previous conviction, which is declared to be a misdemeanour punishable by imprisonment, with or without hard labour, for 18 months, are felonies, and the punishments vary from penal servitude for life in the cases of the larceny of wills or mail bags, to two years' imprisonment in the case of larceny of ore. Gas and water may also be the subject of larceny.

Questions of larceny at common law often arose where the relationship of husband and wife existed, and the matter was first dealt with by statute by the Married Women's Property Act, 1882. Now, by sec. 36 of the Larceny Act, 1916, a wife has the same remedies and redress for the protection and security of her own separate property as if such property belonged to her as a feme sole: Provided that no proceedings may be taken by a wife against her husband while they are living together as to or concerning any property claimed by her, nor while they are living apart as to or concerning any act done by the husband while they were living together concerning property claimed by the wife, unless such property has been wrongfully taken by the husband when leaving or deserting or about to leave or desert his wife. A wife doing an act with respect to any property of her husband which, if done by the husband in respect to property of the wife, would make the husband liable to criminal proceedings by the wife, is in like manner liable to criminal proceedings by her husband. The effect of this section and the proviso was considered by the Court of Criminal Appeal in *Rex* v. *Creamer* (26 Cox, C. C. 393).

At common law a joint owner of a chattel could not be guilty of larceny. Partnership property was dealt with by a statute, and now, by sec. 40 (4) of the Larceny Act, 1916.

Scotland.—A vast number of acts of the Scottish parliament dealt with larceny. The general policy of the acts was to make larceny what was not larceny at common law, *e.g*, stealing fruit, dogs, hawks or deer, and to extend the remedies, *e g*, by giving the justiciar authority throughout the kingdom, by making the master in the case of theft by the servant liable to give the latter up to justice, or by allowing the use of fire-arms against thieves. The general result of legislation in England and Scotland has been to assimilate the law of larceny in both kingdoms. As a rule, what would be larceny in one would be larceny in the other.

Stolen Goods.—In English law, various points of importance arise in connection with chattels which have been the subject of larceny and have not been returned to the possession of their owner. The owner of the goods stolen has an action against the thief for the goods or their value. How far he is entitled to pursue his civil right to the exclusion of criminal prosecution does not seem very clear upon the authorities, but see *Midland Insurance Co.* v. *Smith* (1881, L.R. 6, Q.B D., 568).

Receiving Stolen Property.—Formerly a misdemeanour at common law, this is now governed by the Larceny Act, 1916, which, by section 33, provides that every person who receives any property knowing the same to have been stolen or obtained in any way whatsoever under circumstances which amount to felony or misdemeanour shall be guilty of an offence of the like degree (whether felony or misdemeanour) and on conviction thereof liable—(*a*) in the case of felony, to penal servitude for any term not exceeding 14 years; (*b*) in the case of misdemeanour, to penal servitude for any term not exceeding seven years; (*c*) in either case, if a male under the age of 16 years, to be once privately whipped in addition to any punishment to which he may by law be liable. Receiving a mail bag or postal packet is made an equal felony with stealing Every receiver may be indicted and convicted, whether the principal offender has or has not been previously convicted, or is or is not amenable to justice, and every person who, without lawful excuse, knowing the same to have been stolen or obtained in any way whatsoever under such circumstances that if the act had been committed in the United Kingdom the person committing it would have been guilty of felony or misdemeanour, receives or has in his possession any property so stolen or obtained outside the United Kingdom, is guilty of an offence of like degree.

Under the same act (sec. 42) a justice may issue a search warrant, and by sec. 43, whenever any person is being proceeded against for receiving any property, knowing it to have been stolen, or for having in his possession stolen property, for the purpose of proving guilty knowledge there may be given in evidence at any stage of the proceedings—(*a*) the fact that other property stolen within the period of 12 months preceding the

date of the offence charged was found or had been in his possession; (*b*) on certain conditions, the fact that within the five years preceding the date of the offence charged he was convicted of any offence involving fraud or dishonesty.

Restitution of Stolen Property.—For the general law as to the civil rights and liabilities of the owner and third parties in respect of stolen goods, *see* SALE OF GOODS.

Compounding Theft.—As to compounding offences and corruptly taking rewards, compounding theft, or *theftbote* (*redemptio furti*), that is, taking back stolen goods or receiving compensation on condition of not prosecuting, is a misdemeanour at common law. It need not necessarily be committed by the owner of the goods. Under sec. 34 of the Larceny Act, 1916, it is a felony punishable by seven years' penal servitude to take money or reward corruptly for helping to recover stolen goods without using all due diligence to bring the offender to trial. By sec. 102 of the Larceny Act, 1861, to advertise or print or publish any advertisement offering a reward for the return of stolen goods, and using any words purporting that no questions will be asked, etc., renders the offender liable to a penalty of £50. This penalty must, by the Larceny (Advertisements) Act, 1870, be sued for within six months, and the assent of the attorney-general is necessary. Various acts provide for the liabilities of pawnbrokers, publicans, marine-store dealers and others into whose possession stolen goods come. (*See* also EMBEZZLEMENT; FALSE PRETENCES; ROBBERY.) (W. DE B. H.)

UNITED STATES

As the common law of the United States had its source in English precedents, the fundamental principles as to larceny are similar. They have, however, been altered and extended by statute and decision in every State to a widely varying degree. The common law requirement of asportation, for example, has been abolished by statute in Texas, while the courts in other States disagree as to what amounts to asportation. Legislation has dealt also with the requirement that the property be taken from the "possession" of another, but the principle is still difficult of application in some circumstances and the problem has not been consistently or even generally obviated Various dealings with property which are not larceny, nor even criminal, at common law—such, *e.g.*, as embezzlement, theft of growing fruit, unauthorized taking of an automobile without intent permanently to deprive the owner thereof—have been made criminal by statute to some extent in every State and have frequently been either denominated larceny or made chargeable as larceny. A distinction between grand and petit larceny is still commonly recognized in legislation as affecting the amount or character of punishment, the jurisdiction of courts, powers of arrest, or other matters, but the diacritical value varies both in the different States and in some States according to the different objectives. Thus in New York the crime is divided into grand larceny in the first degree, punishable by a maximum of 10 years' imprisonment; grand larceny in the second degree, 5 years; petit larceny, 1 year. The division points are in general $500 and $50, but theft of property of less than $50 may be grand larceny in the first degree under some circumstances. In Michigan there are no degrees of larceny and the terms "grand" and "petit" are ignored in the statutes, but the circumstances or a value of over $25 determine the punishment. American statutes making the possession of certain things unlawful—notably the National Prohibition Act declaring that no property right shall exist in unlawfully possessed liquor—give greater importance in that country than in England to the question of whether one can be convicted of larceny for the theft of chattels which are incapable of lawful possession. By strictly legalistic reasoning one inferior court came to the decision that larceny of such things is impossible, but the great weight of authority holds the taker guilty of larceny. Because there is no common law of the United States as a nation, larceny as a crime against the Federal Government is wholly statutory. Congressional legislation has been confined to particular situations such as the theft of goods in interstate commerce, or in the possession of certain officials, etc.

(J. B. WA.)

LARCH, a name applied to a small group of coniferous trees of the class Gymnosperms. The members of the genus *Larix* are distinguished from the firs by their deciduous leaves, scattered singly on the young shoots of the season, but on all older branchlets growing in whorl-like tufts, each surrounding the extremity of a rudimentary or abortive branch; they differ from cedars (*Cedrus*) not only in the deciduous leaves, but in the cones, the scales of which are thinner and persistent. There are about 10 species, natives of Europe, or the northern plains and mountain ranges of Asia and North America, though one (*Larix Griffithii*) occurs only on the Himalayas.

The common European larch (*L. europaea*) is a stately tree with tall erect trunk, gradually tapering from root to summit, and horizontal branches springing at irregular intervals from the stem, and in old trees often becoming more or less drooping, but rising again towards the extremities; the branchlets or side shoots, very slender and pendulous, are thickly studded with the spurs, each bearing a fascicle of 30 or more narrow linear leaves, of a peculiar bright light green when they first appear in the spring, but becoming of a deeper hue when mature. The erect, oblong cones, which remain long on the branches, are about 1 in. long, with reddish-brown scales. The tree flowers in April or May, and the winged seeds are shed the following autumn. In the common European varieties the bark is reddish-grey, and rather rough and scarred in old trees. The trunk attains a height of from 80 to 140 ft., with a diameter of from 3 to 5 ft. near the ground, but in close woods is comparatively slender.

The larch abounds on the Alps of Switzerland, on which it flourishes at an elevation of 5,000 ft., and also on those of Tirol and Savoy, on the Carpathians, and in most of the hill regions of central Europe. It forms extensive woods in Russia, but does not extend to Scandinavia, though the tree grows freely in Norway and Sweden where planted, and even appears to multiply itself by self-sown seed. The larch, from its lofty straight trunk and the high quality of its wood, is one of the most important of coniferous trees; its growth is extremely rapid, the stem attaining a large size in from 60 to 80 years, while the tree yields good useful timber at 40 or 50 years. The wood of large trees is compact in texture, in the best varieties of a deep reddish colour varying to brownish-yellow.

When well prepared for use, larch is one of the most durable of coniferous woods. Its strength and toughness render it valuable for naval purposes; its freedom from any tendency to split adapts it for clinker-built boats. It is much employed for house-building; most of the picturesque log-houses in Vaud, Switzerland, and the adjacent cantons are built of squared larch trunks, and derive their fine brown tint from the hardened resin that slowly exudes from the wood after long exposure to the summer sun. It answers well for fence-posts and river piles; many of the foundations of Venice rest upon larch, the lasting qualities of which were well known and appreciated, not only in medieval times, but in the days of Vitruvius and Pliny.

In the trunk of the larch, where the sun is powerful in summer, a fine clear turpentine exists in great abundance; in Savoy and the south of Switzerland, it is collected for sale, though not in such quantity as formerly, when, being taken to Venice for shipment, it was known in commerce as "Venice turpentine." Real larch turpentine is a thick tenacious fluid, of a deep yellow colour, and nearly transparent; it does not harden by time; it contains 15% of the essential oil of turpentine, also resin, succinic, pinic and sylvic acids, and a bitter extractive matter.

The larch, though mentioned by Parkinson in 1629 as "nursed up" by a few "lovers of variety" as a rare exotic, does not seem to have been much grown in England till early in the 18th century. It grows as rapidly and attains as large a size in British habitats suited to it as in its home on the Alps, and often produces equally good timber. The European larch has long been planted in the eastern United States for ornament and to a limited extent for timber. The Japanese larch (*L. Kaempferi*) is also widely planted. This Oriental species attains a height of 90 ft.; it has short, horizontal branches, greyish bark, soft bluish-green leaves marked with two white bands beneath, and ovoid cones ½ in. to 1½ in. long.

The golden larch (*Pseudolarix amabilis*) is a beautiful ornamental tree planted for its light-green feathery foliage, which turns yellow in autumn. It is native to eastern China, where it grows to a height of 130 ft., and differs from the true larches in having larger cones with deciduous scales, longer and broader leaves, and pendulous clusters of staminate flowers.

In North America there are three native species of larch. Of these the most widely distributed is the American larch (*L. laricina*), commonly called tamarack, known also as hackmatack and to the French Canadians as *épinette rouge*. It attains a height of 50 ft. to 60 ft. and a trunk diameter of 1½ ft., and resembles the European larch, but has much smaller cones. The tamarack grows from Newfoundland and Labrador north-westward to Mackenzie, where it extends in dwarf forms to the Arctic ocean, and also in western Alaska. It occurs sparingly southward to West Virginia, northern Indiana, Minnesota and the eastern base of the Rocky Mountains in Alberta. At the south it is found only in deep cold swamps, but at the north it often grows on well-drained uplands. The tamarack reaches its greatest size north of Lake Winnipeg and is the largest tree in Labrador. The hard, strong, durable wood is put to numerous uses, as for railway-ties, telegraph-poles and fence-posts.

The largest North American species is the western larch (*L. occidentalis*); this sometimes grows 250 ft. high, with a tapering, naked trunk, 6 ft. to 8 ft. in diameter, terminating in a short narrow pyramidal head of fine branches. It occurs, usually at from 2,000 ft. to 7,000 ft. altitude, from southern British Columbia to northern Oregon and eastward to Montana. The heavy, close-grained, very durable, light red wood is suitable for many uses. In 1925 the total lumber cut of western larch was 286,459,000 bd.ft., valued at the mill at $5,127,876. The alpine larch (*L. Lyallii*), a tree, usually 40 ft. to 50 ft. high, is restricted to a narrow belt near the timber line on high mountains from southern British Columbia and Alberta to Oregon and Montana.

LARCIUS (less accurately LARTIUS), **TITUS,** probably surnamed FLAVUS, a member of an Etruscan family (*cf.* Lars Porsena) early settled in Rome. When consul in 501 B.C. he was chosen dictator (the title and office being then introduced for the first time) to command against the thirty Latin cities, which had sworn to reinstate Tarquin in Rome. Other authorities put the appointment three years later, when the plebeians refused to serve against the Latins until they had been released from the burden of their debts. He opposed harsh measures against the Latins, and also interested himself in the improvement of the lot of the plebeians. His brother, Spurius, is associated with Horatius Cocles in the defence of the Sublician bridge against the Etruscans.

See Livy ii. 10, 18, 21, 29; Dion. Halic. v. 50–77, vi. 37; Cicero, *De Re Publica*, ii. 32.

LARD, the melted and strained fat of the common hog. Properly it is prepared from the "leaf" or fat of the bowel and kidneys, but in commerce the term as applied to products which include fat obtained from other parts of the animal and sometimes containing no "leaf" at all. Lard of various grades is made in enormous quantities by the great pork-packing houses at Chicago and elsewhere in America. "Neutral lard" is prepared at a temperature of 40°–50°C. from freshly killed hogs; the finest quality, used for making oleomargarine, is got from the leaf, while the second, employed by biscuit and pastry bakers, is obtained from the fat of the back. Steam heat is utilized in extracting inferior qualities, such as "choice lard" and "prime steam lard," the source of the latter being any fat portion of the animal. Lard is a pure white fat of a butterlike consistence; its specific gravity is about 0·93, its solidifying point about 27°–30°C., and its melting point 35°–45°C. It contains about 60% of olein and 40% of palmitin and stearin. Adulteration is common, the substances used including stearin both of beef and of mutton, and vegetable oils such as cotton seed oil: indeed, mixtures have been sold as lard that contain nothing but such adulterants. In the pharmacopoeia lard figures as *adeps* and is employed as a basis for ointments. Benzoated lard, used for the same purpose, is prepared by heating lard with 3% of powdered benzoin for two hours; it keeps somewhat better than ordinary lard, but has slightly irritant properties.

Lard oil is the limpid, clear, colourless oil expressed by hydraulic pressure and gentle heat from lard; it is employed for burning and for lubrication. Of the solid residue, lard stearine, the best qualities are utilized for making oleomargarine, the inferior ones in the manufacture of candles. (*See* OILS AND FATS.)

LARDNER, RING W. (1885–), American author and humorist, was born at Niles (Mich.), March 6, 1885. He received his education at the Niles high school and the Armour Institute of Technology, Chicago. He was a reporter on the South Bend (Ind.) *Times*, 1905–07, after which he spent four years in Chicago, contributing to the sporting columns of various newspapers there. He was editor of the *Sporting News*, St. Louis, 1910–11, and sporting writer for the Chicago *Tribune*, 1913–19, and later was connected with the Bell syndicate. His humour is based in part on its racy use of vernacular and the language of illiteracy. He has written a number of books, among which are *Bib Ballads* (1915); *You Know Me, Al* (1916); *Gullible's Travels* (1917); *Treat 'em Rough* (1918); *The Real Dope* (1919); *How to Write Short Stories* (1924); and *The Love Nest* (1926).

See T. L. Masson, *Our American Humorists* (1922).

LAREDO, a city of southern Texas, U.S.A., on the Rio Grande, opposite Nuevo Laredo, Mexico; a port of entry and the county seat of Webb county. It is the southern terminus of the Meridian highway; is served by the Missouri Pacific, the Rio Grande and Eagle Pass, and the Texas Mexican railways, the National railways of Mexico, and motor-bus lines to Corpus Christi, Mission, San Antonio and Monterrey, Mexico. A motor highway to Mexico City is under construction, and a municipal air port is contemplated. The population in 1920 was 22,710 (52% Mexicans) and was estimated locally at 40,000 in 1928.

Two international bridges cross the river here, with customs, immigration and health offices of the respective Governments at either end. About 50,000 immigrants enter the United States annually through this gateway, and it is estimated that 100,000 other visitors come to the city. The climate is dry, with an average annual rainfall of 18·51 in., and the winter temperature rarely falls below 42° F. Laredo is the American trade centre nearest the large markets of Mexico. Over 50% of the commerce across the Rio Grande passes through it, and the exports amount to about $40,000,000 annually. It is also an important shipping point for Bermuda onions, spinach and other winter and early spring vegetables (2,700 car-loads in recent years) to northern markets. Citrus fruits, figs, grapes, cotton, corn and alfalfa are other important crops of the region. There are 8,000 ac. of irrigated land along the river, just above and below the city, and a project is under way for irrigating 65,000 ac. more.

High grade cannel coal is mined 28 m. N.W. of Laredo. Natural gas was discovered about 28 m. E. in 1908, and the production now is 4,000,000,000 cu.ft. daily. The first oil well came in on April 17, 1921. At the end of 1928 there were 613 producing wells, and the daily production now averages 20,000 barrels. Bricks and Spanish tile are important manufactures. There are also several plants making Mexican products, a petroleum refinery, a cotton seed oil mill and other industries. Ft. McIntosh, a U.S. military post, is just west of the city.

Laredo and Nuevo Laredo were originally one Mexican town, named after the seaport in Spain. The first settlement was made about 1751 by Capt. Tomás Sánchez, and in 1767 a city charter of liberal character was secured. The part on the left bank of the river was captured in 1846 by a force of Texas Rangers, occupied by U.S. troops under Gen. Lamar in 1847, and chartered as a city of Texas in 1852. It remained a quaint, somnolent adobe town until the first railroad reached it in 1881. After that, growth was rapid. By 1880 the population was 11,319, and in the next 30 years it doubled. A new impetus was given by the discovery of oil in 1921.

LA RÉOLE, a town of south-western France, in the department of Gironde, on the right bank of the Gironde, 38 m. S.E. of Bordeaux by rail. Pop. (1926) 2,694. La Réole grew up round a monastery of the 7th or 8th century, reformed in the 11th cen-

tury under the name of *Regula,* whence that of the town. There are a church of the end of the 12th century and some of the buildings (18th century) of the abbey, a town hall of the 12th and 14th centuries, remains of the town fortifications from the 12th and 14th centuries, as well as a ruined château built by Henry II. of England. The town is the centre of the district in which the well-known breed of Bazadais cattle is reared. It is an agricultural market, trades in wine and makes liqueur, casks, rope, etc.

LARES, older form *Lases,* Roman tutelary deities (etymology unknown, possibly connected with *lascivus*). They were originally gods of the cultivated fields, worshipped by each household at the *compitum* or cross-roads where its allotment joined those of others (*see* below). Later, they were worshipped in the houses and the household Lar (*familiaris*) was conceived of as the centre-point of the family and of the family cult. The word itself (in the singular) came to be used in the general sense of "home." It is certain that originally each household had only one Lar; the plural was at first only used to include other classes of Lares, and only gradually, after the time of Cicero, ousted the singular. The image of the Lar stood in its special shrine (*lararium*) or niche, originally in the *atrium.* It was usually a youthful figure, dressed in a short, high-girt tunic, holding in one hand a *rhyton* (drinking-horn), in the other a *patera* (cup). Under the empire we find usually two of these, one on each side of the central figure of the Genius, Vesta, or some other deity. The whole group was called indifferently Lares or Penates. A prayer was said to the Lar every morning and offerings made at family festivals, such as the Caristia (*see* MANES, PENATES). On these occasions the Lares were crowned with garlands, and offerings of wine and incense, cakes and honey, and swine were laid before them. Their worship persisted throughout the pagan period.

The public Lares belonged to the State religion. Amongst these must be included, especially after the time of Augustus, the *Lares compitales.* Generally two in number, they were the presiding deities of the cross-roads (*compita*), where they had their special chapels. Their sphere of influence included not only the cross-roads, but the whole neighbouring district of the town and country in which they were situated. They had a special annual festival, called *Compitalia,* to which public games were added some time during the republican period. The colleges of freedmen and slaves, who assisted the presidents of the festival, were abolished by Julius Caesar, but revived by Augustus, who added to these Lares his own Genius (*q.v.*).

The State itself had its own Lares, called *praestites,* the protecting patrons and guardians of the city. They had a temple and altar on the Via Sacra, near the Palatine, and were represented on coins as men wearing the chlamys, carrying lances, seated, with a dog, the emblem of watchfulness, at their feet. Mention may also be made of the *Lares grundules,* whose functions are unknown; the *viales,* who protected travellers; the *permarini,* connected with the sea, to whom L. Aemilius Regillus, after a naval victory over Antiochus (190 B.C.), vowed a temple in the Campus Martius, which was dedicated by M. Aemilius Lepidus, the censor, in 179.

The above is the view of Wissowa and Warde Fowler; the older idea, that the Lares are ancestral ghosts, is still maintained by some, especially E. Samter.

LA RÉVELLIÈRE-LÉPEAUX, LOUIS MARIE DE (1753–1824), French politician, member of the directory, was born at Montaign (Vendée), on Aug. 24, 1753. A deputy to the states-general in 1789, he returned at the close of the session to Angers, where he sat on the council of Maine-et-Loire, and had to deal with the first Vendéen outbreaks. In 1792 he was returned to the Convention, and on Nov. 19 he proposed the famous decree by which France offered protection to foreign nations in their struggle for liberty. Proscribed with the Girondins in 1793 he was in hiding until the revolution of 9–10 Thermidor (July 27 and 28, 1794). After serving on the commission to prepare the new constitution he became successively president of the assembly, a member of the committee of public safety and president of the directory. He was in alliance with Jean François Rewbell but the greatest of his fellow-directors, Lazare Carnot, was the object of his undying hatred. He was bitterly hostile to the Christian religion, which he proposed to supplant by theophilanthropy, a religion invented by the English deist David Williams He was compelled to resign by the revolution of the 30th Prairial (June 18, 1799) and lived in retirement until his death on March 27, 1824. La Révellière's *Mémoires,* in which he took credit for the *coup d'état* of the 18th Fructidor (Sept. 4, 1797), must be read with caution.

The *Mémoires* were edited by R. D. D'Angers (3 vols., 1895). *See* also E. Charavay, *La Révellière-Lépeaux et ses mémoires* (1895), and A. Meynier, *Un Représentant de la bourgeoisie angevine* (1905).

LARGENTIÈRE, a town of south-eastern France, capital of an arrondissement in the department of Ardèche, in the valley of the Ligne, 29 m. S.W. of Privas by road. Pop. (1926) 1,491. A church of the 12th, 13th and 15th centuries and the old castle of the bishops of Viviers, lords of Largentière, now used as a hospital, are the chief buildings. The town is the seat of a sub-prefect and of a tribunal of first instance; and has silk-mills, and carries on silk-spinning, wine-growing and trade in fruit and silk. It owes its name to silver-mines worked in the vicinity in the middle ages.

LARGILLIÈRE, NICOLAS (1656–1746), French painter, was born at Paris on Oct. 20, 1656. His father, a merchant, took him to Antwerp at the age of three. He was the pupil of Goubeau in Antwerp and at the age of 18 went to England, where he was befriended by Lely, who employed him for four years at Windsor. His skill attracted the notice of Charles II., who wished to retain him in his service, but the fury aroused against Roman Catholics by the Rye House plot alarmed Largillière, and he went to Paris, where he was well received by Le Brun and Van der Meulen In spite of his Flemish training, his reputation as a portrait-painter was soon established; his brilliant colour and lively touch attracted the celebrities of the day—actresses, public men and popular preachers flocking to his studio. Huet, bishop of Avranches, Cardinal de Noailles, the Duclos and President Lambert, with his wife and daughter, are amongst his most noted subjects. In 1686 he was received by the Academy as a member, and presented as his diploma picture the fine portrait of Le Brun, now in the Louvre. He was received as an historical painter; but, although he occasionally produced works of that class ("Crucifixion," engraved by Roettiers), and also treated subjects of still life, it was in portraits that he excelled. Several of his works are at Versailles. The church of St. Étienne du Mont at Paris contains the finest example of Largillière's work when dealing with large groups of figures; it is an *ex voto* offered by the city to St. Geneviève, painted in 1694, and containing portraits of all the leading officers of the municipality. Largillière passed through every post of honour in the Academy, until in 1743 he was made chancellor. He died on March 20, 1746.

LARGO (It. *broad*), musical term signifying that the style of performance is to be slow, broad and dignified. Also the name for a piece in this style, such as the famous arrangement of Handel's *Ombra mai fu,* from the opera *Lerse.*

LARGS, police burgh and watering place, Ayrshire, Scotland. Pop. (1921) 9,450. It is situated 43 m. W. by S. of Glasgow by the L.M.S. railway. Its fine beach and dry, bracing climate attract many residents and summer visitors. Skelmorlie Aisle, the sole relic of the old parish church of St. Columba, was converted into a mausoleum in 1636. Near it a mound covers remains, possibly those of the Norwegians who fell in the battle (1263) between Alexander III. and Haco, king of Norway. The harbour is used mainly by Clyde passenger steamers and yachtsmen. From the quay a broad esplanade has been constructed northwards round the bay.

LARGUS, SCRIBONIUS, court physician to the Emperor Claudius, drew up (about A.D. 47) a list of 271 prescriptions (*Compositiones*), most of them his own. The greater part of it

was transferred without acknowledgment to the work of Marcellus Empiricus (*c.* 410), *De Medicamentis Empiricis, Physicis, et Rationabilibus*. *See* the ed. of the *Compositiones* by G. Helmreich (Teubner series, 1887).

LARIDAE: *see* GULL; TERN.

LARINO, a town and episcopal see of the Molise (province of Campobasso), Italy (anc. *Larinum*), 32 m. north-east of Campobasso by rail (20 m direct), 984 ft. above sea-level. Pop. (1921) 6,734. The cathedral, completed in 1319, has a good Gothic façade. The campanile rests upon a Gothic arch erected in 1451. The Palazzo Comunale has a courtyard of the 16th century. The ancient town, enclosed by megalithic walls, lay east of the modern, and was at first called Frenter. It was destroyed in 218 B.C. by the Romans, and rebuilt under the name of Ladinod (found on its coins). It lay in the 2nd Augustan region (Apulia), but the people belonged to the Frentani by race. Its strong position gave it importance in the military history of Italy from the Hannibalic wars onwards. The town was situated on the main road to the south-east, which left the coast at Histonium (Vasto) and ran from Larinum east to Sipontum. From Larinum a branch road ran to Bovianum Vetus. Remains of its amphitheatre and of baths, etc., exist, and it did not cease to be inhabited until after the earthquake of 1300, when the modern city was established.

LARISSA (anc. LARISA), the chief town of the department of Larissa in Thessaly, on the Salambria river (anc. Peneios) 35m. N.W. of Volo, with which port, and with Athens and Salonika, it is connected by rail. Pop. (1920 and 1923 estimate) 27,390. In early Greek history, when Thessaly was dominated by a few powerful clans, Larissa was the seat of the Aleuadae who until 369 B.C. furnished the commander-in-chief (*tagos*) of the Thessalian levies. Their rivals, the Scopadae, held Crannon ("Old Larissa") about 14m. south-west. The instability of Larissa as a city state was proverbial; in the 5th century, and under Philip V. of Macedon, it was short of citizens. It supported Athens in the Peloponnesian War, and its strategical position gave it importance to Macedonians, Romans and, more recently, to Turks. Since the 15th century it has been the seat of an archbishop, who has now 15 suffragans. Till 1881, when Thessaly was annexed to the Greek kingdom, it was the seat of a pasha in the vilayet of Jannina, and a military centre. During the Greek War of Independence it was headquarters of Ali Pasha: descendants of his Sudani troops occupied a suburb till recently, and till 1920 most of the inhabitants were still Turks, though many left in 1881, and after the Greco-Turkish War of 1897. There are four mosques, and large Muslim cemeteries.

Larissa was a common place name in Greece and Western Asia Minor: probably it meant a "citadel," and was so applied at Argos. Another Thessalian *Larissa* (*cremaste*, "suspended," or *Pelasgia* [*Strabo* 440]) lay high on the slope of Mt. Othrys.

LARISTAN, an extensive district in the south-east of the province of Fars in Persia, extending on the south to the shores of the Persian gulf The name has not now the political significance it had in former times when, for a long period, Laristan was a quasi-independent State. The last Khan was deposed and put to death by Shah Abbas I. The district consists largely of mountains and arid uplands with a narrow belt of coastal plain which in places is swampy and saline. It is very sparsely peopled by Persians in the interior and Arabs in the maritime plains and is one of the least productive parts of Persia, having a most scanty rainfall which for drinking purposes is collected in cisterns. Sulphur and ironstone are found on the coast and elsewhere and other minerals are possibly present, but almost certainly not in exploitable quantities. A noted local product is the condiment named *mahiabeh* (fish-jelly) a compound of pounded small sprat-like fish, salt, mustard, nutmeg, cloves and other spices, used as a relish with nearly all foods. It is somewhat similar to the compound of dried locusts, red pepper and honey which is made in Oman and is greatly prized. Lar, the chief town, in 27° 43′ N., 54° 24′ E., at an elevation of 3,000 ft., is situated 180 m S.E. of Shiraz, on a caravan track from the coast at Bandar Abbas. Once a flourishing place with a population of 50,000 in the early part of the 18th century, its inhabitants to-day probably number fewer than 10,000. (P. Z. C.)

LARIVEY, PIERRE (*c.* 1550–1612), French dramatist, belonged to a family of Italian origin, established at Troyes, which had gallicized its name from Giunta to L'Arrivey. Pierre Larivey appears to have cast horoscopes, and to have acted as clerk to the chapter of the church of St. Etienne, of which he eventually became a canon. Larivey was not the originator of French comedy, but he naturalized the Italian comedy of intrigue in France. He adapted, rather than translated, 12 Italian comedies into French prose. The first volume of the *Comédies facétieuses* appeared in 1579, and the second in 1611. Only nine in all were printed. The licence of the manners depicted in these plays is matched by the coarseness of the expression. Larivey's merit lies in the use of popular language in dialogue, which often rises to real excellence, and which was not without influence on Molière and Regnard. Molière's *L'Avare* owes something to the scene in Larivey's masterpiece, *Les Esprits*, where Séverin laments the loss of his purse, and the opening scene of the piece seems to have suggested Regnard's *Retour imprévu*. It is quite likely that Molière may have played in some of Larivey's pieces while he was touring the provinces. Larivey was the author of many translations, varying in subject from the *Facétieuses nuits* (1573) of Straparola to the *Humanité de Jésus-Christ* (1604) from Pietro Aretino. The nine comedies printed were: *Le Laquais*, from the *Ragazzo* of Ludovico Dolce; *La Veuve*, from the *Vedova* of Nicolo Buonaparte; *Les Esprits*, from the *Aridosio* of Lorenzino de Medicis; *Le Morfondu*, from the *Gelosia* of Antonio Grazzini; *Les Jaloux*, from the *Gelosi* of Vincent Gabbiani; and *Les Escolliers*, from the *Cecca* of Girolamo Razzi, in the first volume; and in the second, *Constance*, from the *Costanza* of Razzi; *Le Fidèle*, from the *Fedele* of Luigi Pasqualigo; and *Les Tromperies*, from the *Inganni* of N. Secchi.

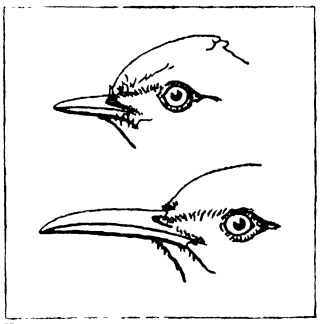

FIG. 1.—LULLULA ARBOREA (ABOVE) AND CERTHILAUDA (BELOW), SHOWING HOW THE BILL HAS BEEN ADJUSTED TO EXTERNAL CIRCUMSTANCES

LARK, applied with a prefix, *e.g.*, titlark, wood-lark, to a number of birds, but when used alone by Englishmen means the skylark, *Alauda arvensis*. This bird, a favourite cage-bird by reason of its beautiful song, and also esteemed for the table, inhabits the northern hemisphere of the Old World from the Faeroes to the Kurile Islands, migrating southwards in winter to northern India, Persia and Egypt. It has been introduced to Long Island (N.Y.), Hawaii and New Zealand, and is abundant wherever there is open or agricultural country It nests in grass and growing corn, the eggs varying from three to five, dull grey in colour, heavily mottled with purplish-brown In the winter the birds congregate in flocks It is resident in Great Britain throughout the year, though most numerous in the autumn. Both sexes are protectively coloured The male mounts in wide circles as it sings. The food is injurious insects and seeds of weeds.

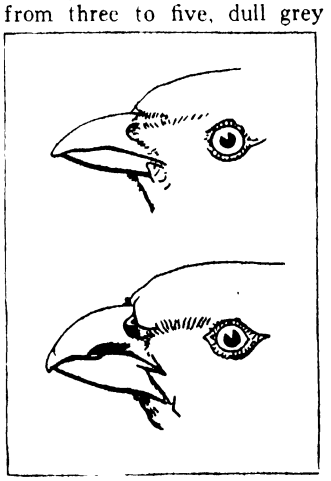

FIG. 2.—VARIATIONS IN THE FORM OF THE BILL BETWEEN MELANOCORYPHA CALANDRA (ABOVE) AND RHAMPHOCORYS CLOT-BEY (BELOW)

The wood-lark, *Lullula arborea*, is more local than the skylark and is never found far from trees. Its song is less varied but very beautiful. It is almost confined to Europe.

The crested lark, *Galerita cristata*, has a larger crest, a stronger and more curved bill and a rufous lining to the wings. It is common in France. Some of its rela-

tives inhabit deserts and exhibit a plumage of a light sandy hue. The harmony between plumage and soil is particularly striking in North African larks in the breeding season (see *Ibis*, supp. number, March, 1927).

The larks present a great variety of structure. The bill may be long and thin (fig. 1) or short and stout (fig. 2). The hind claw, usually long, may be reduced to moderate dimensions (fig 3). The first primary, which is almost aborted in the skylark, is well developed in *Melanocorypha* (fig. 4). The most constant feature is the *podotheca* or covering of the tarsus, which is scutellate both in front and behind.

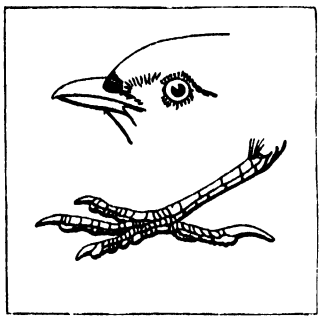

FIG. 3.—CALANDRELLA BRACHYDACTYLA, SHOWING THE HIND CLAW, REDUCED IN THIS SPECIES FROM THE USUALLY ELONGATED FORM TO A MODERATE SIZE

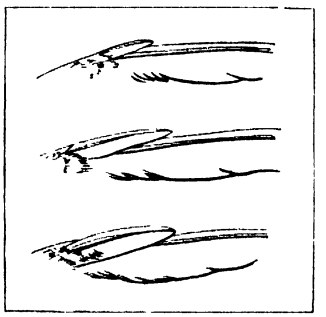

FIG 4.—FIRST PRIMARIES, SHOWING VARYING DEGREES OF DEVELOPMENT IN RELATED LARK SPECIES Upper, *Alauda arborea;* centre, *Certhilauda;* lower, *Melanocorypha calandra*

Only one genus, with a single species, *Mirafra horsfieldi,* inhabits Australia, and one genus, *Otocorys,* extends to America.

Among the birds popularly called larks are the mud-lark, rock-lark, titlark and tree-lark, which are pipits (*q.v.*), the grasshopper-lark, a warbler (*q.v.*), and the American meadow-lark, which is an Icterus (*q.v.*). The true larks moult but once a year, whereas the pipits moult twice

LARKHALL, mining and manufacturing town, Lanarkshire, Scotland, near the left bank of the Clyde, 1 m. S.E. of Glasgow by the L.M.S. railway. Pop. (1921) 14,974 Brick-making, bleaching, silk-weaving, and coach-building are carried on.

LARKHANA, a town and district of British India, in Sind, Bombay. The town is on a canal not far from the Indus, and has a station on the North-western railway, 281 m N. by E. of Karachi. It is pleasantly situated in a fertile locality, and is well laid out with wide streets and spacious gardens. It is a centre of trade, with manufactures of cotton, silk, leather, metalware and paper. Pop. (1921), 17,723.

The DISTRICT OF LARKHANA, lying along the right bank of the Indus, was formed out of portions of Shikarpur and Karachi districts in 1901, and has an area of 5,053 sq m., pop. (1921) 597,960 Its western part is mountainous, but the remainder is a plain of alluvium watered by canals and well cultivated, being the most fertile part of Sind The staple grain-crops are rice, wheat and millets, which are exported, together with wool, cotton and other agricultural produce. Cotton cloth, carpets, salt and leather goods are manufactured, and dyeing is an important industry. The district is served by the North-western railway.

LARKSPUR, the popular name for species of *Delphinium,* a genus of hardy herbaceous plants belonging to the family Ranunculaceae (*q.v.*). They are of erect branching habit, with the flowers in terminal racemes, often of considerable length. Blue is the predominating colour, but purple, pink, yellow (*D. sulphureum*), scarlet (*D. cardinale*) and white also occur; the "spur" is produced by the elongation of the upper sepal. The field or rocket larkspur (*D. Ajacis*), the branching larkspur (*D. Consolida*), *D. cardio-petalum* and their varieties, are charming annuals; height about 18 in The spotted larkspur (*D. requienii*) and a few others are biennials. The perennial larkspurs, however, are the most gorgeous of the family. There are upwards of 150 species, natives of the old and new worlds, and a great number of varieties, raised chiefly from *D. exaltatum, D. formosum* and *D. grandiflorum.* Members vary from 2 ft. to 6 ft. in height.

The larkspurs are of easy cultivation, either in beds or herbaceous borders; the soil should be deeply dug and manured. The annual varieties are best sown early in April, where they are intended to flower, and suitably thinned out as growth is made. The perennial kinds are increased by the division of existing plants in spring, or by cuttings taken in spring or autumn and rooted in pots in cold frames. The varieties cannot be perpetuated with certainty by seed. Seed is the most popular means, however, of raising larkspurs in the majority of gardens, and is suitable for all ordinary purposes; it should be sown as soon as gathered, preferably in rows in nursery beds, and the young plants transplanted when ready They should be fit for the borders in the spring of the following year.

THE LARKSPUR (DELPHINIUM CONSOLIDA), SHOWING GENERAL HABIT OF GROWTH AND DETAILS OF ROOT

In North America there are upwards of 50 native species, widely distributed in the United States and southern Canada, but most numerous in the Rocky Mountain region and on the Pacific coast, 16 being found in California. Many have exceedingly handsome flowers and various species are poisonous to grazing animals Noteworthy representatives are the tall larkspur (*D. exaltatum*), of the eastern States; the Carolina larkspur (*D. carolinianum*), of the Southern States; the prairie larkspur (*D. virescens*), of the interior plains; the western larkspur (*D occidentale*), of the higher Rocky Mountains; and the scarlet larkspur (*D. cardinale*), of coastal California.

LARKSVILLE, an anthracite-mining borough of Luzerne county, Pa., U.S.A., adjoining West Wilkes-Barre; with a population in 1920 of 9,438 (25% foreign-born white) The borough was incorporated in 1909.

LARMOR, SIR JOSEPH (1857–), British mathematician, was born at Magheragall in Ireland on July 11, 1857, and was educated at Belfast, and St. John's College, Cambridge. He was professor of mathematics in the Queen's University, Ireland (1880–85), and was lecturer in mathematics in the University of Cambridge (1885–1903), and then Lucasian Professor. His research in mathematics and mathematical physics was devoted to the problems of electrodynamics and thermodynamics, and the electrical properties of ether and matter. He was intimately connected for many years with the Royal Society, of which he became a fellow in 1892, serving on the council and acting as secretary from 1901–12. He received the highest academic honours and awards, British and foreign. Larmor was knighted in 1901, and from 1911–22 was Unionist member of Parliament for Cambridge University. His writings include *Ether and Matter* (1900), and numerous memoirs on mathematics and physics. He collected and edited the scientific writings of Cavendish, Fitzgerald, Kelvin, Stokes and J. J. Thomson.

LARNACA (anc. *Citium* [*q.v.*], Turk. *Tuzla*), a seaport on the south-east coast of Cyprus, 23 m. S.S.E. from Nicosia. Pop. (1921) 10,652. It exports barley, wheat, cotton, raisins, oranges, lemons, gypsum and asbestos. There is an iron pier 450 ft. long, but vessels anchor in the bay. Larnaca occupies part of the site of the ancient *Citium*: the modern seafront and business street is called Scala; the older quarter is ½ m. inland.

See C. D. Cobham, *Excerpta Cypria: Materials for a History of Cyprus* (Cambridge ed. 1908) and the article CYPRUS.

LA ROCHE, a small ancient town in the Belgian Ardenne, on a rock commanding the river Ourthe, which meanders round the little place and skirts the rock on which are ruins of the 11th cen-

tury castle. This is supposed to have been the site of a hunting box of Pippin, and certainly the counts of La Roche held it in fief from his descendants, the Carolingian rulers. In the 12th century they sold it to the counts of Luxemburg. In the 16th and 17th centuries the French and Imperialists frequently fought in its neighbourhood. La Roche is a tourist centre in fine sylvan scenery. The Diable-Château is a freak of nature, the apparent replica of a mediaeval castle. Pop. (1920) 2,019.

LA ROCHEFOUCAULD, the name of an old French family which is derived from a castle in the province of Angoumois (department of Charente), which was in its possession in the 11th century. This castle was largely rebuilt in the reign of Francis I., and is one of the finest specimens of the Renaissance architecture in France. François de la Rochefoucauld (1494–1517), godson of King Francis I., was made count in 1515. At the time of the wars of religion the family fought for the Protestant cause. François (1588–1650) was created duke and peer of France by Louis XIII. in 1622. His son François was the author of the *Maxims,* and the son of the latter acquired for his house the estates of La Roche-Guyon and Liancourt by his marriage with Jeanne Charlotte du Plessis-Liancourt. Alexandre, duc de La Rochefoucauld (d. 1762), left two daughters, who married into the Rôye branch of the family.

LA ROCHEFOUCAULD, FRANÇOIS DE (1613–1680), the greatest maxim writer of France, was born in Paris in the Rue des Petits Champs on Sept. 15, 1613. The author of the *Maxims,* who bore during the lifetime of his father (*see* above) the title of prince de Marcillac, joined the army before he was sixteen, and almost immediately began to make a figure in public life. He had been nominally married a year before to Andrée de Vivonne, who seems to have been an affectionate wife. For some years Marcillac continued to take part in the annual campaigns. Then he passed under the spell of Madame de Chevreuse, the first of three celebrated women who successively influenced his life. Through Madame de Chevreuse he became attached to the queen, Anne of Austria, and in one of her quarrels with Richelieu and her husband a scheme seems to have been formed, according to which Marcillac was to carry her off to Brussels on a pillion. These intrigues provided Marcillac an eight days' experience of the Bastille and occasional periods of exile to his father's estates. After the death of Richelieu (1642), Marcillac became one of the so-called *importants,* and took an active part in reconciling the queen and Condé in a league against Gaston of Orleans. But the growing credit of Mazarin came in his way, and the *liaison* in which about this time (1645) he became entangled with the beautiful duchess of Longueville made him irrevocably a Frondeur. He was a conspicuous figure in the siege of Paris, fought desperately in the desultory engagements which were constantly taking place, and was severely wounded at the siege of Mardyke. In the second Fronde Marcillac followed the fortunes of Condé. In the later Fronde La Rochefoucauld was always brave and generally unlucky. In the battle of the Faubourg Saint Antoine (1652), he was shot through the head, and it was thought that he would lose the sight of both eyes. It was nearly a year before he recovered, and then he found himself at his country seat of Verteuil. He did not return to court life much before Mazarin's death, when Louis XIV. was on the eve of assuming absolute power.

Somewhat earlier, La Rochefoucauld had taken his place in the salon of Madame de Sablé, a member of the old Rambouillet coterie. He, like almost all his more prominent contemporaries, had spent his solitude in writing memoirs, while the special literary employment of the Sablé salon was the fabrication of *Sentences* and *Maximes.* In 1662 a surreptitious publication of his memoirs, or what purported to be his memoirs, by the Elzevirs, called forth from him a flat denial of their authenticity. Three years later (1665) he published, anonymously, the *Maxims,* which at once established him high among the men of letters of the time. He might have entered the Academy for the asking; and in the altered measure of the times his son, the prince de Marcillac, to whom some time before his death he resigned his titles and honours, enjoyed a considerable position at court. Above all, La Rochefoucauld was generally recognized as a type of the older noblesse of the age of Louis XIV. He died in Paris on March 17, 1680, of the gout which had so long tormented him.

His literary work consists of three parts—letters, *Memoirs* and the *Maxims.* His letters exceed one hundred in number, and are biographically valuable, besides displaying not a few of his literary characteristics; but they need not further detain us. The *Memoirs,* when they are read in their proper form, yield in literary merit, in interest, and in value to no memoirs of the time, not even to those of Retz, between whom and La Rochefoucauld there was a strange mixture of enmity and esteem which resulted in a couple of most characteristic "portraits." Only in 1817 did anything like a genuine edition of the *Memoirs* (even then by no means perfect) appear.

The *Maxims* the author re-edited frequently during his life, with alterations and additions; they amount to about seven hundred in number, in hardly any case exceeding half a page in length, and more frequently confined to two or three lines. The view of conduct which they illustrate is usually summed up in the words "everything is reducible to the motive of self-interest." But the phrase is misleading. The *Maxims* are in no respect mere deductions from or applications of any such general theory. They are on the contrary independent judgments on different relations of life, different affections of the human mind, and so forth, from which, taken together, the general view may be deduced or rather composed. With a few exceptions La Rochefoucauld's maxims represent the matured result of the reflection of a man deeply versed in the business and pleasures of the world, and possessed of an extraordinarily fine and acute intellect. The excellence of the literary medium in which they are conveyed is even more remarkable than the soundness of their ethical import.

In uniting the four qualities of brevity, clearness, fulness of meaning and point, La Rochefoucauld has no rival. His *Maxims* are never mere epigrams; they are never platitudes; they are never dark sayings. He has packed them so full of meaning that it would be impossible to pack them closer, yet there is no undue compression

The editions of La Rochefoucauld's *Maxims* (as the full title runs, *Reflexions ou sentences et maximes morales*) published in his lifetime bear the dates 1665 (*editio princeps*), 1666, 1671, 1675, 1678. An important edition which appeared after his death in 1693 may rank almost with these. Of the many modern editions may be mentioned the *édition des bibliophiles* (1870). The previous more or less complete editions of the *Mémoires* are all superseded by that of MM. Gilbert and Gourdault (1868–83), in the series of *Grands Écrivains de la France,* 3 vols. *See* an English version of the *Maximes* by G. H. Powell (1903). *See* also J. Bourdeau in the *Grands écrivains français* (1893); E. Gosse, *Three French Moralistes* (1918); E. Magne, *Le vrai visage de la Rochefoucauld* (1923).

LA ROCHEFOUCAULD-LIANCOURT, FRANÇOIS ALEXANDRE FRÉDÉRIC, DUC DE (1747–1827), French social reformer, was born at La Roche Guyon on Jan 11, 1747, the son of François Armand de La Rochefoucauld, duc d'Estissac. The duc de Liancourt became an officer of carbineers, and married at seventeen. He established a model farm at Liancourt, where he reared cattle imported from England and Switzerland. He also founded a school of arts and crafts for the sons of soldiers, which became in 1788 the École des Enfants de la Patrie. Elected to the states-general of 1789 he became President of the Assembly on July 18. Established in command of a military division in Normany, he offered Louis a refuge in Rouen, and, failing in this effort, assisted him with a large sum of money. After the events of Aug. 10, 1792, he fled to England, and thence to America. After the assassination of his cousin, Louis Alexandre, duc de La Rochefoucauld d'Enville, in September 1792 he assumed the title of duc de La Rochefoucauld. He returned to Paris in 1799, and at the Restoration he entered the House of Peers. Successive governments, revolutionary and otherwise, recognized the value of his institutions at Liancourt, and he was for twenty-three years government inspector of his school of arts and crafts, which had been removed to Châlons. He was one of the first promoters of vaccination in France, and he was an active member of the central boards of administration for hospitals, prisons and agriculture. His opposition to the government in the House of Peers led to

his removal in 1823 from the honorary positions he held. His works, chiefly on economic questions, include books on the English system of taxation, poor-relief and education. He died on March 24, 1827.

His eldest son, FRANÇOIS, DUC DE LA ROCHEFOUCAULD (1765–1848), succeeded his father in the House of Peers. The second, ALEXANDRE, COMTE DE LA ROCHEFOUCAULD (1767–1841), married a San Domingo heiress allied to the Beauharnais family. Mme. de La Rochefoucauld became *dame d'honneur* to the empress Josephine, and their eldest daughter married a brother-in-law of Pauline Bonaparte, Princess Borghese. La Rochefoucauld became ambassador successively to Vienna (1805) and to The Hague (1808–10), where he negotiated the union of Holland with France. During the "Hundred Days" he was made a peer of France. He subsequently devoted himself to philanthropic work, and in 1822 became deputy to the Chamber and sat with the constitutional royalists. He was again raised to the peerage in 1831.

The third son, FRÉDÉRIC GAÉTAN, MARQUIS DE LA ROCHEFOUCAULD-LIANCOURT (1779–1863), wrote on social questions, notably on prison administration; he edited the works of La Rochefoucauld, and the memoirs of Condorcet; and he was the author of some vaudevilles, tragedies and poems *See* A. de Castellane, *Gentilshommes démocrates; Les deux La Rochefoucauld*, etc. (1891).

LA ROCHEJACQUELEIN, DE, the name of an ancient French family of La Vendée, celebrated for its devotion to the throne during and after the Revolution.

At the outbreak of the Revolution the chief of the family was HENRI LOUIS AUGUSTE, marquis de La Rochejacquelein, *maréchal de camp* in the royal army, who had three sons named after himself—Henri, Louis and Auguste. The marquis emigrated with his second son Louis. He entered the service of Great Britain, and died in San Domingo in 1802.

HENRI, comte de La Rochejacquelein, born at Dubertien, near Châtillon, sur Sèvres, on Aug. 20, 1772, did not emigrate with his father. He served in the constitutional guard of the king, and remained in Paris till the execution of Louis XVI. He then took refuge with the marquis de Lescure on his own estates in Poitou. When the anti-clerical policy of the revolution provoked the rising of the peasants of La Vendée, he became one of their leaders. After the defeat of the Vendeans by the republicans at Cholet, he became their nominal commander-in-chief. But he had in fact to obey his army, and could only display his personal valour in action. He could not avert the mistaken policy which led to the rout at Le Mans, and was finally shot, March 4, 1794.

LOUIS, marquis de La Rochejacquelein, the younger brother of Henri, accompanied his father in the emigration, served in the army of Condé, and entered the service of England in America. He returned to France during the Consulate, and in 1801 married the marquise de Lescure, widow of his brother's friend, who was mortally wounded at Cholet Her *Mémoires* (Bordeaux, 1815) give a remarkable picture of the war and the fortunes of the royalists. In 1815 the marquis endeavoured to bring about another Vendéan rising for the king, and was shot in a skirmish at the Pont des Marthes on June 4, 1815.

His grandson, JULIEN MARIE GASTON, born at Chartres on March 27, 1833, was an active legitimist deputy in the Assembly chosen at the close of the German War of 1870–1871. He was a strong opponent of Thiers, and continued to contest constituencies as a legitimist with varying fortunes till his death in 1897.

AUTHORITIES.—*Henri de La Rochejacquelein et la guerre de la Vendée d'après des documents inédits* (Niort, 1890); A. F. Nettement, *Vie de Mme. la Marquise de La Rochejacquelein* (Paris, 1876). The *Mémoires* of the marquise were translated into English by Sir Walter Scott, and issued as a volume of "Constable's Miscellany" (Edinburgh, 1827).

LA ROCHELLE, a seaport of France, capital of the department of Charente-Inférieure, 90 m. S. by E. of Nantes on the railway to Bordeaux. Pop. (1926) 38,293. La Rochelle stands on the Atlantic coast on an inlet opening off the great bay in which lie the islands of Ré and Oléron. Its fortifications have a circuit of 3½ m. with seven gates. Towards the sea are three towers, of which the oldest (1384) is that of St. Nicholas. The 14th century Chain Tower is so called from the chain which closed the harbour; the entrance to the tidal basin was at one time spanned by a pointed arch between the two towers. The lantern tower (1445–76), surmounted by a spire, was once used as a lighthouse. Of the ancient gateways only one has been preserved in its entirety, that of the "Grosse Horloge," a square tower of the 14th or 15th century. The cathedral of La Rochelle (St. Louis or St. Bartholomew) is a heavy Grecian building (1742–1762) with an old 14th century tower, the only remnant of the old church of St. Bartholomew on the same site, destroyed in the 16th century. Externally the town-house is in the Gothic style of the latter years of the 15th century. In the old episcopal palace (which was in turn the residence of Sully, the prince of Condé, Louis XIII., and Anne of Austria, and the scene of the marriage of Alphonso VI. of Portugal with a princess of Savoy) accommodation has been provided for a library, a collection of records and a museum of art and antiquities. Of the old houses, the most interesting is one built in the middle of the 16th century and wrongly known as that of Henry II. The parade-ground, which forms the principal public square, occupies the site of the castle demolished in 1590.

Industries.—Ship-building, saw-milling and the manufacture of briquettes and chemicals, sardine and tunny-preserving and petroleum-refining are among the industries. The rearing of oysters and mussels and the exploitation of salt marshes is carried on.

The inlet of La Rochelle is protected by a mole built by Richelieu. The harbour, one of the safest on the coast, is entered by a channel 2,730 yd. long, and comprises an inner harbour, an interior dock and a larger exterior dock, outside which is the outer port. A large number of sailing ships are engaged in the fisheries, and the fish market of La Rochelle is the most important on the west coast. La Rochelle imports grain, coal, pitch, kaolin, wood and foreign wines, and its exports are French wines, oysters, pit props etc. The harbour is, however, inaccessible to the largest vessels, for the accommodation of which the port of La Pallice was created. Lying about 3 m. W.S W. of La Rochelle, this port opens into the bay opposite the eastern extremity of the island of Ré. Vessels drawing 20 ft. are able to enter during three hours of each tide. The tidal basin is now open, and the outer basin breakwater is in course of construction. The outer port, protected by two jetties, has an area of 31 ac. and a depth of 18½ ft. below lowest tide-level. La Pallice has regular communication with South America, England, America, West Africa, Egypt and the Far East. La Pallice imports coal, pitch, grain, dried codfish, nitrates, pyrites, jute, petroleum, gas, oil, wood pulp and phosphates. The exports are wines and brandy

Known in the 10th century as Rupella, it belonged to the barony of Châtelaillon, which was annexed by the duke of Aquitaine and succeeded Châtelaillon as chief town in Aunis. Captured by Louis VIII. in 1224, it was restored to the English in 1360, but it returned to France when Du Guesclin recovered Saintonge During the 14th, 15th and 16th centuries La Rochelle, then an almost independent commune, was one of the great maritime cities of France. The salt-tax provoked a rebellion at Rochelle which Francis I. repressed in person; in 1568 the town secured exemption by the payment of a large sum. At the Reformation La Rochelle became one of the chief centres of Calvinism, and during the religious wars it armed privateers which preyed on Catholic vessels. In 1571 a synod of the Protestant churches of France was held within its walls under the presidency of Beza for the purpose of drawing up a confession of faith. After the massacre of St. Bartholomew, La Rochelle was unsuccessfully besieged by the Catholic army. The peace of 1573, signed by the people of La Rochelle in the name of all the Protestant party, granted the Calvinists full liberty of worship in several places of safety. Under Louis XIII. it put itself again at the head of the Huguenot party. Its vessels blockaded the mouth of the Gironde and stopped the commerce of Bordeaux, and also seized the islands of Ré and Oléron and several vessels. Richelieu then subdued the town During this investment Richelieu raised the celebrated mole which cut off the town from the open sea. La Rochelle then became the principal port between France and the colony of Canada. But the revocation of the Edict of Nantes (1685) deprived it of some thousands of its most industrious inhabitants, and the loss of Canada by France for a time ruined its commerce.

LA ROCHE-SUR-YON, a town of western France, capital of the department of Vendée, on an eminence on the right bank of the Yon, 48 m. S. of Nantes on the railway to Bordeaux. Pop.

(1926) 11,994. The old castle was dismantled under Louis XIII. and the town almost destroyed in 1794. Napoleon re-erected it, using the stones of the ruins, and made it the chief town of Vendée. It was called Napoleon Vendée or Bourbon-Vendée, according to the ruling dynasty of the time, till 1870 when the old name was restored. The town is the seat of a prefect and a court of assizes, and has a tribunal of first instance and a chamber of commerce. It is a railway centre and is a market for cross-bred horses and cattle. La Roche-sur-Yon has an important *haras* (depôt for stallions) and flour mills, and is famous for its dog fairs.

LAROMIGUIÈRE, PIERRE (1756–1837), French philosopher, was born at Livignac on Nov. 3, 1756, and died on Aug. 12, 1837, in Paris. As professor of philosophy at Toulouse he incurred the censure of the parliament by a thesis on the rights of property in connection with taxation. Subsequently he was appointed professor of logic in the École Normale, Paris, and lectured in the Prytanée. In 1799 he was made a member of the Tribunate, and in 1833 of the Academy of Moral and Political Science. In 1793 he published *Projet d'éléments de métaphysique.* He wrote also two *Mémoires,* read before the Institute, *Les Paradoxes de Condillac* (1805) and *Leçons de philosophie* (1815–18). Laromiguière's philosophy was a revolt against the extreme physiological psychology of the natural scientists, such as Cabanis. He distinguished between those psychological phenomena which can be traced directly to purely physical causes, and the actions of the soul which originate from within itself. Psychology was not for him a branch of physiology, nor on the other hand did he give to his theory an abstruse metaphysical basis.

Daunou, *Notice sur Laromiguière* (1839); J. Victor Cousin, *Cours d'histoire de la philosophie moderne* (5 vols., 1841–46); H. Taine, *Les philosophes français du XIXe siècle* (1857); M. Ferraz, *Histoire de la philosophie en France: Spiritualisme et Libéralisme* (1887); F. Picavet, *Les Idéologues* (1891).

LARRA, MARIANO JOSÉ DE (1809–1837), Spanish satirist, was born at Madrid. His father, a regimental doctor in the French army, was compelled to leave the Peninsula with his family in 1812, and in 1817 Larra returned to Spain, knowing less Spanish than French. After an imprudent marriage in 1829, he broke with his relatives and became a journalist. His plays, *No más mostrador* (1831) and *Macías* (1834), and a historical novel, *El Doncel de Don Enrique el Doliente* (1834), are interesting as experiments only. Larra rapidly became famous under the pseudonyms of "Juan Pérez de Munguía" and "Figaro" which he used in *El Pobrecito Hablador* and *La Revista Española* respectively; a great career seemed to lie before him when, in 1837, in consequence of a disastrous love-affair, he committed suicide. But he lived long enough to prove himself the greatest Spanish prose writer of the 19th century. He wrote at great speed, with the constant fear of the censor before his eyes, but no sign of haste is discernible in his work, and the dexterity with which he aims his venomous shafts is amazing. His political instinct, his abundance of ideas and his forcible, mordant style would have given him a foremost position at any time and in any country; in Spain, they placed him beyond all rivalry.

LARSA (biblical Ellasar, modern Senkerah), an ancient town in southern Mesopotamia in 31° N. and 46° E. The town lay 15 miles south-east of the ancient Erech, on the west bank of the old Euphrates, and probably in early times on the shore of a fresh-water lake. It was one of the oldest of Sumerian cities, and though excavated by Loftus in 1854 it still awaits a modern excavator. The ruins are four and a half miles in circumference, the temple area being 220 × 320 feet, and Loftus found a large number of tablets here. Little is known at present about its relations in pre-Sargonic times but it was probably connected with Erech. During the Elamite conquest it plays a very interesting part as it formed an Elamite stronghold.

LARTET, EDOUARD (1801–1871), French archaeologist, was born in 1801 near Castelnau-Barbarens, department of Gers, France. The then recent work of Cuvier on fossil mammalia encouraged Lartet in excavations which led in 1834 to his first discovery of fossil remains in the neighbourhood of Auch. Thenceforward he devoted his whole time to a systematic examination of the French caves, his first publication on the subject being *The Antiquity of Man in Western Europe* (1860), followed in 1861 by *New Researches on the Coexistence of Man and of the Great Fossil Mammifers characteristic of the Last Geological Period.* In this paper he made public the results of his discoveries in the cave of Aurignac, where evidence existed of the contemporaneous existence of man and extinct mammals. In his work in the Périgord district Lartet had the aid of Henry Christy (*q.v.*). They published the important results of their researches as *Reliquiae Aquitanicae,* the first part appearing in 1865. The most modest and one of the most illustrious of the founders of modern palaeontology, Lartet, a foreign member of the Geological Society of London, had been made professor of palaeontology at the museum of the Jardin des Plantes a few weeks before his death, at Seissan, in January 1871.

LARVA, the name applied to the sexually immature stage or stages of an animal, when this is free-living and differs markedly in form and mode of life from that of the adult; *e.g.,* the tadpole of the frog, the caterpillar of the butterfly.

See LARVAL FORMS; INVERTEBRATE EMBRYOLOGY.

LARYNGITIS, inflammation of the mucous membrane of the *larynx.* There are three chief varieties—*acute, chronic* and *oedematous.* The larynx is also liable to inflammation in tuberculosis and syphilis.

Acute Laryngitis.—This may be independent or an extension from the nasal or bronchial mucous membrane. The chief causes are "catching cold," excessive use of the voice either in speaking or singing, inhalation of irritating particles, vapours, etc., and swallowing very hot fluids or corrosive poisons. It may also occur in measles and influenza. As a result of the inflammation there is a general swelling of the parts about the larynx and the epiglottis, the result being a narrowing of the channel for the entrance of the air, and to this the chief dangers are due. The symptoms vary with the intensity of the attack; there is first a sense of tickling, then of heat, dryness and pain in the throat, with some difficulty in swallowing. There is a dry cough, with expectoration later; phonation becomes painful, while the voice is husky, and may be completely lost. In children there is some dyspnoea. In favourable cases, which form the majority, the attack abates in a few days, but the inflammation may become oedematous and death may occur suddenly from an asphyxial paroxysm. Many cases of acute laryngitis are so slight as to make themselves known only by hoarseness and the character of the cough, nevertheless in every instance the attack demands serious attention. In children the question of diphtheria must not be lost sight of The treatment is rest; no talking must be allowed. The patient should be kept in bed, in a room at an even temperature, and the air saturated with moisture. An ice-bag round the throat gives much relief, while internally diaphoretics may be given, and a full dose of Dover's powder if there be much pain or cough.

Chronic Laryngitis.—This follows repeated attacks of the acute form and is nearly always accompanied by granular pharyngitis. It is common in people who habitually over-use the voice, and causes the hoarse voice of street sellers. The constant inhalation of irritating vapours, such as tobacco smoke, may also cause it. There is usually little or no pain, only the unpleasant sensation of tickling in the larynx, with a constant desire to cough. The treatment consists in stopping the cause, where known, *e.g.,* the smoking or shouting, and local application of astringents

Oedematous Laryngitis.—This is a very fatal condition, which may occur though rarely, in acute laryngitis It is far more commonly seen in syphilitic and tuberculous conditions of the larynx, in kidney disease, in certain fevers, and in cases of cellulitis of the neck. The larynx is also one of the sites of *Angeioneurotic oedema.* There are all the symptoms of acute laryngitis on an exaggerated scale. The dyspnoea, accompanied by marked stridor, may arise and become dangerous within an hour The mucous membrane round the epiglottis is enormously swollen.

The treatment is ice round the throat and scarification of the swollen parts; should that not relieve the symptoms, tracheotomy must be performed immediately.

Tuberculous Laryngitis.—This is practically always associated with phthisis. The mucous membrane is invaded by the tubercles, which first form small masses and later caseate and break down. The first indication is hoarseness, or, in certain forms, pains on swallowing. Cough is, as a rule, a late symptom. A sudden oedema may bring about rapidly a fatal termination. The general treatment is that for phthisis; locally, the affected parts may be removed by one or a series of operations, generally under local anaesthesia, or they may be treated with some destructive agent such as lactic acid. The pain on swallowing can be best alleviated by painting with a weak solution of cocaine. The condition is a very grave one; the prognosis depends largely on the associated pulmonary infection—if that be extensive, a very small amount of laryngeal mischief resists treatment and vice versa.

Syphilitic Laryngitis.—Invasion of the larynx in syphilis is very common. It may occur in both stages of the disease and in the inherited form. In the secondary stage the damage is superficial, and the symptoms those of a slight acute laryngitis The injury in the tertiary stage is much more serious, deep ulcers, which in healing form strong cicatrices, may produce stenosis of the air-passage requiring surgical interference. Occasionally a fatal oedema may arise. The treatment is that of the primary condition. (*See* VENEREAL DISEASES.)

Paroxysmal Laryngitis, or Laryngismus Stridulus.—This is a nervous affection of the larynx that occurs in infants. It appears to be associated with adenoids and rickets. The disease consists of a reflex spasm of the glottis with complete occlusion of the air-passages. The attacks, which are recurrent, cause acute asphyxia. They may cease for no obvious reason, or one may prove fatal. The whole attack is of such short duration that the infant has either recovered or succumbed before assistance can be called. After an attack, careful examination should be made, and the adenoids, if present, removed by operation.

LARYNGOSCOPE, an instrument consisting of an arrangement of mirrors whereby the action of the vocal cords can be seen and studied. It was perfected and brought into general use, if not actually invented, by Manoel Garcia the famous singing teacher (*q.v.*). A further development of the instrument is the laryngostroboscope. (*See* VOICE.)

LA SABLIÈRE, MARGUERITE DE (*c.* 1640–1693), friend and patron of La Fontaine, was the wife of Antoine Rambouillet, sieur de la Sablière (1624–1679), a Protestant financier entrusted with the administration of the royal estates, her maiden name being Marguerite Hessein. She received an excellent education in Latin, mathematics, physics and anatomy from the best scholars of her time, and her house became a meeting-place for poets, scientists, men of letters, and courtiers, members of the court of Louis XIV About 1673 Mme. de la Sablière received into her house La Fontaine, whom for twenty years she relieved of every kind of material anxiety. Another friend and inmate of the house was the traveller and physician François Bernier. The abbé Chaulieu and his fellow-poet, Charles Auguste, marquis de La Fare, were among her most intimate associates La Fare sold his commission in the army to be able to spend his time with her. This liaison, which seems to have been the only serious passion of her life, was broken in 1679. She died in Paris on Jan. 8, 1693.

LA SALE (or LA SALLE), **ANTOINE DE** (*c.* 1388–1462?), French writer, was born in Provence, probably at Arles. He was a natural son of Bernard de la Salle, a famous soldier of fortune, who served many masters, among others the Angevin dukes In 1402 Antoine entered the court of Anjou, probably as a page, and in 1407 he was at Messina with Duke Louis II., who had gone there to enforce his claim to the kingdom of Sicily. The next years he perhaps spent in Brabant, for he was present at two tournaments given at Brussels and Ghent. With other gentlemen from Brabant, whose names he has preserved, he took part in the expedition of 1415 against the Moors, organized by John I. of Portugal. In 1420 he accompanied Louis III. on another expedition to Naples, making in that year an excursion from Norcia to the Monte della Sibilla, and the neighbouring Lake of Pilate, the story of which forms one of the episodes of *La Salade.* La Sale probably returned with Louis III. of Anjou, who was also comte de Provence, in 1426 to Provence, where he was acting as *viguier* of Arles in 1429. In 1434 René, Louis's successor, made La Sale tutor to his son Jean d'Anjou, duc de Calabre, to whom he dedicated, between the years 1438 and 1447, his *La Salade,* which is a text-book of the studies necessary for a prince. Between 1439 and 1442 he was again in Italy with René. After 40 years' service of the house of Anjou, La Sale left it to become tutor to the sons of Louis de Luxembourg, comte de Saint Pol, who took him to Flanders and presented him at the court of Philippe le Bon, duke of Burgundy. For his new pupils he wrote at Châtelet-sur-Oise, in 1451, a moral work entitled *La Salle.*

He was nearly 70 years of age when he completed, in 1456, the famous *Hystoire et plaisante cronicque du petit Jehan de Saintré et de la jeune dame des Belles-Cousines, Sans autre nom nommer,* dedicated to his former pupil, Jean de Calabre. The *Réconfort à Madame de Neufville,* a consolatory epistle including two stories of parental fortitude, was written at Vendeuil-sur-Oise about 1458, and in 1459 La Sale produced his treatise *Des anciens tournois et faictz d'armes* and the *Journée d'Onneur et de Prouesse.* He followed his patron to Genappe in Brabant when the Dauphin took refuge at the Burgundian court.

La Sale is generally accepted as the author of one of the most famous satires in the French language, *Les Quinze Joyes de mariage,* because his name has been disengaged from an acrostic at the end of the Rouen ms. He has been credited with the famous collection of stories supposed to be narrated by various persons at the court of Philippe le Bon, and which was entitled the *Cent Nouvelles,* for which Louis XI. was long held responsible, but modern criticism is against the attribution. The last mention of La Sale's name is in 1461.

Petit Jehan de Saintré gives, at the point when the traditions of chivalry were fast disappearing, an account of the education of an ideal knight and rules for his conduct under many different circumstances. When Petit Jehan, aged 13, is persuaded by the Dame des Belles-Cousines to accept her as his lady, she gives him systematic instruction in religion, courtesy, chivalry and the arts of success. Saintré becomes an accomplished knight, the fame of whose prowess spreads throughout Europe. This section of the romance gives a very charming picture of the manners of the time. Unfortunately in the second part this virtuous lady falls a victim to a vulgar intrigue with Damp Abbé. One of La Sale's commentators, M. Joseph Nève, makes the too ingenious suggestion that the second section is designed simply to show how the hero, after passing through the other grades of education, learns at last by experience to arm himself against coquetry. *Petit Jehan de Saintré* was dedicated to the duc de Calabre. His wife, Marie de Bourbon, was one of the "Belles-Cousines" who contended for the favour of Jacques or Jacquet de Lalaing in the *Livre des faits de Jacques Lalaing* which forms the chief source of the early exploits of Petit Jehan and is usually attributed to the Burgundian herald Lefèvre. Jehan de Saintré flourished in the Hundred Years' War, was taken prisoner after Poitiers, with the elder Boucicaut, and was employed in negotiating the treaty of Bretigny. Froissart mentioned him as "le meilleur et le plus vaillant chevalier de France."

Evidence in favour of La Sale's authorship of *Les Quinze Joyes de Mariage* is brought forward by M. E. Gossart (*Bibliophile belge,* 1871, pp. 83–87). Gaston Paris (*Revue de Paris,* Dec. 1897) expressed an opinion that to find anything like the malicious penetration by which La Sale divines the most intimate details of married life, it is necessary to travel as far as Balzac.

BIBLIOGRAPHY.—The best editions of La Sale's works are:—*Petit Jehan de Saintré* by J. M. Guichard (1843); *Les Quinze Joyes de mariage* by P. Jannet (Bibl. elzév., 1857), and by Heuckenkamp (1901). *La Salade* was printed more than once during the 16th century. *La Salle* was never printed; for its contents *see* E. Gossart in the *Bibliophile belge* (1871, pp. 77 *et seq.*). *See* also Joseph Nève, *Antoine de la Salle, sa vie et ses ouvrages . . . suivi du Réconfort de Madame de Fresne . . . et de fragments et documents inédits* (1903), who argues for the rejection of *Les Quinze Joyes* from La Sale's works; Pietro Toldo, *Contributo allo studio della novella francese del XV e XVI*

secolo (1895), and a review of it by Gaston Paris in the *Journal des Savants* (May 1895); L. Stern, "Versuch über Antoine de la Salle," in *Archiv für das Studium der neueren Sprachen*, vol. xlvi.; G. Raynaud, "Un Nouveau Manuscrit du Petit Jehan de Saintré," in *Romania*, vol. xxxi.

LASALLE, ANTOINE CHEVALIER LOUIS COLLINET, COUNT (1775–1809), French soldier, was the grandson of Abraham Fabert, marshal of France. He had reached the rank of lieutenant when the Revolution broke out. As an aristocrat, he lost his commission, but enlisted in the ranks, and by 1795 was serving as a staff-officer in the army of Italy. By 1800 he had become colonel, and in one combat in that year he had two horses killed under him, and broke seven swords. In 1805 as general of brigade, he was present at Austerlitz. In the pursuit after Jena in 1806, though he had but 600 hussars and no artillery, he terrified the strong fortress of Stettin into surrender, a feat rarely equalled save by that of Cromwell on Bletchingdon House. Made general of division for this exploit, he was next in the Polish campaign, and at Heilsberg saved the life of Murat. He distinguished himself further in the Peninsular War. A year later, at the head of one of the cavalry divisions of the *Grande Armée* he took part in the Austrian war and was killed at Wagram. With the possible exception of Curély, who was in 1809 still unknown, Napoleon never possessed a better leader of light horse.

LA SALLE, RENÉ ROBERT CAVELIER, SIEUR DE (1643–1687), French explorer in North America, was baptized at Rouen, France, on Nov. 22, 1643. He received the best education of the period, that of the Jesuits, but acquired an enmity for the organization which influenced many of his later acts. In 1666 he emigrated to Montreal where he received a grant of land on the St. Lawrence river. An impetus to explore, however, led him constantly into the wilderness and in 1669 and 1670 he undertook explorations south of Lakes Ontario and Erie. The claim often made that he discovered the Ohio river in 1671 is not accepted by modern historians. His services and ability made him a favourite with Frontenac, the governor of Canada, and in 1674 he was sent to France as the governor's representative to defend the building of Fort Frontenac (on the site of Kingston, Ont.), which Frontenac had undertaken upon his own initiative, and also to petition for the command of the fort. His petitions were successful. In 1677 he again visited France to seek further privileges and financial assistance in extending his explorations and the fur trade westward, together with the permission to build forts. He was rewarded with a monopoly of the trade in the Mississippi valley.

In 1679, after thorough preparation, members of his expedition boarded the "Griffin," the first commercial vessel on Lake Erie, and proceeded to Green Bay, Wisconsin, where the ship was loaded with a cargo of furs and started on its return voyage, La Salle hoping the cargo would pay his creditors at Montreal. The ship was never heard from again, an inauspicious start. Unaware of this, La Salle continued down the west shore of Lake Michigan to the mouth of the river St. Joseph where Fort Miami was built. From there, joined by a party under his lieutenant, Henri de Tonti, his expedition of 34 men ascended the river and portaged to the Illinois, where near Lake Peoria they erected Fort Crèvecoeur. Preparations were here made for the voyage down the Mississippi, while Michael Accault, Father Hennepin and another *voyageur* were sent on a successful trip up that river beyond the Falls of St. Anthony in Minnesota. La Salle and four companions started on a flying trip back to Fort Frontenac to straighten out finances and bring supplies, while Tonti led a small party in search of a better site for a fort. Messengers met La Salle upon his return with the news that Fort Crèvecoeur had been abandoned and the men deserted. La Salle, fearing for Tonti's safety, rapidly canoed westward and descended the Illinois to the Mississippi without finding him. He and his men then returned on foot to Fort Miami, from where La Salle returned to Fort Frontenac for a third time. Tonti and his men, after being captured by the Indians, had meantime made their way to Green Bay.

La Salle, having been able to raise funds, returned in the spring full of courage for another attempt. Tonti rejoined him and the party of over fifty proceeded via the Chicago-Illinois portage to the Mississippi river, down which they descended without difficulty to its long-sought mouth. There on April 9, 1682, La Salle took possession of the region watered by the Mississippi and all its tributaries for King Louis of France and named it "Louisiana."

La Salle was on the verge of success. He intended to build forts and plant colonies both in the Illinois region and at the mouth of the Mississippi, through which he could control the resources of his vast empire. He hoped soon to free himself of the entanglements of Canada and become governor of an independent realm. In Dec. 1682, he began the construction of Fort St. Louis on the Illinois river, the first post of a permanent character in the Illinois country. To facilitate the transportation of supplies he sent two men to build a post on the present site of Chicago to guard the Chicago portage. Unfortunately, however, Frontenac, his loyal supporter, was recalled to France. La Salle's merchant rivals, who resented his monopoly, carried on a campaign against him, succeeding first with Frontenac's successor, and finally with the French government at home. La Salle, convinced of the hostility of the new governor, started east to treat with him, but on the way met officials sent by the governor to take over the Illinois forts. La Salle was forced to carry his troubles direct to France.

There he met with favour, and the ministry, convinced that a colony at the mouth of the Mississippi was a strategic move of first importance against Spain, with whom France was then at war, authorized and aided La Salle to attempt it. La Salle was made governor of all Louisiana and the forts in the Illinois country were restored to him and repossessed by Tonti. In 1684 La Salle left France with four ships and about 400 men to make the settlement. The naval commander, Beaujeu, however, refused to obey La Salle from the first, and before long was responsible for the loss of the main supply ship to the Spanish. In the West Indies La Salle was seized with the fever and during his long illness the expedition became completely disorganized. When he finally continued with only 180 men it was only to miss the mouth of the Mississippi by proceeding too far to the westward. He retraced his steps and, conditions on shipboard becoming desperate, disembarked his colonists on the present Matagorda bay, Texas, the inlet of which he supposed to be the western outlet of the Mississippi. A short land journey soon convinced him of his mistake, and a longer land expedition to find the Mississippi was unsuccessful. Two of his remaining three ships were wrecked and the third had returned to France. The plight of the colony—reduced to 45 men—had become so desperate that La Salle and a small party made a fruitless attempt to reach Canada where their situation might be made known. Finally, in January 1687, he determined to make a second attempt and took about half the remaining survivors with him. On the way a mutiny occurred and La Salle was assassinated by one of his own men. A few reached Fort St. Louis on the Illinois river. Most of the colonists who had remained were murdered by the Indians. Magnificent in his personal failures, La Salle by his courage against odds has always made a great appeal. Though he seemed to fail, his explorations gave France claim to a splendid empire.

Parkman, *The Discovery of the Great West* (1869); H. Lorin, *Le Comte de Frontenac* (1895); G. Gravier, *Cavelier de La Salle* (1871); L. S. Hasbrouck, *La Salle* (1916).

LA SALLE, ST. JEAN BAPTISTE DE (1651–1719), founder of the order of Christian Brothers, born at Reims, became a canon of the cathedral. He established a school at Reims, where free elementary instruction was given to poor children. His assistants were organized into a community, which gradually rooted itself all over France; and a training-school for teachers, the Collège de Saint-Yon, was set up at Rouen. In 1725, six years after the founder's death, the society was recognized by the pope, under the official title of "Brothers of the Christian Schools"; its members took the usual monastic vows, but did not aspire to the priesthood. During the first hundred years of its existence its activities were mainly confined to France; during the 19th century it spread to most of the countries of western Europe, and to the United States. When La Salle was canonized

in 1900, the total number of brothers was estimated at 15,000.

LA SALLE, a city of La Salle county, Ill., U.S.A., 100m. S.W. of Chicago, at the head of navigation on the Illinois river. It is on Federal highway 51, is the western terminus of the Illinois and Michigan canal, and is served by the Burlington, the Chicago and Joliet (electric), the Illinois Central, the Illinois Traction (electric), and the Rock Island railways. The population was 13,050 in 1920 (22·5% foreign-born white), and was estimated locally at over 15,000 in 1928. There are coal mines, quarries of fine building stone, glass sand and clay in the vicinity. The city has extensive manufactures of zinc, sulphuric acid, cement, brick and clocks, with an aggregate factory output in 1925 valued at $8,990,898. La Salle was settled in 1830 and chartered as a city in 1852. Six miles east is Starved Rock (in a State park of 900ac.), rising abruptly out of the river to a height of 160ft., where La Salle about 1683 erected Fort St. Louis.

LASCAR, the name for all oriental, and especially Indian, sailors, which has been adopted in England into the Merchant Shipping Acts, though without any definition. It is derived from the Persian *lashkar*=army, or camp, and seems to have been applied by the Portuguese, first to an inferior class of men in military service (*cf.* "gun-lascars"), and then to sailors as early as the 17th century. The form *askari* on the east coast of Africa, meaning "sepoy," comes from the Arabic *'askar*=army.

LASCARIS, CONSTANTINE (d. 1493 or 1500), Greek scholar and grammarian, one of the promoters of the revival of Greek learning in Italy, was born at Constantinople. He was a member of the Bithynian family which had furnished three emperors of Nicaea during the 13th century. After the fall of Constantinople in 1453, he took refuge first in Corfu and then in Italy, where Francesco Sforza, duke of Milan, appointed him Greek tutor to his daughter. Here was published his *Grammatica Graeca, sive compendium octo orationis partium,* remarkable as being the first book entirely in Greek issued from the printing press. After leaving Milan, Lascaris taught in Rome and Naples. Ultimately he settled in Messina, Sicily, where he continued to teach publicly until his death.

LASCARIS, JOANNES (John) or **JANUS** (*c.* 1445–1535), Greek scholar, probably the younger brother of Constantine Lascaris, surnamed Rhyndacenus. After the fall of Constantinople he was taken to the Peloponnese, thence to Crete, and ultimately found refuge in Florence at the court of Lorenzo de' Medici, whose intermediary he was with the sultan Bayezid II. in the purchase of Greek mss. for the Medicean library. On the expulsion of the Medici from Florence, at the invitation of Charles VIII. of France, Lascaris removed to Paris (1495), where he gave public instruction in Greek By Louis XII he was several times employed on public missions, amongst others to Venice (1503–08), and in 1515 he appears to have accepted the invitation of Leo X. to take charge of the Greek college he had founded at Rome. We afterwards (1518) find Lascaris employed along with Budaeus (Budé) by Francis I. in the formation of the royal library at Fontainebleau, and also again sent in the service of the French Crown to Venice. He died at Rome, whither he had been summoned by Pope Paul III., in 1535. Among his pupils was Musurus. Amongst other works, Lascaris edited or wrote: *Anthologia epigrammatum Graecorum* (1494), in which he ascribed the collection of the Anthology to Agathias, not to Planudes; *Didymi Alexandrini scholia in Iliadem* (1517); Porphyrius of Tyre's *Homericarum quaestionum liber* (1518).

See H. Hody, *De Graecis illustribus* (1742); W. Roscoe, *Life of Leo X.* ii. (1846); C. F. Börner, *De doctis hominibus Graecis* (Leipzig, 1750); A. Horawitz in Ersch and Gruber's *Allgemeine Encyclopädie;* J. E. Sandys, *Hist. Class. Schol.,* ed. 2, vol. ii. (1908), p. 78.

LAS CASAS, BARTOLOMÉ DE (1474–1566), bishop of Chiapas, known to posterity as the "Apostle of the Indians," was born in Seville in 1474, of noble family; and educated at the University of Salamanca. In 1510 he took holy orders, the first to be granted in the New World, and as a member of Diego Velasquez's colonizing expedition to Cuba in 1511–12 tried vainly to check the massacre of Indians at Caonas.

In 1514 he became suddenly convinced of the unextenuated evil of the *repartimiento* system (allotment of Indians for forced labour), and in 1515 he went to Spain to plead the cause of the Indians before the king (Ferdinand the Catholic). Despite the opposition with which he was confronted from a powerful vested interest in high places, he persisted, and on the death of the king in Jan. 1516, the regent, Cardinal Jimenes de Cisneros, placed him at the head of a commission of Hieronymite fathers to inquire into the means of alleviating the wrongs suffered by the Indians. When the commission arrived at Hispaniola, Las Casas' zeal rebelled at the caution of his colleagues, and he returned to Spain in 1517. Las Casas vigorously pressed his cause with the advisers of the new king, Charles V. He drew up a plan for colonizing the Indians, advocating the importation of negro slaves. The plan failed, and he soon repented the fallacy of substituting negro for Indian slavery. His attempt to found a model colony on the mainland (Cumuná) was defeated through the rapacious brutality of the conquistadors from the islands, and in 1522 he retired to a Dominican convent in Hispaniola.

In 1530 he returned to Spain and obtained a royal cedula prohibiting the enforcement of slavery in Peru, which he delivered in person. His mission concluded, he converted a fierce tribe of Indians in the interior of central America (Tuzutlan), founding the first example of what was to become a system under the Jesuits. It was during this period (*c.* 1535) that he wrote the treatise *De unico vocationis modo.* In 1539 he was sent by his order to gather Dominican recruits in Spain and wrote his best known work—*Brevísima relación de la Destruycion de las Indias occidentales* and in 1542 his *Veynte Razones* in defence of the liberties of the Indians. The emperor, perhaps to get him out of the country, offered him the diocese of Cuzco; this he refused, but accepted the arid bishopric of Chiapas (in Southern Mexico), to which he was confirmed in 1544. When he reached his diocese, he encountered immediate opposition: disloyalty on the part of the clergy, hostility on that of the authorities. He left for Spain in 1547 and surrendered his episcopal dignity. In 1550 he met the famous scholar Gines de Sepúlveda in an open debate on the thesis of the enslavement and destruction of aboriginal peoples. Soon afterward he retired from politics, but in 1555 he followed Prince Philip to England to thwart an attempt on the part of the colonists to obtain the prince's assent to the perpetual bondage of the Indians. Most of his last days were spent in the convents of San Gregorio at Valladolid and of the Atocha in Madrid, where he died in the latter days of July, 1566, one of the few humane and kindly figures in the history of the Spanish conquests in America. Much biographical material appears in his *Obras* (1552); his *Historia de las Indias* was not published until 1875–76.

LAS CASES, EMMANUEL AUGUSTIN DIEUDONNÉ MARIN JOSEPH, Marquis (1766–1842), French official, was born near Revel in Languedoc. He was educated at the military schools of Vendôme and Paris; he entered the navy and took part in various engagements of the years 1781–1782. The outbreak of the revolution in 1789 caused him to "emigrate," and he spent some years in Germany and England, sharing in the disastrous Quiberon expedition (1795). After some years in London he returned to France during the consulate with other royalists who rallied to the side of Napoleon. In 1810 Napoleon made him a chamberlain and created him a count of the empire (he was marquis by hereditary right). After the first abdication of the emperor (April 11, 1814), Las Cases retired to England, but returned to serve Napoleon during the Hundred Days. At the second abdication he proposed that the emperor should appeal to the British nation, afterwards accompanying him to St. Helena. He afterwards published the *Mémorial de Ste. Hélène,* from which he gained an enormous sum. This work should be read with great caution. He infringed the British regulations in such a way as to lead to his expulsion by the governor, Sir Hudson Lowe (Nov. 1816). He died in 1842 at Passy.

See *Mémoires de E. A. D., comte de Las Cases* (Brussels, 1818); *Mémorial de Ste. Hélène* (4 vols., London and Paris, 1823; often republished and translated); *Suite au mémorial de Ste. Hélène, ou observations critiques,* etc. (2 vols., 1824), anonymous, but known to

be by Grille and Musset-Pathay. *See* also GOURGAUD, MONTHOLON, LOWE, SIR HUDSON and NAPOLEON.

LASCELLES, HENRY GEORGE CHARLES, VISCOUNT (1882–), eldest son of Henry Ulick Lascelles, 5th Earl of Harewood, was born on Sept. 9, 1882. He was educated at Eton and entered the army as a lieutenant in the Grenadier Guards. For a time he exchanged military for diplomatic service, becoming an honorary attaché to the Embassy in Rome 1905–07, and A.D.C. to the governor-general of Canada (Earl Grey) 1907–11. He served in France during the World War, being three times wounded and winning the D.S.O. with bar, as well as the Croix de Guerre. In 1922 (Feb. 28) he married Princess Mary, only daughter of King George V., and he was the same year created a Knight of the Garter. Through his grandmother, Elizabeth Joanna, daughter of the 1st Marquess of Clanricarde, he inherited the property, though not the titles, of his great-uncle, the second and last marquess, who died on April 12, 1916.

LAS CRUCES, a town of southern New Mexico, U.S.A., on the Rio Grande, at an altitude of 3,700 ft., 40 m. N.N.W. of El Paso; the county seat of Dona Ana county. It is on Federal highways 80 and 85, and is served by the Santa Fe railway. The population was 3,969 in 1920, and was estimated locally at 5,500 in 1928. It is the commercial centre of the Elephant Butte irrigation district (90,000 ac.). The dam is 80 m. north of the city. At Mesilla park, 3 m. south, is the New Mexico college of Agriculture and Mechanic Arts (established 1889) and the agricultural experiment station. Just west of the college is the old adobe town of Mesilla (now inhabited exclusively by Mexicans), once the capital of the South-West Territory, where the Gadsden Purchase was consummated in 1854. Las Cruces was founded in 1849 and incorporated in 1907.

LASHIO: *see* SHAN STATES.

LASKER, EDUARD (1829–1884), German publicist, was born on Oct. 14, 1829, at Jarotschin, Posen, being the son of a Jewish tradesman. He attended the gymnasium, and afterwards the university of Breslau. In 1848, after the outbreak of the revolution, he went to Vienna and entered the students' legion, fighting against the imperial troops during the siege of the city in October. He then continued his legal studies at Breslau and Berlin, and after a visit of three years to England, then the model state for German liberals, entered the Prussian judicial service. In 1870 he left the government service, and in 1873 was appointed to an administrative post in the service of the city of Berlin. In 1865 he was elected member for one of the divisions of Berlin in the Prussian parliament. He joined the radical or *Fortschritts* party, and in 1867 was also elected to the German parliament, but he helped to form the national liberal party, and in consequence lost his seat in Berlin, which remained faithful to the radicals; after this he represented Magdeburg and Frankfort-on-Main in the Prussian, and Meiningen in the German, parliament. His motion that Baden should be included in the North German Confederation in Jan. 1870 caused much embarrassment to Bismarck, but probably hastened the crisis of 1870. His great work was his share in the judicial reform during the ten years 1867–77. To him more than to any other single individual is due the great codification of the law. He compelled the government to withdraw or amend many proposals which seemed dangerous to liberty, but opposed those liberals who, unable to obtain all the concessions which they called for, refused to vote for the new laws as a whole. A speech by Lasker on Feb. 7, 1873, attacking the management of the Pomeranian railway and the revelations which followed led to the fall of Hermann Wagener, one of Bismarck's most trusted assistants. This episode is generally regarded as the beginning of the reaction against economic liberalism by which he and his party were to be deprived of their influence. He refused to follow Bismarck in his financial and economic policy after 1878; always unsympathetic to the chancellor, he was now selected for his most bitter attacks. In 1879 he lost his seat in the Prussian parliament; he joined the *Sezession,* but was ill at ease in his new position. He died suddenly in New York on Jan. 5, 1884.

See L. Bamberger, *Eduard Lasker, Gedenkrede* (Leipzig, 1884); A. Wolff, *Zur Erinnerung an Eduard Lasker* (Berlin, 1884); Freund, *Einiges über Eduard Lasker* (Leipzig, 1885); and *Eduard Lasker, seine Biographie und letzte öffentliche Rede,* by various writers (Stuttgart, 1884).

LASKI, the name of a noble and powerful Polish family, is taken from the town of Lask, the seat of their lordship.

JAN LASKI, the elder (1456–1531), Polish statesman and ecclesiastic, took orders at an early age, and in 1495 was secretary to the Polish chancellor Zawisza Kurozwecki, in which position he acquired both influence and experience, and was sent on important diplomatic missions to Rome in 1495 and again in 1500, and once on a special embassy to Flanders, of which he has left an account. On the accession to the Polish throne in 1501 of the indolent Alexander, who had little knowledge of Polish affairs and chiefly resided in Lithuania, Laski was appointed by the senate the king's secretary, in which capacity he successfully opposed the growing separatist tendencies of the grand-duchy and maintained the influence of Catholicism, now seriously threatened there by the Muscovite propaganda. In 1503 his king appointed him chancellor, in which capacity Laski supported the *szlachta,* or country-gentlemen, against the lower orders, going so far as to pass an edict excluding henceforth all plebeians from the higher benefices of the church. In 1511 Laski became archbishop of Gnesen, and thus primate of the Polish Church. He carried out difficult negotiations for King Sigismund I. with the Teutonic Knights with conspicuous ability, which he also displayed at the Lateran Council convened by Pope Julius II. in 1513, where he attended to plead the cause of Poland against the Knights.

This mission was equally profitable to his country and himself, and he succeeded in obtaining from the pope for the archbishops of Gnesen the title of *Legati nati.* In his old age Laski's partiality for his nephew, Hieronymus, led him to support the candidature of John Zapolya, the protégé of the Turks, for the Hungarian crown so vehemently against the Hapsburgs that Clement VII. excommunicated him, and the shock of this disgrace was the cause of his sudden death in 1531. Of his numerous works the most noteworthy are his collection of Polish statutes entitled *Statuta provinciae gnesnensis antiqua,* etc. (Cracow, 1525–28) and *De Ruthenorum nationibus eorumque erroribus,* printed at Nuremberg

See Heinrich R. von Zeissberg, *Joh Laski, Erzbischof in Gnesen* (Vienna, 1874); and Jan Korytkowski, *Jan Laski, Archbishop of Gnesen* (Gnesen, 1880)

HIERONYMUS JAROSLAW LASKI (1496–1542), Polish diplomatist, nephew of Archbishop Laski, was successively palatine of Inowroclaw and of Sieradia On the death of Ladislaus V. (*q.v.*), Laski, contrary to the wish of his own sovereign, Sigismund I., who favoured the Hapsburgs, entered the service of John Zapolya, the rival claimant, thus seriously compromising Poland both with the emperor and the pope. Laski acted as Zapolya's envoy to Paris, Copenhagen and Munich, and finally to the Sultan, under whose protection Zapolya had placed himself. On his way to Constantinople he was attacked and robbed both of his credentials and the rich presents he was bearing to the Sultan. In spite of this, he persuaded the Sultan to recognize Zapolya, and even, on his own authority, concluded a ten years' truce between his old master King Sigismund of Poland and the Porte He then returned to Hungary at the head of 10,000 men, with whose aid he enabled Zapolya to re-establish his position and defeat Ferdinand. He was rewarded with the countship of Zips and the governor-generalship of Transylvania. But his influence excited the jealousy of the Magyars, and Zapolya was persuaded to imprison him. On being released by the interposition of the Polish grand hetman, Tarnowski, he became Zapolya's most violent opponent. Shortly after his return to Poland, Laski died suddenly at Cracow, probably poisoned by one of his innumerable enemies.

See Alexander Hirschberg, *Hieronymus Laski* (Pol.) (Lemberg, 1888).

JAN LASKI, the younger (1499–1560), also known as *Johannes a Lasco,* Polish reformer, son of Jaroslaw (d. 1523) voivode of Sieradia and nephew of Archbishop Laski, while studying abroad made the acquaintance of Zwingli and Erasmus and returned to Poland in 1526 saturated with the new doctrines. Nevertheless, he took orders, and owing to the influence of his uncle obtained the bishopric of Veszprem in Hungary from King John Zapolya,

besides holding a canonry of Cracow and the office of royal secretary. In 1531 he resigned all his benefices rather than give up a woman whom he had secretly married, and having incurred general reprobation and the lasting displeasure of his uncle the archbishop, he fled to Germany, where ultimately (1543) he adopted the Augsburg Confession. For the next 13 years Laski wandered through western Europe, preaching the new doctrines and urging Poland to adopt them. In 1556, during the brief triumph of the anti-Catholics, he returned to Poland, took part in the synod of Brzesc, and published a number of important polemical works.

See H. Dalton, *Johannes a Lasco* (1881), English version of the earlier portion by J. Evans (1886); Bartels, *Johannes a Lasco* (1860); Harboe, *Schicksale des Johannes a Lasco* (1758); R. Wallace, *Antitrinitarian Biography* (1850); Bonet-Maury, *Early Sources of Eng. Unit. Christianity* (1884); W. A. Archbold, "Laski," in *Dict. Nat. Biog.* (1892); George Pascal, *Jean de Lasco* (Paris, 1894); *Life* in Polish by Antoni Walewski (Warsaw, 1872); and Juljan Bukowski, *History of the Reformation in Poland* (Pol.) (Cracow, 1883).

LASKOWSKI, LADISLAS (1841–1928), Polish anatomist, was born in Warsaw. He was imprisoned for his part in the insurrection of 1863, but escaped to Cambridge, continuing his medical studies there, and later in Paris. He joined the French Army medical service during the Franco-Prussian War. He was for many years professor of human anatomy at the University of Geneva. On his retirement, in 1916, he took up the study of astronomy, and, with the aid of a small observatory in his own house, discovered a star, nova Aquilae. His chief contribution to science, which gained him several academic honours, was his discovery of a method of preserving bodies for dissection. He died in Geneva on April 16, 1928.

LAS PALMAS, the capital of the Spanish island of Grand Canary, in the Canary archipelago, in 28° 7′ N. and 5° 24′ W. Pop. (1920) 66,461. Las Palmas is the largest city in the Canary islands, of which it was the capital until 1833. Its bishop is subordinate to the archbishop of Seville. The palms from which the city derives its name are still characteristic of the fertile valley which it occupies. Las Palmas is built on both banks of a small river, and although parts of it date from the 16th century, it is on the whole a clean and modern city, well drained, and supplied with pure water, conveyed by an aqueduct from the highlands of the interior. Its principal buildings include a handsome cathedral, founded in the 16th century but only completed in the 19th, a theatre, a museum, an academy of art, and several hospitals and good schools. The modern development of Las Palmas is largely due to the foreign merchants, and especially to the British who control the greater portion of the local commerce. La Luz, the port, is connected with Las Palmas by a railway 4 m. long. It is strongly fortified. The harbour, protected by the promontory of La Isleta, which is connected with the mainland by a narrow bar of sand, can accommodate the largest ships, and affords secure anchorage in all weathers. Ships can discharge at the breakwater (1,257 yd. long) or at the Santa Catalina mole, constructed in 1883–1902. The minimum depth of water alongside the quays is 4½ ft. La Luz is one of the principal Atlantic coaling stations, and the coal-trade is entirely in British hands. The chief exports are fruit, vegetables, sugar, wine and cochineal; coal, iron, cement, timber, petroleum, manure, textiles and provisions are the chief imports. (*See* also CANARY ISLANDS.)

LASSALLE, FERDINAND (1825–1864), German Socialist, of Jewish extraction, was born at Breslau on April 11, 1825. He took a keen interest in public affairs, and early resolved to devote himself to the realization of democratic liberty; but after studying at Berlin university, where his brilliance gained for him the name of *Das Wunderkind,* he joined the group of Young Hegelians, and settled down to a scholastic career. His meeting with the Countess Sophie von Hatzfeldt in 1846, however, plunged him into a life of activity, and his prosecution of her suit throughout the next 11 years, in a trial for separation and alimony against her husband, Edmund von Hatzfeldt-Wildenburg, constitutes one of the most dramatic episodes in Lassalle's meteoric career. His only other entrance into public life during this earlier period was in 1848, when he suffered imprisonment for his revolutionary activities. For the most part these years were spent in study and the completion of his three most famous works. In 1857, he published *Die Philosophie Herakleitos dargestellt,* a study of Heraclitus from the Hegelian point of view; this was followed in 1859 by a pamphlet on *The Italian War and Prussia's Mission,* in which Bismarck's policy is foreshadowed; while in 1861 appeared *Die System des erworbenen Rechts,* a brilliant treatise on property.

In the following year began the short-lived activity which was to give Lassalle an historical significance. At that time, when political life in Germany was paralysed by the opposition of the Prussian Liberals to Bismarck's constitutional changes, Lassalle came forward as the antagonist of both Government and Opposition. Seeing an opportunity to realize his youthful ideals, and to fight for democracy, he called on the German workers to form their own party and to concentrate on their political and economic emancipation. The two main points in his programme were universal suffrage and a form of State Socialism, but he regarded the latter as the more important, the former being merely a means to that end. For two and a half years he struggled to arouse the workers from their apathy, and by means of pamphlets and speeches, succeeded in inflaming the country, particularly in the Rhineland area, where he was received with enthusiasm. His most important publications at this time were *The Working Man's Programme* (1862), and *The Open Letter* (1863), a succinct statement of the principles which should guide the workers in their establishment of a new era. In 1863, Lassalle founded the *Allgemeiner Deutscher Arbeiterverein,* the embryo of the German Social Democratic Party, a permanent memento of his work.

He died on Aug. 31, 1864, from a wound received in a duel at Carouge, Geneva. The duel arose from a love affair, which is familiar to English readers from its treatment by George Meredith in the *Tragic Comedians.* Although a champion of the working classes, Lassalle was a great figure in society. In the summer of 1864 he met in Switzerland Fräulein von Dönniges, for whom he had had earlier in Berlin a passion which was fully reciprocated. She was the daughter of the Bavarian envoy at Geneva, who would not hear of Lassalle as a suitor, and she was married, under pressure, to the Wallachian Count von Racowitza. Thereupon Lassalle challenged the father and the husband. The challenge was accepted by Racowitza, and the duel proved fatal.

Lassalle left no clear exposition of his theories, and it was only after his death that an examination of his letters and writings revealed his capacity both as a thinker and an agitator During his years of study (1848–62), he worked out his philosophy of life, but as a propagandist he subordinated his philosophy to the needs of the moment. His investigations into the history of man led him to conceive of three stages of development: the ancient and feudal, which, through the subjection of the labourer, sought solidarity without freedom; the reign of capital and the middle classes, established in 1789, which sought freedom by destroying solidarity; and the new era, beginning in 1848, which would reconcile both by the introduction of the principle of association. But by association, Lassalle meant productive associations of working men under the benevolent guidance of the State, not the co-operative institutions which were then being organized by Schulze-Delitzsch, to which he was bitterly opposed.

But if, as a propagandist, Lassalle merely accepted the orthodox political economy, as a thinker he made several valuable contributions to economic theory. His explanation of trade cycles, or, as he called them, conjunctures, though incomplete, is yet worthy of consideration; while his discussion of property, which he maintained is an historical category, and of capital, was developed by later socialist writers. It must be admitted, however, that Lassalle's greatest work is in the political sphere, and it is as a propagandist who successfully placed a socialist programme before the German workers, and who succeeded in forming the first effective socialist party, that he will chiefly be remembered.

Lassalle's most important works, apart from those already mentioned are: *Über Verfassungswesen; Arbeiterprogramm; Zur Arbeiterfrage; Arbeiterbesebuch; Herr Bastiat-Schulze von Delitzsch, oder Kapital und Arbeit.* His *Collected Works* appeared at Leipzig (1899–1901).

The best biography of Lassalle is H. Oncken's *Lassalle* (Stuttgart, 1904); another excellent work on his life and writings is George

Brandes' Danish work, *Ferdinand Lassalle* (German translaton, 4th ed., Leipzig, 1900). *See* also A. Aaberg, *Ferdinand Lassalle* (Leipzig, 1883); C. v. Plener, *Lassalle* (Leipzig, 1884); G. Becker, *Enthüllungen über das tragische Lebensende F. Lassalles;* A. Kutschbach, *Im Anschluss an die Memoiren der H. von Racowitza. See* further W. H. Dawson, *German Socialism and Lassalle* (1888); K. Haenisch, *Lassalle; Mensch und Politiker* (1925).

(T. Kl.)

LASSEN, CHRISTIAN (1800–1876), German orientalist, was born at Bergen, Norway, on Oct. 22, 1800. He was educated at Christiania (Oslo), at Heidelberg and at Bonn, where he acquired a sound knowledge of Sanskrit. He spent the next three years in Paris and London, collecting materials for future research, especially with reference to the Hindu drama and philosophy. On his return to Bonn he studied Arabic and took the degree of Ph.D. In 1829–31 he brought out, with August W. von Schlegel, a critical annotated edition of the Hitopadeśá He also directed his attention to the Zend, and to Iranian studies generally, and in *Die altpersischen Keilinschriften von Persepolis* (1836) revealed the true character of the Old Persian cuneiform inscriptions. He published in the 6th volume of his journal (1845), a collection of all the old Persian cuneiform inscriptions known up to that date. He also deciphered the newly-discovered Bactrian coins (*see* his *Zur Geschichte der griechischen und indo-skythischen Könige in Bakterien, Kabul, und Indien,* 1838). The great work of Lassen's life was his *Indische Altertumskunde* (1847–61).

His works include: an edition and translation (with von Schlegel) of the first two cantos of the *Ramayana* (1829–38); an edition of the first act of Bhavabhuti's drama *Malatimadhava* (1832); a complete edition with Latin translation, of the *Sankhyakarika* (1832); an edition and translation of Jayadeva's lyrical drama *Gitagovinda* and his *Institutiones linguae Pracriticae* (1837); *Anthologia Sanscritica* (1838, new ed. J. Gildemeister, 1868).

LASSEN, EDUARD (1830–1904), Belgian musical composer, was born in Copenhagen, but educated at the Brussels Conservatoire. He won the *Prix de Rome* in 1851, and went for a long tour in Germany and Italy. He settled at Weimar, where in 1861 he succeeded Liszt as conductor of the opera, and he died there on Jan. 15, 1904. Besides many well-known songs, he wrote operas—*Landgraf Ludwig's Brautfahrt* (1857), *Frauenlob* (1861), *Le Captif* (1868)—instrumental music to dramas, notably to Goethe's *Faust* (1876), two symphonies and various choral works.

LASSO (LASSUS), ORLANDO (*c.* 1530–1594), Belgian musical composer, whose real name was probably Roland Delattre, was born at Mons in Hainault, not much earlier than 1532. He seems to have visited England in 1554 and to have been introduced to Cardinal Pole, to whom an adulatory motet appears in 1556.

His first book of motets appeared at Antwerp in 1556, containing the motet in honour of Cardinal Pole. The style of Orlando had already begun to purify itself from the experimental incongruities that led Burney, who seems to have known only his earlier works, to call him "a dwarf on stilts" as compared with Palestrina. But where he is orthodox he is as yet stiff, and his secular compositions are, so far, better than his more serious efforts. In 1557, if not before, he was invited by Albrecht IV., duke of Bavaria, to go to Munich. The duke was an intelligent patron of the fine arts, a notable athlete, and a man of strict principles. Munich now became Orlando's permanent home; though he sometimes paid long visits to Italy and France, whether in response to royal invitations or with projects of his own. In 1558 he made a happy marriage by which he had four sons and two daughters. The four sons all became good musicians; and the two eldest (under the patronage of Duke Maximilian I., the second successor of Orlando's master) published the enormous collection of Orlando's Latin motets known as the Magnum opus musicum.

Like Haydn at Esterhaz, but in no provincial isolation, Orlando at Munich worked out his art under ideal circumstances. His duty was to make music all day and every day, and to make it according to his own taste. Nothing was too good, too severe or too new for the duke. Church music was not more in demand than secular. Instrumental music, which in the 16th century had hardly any independent existence, accompanied the meals of the court; and Orlando would rise from dessert to sing trios and quartets with picked voices. The daily prayers included a full mass with polyphonic music. Such things were possible in those days, for 16th century music was no sooner written than it could be performed, entailing as little expense and preparation as a game of billiards in a good billiard room. From Munich Orlando's fame radiated throughout Europe, and every contemporary authority attests that he was received with acclamation wherever his travels took him. Experience rapidly taught him a style as pure as Palestrina's, without narrowing his range or curbing his originality. He was omnivorous of the literary culture of the time; and during his stay at the court of France in 1571 he became a friend of the poet Ronsard.

In 1579 Duke Albrecht died. Orlando's salary had already been guaranteed to him for life, and the new duke was very kind to him. But the loss of his master was a great grief and seems to have checked his activity for some time. In 1589, after the publication of six Masses, ending with a beautiful Missa pro defunctis, his strength began to fail; and a sudden serious illness left him alarmingly depressed and inactive until his death on June 14, 1594.

If Palestrina represents the supreme height attained by 16th century music, Orlando represents the whole century. The swiftness of his intellectual and artistic development is astonishing. His first four volumes of madrigals show but an intermittent sense of beauty. Many a number in them is a solid mass of "false relations" between twin major and minor chords, such as make an unenviable mark of distinction between English styles and the purity of the Italians. In the Italian madrigal (as distinguished from the *villanella* and other light forms), Orlando seldom attained or attempted a pure style, though some of his later madrigals are indeed glorious. But in his French chansons, many of which are settings of the poems of his friend Ronsard, his wit and deftness are unfailing, and it would be worth while to find appropriate but decent texts for those compositions, German, French and Italian, which modern singers cannot sing to the gross original words. In 1562 when the Council of Trent was censuring the abuses of Flemish church music, Orlando had already purified his ecclesiastical style; though he saw no reason why it should cease to be Flemish. At the same time Orlando's Masses are not among his greatest works. Perhaps the uses of Duke Albrecht's private chapel were less favourable to finely proportioned liturgical music than the uses of metropolitan Rome. But, in any case, the music of a 16th century Mass demands, before all other technical qualities, the power of composition. No power of illustration can replace power of composition where the composer has to deal with a text of universal import. And Orlando is primarily not a composer, but an illustrator.

Palestrina and Victoria are as inveterate composers as Beethoven and Schubert. When Palestrina is uninspired his composition remains efficient; and when Victoria is uninspired his composition becomes diffuse. Dullness results in both cases. The uninspired Orlando does not become dull, though he may become very ugly. But he reveals to us that he is not normally a composer at all. Like Max Reger, he can sit down to write, with nothing in his head, and brew a kind of musical audit-ale alarming in its concentration. But for him, as for the listener, a long pull at such stuff is impossible. When inspiration comes, the gift of composition comes with it: the sections coalesce and relieve each other with incalculable variety of proportion in forms uniquely right; and the inveterate illustrator is not repressed but raised to a sublime activity. In the wonderful "Justorum animae" (Magnum opus No. 266 [301]) the rhythms of "suit in pace" become vast like the beating of an angel's wings in space. It is one of the supreme passages in music, and is perfectly poised upon its context. Orlando can also become a composer on less powerful impulse. His high spirits will suffice, together with his Shakespearian love of puns, for which the solmization syllables "ut, re, mi, fa, sol, la" give abundant musical opportunities. It is not surprising, then, to find him enjoying caricature, and setting a whole Latin poem written exclusively in false quantities; and

making a long motet out of the words "super flumina Babylonis" spelled syllabically (s, u—su; p, e, r—per—super). Even these follies become musical and when the text is itself inspired by genuine high spirits Orlando again rises to power of composition. His setting of Walter de Mapes's "Fertur in conviviis" (given in the Magnum Opus with a stupid moral derangement of the text), and most of his French chansons, are among the most deeply humorous music in the world.

If 16th century music could have covered the range of 16th century drama or of 19th century symphony and opera, Orlando might more easily have proved to us that his humour came from a Shakespearian understanding of the sublime. His Penitential Psalms stand with Josquin's Miserere and Palestrina's first book of Lamentations as artistic monuments of 16th century penitential religion, just as Bach's Matthew Passion stands alone among such monuments in later art. Yet the passage (quoted by Sir Hubert Parry in vol. 3 of the *Oxford History of Music*) "Nolite fieri sicut mulus" is one among many traits which are grotesquely descriptive without losing harmony with the austere depths of their context. Such music, if only from its peculiar technique of crossing parts and unexpected intervals, is exceptionally difficult to read; and hence intelligent conducting and performance of it are rare.

Orlando's works as shown by the plan of Messrs. Breitkopf and Härtel's complete critical edition (begun in 1894) comprise: (1) The Magnum opus musicum, a posthumous collection containing Latin pieces for from two to twelve voices, 516 in number (or, counting by single movements, over 700); not all of these are to the original texts. The Magnum opus fills eleven volumes. (2) Five volumes of madrigals, containing six books, and a large number of single madrigals, and about half a volume of lighter Italian songs (villanellas, etc.). (3) Three volumes (not four as in the prospectus) of French chansons. (4) Two volumes of German four-part and five-part *Lieder*. (5) Serial church music: three volumes, containing Lessons from the Book of Job (two settings); Passion according to St. Matthew (*i.e.*, like the Passions of Victoria and Soriano, a setting of the words of the crowds and of the disciples); Lamentations of Jeremiah; Morning Lessons; the Officia printed in the third volume of the Patroncinium (a publication suggested and supported by Orlando's patrons and containing eight entire volumes of his works); the Seven Penitential Psalms; German Psalms and Prophetiae Sibyllarum. (6) One hundred Magnificats (Jubilus B. M. Virginis) 3 vols. (7) Eight volumes of Masses. (8) Two volumes of Latin songs not in the Magnum opus. (9) Five volumes of unpublished works.

(D. F. T.)

LASSO (Span. *lazo*, snare, ultimately from Lat. *lagueus*, *cf.* "lace"), a rope 60 to 100ft. in length with a slip-noose at one end, used in the Spanish and Portuguese parts of America and in the western United States for catching wild horses and cattle. It is now less employed in South America than in the vast grazing country west of the Mississippi river, where the herders, called locally cow-boys or cow-punchers, are provided with it. When not in use, the lasso, called *rope* in the West, is coiled at the right of the saddle in front of the rider. When an animal is to be caught the herder, galloping after it, swings the coiled lasso round his head and casts it straight forward in such a manner that the noose settles over the head or round the legs of the quarry, when it is speedily brought into submission.

LASUS, Greek lyric poet, of Hermione in Argolis, flourished about 510 B.C. A member of the literary and artistic circle of the Peisistratidae, he was the instructor of Pindar in music and poetry and the rival of Simonides. He developed the structure of the dithyramb, made it more mimetic in character and enlarged its scope beyond the story of Dionysus. He also instituted prize contests. Athenaeus (xiv. 624 E.) has preserved a fragment of one of his poems, a hymn to Demeter of Hermione. Lasus was also the author of the first theoretical treatise on music.

LAS VEGAS, a city of Nevada, U.S.A., on Federal highway 91 and the Union Pacific railway, at an altitude of 2,024 ft.; the county seat of Clark county. It is a station on the air-mail route from Salt Lake City to Los Angeles. The population was 2,304 in 1920, and was estimated locally at 5,500 in 1928. Mining (of the precious metals, lime, borax, salt and gypsum) is the leading occupation of the county. There are railroad repair shops in the city. Farming is carried on to some extent in Las Vegas valley, on land irrigated from artesian wells, of which there are about 100 in the valley. One of them supplies the city with water, and could furnish enough for a population of 25,000. The proposed site of the Boulder Dam across the Colorado river, the central feature of a tremendous engineering project for preventing floods, irrigating arid lands and generating power, is 31 m. E of Las Vegas. Las Vegas was settled about 1905 and was incorporated in 1912.

LAS VEGAS (läs vāg′ ąs), an urban community of northern New Mexico, U.S.A., formed of two adjoining municipal corporations (a city and a town) 45 m. E. by S. of Santa Fe, at an elevation of 6,384 ft., on the Gallinas river, the Santa Fe railway, and Federal highways 66 and 85. The modern city, on the east bank of the river, is the county seat of San Miguel county. Its population in 1920 was 4,304; that of the old town, on the west bank, built of low adobe houses, on narrow crooked streets, was 3,902. The combined population in 1928 was estimated locally at 9,000.

Las Vegas is a division headquarters of the Santa Fe, which has large repair shops here; an important market for wool, hides and pelts; and the supply centre for 47,000 ac. of irrigated land. It is the seat of the New Mexico Normal university (opened 1898), and of the State hospital for the insane. The county court-house is in the old town. There are medicinal hot springs and a sanatorium 6 m. N.W. The old town was a Mexican settlement on the Sante Fe trail, founded in 1835, under the Mexican republic. Its plaza was a refuge for traders' caravans and on one of its flat roofs Gen. Stephen W. Kearny (on Aug. 15, 1846) administered to the Mexican citizens the oath of allegiance to the United States. After the railway arrived in 1879 a town grew up around the station, which was incorporated in 1888 as East Las Vegas, and in 1888 as the city of Las Vegas. The old town was incorporated in 1903.

LASWARI, one of the decisive battles of India. It was fought on Nov. 1, 1803, between the British, under Gen. Lake, and the Mahratta troops of Sindia, consisting of the remnant of Perron's battalions. Laswari is a village in the state of Alwar some 80m. S. of Delhi, and here Lake overtook the enemy and attacked them with his cavalry before the infantry arrived. The result was indecisive, but when the infantry came up there ensued one of the most evenly contested battles ever fought between the British and the natives of India, which ended in a complete victory for the British.

LASZLO DE LOMBO, PHILIP ALEXIUS (1869–), naturalized British portrait painter, was born in Budapest, and studied art there in the Industrial art school and the National drawing school. He went later to Munich, where he was a pupil of A. Liezenmayer, and to Paris where he studied under Lefebre and Benjamin Constant. His portrait of Prince Hohenlohe obtained a gold medal at the Paris Salon in 1899, and in the following year a second gold medal was awarded to him for a portrait of Pope Leo XIII. His work afterwards brought him many other awards, and he was the recipient of many honours.

Among his best-known works are the portraits of King Edward VII., Queen Alexandra, the ex-Kaiser and Signor Mussolini.

LATACUNGA (in local parlance, TACUNGA), a plateau town of Ecuador, capital of the province of León, 46 m. S. of Quito, near the confluence of the Alagues and Cutuchi to form the Patate, the headstream of the Pastaza. Pop. (1925 estimate) 15,000, largely Indian. Latacunga stands on the old road between Guayaquil and Quito and is on the railway between those cities. It is 9,141 ft. above sea-level; its climate is cold and unpleasant, owing to the winds from the neighbouring snow-clad heights, and the barren, pumice-covered table-land on which it stands. Cotopaxi is only 25 m. distant, and the town has suffered repeatedly from eruptions. Founded in 1534, it was four times destroyed by earthquakes between 1698 and 1798.

LA TAILLE, JEAN DE (*c.* 1540–1608), French poet and dramatist, was born at Bondaroy. He studied the humanities in Paris under Muret, and law at Orleans under Anne de Bourg. He began his career as a Huguenot, but afterwards adopted a mild Catholicism. He was wounded at the battle of Arnay-le-Duc in 1570, and retired to his estate at Bondaroy, where he wrote a political pamphlet entitled *Histoire abrégée des singeries de la ligue,* often published with the *Satire Ménippée.* His chief poem is a satire on the follies of court life, *Le Courtisan retiré;* he also wrote a political poem, *Le Prince nécessaire.* In 1572 appeared his tragedy of *Saül le furieux,* with a preface on *L'Art de la tragédie.* Like Jodelle, Grévin, La Péruse and their followers, he wrote, not for the general public to which the mysteries and farces had addressed themselves, but for the limited audience of a lettered aristocracy. He therefore depreciated the native drama and insisted on the Senecan model. A second tragedy, *La Famine ou les Gabéonites* (1573), is inferior in construction. He wrote, about 1562, two comedies, *Le Négromant* and *Les Corrivaux,* which were published in 1573. *Les Corrivaux* is remarkable for its colloquial prose dialogue.

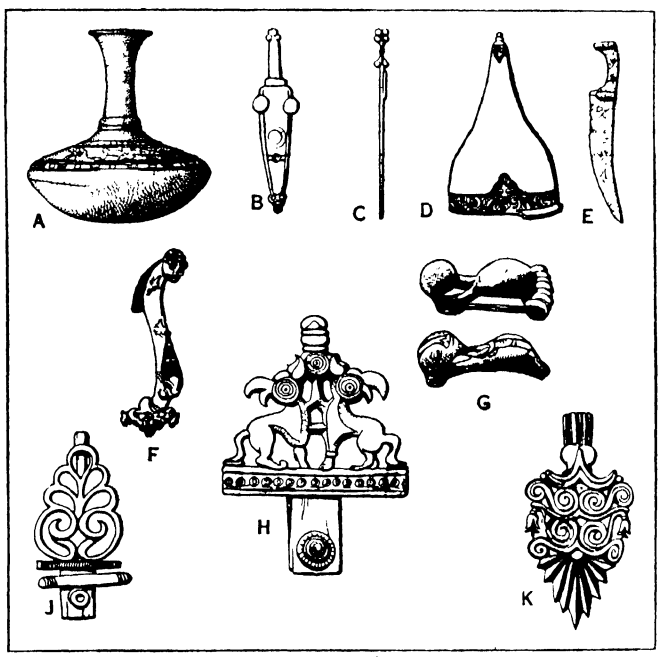
The works of Jean de la Taille were edited by René de Maulde (4 vols., 1878–82). *See* also E. Faguet, *La Tragédie française au XVIe siècle* (1883).

LATAKIA, a seaport of Syria opposite the island of Cyprus, pop. about 22,000 (12,000 Muslims). The ancient Phoenician name was Ramitha and it received the name Laodicea from Seleucus Nicator with the addition *ad mare* to distinguish it from five others. In the Roman period it was favoured by Caesar and took the name Julia. The town received the *jus italicum* from Severus. In Christian times it became the see of a bishop. In the period of the crusades it was a wealthy city, fell to Tancred (1102) and was recaptured by Saladin (1188). A Christian settlement here which had been granted certain privileges was driven forth by Sultan Kalaūn. Its fortunes gradually receding were at a low ebb in the 16th century, but trade (notably tobacco) brought a new revival of prosperity in the following century. It has suffered much damage from earthquakes (1170, 1287, 1822).

In classical times its slopes were covered with vines. It had, for those times, a good harbour and the native wine was much exported. On its looms a celebrated kind of linen was manufactured and cloaks and cloths from Laodicea always commanded a good price. The chief object of archaeological interest is a triumphal arch probably of the time of Septimius Severus. Four Corinthian pillars with entablature perhaps belonged to the portico of a temple. The chief modern industry is the cultivation of the well-known Latakia tobacco and other industries include silk, oil, poultry and sponge-fishing. Formerly it produced a beautiful type of rug.

On the French occupation of the country under the League of Nations mandate the littoral north of Lebanon was made into a territory of the 'Alāwīyin with Latakia as centre of administration (1920) and later erected into a State (1922). A new road has been constructed since the war from Latakia to Tripoli.

(E. Ro.)



LATEEN, a certain kind of triangular sail, having a long yard by which it is suspended to the mast. A "lateener" is a vessel rigged with a lateen sail and yard. This rig was formerly much used, and is still the typical sail of the *felucca* of the Mediterranean and *dhow* of the Arabian sea.

LATENCY IN INFECTIVE DISEASE, a condition in which, infection having occurred, the manifestations of bacterial disease are postponed. In one sense, latency is an excessive prolongation of incubation period, but the following case, reported by Abraham in a discussion on the subject at the Royal Medical and Chirurgical Society (now Royal Society of Medicine) in 1896 is remarkable. A man became leprous 40 years after his last exposure to the disease. During this period of 40 years he had lived continuously in England and had held no communication, even by letter, with lepers or regions in which leprosy is endemic. It must be assumed that in this case the leprosy bacilli were introduced into the body of the man at least 40 years before he manifested the disease, and that during that period they remained living and latent. In the disease of silkworms known as "pébrine" the micro-organisms which cause the disease can actually be seen in the eggs laid by an infected moth. But though the eggs are kept under conditions not unfavourable to bacterial growth the micro-organisms in the eggs do not begin to develop until the changes occur which lead to the formation of a caterpillar. Hence a strict latency, as distinguished from an undue prolongation of incubation period, in infective disease, must be allowed. It is quite conceivable that the balance between the micro-organism and the tissues in which it is deposited, may, on occasions, be such that the micro-organism neither dies nor exerts its vital functions, but remains, so to speak, in a state of suspended animation and capable of development, if, at any time, the opposing force exerted by the tissues becomes lessened. Clinically "latent" disease almost always becomes manifest at a time when the patient has been subject to depressing conditions of some kind. (For the meaning of the term "latency" in biology *see* HEREDITY.)

(W. S. L.-B.)

LA TÈNE ("the Shallows"), the site which gave its name to the culture of the second Iron Age of Central and Western Europe, lies in Switzerland, at the east end of the Lake of Neuchâtel. It was not the starting-point of that culture, as it seems only to have been occupied from the Middle La Tène period; but it was here that objects characteristic of the La Tène civilization were first identified. Déchelette and Forrer hold it to be a prehistoric customs station, but P. Vouga is probably correct in regarding it as a fortified and garrisoned dépôt, a distributing-centre of weapons and other objects. Reinecke divides the La Tène Period into four phases (A–D), the first two corresponding to Déchelette's I.; the third and fourth to Déchelette's II. and III.

Phase A.—The domain of phase A, the Earliest La Tène period, which according to Reinecke's latest chronology, began *c.* 550 and

A, E, F, G. FROM LINDENSCHMIT, "DIE ALTERTÜMER UNSERER HEIDNISCHEN VORZEIT" (ZABERN); B, D, H, J, K. FROM DÉCHELETTE, "MANUEL D ARCHÉOLOGIE PRÉHISTORIQUE" (LIBRAIRIE ALPHONSE PICARD), C FROM KOSSINNA, "GESELLSCHAFT FÜR DEUTSCHE VORGESCHICHTE"

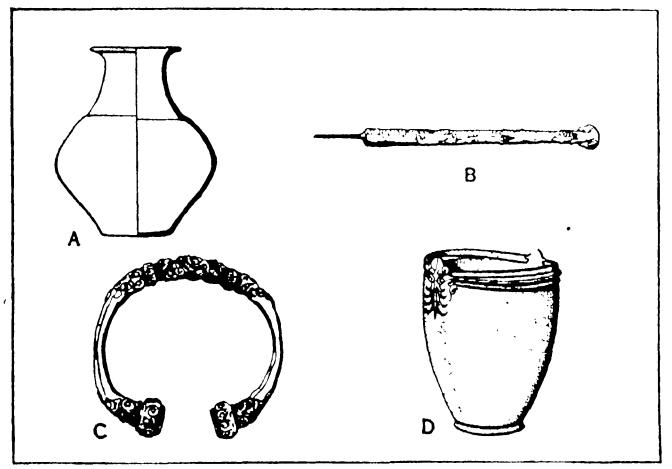


FIG. 1.—POTTERY AND BRONZE OF THE EARLIEST LA TÈNE PERIOD (C. 550–420 B C.)

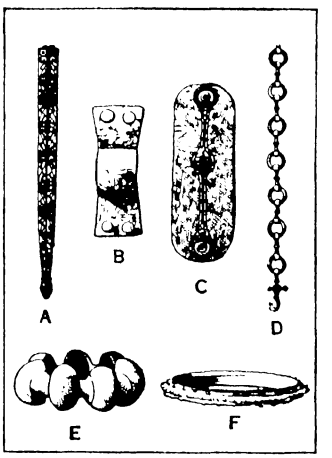
A. Lenticular pottery flask; B. Short dagger-sword; C. Long sword; D. High conic helmet; E. Heavy knife (Hiebmesser); F & G. Mask and bird-headed fibulae; H, J, K. Girdle clasps

lasted till *c.* 425 or 420 B.C., may be divided into a central, western and eastern area. In the first, the middle Rhine and adjacent regions, A is best represented by the remarkably rich group of burials known as the "chieftains' graves" which extend from Württemberg to the province of Luxembourg (Eygenbilsen). The western area is situated in east and north-east France. Most of the rich chariot-burials in Champagne may be assigned to phase A.

The eastern area lies in east Bavaria, west Bohemia, etc. Here a strong influence from upper Italy made itself felt; but in the central and western areas the Greek influence was paramount, reaching those regions from the Greek colonies in south France. Although flat-graves already occur (as in the Marne area), the rite is usually inhumation under a tumulus; cremation is occasionally met with in the "chieftains' graves." In the latter, native pottery is rare; it is replaced by metal vessels. In the west, we find mono- and polychrome pottery, and vessels influenced by Etruscan bucchero ware. Unpainted vessels occur in Brittany with rich curvilinear incised ornamentation and bird motifs. As phase A has not been worked out in France, we cannot yet say which examples of these types belong to phase A and which to B (the Breton Group probably survived into C) but Greek influence is apparent both in form and ornamentation. In the east, we find distinctive pottery, the most typical, perhaps, being the flask with lenticular body (fig. 1*a*). In the eastern group, contemporary Greek influence was far less strongly felt. The potter's wheel was introduced in A but many vessels are hand-made. Attic pottery and Greek wine-jars occur on a few sites in the western and central areas. Among the chief metal types are:—the short dagger-sword (fig. 1*b*); long swords (fig. 1*c*); high, conic helmets (fig. 1*d*); large heavy knives (*Hiebmesser*) (fig. 1*e*); the Ceatosa, mask and bird-headed fibulae (brooches) (fig. 1, *f* and *g*); torcs, arm- and finger-rings (bronze and gold); girdle clasps (fig. 1, *h*, *j*, *k*); horse harness and parts of chariots. Most important is the series of Greek bronze vessels (6th and 5th centuries B.C.): wine-flagons, stamnoi, dishes, etc. Barbaric copies of the flagons occur. The Earliest La Tène period is not represented in the British Isles.

Phase B.—The Early La Tène period reveals a greater uniformity of culture than phase A and embraces a wider area. We find it in Britain, and in the provinces immediately north of the central German mountain-chain. To the east, it spread beyond Budapest; to the south, into Switzerland and Italy. Associated finds in La Tène B graves in Italy show this phase to have ended *c.* 300 B.C. The rite is inhumation. Cemeteries of flat-graves take the place of the isolated tumuli, although the latter persist



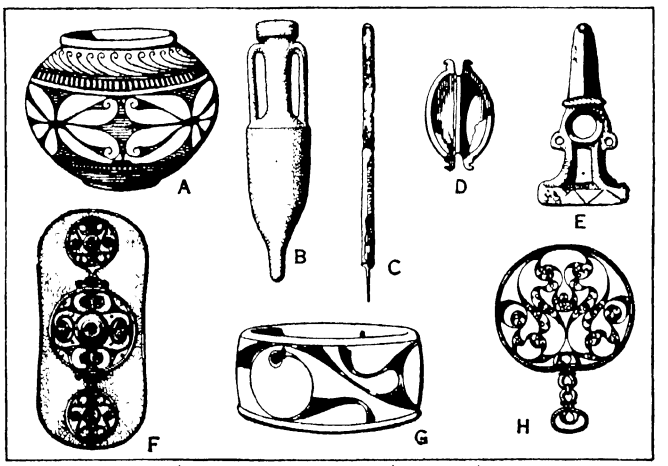
A. FROM LINDENSCHMIT, "DIE ALTERTÜMER UNSERER HEIDNISCHEN VORZEIT" (ZABERN); B. & C. FROM DÉCHELETTE, "MANUEL D'ARCHÉOLOGIE PRÉHISTORIQUE" (LIBRAIRIE ALPHONSE PICARD), D FROM "GUIDE TO EARLY IRON AGE ANTIQUITIES" (BRITISH MUSEUM)

FIG. 2.—POTTERY AND METAL OF THE EARLY TA TÈNE PERIOD (C. 420–300 B.C.)

A. Large bottle shaped urn. Rhenish; B. Short sword; C. Armlet; D. Bronze bucket found at Waldalgesheim, Coblenz

here and there. Large bottle shaped urns occur in the middle Rhenish area (fig. 2*a*). Among the most important metal types are:—the shortish sword, the scabbard ending in a trefoil or open-work chape (fig. 2*b*), the fibula with foot bent back towards the bow, a number of torcs and armlets, the types with "buffer" or "seal-top" terminals being very characteristic (fig. 2*c*); small phallic figurines in bronze. There was a great falling off in the imported Greek bronze vessels, the bucket found at Waldalgesheim (*see* fig. 2*d*) being the only new type. The earliest Celtic coins were struck in this period, which also saw the spread of the La Tène culture into Britain.

Phase C.—The Middle La Tène Period covers the time before and after 200 B.C. The Celts abandoned to the conquering Teutonic peoples the provinces to the north of the central German mountains. A great expansion of Celtic power took place to the east into the middle and lower Danubian areas, the Balkan peninsula and Asia Minor. The rite is the same as in B, for, cremation, though not unknown, is exceptional. In the Marne area, pottery is rare; the forms of the vessels in south Germany reveal Hellenistic influence. Among the chief metal types are:—longer swords (the points less tapered than in B) with bell-shaped guards, their scabbards, often finely decorated, ending in strangulated (fig. 3*a*) or cordiform chapes; broad-bladed spear-heads; large oval to oblong wooden shields with iron "trigger-guard" bosses (*see* fig 3*b*); fibulae with feet *clasping* the bows; chain girdles (fig. 3*d*); a variety of bronze armlets (fig. 3*e*); band-shaped glass bangles (fig. 3*f*). Torcs are rare. On the continent red enamel is substituted for coral though enamelled objects are found as early as the fifth century. Coinage becomes more general among the mainland Celts. This phase is sparsely represented in England. The La Tène culture also appears in Ireland.



A. & C FROM "GUIDE TO EARLY IRON AGE ANTIQUITIES" (BRITISH MUSEUM), B, E, F FROM LINDENSCHMIT, "DIE ALTERTUMER UNSERER HEIDNISCHEN VORZEIT" (ZABERN), D. FROM DÉCHELETTE, "MANUEL D ARCHÉOLOGIE PRÉHISTORIQUE" (LIBRAIRIE ALPHONSE PICARD)

FIG. 3.—METAL AND GLASS WORK OF THE MIDDLE LA TÈNE PERIOD (C 300–120 B C)

A. Finely decorated sword scabbard; B. Shield boss; C. Oblong shield; D. Chain girdle; E. Bronze armlet; F. Band-shaped glass bangle

Phase D.—The Late La Tène Period extends from 120 or 100 B.C. to 15 B C. or A.D. 1 The rite is cremation. Unpainted and painted (fig. 4*a*) pottery is found, the latter only on the continent. Wheel-made vessels are more frequent than in phases

A, B, C, E. FROM DÉCHELETTE, "MANUEL D'ARCHÉOLOGIE PRÉHISTORIQUE" (LIBRAIRIE ALPHONSE PICARD); D, F, G FROM "GUIDE TO EARLY IRON AGE ANTIQUITIES" (BRITISH MUSEUM); H. FROM "ARCHAEOLOGIA" (SOCIETY OF ANTIQUARIES OF LONDON)

FIG. 4.—POTTERY, METAL AND WOOD OF THE LATE LA TÈNE PERIOD (C. 120 B.C.–A.D. 1)

A. Painted Continental pottery; B. Italian amphora; C. Long slashing sword; D. Ellipsoid iron shield boss; E. Clasp; F. Enamelled Bronze shield from the Thames at Battersea; G. Wooden bowl (restored) from Glastonbury; H. Mirror with engraved back, from Desborough, Northants

A–C. Arretine ware and narrow Italian amphorae (fig. 4*b*) are also found. In south-east Britain, the Belgic or Aylesford pottery is well represented; in the western regions we find the "Glastonbury" ware. Among the more typical metal objects are:—the long slashing sword with blunt point and rounded chape (fig. 4*c*); scabbards, often "laddered"; ellipsoid (fig. 4*d*) and round iron shield-bosses; shields, wooden on the continent, bronze in Britain

(Witham [C], Battersea [D] [figs. 3*c* and 4*f*]); spear-heads are frequent as in A–C; the fibula with open catch-piece, the foot and bow forming a continuous line; clasps (fig. 4*e*); smooth glass bangles; iron (and clay) fire-dogs; many tools of iron; bronze imported vessels of southern origin (situlae, lidded flagons and skillets). Minting of coins in south-east and east Britain began in the Late La Tène period. The introduction of writing probably took place in this phase. When the La Tène culture in the mainland had been brought to a close by Roman conquest, it continued to flourish in Britain into the first century A.D. The engraved mirrors (fig. 4*h*), and much of the best British enamel-work dates from this period. Phase D witnessed a marked development in industry and agriculture, and the growth of towns (Bibracte—Stradonitz—Velem St. Veit, etc.). It was largely due to the development of town-life that the culture of the Late La Tène period was more homogeneous than that of the phases which preceded it.

Continental Celts.—Among the continental Celts, art reached its zenith at the outset of the La Tène period; in each succeeding phase it declined, till, in D, it had lost much of its vitality. The chief formative influences were:—(1) Legacies of the Hallstatt and Bronze Age styles. These are discernible both in technique and ornamentation, the latter being for the most part rigidly geometric. (2) The influence of more or less contemporary Greek art. This was chiefly felt in the ornamentation, the plant-motifs being mainly derived from Greek models (the palmette, free tendril designs, etc.); we also find S-patterns and other motifs. The figural art was to some extent derived from upper Italy (viz., influence of the situla style; and the finely incised zoomorphic designs, as on the Rodenbach field-flask; *see* Ebert, *Reallexikon*. "Rodenbach" *s.v.*) but Greek influence must also be taken into account Reinecke traces three stages in the development of La Tène art: more or less faithful representations of Greek originals; a perversion of Greek prototypes, some of the features being exaggerated, others suppressed, disintegrations and combinations taking place; and the development of new forms from these barbarized reproductions of Greek models. By phase C the art had developed so far along these lines that it is often difficult to recognize the classical tradition. As opposed to the Hallstatt style, the design as a whole was treated in a freer and more organic manner, though a tendency to mechanical repetition does occur, especially during the Earliest Period. As the influence of classic tradition diminished, the art grew to be less representational and more abstract in feeling. The Scythic influence, though possibly of importance later, can hardly have played a part in the genesis of La Tène style. Among the insular Celts, La Tène art did not reach its zenith until the latter part of the period (*cf.* the wooden bowl from Glastonbury, fig. 4*g* and figs. 3*a*, 3*c*, 4*b* and 4*h*). As zoomorphic ornamentation played a leading rôle in Teutonic art of later times, so, in the Celtic art of the La Tène period, plant-motifs and their derivatives, especially eccentric geometrical patterns, were of paramount importance. (J. M. DE N.)

LATENT HEAT. The heat absorbed when unit mass of any substance changes its state *without* change of temperature; *e.g.,* when 1 gm. of ice at 0° C melts to form water at 0° C, 79·6 calories of heat are absorbed. Latent heat of fusion and latent heat of vaporization are the most familiar examples of the phenomenon, but a similar absorption (or liberation) of heat occurs in all changes of state, *e.g.,* sublimation, solution, dilution, expansion. The term was introduced by Joseph Black, *c.* 1760. For details *see* the articles on HEATS; THERMODYNAMICS; STEAM.

Under the Kinetic theory of heat, latent heat is considered to be the potential energy of separation of attracting masses. The Kinetic theory is based on the assumption that heat is a "mode of motion" The exact character of this motion is unknown, but is sufficiently understood to present a plausible picture of what goes on within matter. The molecules of a substance, the smallest divisions that can be broken up without losing their identities, in turn are structures composed of atoms and the atoms are structures made up of still smaller units called electrons. Electrons may arrange themselves in many different ways, each constituting a different kind of atom which is the unit of a definite substance known as a chemical element. The atoms of different elements unite in a variety of combinations to form the molecules. In studying the forces which hold the atoms in place to form a definite combination, the molecule is considered to be a miniature solar system. An entirely molecular (*e.g.,* solar) system, while its component parts are involved in mutual relative motions, may be participating as a unit in motion relative to surrounding molecular systems. Heat is Kinetic energy represented by this inter-molecular motion. The quality of heat is determined by the aggregate of the mass of molecules involved together with the intensity of the energy. Temperature is indicative only of the intensity of the Kinetic energy. The proximity or distance of the molecules of a substance determine its state as a solid, liquid or vapor. In a solid state the molecules are relatively near each other and the force of attraction is great. When the solid is heated the molecular velocities increase until the centrifugal force is sufficient to break up the molecular systems As heating continues *no further increase of velocity* takes place, and therefore no rise in temperature occurs until uniformity of condition throughout the mass has been attained. The solid changes to a liquid and the latent heat of the liquid is accounted for in the breaking up of the molecular systems.

With further application of heat, velocity increases until a condition is reached when the force of separation is sufficient to cause some of the molecules to be thrown out of the liquid entirely and vaporization begins. The wide displacement of particles means a great increase in potential energy of separation and a consequent large supply of heat. The separation is so great that the volume of the entire mass is enormously increased, necessitating a considerable amount of energy to enable the substance to find room for itself against the environing pressure. This is the external work part of the latent heat of vaporization. Whether heat is the energy of motion of molecules alone or whether atomic and electronic motions within the molecule participate in the effect, does not alter the general conception since it is the aggregate of the kinetic effect that is perceived as heat.

LATERAN COUNCILS, the ecclesiastical councils or synods held at Rome in the Lateran basilica, which was dedicated to Christ under the title of Salvator, and further called the basilica of Constantinople or the church of John the Baptist. Ranking as a papal cathedral, this became a much-favoured place of assembly for ecclesiastical councils both in antiquity (313, 487) and more especially during the middle ages. Among these numerous synods the most prominent are those which the tradition of the Roman Catholic Church has classed as oecumenical councils. In the view of the Greek Church, however, the councils held in later centuries are not recognized as oecumenical, since they did not represent all Christendom.

The fourth Lateran council (twelfth oecumenical), convened by Pope Innocent III in 1215, was the most brilliant and the

most numerously attended of all, and marks the culminating point of a pontificate which itself represents the zenith attained by the mediaeval papacy. Prelates assembled from every country in Christendom, and with them the deputies of numerous princes. The total included 412 bishops, with 800 priors and abbots. besides the representatives of absent prelates and a number of inferior clerics. The seventy decrees of the council begin with a confession of faith directed against the Cathari and Waldenses, which is significant if only for the mention of a transubstantiation of the elements in the Lord's Supper. A series of resolutions provided in detail for the organized suppression of heresy and for the institution of the episcopal inquisition (Canon 3). On every Christian, of either sex, arrived at years of discretion, the duty was imposed of confessing at least once annually and of receiving the Eucharist at least at Easter (Canon 21). Enactments were also passed touching procedure in the ecclesiastical courts, the creation of new monastic orders, appointments to offices in the church, marriage-law, conventual discipline, the veneration of relics, pilgrimages and intercourse with Jews and Saracens. Finally, a great crusade was resolved upon, to defray the expenses of which it was determined that the clergy should lay aside one-twentieth—the pope and the cardinals one-tenth—of their revenues for the next three years; while the crusaders were to be held free of all burdens during the period of their absence.

BIBLIOGRAPHY.—*See* Mansi, vol. xxii.; Hefele, *Conciliengeschichte*, 2nd ed. vol. v. and viii. (by Hergenröther); and the general Church histories of the period. On the 4th Lateran Council *see* also INNOCENT III.

LATERITE. The name laterite (*later*, a brick) was given by F. Buchanan-Hamilton (1807) to the peculiar mantle of ferruginous rock which covers large areas in southern India. Similar material from the Futah Jallon territory of west Africa, analysed by P. Berthier (1820), yielded 2·8% silica, 8·6% alumina, 77·2% ferric oxide and 11·4% combined water. Laterite is recognized today as a curious residual weathering product of such rocks as basalts, granites and shales. Its formation appears to have been remarkably restricted to a relatively recent geological period—subsequent to Cretaceous times. Laterite is in process of formation in many tropical countries subject to monsoon conditions.

Normal laterite is a porous clay-like rock largely impregnated with ferric hydroxide. Not infrequently this ferric hydrate occurs as small pisolitic nodules. Exposed surfaces of laterite are of a blackish brown colour and often have a scoriaceous, lava-like appearance. When freshly broken, laterite shows a vermicular structure, has a porous texture and is mottled with various tints of brown, red and yellow. Creamy aluminous hydroxide often fills the tubular cavities. When first quarried this rock is generally soft enough to be cut with a pick. After exposure it hardens—the result of dehydration. Lateritic débris possesses the property of re-cementing into masses which resemble the primary material. Two types of laterite are generally recognized—a high-level, primary or *in situ* type, and low-level, secondary or detrital (Buchanan's) laterite. There is a curious association of lithomarge beneath laterite clearly suggestive of a genetic relationship.

Laterite occurs widely in Peninsular India, in Malaya and the East Indies, in the Northern Territories and Western Australia, in the equatorial regions of Africa, and in various parts of South America and Cuba. There is little doubt that J. D. Falconer's (1911) iron clay from Nigeria is laterite, and J. H. Goodchild (1913) has shown that the *canga* of Brazil has the same composition as laterite. The variable chemical composition of primary laterite depends largely on relative proportions of the two lateritic constituents—the hydroxides of ferric iron and aluminium. When these two constituents are present in equal amounts—*e.g.*, 50% limonitic matter (Fe_2O_3 42·75%, H_2O 32·70%) and 50% trihydrate of aluminium (Al_2O_3 32·70%, H_2O 17·30%)—the substance represents typical laterite. If the ferruginous matter exceeds 50% the rock would be limonitic laterite (hematitic if dehydrated). When the aluminous proportion exceeds 50% the rock is bauxitic. (*See* BAUXITE.) The nature of its constituents makes laterite greatly resistant to atmospheric weathering. It makes a fair building stone. Ferruginous laterite has been used as iron ore, and aluminous laterite (bauxite) is aluminium ore.

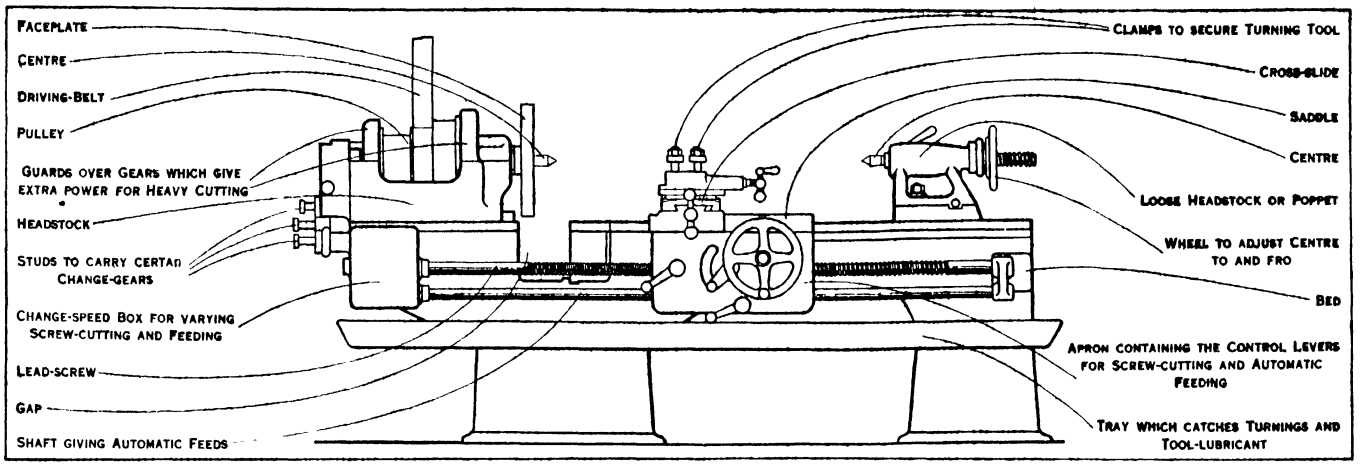
W. G. McGee (1879) considered certain upper Mississippi ferruginous deposits were similar to laterite. F. R. Mallet (1881) thought the same of the iron clays of Ulster and suggested a lacustrine origin for both. J. Walther (1889) was of the opinion that nitric acid, introduced during thunderstorms with tropical rain, interacted to produce easily hydrolysed iron salts which effected the lateritization of the rock *in situ*. Philip Lake (1890) suggested that laterite was the direct weathering product of various rocks. This opinion was supported by R. D. Oldham (1893). Solfataric action was advanced by C. W. Hayes (1895), and by G. A. J. Cole (1896) for the formation of the bauxites of Arkansas (U.S.A.) and Antrim (Ireland) respectively. The idea of laterite in association with pyritiferous rocks, and resulting from the reactions of free sulphuric acid, was put forward by G. C. Dubois (1903) to account for the laterite of Surinam. T. H. Holland (1903) elaborated the conception of micro-organisms breaking up rock silicates, taking the silica necessary for their existence and leaving the alumina they did not want—the silica being subsequently removed by alkaline solutions. J. M. Maclaren (1903) and J. Morrow Campbell (1910) independently arrived at the conclusion that laterite was a sub-soil replacement product resulting from the action of ascending, heated, mineralized waters. C. K. Leith and W. J. Mead have produced evidence to show that the laterite of Cuba (1912) and the bauxite of Arkansas (1915) are the residual weathering products of serpentine (peridotite) and syenite, respectively. F. W. Clarke (1920) concludes that "Bauxite, like laterite, occurs under a variety of conditions, which suggest a dissimilarity of origin." W. A. K. Christie, on the field evidence obtained by C. S. Fox (1923), expressed the opinion that capillary pressures, dialysis and electrolytic migration must play an important rôle in the formation of so obvious a mixture of colloidal substance as Indian laterite. These data, this suggestion of electro-kinetic phenomena, and the field observations of various investigators have been incorporated (1927) in the tropical residual, weathering-product theory of laterite formation. The conditions stipulated in the revised theory are briefly:—

(1) A tropical climate subject to alternations of dry or wet seasons or monsoons.

(2) A level, or very gently sloping, elevated land surface which is not subject to appreciable mechanical erosion (abrasion by rain and wind).

(3) The chemical and mineralogical composition of the exposed rocks to be suitable for a supply of the lateritic constituents—alumina and ferric oxide.

(4) The texture of the rock to be (or rapidly become during weathering) sufficiently porous for the entry of percolating water, so that the conditions for chemical action will be at a maximum.



(5) The infiltrating water to remain in the interstices of the rock for long periods annually; *i.e.*, during the wet monsoon, but eventually to drain away in the dry period, thus giving maximum play to chemical erosion.

(6) The infiltrating water to contain either an acid or alkaline substance with which to react on the rock components as well as to constitute an electrolyte and allow electro-kinetic phenomena to operate.

(7) These annual processes to be in operation continuously for at least a geological epoch of roughly a million years.

(C. S. F.)

LATEX, a fluid found in the cells of angiospermous plants, consisting of an emulsion of various substances suspended in a watery medium in which salts, sugars, tannins, alkaloids, enzymes and other substances are dissolved. This lactiferous fluid circulates in branched tubes which penetrate the tissues of the plant in a longitudinal direction. It has an important function in conducting plastic substances in addition to acting as an excretory reservoir. The Para rubber tree (*Hevea brasiliensis*) is regularly tapped, the coagulated latex which it exudes being worked up into rubber. Opium is obtained from the latex of the opium poppy (*Papaver somniferum*) which contains the alkaloid morphine. *See* PLANTS and FUNGI.

DIAGRAMMATIC SKETCH SHOWING AN ENGINEER'S LATHE CAPABLE OF TURNING, BORING, DRILLING, SCREW-CUTTING AND, WITH ADDITIONAL FITMENTS, MILLING, GRINDING AND GEAR-CUTTING

LATH, a thin flat strip of wood or other material used in building to form a base or groundwork for plaster, or for tiles, slates, or other covering for roofs. Such strips of wood are employed to form lattice-work, or for the bars of Venetian blinds or shutters. A "lattice" is an interlaced structure of laths fastened together so as to form a screen, with diamond-shaped or square interstices. Such a screen was used, as it still is in the East, as a shutter for a window admitting air rather than light; it was hence used of the window closed by such a screen. In modern usage the term is applied to a window with diamond-shaped panes set in lead-work.

LATHE is a machine for holding securely and rotating a piece of wood, metal or other material, in order that it may be cut, scraped, or polished by the turning. The primitive lathe consists of two tree trunks, each holding a pointed centre, between which a cylinder of wood is spun while a tool is held to cut it to shape. This elementary type has been in use in the East since remote times and may still be seen at work in India. An assistant imparts a to and fro motion to the wood by pulling alternately at the ends of a cord wound round it. The turner holds the turning tool between his toes and controls it with his hands.

All modern lathes have a continuous rotation (with the exception of the little ones used in watch-making) and the power is received from a treadle or prime mover. The usual method is to rotate the mandrel or spindle of the headstock, and cause this to turn the work by a driver or a chuck. Articles such as disks and wheels, that cannot be mounted between the centres, are held on a faceplate or in a chuck, the resemblance to the potter's wheel being obvious. The biggest lathes, for gun and marine work, will take pieces 100 feet long; and the chuck will carry a weight of 100 tons in its jaws. The number of tools used in a modern metal-turning lathe varies. Hand tools are still used in small lathes for wood and metal turning, but the slide-rest has practically displaced these. It holds the tool or tools rigidly and gives a controlled movement in the direction required to produce a parallel cylinder, a taper, or a flat face, or to bore a hole. Handles effect the movement, or an automatic feed is derived from the drive. If a long screw is fitted, and connected to the spindle with appropriately chosen toothed gears, called change-wheels, the slide can be caused to travel at a definite rate in regard to the number of turns of the work, and so to cut a true screw upon it. In some turning operations, the operator has constantly to manipulate the handles so as to guide the tool into the necessary paths, while in other cases the lathe may be set up and the automatic feed thrown into action so that no attention is required for some time.

The widely-varying requirements of watchmakers, engineers, etc., have resulted in the development of numerous types of lathe. The watchmaker's lathe is finely built, and many other processes besides simple turning and boring are accomplished, with the help of special attachments; *e.g.*, drilling, milling, gear-tooth cutting, grinding, polishing. The bench lathe is also a small high-precision design of rather larger size, and capable of an even greater variety of operations; it is used by the makers of fine instruments, tools, gauges and small mechanisms. Plain or simple lathes may be worked by boys or girls on repetition articles, for turning, boring, drilling, etc., at a great rate of output. The more complicated lathes employed for a varied range of processes are termed engine lathes (*see* the diagram), and possess the full equipment of chucks and fittings, a wide range of speeds, and automatic feeds as well as the screw-cutting apparatus mentioned. These are made in all sizes; one, of moderate size and great precision, and with additional devices for use in the preparation of tools and cutters, is called a tool-room lathe, and it cuts very accurate screws. The high-precision screw-cutting lathe prepares screws possessing the utmost possible degree of accuracy.

Large lathes for turning shafting, pulleys, wheels, etc., required

BY COURTESY OF J. A. FAY AND EGAN CO

STUDENT OF A MANUAL TRAINING CLASS OPERATING A LATHE

in various engineering construction are made in varied designs. Shafting lathes turn long shafts rapidly, and have multiple tools which cut at the front and the rear, the shaft being supported in steadies to prevent it from running out of truth. The gun lathes are big and have numerous tool-rests, some being arranged for the deep boring of the tubes. In railway works the axle-turning lathes are important; they deal with the two journals of the axle simultaneously. Locomotive and tramcar wheels are also bored and turned on lathes made specially for the purpose, these dealing with two wheels on separate chucks, or wheels mounted on the

axle. Surfacing and boring lathes are relatively short, and deal with wheels, disks, pulleys, flywheels, gear blanks, and many flat castings which do not require support other than that of the chuck jaws. A gap in front of the chuck enables extra large diameters to be "swung," this gap being sometimes a pit in the floor; this type is classed as a face lathe. The inconvenience of attempting to fasten heavy pieces to a chuck with vertical face has led to the development of the turning and boring mills or vertical lathes. The chuck spindle is vertical and the horizontal face of the chuck consequently renders work setting easy. The advantages have become so obvious that many sizes of these machines are now employed extensively for flywheels, gear wheels, pistons, covers, and other parts of engines and machines.

Capstan or turret lathes possess modified tool-rests. Instead of taking one or two tools in a constant position, the turret holds a set for numerous processes, and any one of them can be swung round to cut the work. Hence a set of operations may be effected in rapid succession, or if a piece of bar is held in the chuck, screws, bolts, pins, nuts, washers and a host of other articles can be machined and parted off, the bar being fed through for another cycle. When a turret lathe for dealing with bars is actuated entirely by automatic means instead of by an operator manipulating various levers, it is called an automatic screw machine. If it deals with separate pieces gripped in the chuck in succession, it is termed an auto turning lathe (*see* AUTOMATIC MACHINES). Lathes in which there is no actual turning action include the spinning and the polishing lathes. The first shapes sheet-metal pieces by the pressure of hard steel tools or rollers, and is used to produce parts of silver and gold ware, tin, brass, aluminium domestic and other articles. Sometimes spinning is an alternative to stamping in dies, sometimes it is also used to smooth out the creases made when cup-shaped stampings are done in dies. The polishing lathe is just a head which carries a spindle run at very high speed, and drives the polishing agent, which is a leather wheel or a cotton bob or mop. (F. H.)

LATHROP, FRANCIS (1849–1909), American artist, was born at sea, near the Hawaiian islands, on June 22, 1849, being the great-grandson of Samuel Holden Parsons, and the son of George Alfred Lathrop (1819–77) who for some time was U.S. consul at Honolulu. He was a pupil of T. C. Farrar (1838–91) in New York and studied at the Royal Academy of Dresden. From 1870–73 he studied in England under Ford Madox Brown and Burne-Jones, and in the school of William Morris, where he devoted particular attention to stained glass. Returning to America in 1873, he worked as an illustrator, painted portraits, designed stained glass, and eventually confined himself to decorative work. He designed the chancel of Trinity church, Boston, and decorated the interior of Bowdoin college chapel, at Brunswick (Me.), and several churches in New York. The Marquand memorial window, Princeton chapel, is an example of his work in stained glass. His latest work was a series of medallions for the building of the Hispanic-American society in New York. He died at Woodcliff, N.J., on Oct. 18, 1909.

LATI, the language spoken by a small number of people in Tonkin, close to the Chinese frontier. They are divided into exogamous clans, live in compact villages, practise terrace rice cultivation and rear buffaloes and poultry. The levirate is allowed between the younger brother and the widow of the elder. Ancestor worship, animistic attitudes and food taboos with sexual taboos form elements in their religion. Marriage is patrilocal, but the transfer of the bride is often deferred until she is pregnant. Funerals are directed by the elders of the community and there is a second ritual a year later. They call themselves *A'Khu,* "the men." The language is monosyllabic in form, with tones, and a complete decimal system. Very few loan words appear in the vocabulary and it is regarded provisionally as detached from any of the main language families of S E. Asia.

See *Bulletin* École Française de l'Extrême Orient vi., p. 271–8, ditto xxi., p. 179 *sq.*

LATIMER, HUGH (*c.* 1490–1555), English bishop, and one of the chief promoters of the Reformation in England, was born at Thurcaston, Leicestershire. He was the son of a yeoman, who rented a farm "of three or four pounds by year at the uttermost." The year of Latimer's birth is not definitely known. In the *Life* by Gilpin it is given at 1470, a palpable error, and possibly a misprint for 1490. He was educated at Clare College, Cambridge, graduated B.A. in 1510 and M.A. in 1514. Before the latter date he had taken holy orders. His oration, on taking his degree of bachelor of divinity, was devoted to an attack on the opinions of Melanchthon. Soon his discourses exercised a potent influence on learned and unlearned alike; and, although he restricted himself, as was his custom, to the inculcation of practical righteousness, and the censure of abuses, a rumour of his heretical tendencies reached the bishop of Ely. Latimer was prohibited from preaching in the university or in any pulpits of the diocese, and on his occupying the pulpit of the Augustinian monastery, which enjoyed immunity from episcopal control, he was summoned before Wolsey, who, however, gave him special licence to preach throughout England.

At this time Protestant opinions were being disseminated in England chiefly by the surreptitious circulation of Wycliffe's translations of the New Testament. Latimer had a ready and formidable wit which thoroughly disconcerted his opponents, but he had also a natural distaste for theological discussion, and the truths he was in the habit of inculcating could scarcely be controverted, although, as he stated them, they were diametrically contradictory of prevailing errors both in doctrine and practice. In Dec. 1529 he preached his two "sermons on the cards," which awakened a turbulent controversy in the university. But he was protected from his enemies by Henry VIII., who invited him to preach before him in the Lent of 1530. Latimer then wrote to the king the famous letter on the free circulation of the Bible, an address remarkable, not only for what Froude justly calls "its almost unexampled grandeur," but for its repudiation of the aid of temporal weapons to defend the faith. Shortly afterwards Henry appointed Latimer one of the royal chaplains. He soon became "weary of the court," but he gladly accepted the living of West Kington, Wiltshire, conferred on him by the king in 1531. Harassed by severe bodily ailments, encompassed by a tumult of religious conflict and persecution, he continued to preach the cause he had at heart. At last a sermon which he was persuaded to preach in London exasperated John Stokesley, bishop of the diocese, and furnished an opportunity for summoning Latimer to answer before the bishops in the consistory. After a tedious and captious examination, he was in March brought before convocation, and, on refusing to subscribe to certain articles, was excommunicated and imprisoned; but by the king's intervention he was released after he had accepted all the articles except two, and confessed that he had erred not only "in discretion but in doctrine." After the consecration of Cranmer to the archbishopric of Canterbury in 1533 Latimer's position was changed. In 1534 Henry formally repudiated the authority of the pope, and from this time Latimer was the chief co-operator with Cranmer and Cromwell in advising the king on the legislative measures entailed by that repudiation.

It was, however, Latimer's preaching more than the edicts of Henry that established the principles of the Reformation in the minds and hearts of the people. His sermons are classics of their kind. Vivid, racy, terse in expression; profound in religious feeling, sagacious in their advice on human conduct. To the historical student they are of great value as a mirror of the social and political life of the period.

In Sept. 1535 Latimer was consecrated bishop of Worcester. While holding this office he was selected to officiate as preacher when the friar, John Forest, whom he vainly endeavoured to move to submission, was burned at the stake for denying the royal supremacy. In 1539, being opposed to the "act of the six articles," Latimer resigned his bishopric, learning from Cromwell that this was the wish of the king. On this point he was apparently deceived, but as he now declined to accept the articles he was confined within the precincts of the bishop of Chichester's palace. After the attainder of Cromwell little is known of Latimer until 1546, when, on account of his connection with the preacher Edward Crome, he was summoned before the council at Green-

wich, and committed to the Tower of London. Henry died before his final trial could take place, and the general pardon at the accession of Edward VI. procured him his liberty. He declined to resume his see, notwithstanding the special request of the Commons, but in Jan. 1548 again began to preach, and with more effectiveness than ever; crowds thronged to listen to him both in London and in the country. Shortly after the accession of Mary in 1553 a summons was sent to Latimer to appear before the council at Westminster. Though he might have escaped by flight, and though he knew that "Smithfield already groaned for him," he at once joyfully obeyed. The hardships of his imprisonment, and the long disputations at Oxford, told severely on his health; but he endured all with unbroken cheerfulness. On Oct. 16, 1555 he and Ridley were led to the stake at Oxford. The motives which now inspired his courage placed him beyond the influence of fear, and enabled him to taste in dying the thrill of victorious achievement. Ridley he greeted with the words, "Be of good comfort, Master Ridley, and play the man; we shall this day light such a candle by God's grace in England as (I trust) shall never be put out." He "received the flame (as it were) embracing it. After he had stroked his face with his hands, and (as it were) bathed them a little in the fire, he soon died (as it appeared) with very little pain or none."

Bibliography.—Two volumes of Latimer's sermons were published in 1549. A complete edition of his works, edited by G. E. Corrie for the Parker Society, appeared in two volumes (1844–45). His *Sermon on the Ploughers* and *Seven Sermons preached before Edward VI.* were reprinted by E. Arber (1869). The chief contemporary authorities for his life are his own *Sermons*, John Stow's *Chronicle* and Foxe's *Book of Martyrs*. In addition to memoirs prefixed to editions of his sermons, there are lives of Latimer by R. Demaus (1869, new and revised ed. 1881), and by R. M. and A. J. Carlyle (1899).

LATINA, VIA, an ancient highroad of Italy, leading southeast from Rome. It was probably one of the oldest Roman roads, leading to the pass of Algidus, important in early military history; and it must have preceded the Via Appia as a route to Campania, inasmuch as the Latin colony at Cales was founded in 334 B.C. and must have been accessible from Rome by road, whereas the Via Appia was only made twenty-two years later. It follows, too, a far more natural line of communication, without the engineering difficulties of the Via Appia. As a through route it no doubt preceded the Via Labicana (*see* Labicana, Via), though the latter may have been preferred later. After their junction, the Via Latina continued to follow the valley of the Trerus, following the line taken by the railway to Naples via Cassino, and passing below the Hernican hill-towns, Anagnia, Ferentinum, Frusino, etc. At Fregellae it crossed the Liris, and then passed through Aquinum and Casinum, both low-lying. It then entered the interval between the Apennines and the volcanic group of Rocca Monfina, and the original road, instead of traversing it, turned abruptly northeast over the mountains to Venafrum, thus giving direct communication with the interior of Samnium by roads, to Aesernia and Telesia. Later, however, there was in all probability a short cut by Rufrae along the line of the modern road and railway. The two lines rejoined near the present railway station of Caianello and the road ran to Teanum and Cales, and so to Casilinum, where was the crossing of the Volturnus and the junction with the Via Appia. The distance from Rome to Casilinum was 129 m. by the Via Appia, 135 m. by the old Via Latina through Venafrum, 126 m. by the short cut by Rufrae. Considerable remains of the road exist in the neighbourhood of Rome; for the first 40 m., as far as Compitum Anagninum, it is not followed by any modern road; while farther on in its course it is in the main identical with the modern highroad.

See T. Ashby in *Papers of the British School at Rome* iv. 1 *sq.*, v. 1 *sq.* for a full account of its remains for the first 40 miles.

LATINI, BRUNETTO (1210?–1294?), Italian philosopher, was born in Florence, and belonged to the Guelph party. After the disaster of Montaperti he took refuge for some years (1261–68) in France, but in 1269 returned to Tuscany and for some twenty years held successive high offices. Giovanni Villani says that "he was a great philosopher and a consummate master of rhetoric. . . . He began and directed the growth of the Florentines, both in making them ready in speaking well and in knowing how to guide and direct our republic according to the rules of politics." While in France he wrote in French his prose *Trésor*, a summary of the encyclopaedic knowledge of the day (translated into Italian as *Tesoro* by Bono Giamboni in the 13th century), and in Italian his poem *Tesoretto*, rhymed couplets in heptasyllabic metre, a sort of abridgment put in allegorical form, the earliest Italian didactic verse. He is famous as the friend of Dante (see *Inferno*, xv. 82–87).

For the *Trésor see* P. Chabville's edition (1863); for the *Tesoro*, Gaiter's edition (1878); for the *Tesoretto*, B. Wiese's study in *Zeitschrift für romanische Philologie*, vii. *See* also the biographical and critical accounts of Brunetto Latini by Thor Sundby (1884), and Marchesini (1887 and 1890).

LATIN LANGUAGE. To write the history of a language is to trace the *changes* which it underwent in form with special reference to time and place, from its earliest records, and indeed before, to its latest. For a spoken language is constantly in a state of change, never fixed; it is dynamic, not static. Strictly speaking, languages do not "live" or "die" or have "family" relationships; such terms are purely metaphorical. Thus the Romance languages (*q.v.*), said to be "descended" from Latin, really represent Latin in its *changed* form in various localities at various dates down to the present. In the same way, Latin itself is a *changed* form, a developed dialect, of an earlier tongue, a so-called "parent" language, which is commonly known as Indo-European (*q.v.*), since most of its members in the Old World are located mainly either in India or Europe. If Latin is said to be "related" to these other members, all that is meant by the phrase is that it possesses in common with them, not by borrowing but by "inheritance" (*i.e.*, by direct derivation from I.E.), a fund of words (its vocabulary), certain types of word-formation and inflexion (morphology), and certain modes of expression (syntax). The I.E. tongue itself must by no means be thought of as primitive or original. Even in its pre-ethnic state (*i.e.*, before cleavage into dialects, and before the distribution of these dialects from a common centre), it was a highly developed speech, with an age-long evolution behind it.

Naturally and inevitably Latin had diverged considerably from this pre-ethnic tongue by the time (*c.* 600 B.C.) from which the oldest extant records of it, inscriptions, date. Destined to survive over 1,000 years more as a distinct though constantly changing language, but itself split, as I.E. had been, into separate dialects long before the close of its career, it had acquired, by the end of the 1st century B.C., a *norm* which, by standards not really arbitrary, is judged classical, and which, in prose style especially, but also in verse, at once reflects and is reflected by that grave, restrained, stately and impressive character of the Roman people who first spoke it, and whose empire made it a world language.

Pre-history.—For, to begin with, Latin was not even the language of Italy but only of the Latins or people of Latium, that is of the Romans themselves and of their immediate neighbours. Precisely whence, at what date, and by what route this tongue was brought to the banks of the Tiber we do not know; from somewhere in Europe, across the Alps and Apennines, we may conjecture, and certainly before the Etruscan invasion of Italy by sea in the 8th century B.C. More exact definition cannot be given. Spoken contemporaneously with it, in Italy, say about the 5th century B.C., were other more or less closely related I.E. languages and dialects, from the very Latin-like Sicel, known now only from Sicily, to Ligurian, linguistically as well as geographically intermediate between Italic and Keltic, in the north-west; an Illyrian group of dialects (Messapic, Venetic, Raetic, and perhaps the so-called old Sabellic, *q.v.*) on the Adriatic coast; and finally, the Italic dialects proper—Oscan (*q.v.*), Umbrian and the minor dialects. There were also the less nearly related, but still I.E. Keltic, brought in by the invading Gauls, and Greek of Magna Graecia. Lastly there was Etruscan (*q.v.*) spoken north of the Tiber, and for a time in Campania. This last was not I.E.; but until the coming of Hannibal's Carthaginian troops, Etruscan is the only non-I.E. tongue of which there is any record in ancient Italy. Outside Italy, the Italic group of dialects (includ-

ing Latin itself, and its closest congeners like Faliscan) is most nearly linked to Keltic, and next to Greek and Germanic, but the historical implications of their similarities are clear only in the case of Keltic (*q.v.*) and Italic (*q.v.*). In this case, striking phenomena, among them the subdivision of Keltic into two main branches, Goedelic and Brythonic, strictly parallel to the subdivision of Italic into Latin-Faliscan and Osco-Umbrian, make it certain that the linguistic ancestors of the Keltic and Italic speaking peoples must have lived for a long period in close community. Inside Italy itself, Latin was early subjected to considerable influence from the non-I.E. Etruscan, and from its nearest Italic neighbour, Sabine. Greek influence only became important later, and Keltic influence was never great, being limited to a few elements borrowed by the Latin vocabulary; *e.g., petorritum,* "four wheeler"; *gaesum,* "spear." Not only individual names like *Casca, Sulla,* but characteristic features of the Roman name system, and formative suffixes used in name formation, have been ascribed to Etruscan sources, and with them a number of borrowed words (*e.g., histrio,* "actor"; *persona,* "mask"; and even the stem of the verb *am-ore,* "love"); the substitution of breathed for voiced sounds, *e.g.,* in *sporta* (Gr. *σπυρίδα,* acc. sg., "basket"), *catamitus* (Gr. Γανυμήδης, "Ganymede"), and other words; the aspiration in names like *Gracchus, Cethegus* (and perhaps in the *chommoda* for *commoda* of Arrius in Catullus); loss or weakening of syllables as in Latin *Pollux* (from Gr. Πολυδεύκης) consequent upon a shift of accent to the initial syllable of the word; that mode of accentuation itself; and the names of the three old tribes said to have constituted the early Roman people—*Ramnes, Tities, Luceres*—even the very name of Rome, *Roma,* where the existence of an Etruscan quarter, *vicus Tuscus,* is well known. Finally, reason has been shown for rejecting the older view, which derived the Latin alphabet directly from the Greek, in favour of an origin at least partly Etruscan.

From the Sabines were taken a number of forms showing *f* medially, as *rufus,* "red haired" (contrast *ruber,* "red," with pure Latin *b*); or *f* initially, *e.g., fordicidia,* "sacrifice of unborn calves" (pure Latin *h,* as in *hordicalia*), *filum,* "thread," beside Latin *ni-hil,* "nothing"—literally "not a thread"; and *l* for pure Latin *d,* as in *lacrima,* "tear." It has also been plausibly held that the peculiar hodge-podge of six or eight different means of forming non-present or non-continuous tenses which in Latin were fused together into a single "perfect" tense, and also the shaping of forms in *-r* in the passive voice, were the work of a large Sabine element in the population of Rome which some have identified with the Patrician class. Finally, if not from Sabine itself, from some one of the Italic dialects outside the Latinian group, were imported words with *p* or *b* for pure Latin *qu* (*c*) or *u* (*g*), as *Pompilius, lupus,* "wolf," *popina,* "cook-shop"; *bos,* "ox." Thus does the evidence of language confirm the historical tradition of Sabine and Etruscan kings in Rome.

Latin in the Historical Period.—Certain differences too in sounds (*e.g., losna,* Lat. *luna,* "moon"; *nefrones,* Lat. *nebrundines,* "testes"), in usage (*e.g., tammodo,* properly "just as," in the sense of "on the spot, straightway"), in word forms (*e.g., magistreis* for the n. pl. *magistri;* or the dual form *Cestio,* "the two Cestiuses"), and in vocabulary (*e g., tongitio,* "idea," Lat. "notio") are clearly marked in early rustic Latin as spoken at Praeneste, some 20 miles from Rome; but besides such local peculiarities of dialectic Latin, account must be taken of distinctions of date, and further, subsequent to the development, for the most part after Greek models, of an elaborate literature, also of (1) differences which may be called social, though they are not merely as between educated and uneducated usage, but also between the "stylized" language of literary forms and the popular spoken language of everyday life; and (2) differences, at least in expression and style, between prose and poetry, or between the language of oratory and that of philosophy, science, law or of correspondence. Slangy Latin, for example, is occasionally to be recognized in the letters of some of Cicero's friends. Naturally the popular language ("vulgar Latin") appears, not only in the artless inscriptions of plain folk, but from time to time in the literature too, as in the plays of Plautus, and later in the *Satiricon* of Petronius, and, at the end of the story, it is spoken Latin which wins the day and which is the true basis of the Romance languages. And again in Romance, it is important to discriminate with regard to date and locality. The language of Spain, for example, was superimposed upon a different linguistic substratum from, say that of Rumania; it was planted there by speakers of quite different stock, and that 300 years earlier. Such considerations help to explain the divergent development of the Romance languages from a common spoken Latin. The oldest documents of what can no longer be called Latin do not, it is true, go back beyond the 9th century A.D.; but it is certain that, as regularly happens, the development of the written had lagged far behind that of the spoken tongue. The artificiality of the Latin of writers later than the 4th or 5th century is self-evident. Indeed the very conditions—central government, stability and security of life, ease of intercommunication and the rest—which had ensured the spread and maintenance of a common language, were already seriously impaired and destined soon to fail. As an official language for correspondence and ritual Latin has been retained by the Roman Church; and it remained the language of instruction throughout western Europe for many centuries But in both cases it was divorced from the living tongues developing around it. Recent serious suggestions (as made by a committee of the British Association for the Advancement of Science) to revive Latin as an international auxiliary language for learned use, are hardly likely to result in actual practice. Amongst classical scholars it has always been so used.

The sources of our knowledge of the history of Latin are mainly the language itself as recorded in inscriptions and in the literature; the testimony of ancient grammarians and glossographers; and the light shed by comparison with related languages and dialects, and by the history of the Romance languages themselves. Chronologically we may distinguish six periods, beginning with (1) *pre-literary Latin* (to *c* 250 B.C.). The oldest document is a presentation inscription on a brooch found, not at Rome itself, but at Praeneste, so that perhaps it would be better counted dialectic. It runs *Manios med fhefhaked Numasioi,* "Manius made me for Numerius," and is not later than *c.* 600 B.C. The differences between this and the classical Latin (*Manius me fecit Numerio*) are striking. Next in date we have two 5th century inscriptions, from the Roman Forum and Tivoli (*Tibur*) respectively, the latter discovered in 1926, neither perfectly understood, the former indeed being so much mutilated as to defy all attempt at restoration and interpretation. But it shows among others the following interesting forms which are certain: *recei* "for the king, regi," *sakros,* "holy, sacer"; *iouxmenta,* "beasts of burden, iumenta"; *diouestod,* "lawfully, iusto"; and the Tibur inscription contains *mitat* 3rd sg. pres. subj. (mittat), a spelling which had long been known from the Quirinal vase inscription (4th century), a curse beginning with the words *iouesat deiuos qoi med mitat,* "whoso sends me adjures the gods. . . ." The epitaphs of the Scipios, the laws of the Twelve Tables, the Saliar and Arval hymns, and the commemorative inscription of Gaius Duilius—these were nearly all more or less "restored" in a later age—are the more important surviving documents of this period.

(2) The period of *archaic Latin* (from *c.* 250 to *c.* 90 B.C.) is represented not only by numerous inscriptions of all kinds, but also by considerable literary remains (of Livius Andronicus, Naevius, Plautus, Ennius, the elder Cato, Terence, Pacuvius, Accius and Lucilius). Speaking broadly, we may say that the written still reflected with fidelity the spoken language, which is the reason why certain idioms of old Latin, judged by the standards of the classical language to be "incorrect," reappear in late Latin and Romance; *e.g.,* the use of the present instead of the future tense in an *if*-clause such as *si venis, te videbo,* "if you come, I shall see you" (in classical Latin, *si venies,* "if you [shall] come"), like French *si tu viens, je te verrai,* although Italian has the literary idiom, *se tu verrai* (fut.), *io te vedrò.* Similarly, the versification of Plautus is intelligible only if it is recognized that the diction of his plays was in accord with

popular usage (*e.g.*, note the loss of final *-s* and *-m*, as in Romance, or the scansion of *ille* as a monosyllable, *cf.* Fr. and Ital. *il*); orthography was not yet standardized (thus consonants really pronounced double, or prolonged, were commonly written single, as in *habuise* for *-isse*—at least in inscriptions—the manuscripts of Plautus have had their spelling continually modernized, like texts of Shakespeare); and old verbal and nominal forms still, though precariously, held their own (*e.g.*, the future perfect in *-[s]so* and perfect subjunctive in *-[s]sim*, the passive infinitive in *-ier*, the ablative singular in *-d*, the dissyllabic genitive singular of *a*-stems in *-āī*, and, in a few words, the genitive plural of *o*-stems in *-um* instead of *-orum*). Finally, Greek words imported during the period were, as a rule, completely Latinized in form and sound; no attempt was made to preserve rigorously their native shape. But already there was in process of development a national prose style, not very well represented, however, by Cato's treatise on agriculture. For its most characteristic features show that Latin prose had its springs in oratory.

(3) In the *classical period*, roughly contemporary with the Golden Age of Latin literature, *c.* 90 B.C to A.D. 14, we may note of the poets, Lucretius, who was old-fashioned in language as well as in style, Catullus representing the new school, Virgil and Horace with their finished style and highly elaborated language; and in prose, the archaizing Sallust, the simple and direct Caesar, and the polished Cicero. Inscriptions of this period are reckoned in thousands from Rome alone. The cleft between the popular and the literary language can be shown to have become wide by the end of the Republic. Steadily increasing Greek influence is marked, though in syntax its extent has certainly been exaggerated by commentators and grammarians. But viewed as a whole, in respect of vocabulary, accent, sounds, forms and syntax, the Latin language had, by the last century B.C., developed all the characteristics which may be regarded as typical of it: of these the salient features are indicated below.

(4) *Silver Latin: from Tiberius to Trajan* (A.D. 14 to 117). In earlier ages often not Roman, Latin authors were now seldom even Italian by birth. Of Livy it was said by a contemporary that marks of his Paduan origin were discernible in his language, though modern criticism cannot claim to be able to recognize them. But into the language of later writers provincialisms and vulgarisms creep in increasing numbers and frequency. Ovid's diction is at times distinctly artificial. Characteristic, too, is the straining after effect which reveals itself in writers like Tacitus, trained as rhetoricians, and which was responsible for many a queerly turned sentence; archaisms and Graecisms are both of them needlessly frequent; and prose was invaded by expressions and style hitherto considered proper to verse. Seneca, Lucan, Martial, Quintilian—these all Spaniards—the elder and the younger Pliny, and Juvenal, are the other outstanding writers of this period.

(5) Archaism is so pronounced in the succeeding age (A.D. 117 to *c.* 180, Gellius, Fronto, Apuleius) that we may even speak of an *archaizing period*. But it is accompanied by daring innovation, especially in the creation of new forms and in the admission of popular ones.

(6) To the *period of decadence* which followed belong the Christian writers, among them the famous *Africans*, Tertullian, Cyprian, Arnobius and Augustine. The classical standard was gradually and unconsciously being lost. The written Latin of learned ecclesiastics of still later date—Gregory of Tours (6th century) may be taken as a fair sample—was an artificial survival, full of corruptions, and remote from the living dialects into which the spoken Latin of the Empire was developing wherever it had really taken root, that is, except in Dacia and Illyricum, mainly in the West.

The Developed Language.—The more striking features which distinguish Latin may now be briefly noted: one of that group of I.E. known as the *centum*-languages, which may be broadly designated Western, and is characterized by the preservation of *k*-sounds (Latin *centum*, "hundred," but Sanskrit *šatam*) and the more or less complete labialization of *q*-sounds (Latin *quis;* "who?"; Oscan *pis*, but Skr. *ka-s*), it has modified considerably the inherited system of accentuation, and with it the original vowel sounds by extruding or weakening them in final and (if unaccented) medial syllables, and by generally substituting simple sounds for original diphthongs (*see* below, 2. *Accent*, for examples); of the I.E. consonants it represented in most cases certain sounds which in Sanskrit became mainly voiced aspirates (*bh, dh, gh*) by spirant (*f, h*) or stopped sounds (*b, d, g*), *e.g.*, corresponding to Latin *fero*, "carry," *fumus*, "smoke," *formus*, "warm," we have in Sanskrit *bharati*, *dhuma-s*, *gharma-s*, and similarly Lat. *haurio*, "drain," but Skr. *ghasati*, "consumes," Lat. *tibi*, "to thee"; *iubeo*, "bid"; *medius*, "middle"; *in-dulgere*, "be complaisant" (literally "go a long way"); *muger*, "false at play"; but Skt. *tubhy-am*, *yodhayati*, "stirs to battle," *madhya-s*, *dirgha-s*, "long"; *mogha-s* "vain"; Latin also changed *-s-* standing between vowels into *-r-*, a change which can be dated to *c.* 450–350 B.C., *e.g.*, *Furius* from an older *Fusios*, cited by the grammarians—exceptions, when not phonetically explicable (as in *causa*, older *caussa*, "a case of law") being due to borrowing, *e.g.*, *carbasus*, "linen," which was probably taken from Sabine. In the sphere of declension it preserved almost intact six of the original eight cases, the functions of the other two being absorbed by the six that were kept; it tended to fuse stems in *-i-* and stems ending in a consonant (*e.g.*, *-es* came to be the termination of the nom. and acc. pl. in both classes), and in conjugation, among other innovations, it developed a new set of forms in *-b-* (*e.g.*, *amabam*, "I loved," *amabo*, "I shall love") for the imperfect and future tenses, and in *-r* for the passive voice, it amalgamated the old perfect and aorist tenses, and the old subjunctive and optative moods. Finally, in syntax, the development of the elaborate and somewhat rigid principles which govern the "sequence" of tenses and the forms of indirect quotation, is perhaps the most noteworthy feature.

1. The *pronunciation* of Latin in Italy in the classical period has been determined with approximate accuracy by the application of strict philological method. Thus in the last century B.C. the Romans never pronounced C like an English *s*, or G as *j*, but always like *k* and *g* (in *get*) respectively, I and V, as consonants, were sounded like English *y* and *w* respectively (not *j* and *v*), S was always as *-ss* in *hiss*, and the vowels had roughly much the same sounds as in modern Italian.

2. *Accent.* In pre-ethnic I.E. the position of the chief accent of a word (or word group) was not limited either by the quantities or the number of the syllables. But in an early stage of the development of Latin the I.E. accent, which in character had been predominantly *musical*, at least in the final period of I.E., gave way to a system of accentuation by which the initial syllable of a word was uttered with more force, and subsequently the Latin accent remained a *stress* accent, though before the classical period it had come to be restricted to the last three syllables of a word, the precise position being determined by quantity, and the penultimate being accented if long (*e.g.*, *amāre*), the antepenultimate if the penultimate was short (*e.g.*, *amábĭmus*). The chief difference between this and a somewhat earlier system of accentuation, which prevailed as late as the days of Plautus, is that in words of four or more syllables, in which the penultimate and the two preceding syllables were all short, the *fourth* syllable from the end was accented (*e.g.*, *fácĭlĭus*). A few typical examples of the changes dependent upon these conditions of accent may serve to indicate their importance (the position of the accent, where indicated, is that not of classical but of pre-Plautine Latin):—

(*a*) Syncope of short medial and final unaccented vowels, *e.g.*, in *árdĕre*, "to be parched," beside *aridus*, "dry, parched" (unsyncopated), *mens*, "mind," from an older **méntis* (*denotes a form which is not recorded, but which can be proved to have existed); syncope with vocalization of a neighbouring consonant; *e.g.*, *amicio*, "throw around," from **am-iacio* (the *y*-sound of the initial *i* in *iacio* "throw," has become the vowel *i* at the same time that the *-a-* was lost), *sákros*, "holy," became *sacer* (*-ros* first passed into *-rs*, in which *r* is vocalic, like a French final *-re*, and this successively into *-ers*, *-err* and *-er*).

(*b*) Weakening of short medial vowels in unaccented syllables; *e.g.*, *óbsideo*, "beset," beside *sĕdeo*, "sit"; *éfficio*, "complete"

but *făcio*, "do, make"—contrast (before two consonants) *effectus*, "completed," or (before *r*) *péperi*, "have borne," but *părio*, "bring forth"; *ílico*, "on the spot" beside *lŏcus*, "place"—contrast (after *i*) *pietas*, "sense of duty," but old Latin **piŏs* (classical *pius*), "dutiful," or (before two consonants) *vénustus*, "charming," but old Latin *Venos*, "(the goddess) love"; *capitis* gen. sg. "head," but *caput* n. sg.; weakening of diphthongs in unaccented syllables; *e.g.*, *cecīdi*, "have slain," but *caedo* (older *caid-*), "slay," *éxclūdo*, "shut out," but *claudo*, "shut."

(*c*) Dependent upon stress accent, too, is the regular shortening of a long syllable when preceded by a short syllable and also immediately either preceded or followed by the accent; thus *bene*, "well" (order *-ē*), but, *e g.*, *honestē*, in which the second syllable is long.

3. In addition to those already mentioned, some of the more important *changes of sound* are.—

(A) Of the vowels and diphthongs: *e* followed by *l* became *o* (except before *e*, *i*, or a second *l*), hence *volo*, "wish," *volebam*, *volam*, but *velim*, *vellem*, *velle*; *-e* before *nc*, *ng*, and *gn* (pronounced *ngn*) became *i*, *e.g.*, *septingenti*, "seven hundred," but *septem*, "seven"; *-ei* became *ī*, *e.g*, *dīco*, "say," older *deico*, and similarly *ai* became *ae*, *e.g.*, *aedes*, "temple" (older *ai-*), but in rustic Latin a long open *e*, as in *ēdus* for *haedus*, "goat," *oi* became successively *oe* and *ū*, *e.g.*, *ūnus* (older *oi-*); *eu* became first *ou* and then *ū*, *e g.*, *iūmentum*, "beast of burden," old Latin pl. *iouxmenta* (*see* above), but in Greek ζεύγ-νυ-μι "yoke"; and with this *ou* original *ou* also became *ū*, *e.g.*, *lūcus*, "grove," lit. "a clearing," in old Latin *loucom* (acc. sg), except in rustic Latin, in which both *ou* and *au* (ordinarily preserved in polite Latin) gave *ō*, *e.g*, *lōsna*, "moon" at Praeneste (*see* above), cognate with *lux*, "light," *lucas*, "grove," and *ōrum*, "gold" (hence Ital. *oro*, Fr. *or*) but polite *aurum*

(B) Of the consonants: after *c.* A.D. 50 *b* between vowels became a sound like English *v* (*cf.* Ital. *avere*, Fr. *avoir* from Latin *habere*, "have"); and about the same time Latin *v* (pronounced like English *w*) passed into the same sound (*cf.* Ital. *voce*, Fr. *voix* from Latin *vōcem*, "word, voice"), but the corresponding change of consonantal *i* (=English *y*) into a *j*-sound (*cf.* Ital. *giusto*, Fr. *juste* from Latin *iustum*, "legal, fair") took place some 400 years later; whereas consonantal *i* and consonantal *u* inherited from I E., were lost at a very early date, the former between any two vowels, the latter between two like vowels of which the first was accented: thus in *torreo*, "scorch," the ending was originally *-ēio*, the gen. sg. *divitis* (nom. *dives*) became, with the loss of *u* and contraction, *dītis*. Where for any reason *i* occurs in the developed language between vowels it really stands for *-iy-* in pronunciation, *e.g.*, in *eius* pronounced *ei-y-us*. From the group *du* (*u* being consonantal) at the beginning of a word arose *b-*: thus we have *bis*, "twice," from **dwis*, beside *duo*, "two." In popular Latin a single breathed consonant (*p*, *t*, *k*) seems regularly to have been doubled in the middle of a word when preceded by a long vowel, and the vowel shortened at the same time—but not in the literary language. Hence arose a number of "doublets"; *e.g.*, in the popular language *cuppa*, "cask" (Fr. *coupe*), beside *cūpa* (Fr. *cuve*) in the literary language. On the other hand, *-ss-* became *-s-* in the first century B.C. after a long vowel or diphthong; *e.g.*, *cāsum* supine of *cado*, "fall," from *cāssum*, older **cad-tum* (I.E. *t*+*t*, *d*+*t*, *dh*+*t* regularly becoming *-ss-* except before *r*), and *-ll-* became *l* after a long vowel when *i* stood in the following syllable: thus the plural of *mille*, "thousand," is *mīlia*. Assimilation of neighbouring unlike consonants, characteristic of all languages, is prevalent in Latin: *āctus*, "driven," from **ag-tos* (*cf. ag-o*); *ferre*, "carry," from **fer-se* (*cf. es-se*). Before *d*, *m*, *n*, *l* and *v*, *-s-* was always lost and the preceding vowel lengthened; *e.g.*, *prīmus*, "first," for **pris-mos* (*cf. pris-cus*, "ancient").

4. The Latin *vocabulary* is in the main inherited directly from I.E., but there are numerous borrowed words from other tongues; moreover, the popular speech retained the power freely to form compounds much longer than the written language. Some of these are half-comic, as the *vaniloquidorus*, "generous in talk," of Plautus (there the element *-doro-* is also Greek). Prepositional compounds, however, in which the true force of the preposition was not felt, so that the compound (*e.g.*, in *con-*, *de-*, *in-*) gains merely in emphasis, were common in the spoken tongue throughout its history. Many suffixes remained or became productive, and new words were constantly being built up on old patterns from existing stems.

5. As to the *numerals*, they reflect an I.E. system of reckoning that was mainly decimal. Only the first three of cardinal numerals up to 100 were declined; the decades, however, were originally neuter plurals, and the hundreds and thousands (except *centum* and *mille*) are regularly declined. Even where originally nouns the numerals have almost all become adjectival.

6. *Noun and Verb Forms.* Certain peculiarities have been noted above; observe in addition the almost complete loss of the dual number, the employment of a termination *-i* in the gen. sg. of the first (*-ae* from *-āi*) and second declensions (peculiar to Italic and Keltic in the *o*-stems), and the adoption (as in Greek) of pronominal terminations in the nom. pl. of the same two declensions, the extension of *-ti-* abstract nouns by an *-ōn-* suffix (*e.g.*, *ratio*, "thought"), the wider development of the *dies*-type of declension, and the loss of the *u*-declension of adjectives. In verbs we note the disuse of the augment in the past tenses (Greek ἔ-θη-κ-α, "I put," but Latin *fē-c-i*, "I did"), and the growth of new forms for the future perfect and pluperfect tenses and for the imperfect subjunctive. Even the syntactical categories of the future-perfect and imperfect subjunctive were new

7. Further features of special interest from the point of view of *syntax* are the running together of the true ablative, the instrumental, and (for the most part) the locative of I E. into a single ablative case, and sharp definition in the use of all the cases; the development of constructions by which the subjunctive was regularly used in dependent questions, in clauses of definition, purpose, and result; and the peculiarly Latin idiom of the gerundive.

LATIN LITERATURE. Pre-literary Period, to 240 B.C.—The germs of an indigenous literature had existed at an early period in Italy in forms such as we might expect in a people just emerging from barbarism. The art of writing was first employed in the service of the State and of religion for books of ritual, treaties with other States, laws of the Twelve Tables, etc. An approach to literature was made in the chronicles, public and private, funeral orations and tomb-inscriptions. A nearer approach was probably made in oratory, as we learn from Cicero that the famous speech delivered by Appius Claudius Caecus against concluding peace with Pyrrhus (280 B.C.) was extant in his time. Appius also published a collection of moral maxims and reflections in verse.

But it was rather in the chants and litanies of the ancient

religion, such as those of the Salii and the Fratres Arvales, and the dirges for the dead (*neniae*), and in certain extemporaneous effusions, that some germs of a native poetry might have been detected; these seem to have been in Saturnian (*q.v.*) or other rude and probably accentual metre. We may also mention the *vates* (bards or soothsayers), of whom the most famous was one Marcius, and the "Fescennine verses" (*q.v.*). There were also commemorative poems, accompanied with music, which were sung at funeral banquets, in celebration of the exploits and virtues of distinguished men. The latest and probably the most important of these rude and inchoate forms was that of quasi-dramatic *saturae* (medleys), put together without any regular plot and said to have consisted of jocular dialogue in verse,[1] accompanied with music (Livy vii. 2). These have a real bearing on the subsequent development of Latin literature. They may have contributed to the formation of the style of comedy which appears at the very outset much more mature than that of serious poetry, tragic or epic. They gave the name and some of the characteristics to that special literary product of the Roman soil, the *satura*, addressed to readers, not to spectators, which ultimately was developed by Lucilius, Horace, Persius and Juvenal.

First Literary Period: 240 to 80 B.C.—*Livius Andronicus.*—The historical event which brought about the greatest change in the intellectual condition of the Romans, and thereby exercised a decisive influence on the whole course of human culture, was the capture of Tarentum in 272. After the capture many Greek slaves were brought to Rome, and among them the young Livius Andronicus (*c.* 284–204), who was employed in teaching Greek in the family of his master, a member of the Livian gens. From that time to learn Greek became a regular part of the education of a Roman noble. In the year after the first Punic war (240), when the armies had returned and the people were at leisure to enjoy the fruits of victory, Livius Andronicus substituted at one of the public festivals a regular drama, translated or adapted from the Greek for the musical medleys (*saturae*) hitherto in use. From this time dramatic performances became a regular accompaniment of the public games, and came more and more to drive out or transform the native compositions. The dramatic work of Livius was mainly of educative value. The same may be said of his translation of the *Odyssey*, which was still used as a school-book in the days of Horace, and the religious hymn which he was called upon to compose in 207 had no high literary pretensions. He was, however, the first to familiarize the Romans with the forms of the Greek drama and the Greek epic, and thus to determine the main lines which Latin literature followed for more than a century afterwards.

Naevius.—His immediate successor, Cn Naevius (d. *c.* 200 B.C.), was not, like Livius, a Greek, but either a Roman citizen or, more probably, a Campanian who enjoyed the limited citizenship of a Latin and who had served in the Roman army in the first Punic war. His first appearance as a dramatic author was in 235. He adapted both tragedies and comedies from the Greek, but seems to have been more successful in the latter. An attempt to introduce political satire (against the Metelli) led to his imprisonment, and henceforth personalities are absent or carefully veiled in Roman drama, save for a few very mild jests against persons of little importance. Even complimentary allusions are seldom very outspoken. Besides celebrating the success of M. Claudius Marcellus in 222 over the Gauls in a play called *Clastidium*, he gave the first specimen of the *fabula praetexta* or tragedy on a Roman subject in his *Alimonium Romuli et Remi*. In his long Saturnian poem on the first Punic war, he not only told the story of contemporary events but helped to shape the legend of the settlement of Aeneas in Latium.

Plautus.—His younger contemporary, T. Maccius Plautus (*c.* 254–184), was the greatest comic dramatist of Rome, a thorough Roman despite his Umbrian origin, and possessing a range and vigour of wit almost Shakespearean, which breathes into the faded prettiness of New Comedy something of the heartiness of Aristophanes. His work survives fairly complete. Apart from his merits as a dramatist, Plautus is of great interest to philologists, as the largest specimen we have of early Latin. Moreover, he was a very skilful metrician, showing an extraordinary power of adapting the foreign (Greek) metres in which he wrote to the rhythm, largely accentual, of spoken Latin. In consequence of this, careful examination of his text has led to the recovery, in considerable measure, of the very cadences of ancient Latin speech.[1]

Ennius.—Thus far Latin literature had some claim to be considered popular. But a new spirit, which henceforth became predominant, appeared in the time of Plautus. Latin literature became the expression of the ideas, sentiment and culture of the aristocratic governing class. It was by Q. Ennius (239–169) of Rudiae in Messapia, that a new direction was given to Latin literature Deriving from his birthplace the culture, literary and philosophical, of Magna Graecia, and having gained the friendship of the Scipionic circle, he was of all the early writers most fitted to be the medium of conciliation between the serious genius of ancient Greece and the serious genius of Rome.

First among his special services to Latin literature was the fresh impulse which he gave to tragedy. He turned the eyes of his contemporaries from the commonplace social humours of later Greek life to the contemplation of the heroic age. To judge from rather scanty fragments, he introduced into his Greek plots a genuinely Roman tone. Although Rome wanted creative force to add a great series of tragic dramas to the literature of the world, yet the spirit of elevation and moral authority breathed into tragedy by Ennius passed into the ethical and didactic writings and the oratory of a later time.

Another work was the *Saturae*, written in various metres, but chiefly in the trochaic tetrameter. He thus became the inventor of a new form of literature; and, if in his hands the *satura* was rude and indeterminate in its scope, it became a vehicle by which to address a reading public on matters of the day, or on the materials of his wide reading, in a style not far removed from the language of common life. His greatest work, which made the Romans regard him as the father of their literature, was his epic poem, in 18 books, the *Annales*, a chronicle in verse of the whole history of Rome. The idea which inspired Ennius was ultimately realized in both the national epic of Virgil and the national history of Livy. Its metre, the hexameter (*q.v.*) was, although still rude, the first step in the development which culminated in Virgil. As grammarian and poet, he fixed Greek rules of scansion upon the literary Latin. Although of his writings only fragments remain, these fragments are enough, along with what we know of him from ancient testimony, to justify us in regarding him as the most important among the makers of Latin literature before the age of Cicero.

Cato.—M. Porcius Cato the Censor (234–149), was a younger contemporary of Ennius, whom he brought to Rome. More than Naevius and Plautus he represented the pure native, especially the plebeian element. His lack of imagination and his narrow patriotism made him the natural leader of the reaction against the new Hellenic-culture. He strove to make literature ancillary to politics and to objects of practical utility, and thus started prose literature on the chief lines that it afterwards followed. Through his industry and vigorous understanding he gave a great impulse to the creation of Roman oratory, history and systematic didactic writing. He was one of the first to publish his speeches and thus to bring them into the domain of literature. Cicero, who speaks of 150 of these speeches as extant in his day, praises them for their acuteness, their wit, their conciseness. He speaks with emphasis of the impressiveness of Cato's eulogy and the satiric bitterness of his invective.

Cato was the first historical writer of Rome to use his native tongue. His *Origines*, the work of his old age, was written with that thoroughly Roman conception of history which regarded actions and events solely as they affected the continuous and pro-

[1] The reliability of Livy's account is uncertain; *see* Schanz-Hosius, p. 20, for the controversy.

[1] The best and fullest treatment of this matter is to be found in W. M. Lindsay, *Early Latin Verse;* for discussion of a rather important point in connection with the accentual element in Plautine verse, *see* Sonnenschein in *Class. Rev.* XX. (1906), p. 156, Eton, *ibid.*, p. 31, Wallstedt, *Studia Plautina* (Lund, 1909).

gressive life of a State. It was an attempt, apparently somewhat in the style of the Greek logographi (*q.v.*), to record the early history of the Italian communities which Rome had conquered. Its loss is much to be deplored.

Terence, Lucilius, etc.—In Naevius, Plautus, Ennius and Cato are represented the contending forces which strove for ascendancy in determining what was to be the character of the new literature. The work, begun by them, was carried on by younger contemporaries and successors; by Statius Caecilius (*c.* 220–168), an Insubrian Gaul, in comedy; in tragedy by M. Pacuvius (*c.* 220–132), the nephew of Ennius, called by Cicero the greatest of Roman tragedians; and, in the following generation, by L. Accius (*c.* 170–86), who was more usually placed in this position. The impulse given to oratory by Cato, Ser. Sulpicius Galba and others, and along with it the development of prose composition, went on with increased momentum till the age of Cicero. But the interval between the death of Ennius (169) and the beginning of Cicero's career, while one of progressive advance in the appreciation of literary form and style, was much less distinguished by original force than the time immediately before and after the end of the second Punic War. The one complete survival of the generation after the death of Ennius, the comedy of P. Terentius Afer or Terence (*c.* 185–159), exemplifies the gain in literary accomplishment and the loss in literary freedom. Terence has nothing Roman or Italian except his pure and idiomatic Latinity. His Athenian elegance affords the strongest contrast to the Italian rudeness of Cato's *De Re Rustica*. What makes Terence an important witness of the culture of his time is that he wrote from the centre of the Scipionic circle, in which what was most humane and liberal in Roman statesmanship was combined with the appreciation of what was most vital in the Greek thought and literature of the time. The comedies of Terence may therefore be held to give some indication of the tastes of Scipio, Laelius and their friends in their youth. The influence of Panaetius and Polybius was more adapted to their maturity. But in the last years during which this circle kept together a new spirit of discontent, powerfully voiced by the Gracchi in politics and in oratory, arose and with it a new literary *genre*, satire. Roman satire, though in form a legitimate development of the indigenous dramatic *satura* through the written *satura* of Ennius and Pacuvius, is really a birth of this time, and its author was the youngest of those admitted into the intimacy of the Scipionic circle, C. Lucilius of Suessa Aurunca (*c.* 180–103). The loss of his works, which seem to have been full of originality and pungent criticism, is most regrettable. The years that intervened between his death and the beginning of the Ciceronian age are singularly barren in works of original value. But in one direction there was some novelty. The tragic writers had occasionally taken their subjects from Roman life (*fabulae praetextae*), and in comedy we find the corresponding *togatae* of Lucius Afranius and others.

Summary of the Period.—The general results of the last 50 years of the first period (130 to 80) may be thus summed up. In poetry we have the satires of Lucilius, the tragedies of Accius and of a few successors among the Roman aristocracy; various annalistic poems intended to serve as continuations of the great poem of Ennius; minor poems of an epigrammatic and erotic character, unimportant anticipations of the Alexandrian tendency operative in the following period; and works of criticism in trochaic tetrameters by Porcius Licinus and others, forming part of the critical and grammatical movement which almost from the first accompanied the creative movement in Latin literature.

The only extant prose work which may be assigned to the end of this period is the treatise on rhetoric known by the title *Ad Herennium* (*c.* 84) a work indicative of the attention bestowed on prose style and rhetorical studies during the last century of the republic, and which may be regarded as a precursor of the oratorical treatises of Cicero and Quintilian. But the great literary product of this period was oratory, developed indeed with the aid of these rhetorical studies, but itself the immediate outcome of practical needs. The speakers and writers of a later age looked back on Scipio and Laelius, the Gracchi and their contemporaries, L. Crassus and M. Antonius, as masters of their art.

Cicero denies to Rome the existence, before his own time, of any adequate historical literature. Nevertheless it was during this period that the annalists (*q.v.*) flourished, and formed the traditional history and chronology of Rome. There were also special works on antiquities, and contemporary memoirs and autobiographies such as those of M. Aemilius, Scaurus, the elder, Q. Lutatius Catulus (consul 102 B.C.), and P. Rutilius Rufus, which formed the sources of future historians. (*See*, further, ROME: *History, Ancient.*)

So far, then, we find drama, which was not destined to play any leading part in the future literature, a fairly well developed, dignified prose style; imaginative poetry, and its vehicle, the hexameter, albeit rude and unmelodious as yet; satire, using the hexameter as one of its media (it afterwards discarded all others); but, so far, no personal lyric and no elegy or none of importance. The influences of Greek literature to which Latin literature owed its birth had not as yet spread beyond Rome and Latium. The Sabellian races of central and eastern Italy and the Italo-Celtic and Venetian races of the north, in whom the poetic susceptibility of Italy was most manifest two generations later, were not, until after the Social war, sufficiently in sympathy with Rome, and were probably not as yet sufficiently educated to contribute their share to the national literature. Hence the end of the Social war, and of the Civil war, which arose out of it, is most clearly a determining factor in Roman literature, and may most appropriately be taken as marking the end of one period and the beginning of another.

Second Period: 80 to 42 B.C.—The last age of the republic coincides with the first half of the Golden age of Roman literature. It is generally known as the Ciceronian age from the name of its greatest literary representative, whose activity as a speaker and writer was unremitting during nearly the whole period. The five chief representatives of this age who still hold their rank among the great classical writers are Cicero, Caesar and Sallust in prose, Lucretius and Catullus in verse. The works of other prose writers, Varro and Cornelius Nepos, have been partially preserved; but these writers have no claim to rank with those already mentioned as creators and masters of literary style. There was by this time a not inconsiderable educated reading public, and regular publishing had begun. Joined to the national love of oratory, this produced not only the published speech, which already existed, but the pamphlet in speech form, *e.g.*, Cicero's second *Philippic*, which was never delivered.

Cicero.—Thus the speeches of M. Tullius Cicero (106–43) belong to the domain of literature quite as much as to that of forensic or political oratory. It is urged with justice that the greater part of Cicero's *Defence of Archias* was irrelevant to the issue and would not have been listened to by a modern jury. But it was fortunate for the interests of literature that a court of educated Romans could be influenced by the considerations there submitted to them. In this way a dispute about the status of an unimportant person has produced one of the most impressive vindications of literature ever spoken or written In many other orations, the largeness of the issues involved adds interest and elevation. The Roman oratory of the law courts had to deal, not only with petty questions of disputed property, of fraud, or violence, but with great imperial questions, with matters affecting the well-being of large provinces and the honour and safety of the republic; and no man ever lived who, in these respects, was better fitted than Cicero to be the representative of the type of oratory demanded by the condition of the later republic. A patriot, a sensitive artist, a master of technique, he was also, if not exactly a dramatist, an excellent portrayer of the broad outlines of character. The Verres, Catiline, Antony of Cicero are living and permanent types The story told in the *Pro Cluentio* may be true or false, but the picture of provincial crime which it represents is alive. Had we only known Cicero in his speeches we should, even so, recognize him as the master and perfecter of Latin style. But to his services to Roman oratory we have to add his services not indeed to philosophy but to the literature of philosophy. Perhaps no one, save Plato and Aristotle, has so influenced the views of later ages as this brilliant pleader, who gave

part of his leisure to embodying, in an attractive form, ethical doctrines of which he had but a superficial and inaccurate knowledge, but in whose practical applications he, like a true Roman, took a most lively interest. His works on rhetoric place him high among critics of prose style.

The *Letters* of Cicero are of at least three kinds: the manifesto or *apologia* in letter form; the official or semi-official *communiqué;* and the genuine intimate letters like those to Atticus, in which we learn, not only the innermost thoughts of a complex mind, but the rich, varied and easy speech of a Roman of high education.

Caesar.—Among the many rival orators of the age the most eminent were Quintus Hortensius Hortalus and C. Julius Caesar. The former was the leading representative of the Asianic style of oratory, and, like other members of the aristocracy, such as C. Memmius and L. Manlius Torquatus, and like Q. Catulus in the preceding generation, was a kind of dilettante poet and a precursor of the poetry of pleasure, which attained such prominence in the elegiac poets of the Augustan age. Of Julius Caesar (102–44) as an orator we can judge only by his reputation and by the testimony of Cicero; but we are able to appreciate the special praise of perfect taste in the use of language attributed to him.[1] In his *Commentaries,* by laying aside the ornaments of oratory, he created the most admirable style of prose narrative, the style which presents interesting events rapidly and vividly, with scarcely any colouring of personal or moral feeling, any oratorical passion, any pictorial illustration. While he shows the persuasive art of an orator by presenting the subjugation of Gaul and his own action in the Civil War in the light most favourable to his claims, he is entirely free from self-laudation or disparagement of an adversary. The character of the man reveals itself especially in a perfect simplicity of style, the result of the clearest intelligence and the strongest sense of personal dignity. Rhetorical colouring is never used, or at least never displayed; yet the narrative is never cold nor dry.

Sallust.—In the simplicity of his style, the directness of his narrative, the entire absence of any didactic tendency, Caesar presents a marked contrast to another prose writer of that age—the historian C. Sallustius Crispus or Sallust (*c.* 87–36). Like Varro, he survived Cicero by some years, but the tone and spirit in which his works are written assign him to the republican era. He was the first of the purely artistic historians, as distinct from the annalists and the writers of personal memoirs. He imitated the Greek historians in taking particular actions—the *Jugurthan War* and the *Catilinarian Conspiracy*—as the subjects of artistic treatment. He wrote also a continuous work, *Historiae*, treating of the events of the 12 years following the death of Sulla, of which only fragments are preserved. His two extant works are more valuable as first-rate party pamphlets than as trustworthy narratives of facts. His style aims at effectiveness by pregnant expression, sententiousness, archaism. He produces the impression of caring more for the manner of saying a thing than for its truth, and his vehement bias in favour of Caesar colours everything he writes. Of the other historians, or rather annalists, who belong to this period, such as Q. Claudius Quadrigarius, Q. Valerius Antias, and C. Licinius Macer, the father of Calvus, we have only fragments remaining.

Varro.—The period also produced learned writers on philology and antiquities, whereof one is entitled to a separate mention. This was M. Terentius Varro, the most learned not only of the Romans but of the Greeks, as he has been called. The list of Varro's writings includes over 70 treatises and more than 600 books dealing with topics of every conceivable kind. His *Menippeae Saturae,* miscellanies in prose and verse, of which unfortunately only fragments are left, was a work of singular literary interest.

Lucretius.—Since the *Annals* of Ennius no great and original poem had appeared. The powerful poetical force which for half a century continued to be the strongest force in literature, and which created masterpieces of art and genius, first revealed itself in the latter part of the Ciceronian age. The conditions which enabled it to come to maturity in the person of T. Lucretius Carus (96–55) were entire seclusion from public life and absorption in the ideal pleasures of contemplation and artistic production. His *De Rerum Natura* stands forth as the greatest philosophical poem in any language. Form and metre are Greek, and the subject is the philosophy of Epicurus; but all that is of deep human and poetical meaning in the poem is his own. Lucretius's death left the poem unfinished, and he did not possess the perfect poetical technique of Virgil. Yet, apart altogether from its independent value, by his speculative power and enthusiasm, by his revelation of the life and spectacle of nature, by the fresh creativeness of his diction and the elevated movement of his rhythm, Lucretius exercised a more powerful influence than any other on the art of his successors, and particularly on Virgil himself.

Catullus.—While the imaginative and emotional side of Roman poetry was so powerfully represented by Lucretius, attention was directed to its artistic side by a younger generation, who moulded themselves in a great degree on Alexandrian models. Such were Valerius Cato, also a distinguished literary critic, and C. Licinius Calvus, an eminent orator. Of this small group of poets one only has survived, fortunately the man of most genius among them, and probably the least Alexandrian, the bosom-friend of Calvus, C. Valerius Catullus (84–54). He, too, was a new force in Roman literature. He was a provincial by birth, although early brought into intimate relations with members of the great Roman families. The subjects of his best art are taken immediately from his own life—his loves, his friendships, his travels, his animosities, personal and political. No poet has surpassed him in the power of vitally reproducing the pleasure and pain of the passing hour, not recalled by idealizing reflection as in Horace, nor overlaid with mythological ornaments as in Propertius, but in all the keenness of immediate impression. He also is perhaps the most polished and mordant lampooner in any language. His greatest contribution to poetic art consisted in the perfection which he attained in several lyric metres, and in the ease and grace with which he used the language of familiar intercourse to give at once a lifelike and an artistic expression to his feelings. In his life and in his art he was the precursor of those poets who used their genius as the interpreter and minister of pleasure; but he rises above them in the spirit of personal independence, in his affection for his friends, in his keen enjoyment of natural and simple pleasures, and in his power of giving vital expression to these feelings.

Third Period: Augustan Age, 42 B.C. to A.D. 17.—The poetic impulse and culture communicated to Roman literature in the last years of the republic passed on without any break of continuity into the literature of the succeeding age. One or two of the circle of Catullus survived into that age; but an entirely new spirit came over the literature of the new period, and it is by new men, educated indeed under the same literary influences, but living in an altered world and belonging originally to a different order in the State, that the new spirit was expressed. The literature of the later republic reflects the sympathies and prejudices of an aristocratic class, sharing in the conduct of national affairs and living on terms of equality with one another; that of the Augustan age, first in its early serious enthusiasm, and then in the licence and levity of its later development, represents the hopes and aspirations with which the new monarchy was ushered into the world, and the pursuit of pleasure and amusement, which becomes the chief interest of a class cut off from the higher energies of practical life, and moving in the refining and enervating atmosphere of an imperial court. The great inspiring influence of the new literature was the enthusiasm produced first by the hope and afterwards by the fulfilment of the restoration of peace, order and national glory, under the rule of Augustus. That distracted age longed for a deliverer and peacemaker, and in Augustus it found him. It was not, however, by his equals in station that the first feeling was likely to be entertained. The earliest to give expression to it was Virgil; but the spell was soon acknowledged by the colder and more worldly-wise Horace. Before, but still more after, his defeat of Antony and Orientalism,

[1] *Latine loqui elegantissime.*

Virgil hailed him as more than mortal, a kind of Messiah, and Horace echoed Virgil.

The empire of Augustus gave literature an environment both good and bad. On the one hand, its suppression of the turbulence of republican times meant a certain amount of restriction in public life and, in particular, left political oratory almost without any excuse for existence. On the other, it furnished to those who had eyes to see it the noblest of political ideals, that of a world-wide empire of peace and justice. Almost of necessity, therefore, literature became idealistic, or reflective, or purely personal, wherefore, apart from the prose epic of Livy, to be considered later, the work of this age is largely in verse, which includes epic and didactic poetry (Virgil), lyrics, in large measure personal (Horace), satire, avoiding personalities (Horace again), and elegiac poetry, fanciful or dealing with the affections (Gallus, Tibullus, Propertius, Ovid).

Gallus.—The work of Gallus is unfortunately lost, unless, as Skutsch has plausibly suggested (*Aus Vergils Fruhzeit*, 1901; *Gallus und Vergil*, 1906), the pseudo-Virgilian poem *Ciris*, an *epullion* in the Alexandrian manner, is his, and the Sixth and Tenth Eclogues of Virgil contain a poetical summary of his elegies. He certainly was Virgil's friend, and an elegiac poet of considerable merit, to judge by the references to him in the later elegiasts. As governor of Egypt, in 26 B.C. he allowed his vanity to lead him into appropriating honours to himself, or at least allowing them to be paid him, which properly belonged to Augustus. Disgrace and suicide followed, and Virgil found himself obliged to mutilate the fourth Georgic, which should have ended with a panegyric on his friend, and substitute the episode of Orpheus, perhaps originally an independent composition, beautiful in itself but dragged in very unnaturally where it stands. Gallus's amatory pieces were addressed to a lady whom he called Lycoris, no doubt a feigned name.

Virgil.—The greatest surviving Augustan poet, and also the earliest, is P. Vergilius (often miswritten Virgilius, whence the English spelling Virgil) Maro (70–19 B.C.). A native of Andes (Calvisano? certainly not Pietole) in the Mantuan territory, he began his poetical career with a few fugitive pieces in various styles, represented for us by the so-called *Appendix Vergiliana*, a miscellaneous collection, ranging from compositions in all probability his to others which can by no sound criticism be attributed to him, even in his salad days. The little pieces called *catalepta* ("trifles") are an example of the former, the *Culex* ("Gnat") of the latter.[1]

Next came the *Eclogues* or *Bucolics*, a series of ten pieces somewhat in the manner of Theocritus's pastorals, the scene of the odd-numbered ones at least being laid in the Mantuan territory or the neighbouring Italian Alps, and containing many allusions to the poet and his friends. They are slight, but full of exquisitely accurate observation of nature, a mastery of metre and style, and what Horace calls tender humour (*molle atque facetum*, Sat., 1, 10, 44) in the handling of the subject-matter.

In the *Georgics* we are struck by the great advance in the originality and self-dependence of the artist, in the mature perfection of his workmanship, in the deepening and strengthening of all his sympathies and convictions. Although he draws upon Greek authors for material and form, yet by sheer force of original genius he, like Lucretius, has put the didactic poem among the highest forms of serious poetry, so transmuting his material that, without violation of truth, he has made the whole poem alive with poetic feeling. The homeliest details of the farmer's work are transfigured through the poet's love of nature; through his religious feeling and his pious sympathy with the sanctities of human affection; through his patriotic sympathy with the national greatness; and through the rich allusiveness of his art to everything in poetry and legend which can illustrate and glorify his theme.

In the *Eclogues* and *Georgics* Virgil is the idealizing poet of the Italian countryside. In the *Aeneid* he is the idealizing poet of the empire and of Augustus. The epic of national life, vividly conceived but rudely executed by Ennius, was perfected in the years that followed the decisive victory at Actium. To do justice to his idea Virgil enters into rivalry with no less a poet than Homer. That he does not thereby make himself ridiculous is no small tribute to his greatness; that out of the poor, late and artificial legend of Aeneas he has reared up a lasting monument of the grandeur of Rome marks him a consummate artist and a master of epic.

Horace.—The second great poet of the time—Q. Horatius Flaccus or Horace (65–8 B.C.) is both the realist and the idealist of his age. If we want to know the actual lives, manners and ways of thinking of the Romans of the generation succeeding the overthrow of the republic it is in the *Satires* and partially in the *Epistles* of Horace that we shall find them. If we ask what that time provided to stir the fancy and move the mood of imaginative reflection, it is in the lyrical poems of Horace that we shall find the most varied and trustworthy answer. His literary activity extends over about 30 years and naturally divides itself into three periods, each marked by a distinct character. The first—extending from about 40 to 29—is that of the *Epodes* and *Satires*. In the former he imitates the lampooning style of the Greek iambic writers, but the objects of his attack are all, or mostly, imaginary. In the *Satires* we find realistic pictures of social life, and the conduct and opinions of the world submitted to the standard of good feeling and common sense. The style is natural and familiar. The hexameter no longer, as in Lucilius, moves awkwardly, but easily and as if carelessly, as befits the colloquial tone. The next period is the meridian of his genius, the time of his greatest lyrical inspiration, which he himself associates with the peace and leisure secured to him by his Sabine farm. The life of pleasure which he had lived in his youth comes back to him in the idealizing light of meditative retrospect. He had not only become reconciled to the new order of things, but was moved by his intimate friendship with Maecenas to aid in raising the world to sympathy with the imperial rule through the medium of his lyrical inspiration, as Virgil had through the glory of his epic art. With the completion of the three books of *Odes* he cast aside for a time the office of the *vates*, and resumed that of the critical spectator of human life, but in the spirit of a moralist rather than a satirist. In his *Epistles* he combines the ease of the best epistolary style with the grace and concentration of poetry—the style, as it has been called, of "idealized common sense," that of the *urbanus* and cultivated man of the world who is also in his hours of inspiration a genuine poet. In the last ten years of his life Horace published his fourth, and poorest, volume of *Odes* under pressure of the imperial command. But his chief activity is devoted to criticism, vindicating the claims of his own age to literary pre-eminence, and seeking to stimulate the younger writers of the day to what he regarded as the manlier forms of poetry and especially to tragedy (*Epistles* ii. and *Ars Poetica*).

But the poetry of the latter half of the Augustan age destined to survive did not follow the lines either of lyrical or of dramatic art marked out by Horace. There now came to perfection another vehicle for poetic expression, the *elegy*. Here the influence of Alexandria was great; but the pupils seem to have surpassed their teachers. The greatest masters of this kind of poetry are Tibullus, Propertius and Ovid.

Tibullus.—Of the ill-fated C. Cornelius Gallus, their predecessor, we have already spoken. Of the three Tibullus (*c.* 54–19) is the most refined and tender. As the poet of love he gives utterance to the pensive melancholy rather than to the pleasures associated with it. In his sympathy with the life and beliefs of the country people he shows an affinity both to the idyllic spirit and to the piety of Virgil.

Propertius.—A poet of more strength and more powerful imagination, but of less exquisite taste in his art, is Sextus Propertius (*c.* 50–*c.* 15). His youth was spent in Rome. His passion for

[1] The objection to attributing the *Culex* to Virgil, despite good ancient testimony that he wrote a poem so called, is not that it is trash, for the early efforts of great poets have often been rubbish, but that it is a kind of trash, both in content and in style, which could by no psychological possibility have been the fore-runner of Virgil's acknowledged works. R. Radford (*Trans. Amer. Phil. Ass.*, li., p. 159, and elsewhere), and one or two others, would attribute much of the *Appendix* to Ovid.

Cynthia (Hostia, probably a *libertina*) was the inspiration of his best work; and of her he has left a finished portrait. Sometimes heavy from too much Alexandrian learning, at times macabre, he shows more power of dealing gravely with a great or tragic situation than either Tibullus or Ovid, and his diction and rhythm at times approach sublimity.

Ovid.—The most facile and brilliant of the elegiac poets and the least poetical is P. Ovidius Naso or Ovid (43 B.C.–A.D. 18). As an amatory poet he is the poet of pleasure and intrigue rather than of tender sentiment or absorbing passion. Though he treated his subject in relation to himself with more levity and irony than real feeling, yet by his sparkling wit and fancy he created a literature of sentiment and adventure adapted to amuse the idle and luxurious society of which the elder Julia was the centre. His power of continuous narrative is best seen in the *Metamorphoses,* written in hexameters to which he has imparted a rapidity and precision of movement more suited to romantic and picturesque narrative than the weighty verse of Virgil. In his *Fasti* he successfully adapts to Roman themes the manner of Callimachus's *Aitia.* In his latest works—the *Tristia* and *Ex Ponto*—he imparts the interest of personal confessions to the record of a unique experience. Latin poetry is more rich in the expression of personal feeling than of dramatic realism In Ovid we have both. We know him in the intense liveliness of his feeling and the human weakness of his nature more intimately than any other writer of antiquity, except perhaps Cicero. For the next 15 centuries or so, amatory poets and romantic versifiers learned their trade from him. His elegiacs are to Latin poetry what the Popian couplet is to English.

Livy.—The past of Rome had always a peculiar fascination for Roman writers. But it was in the great historical work of T. Livius or Livy (59 B.C.–A.D 17) that the record of the national life received its most systematic exposition. Its execution was the work of a life prolonged through the languor and dissolution following so soon upon the promise of the new era, during which time the past became glorified by contrast with the disheartening aspect of the present. The value of the work consists not in any power of critical investigation or weighing of historical evidence, but in the intense sympathy of the writer with the national ideal, and the vivid imagination with which under the influence of this sympathy he gives life to the events and personages, the wars and political struggles, of times remote from his own. He makes us feel more than any one the majesty of the Roman State, of its great magistracies, and of the august council by which its policy was guided. The vast scale on which the work was conceived and the thoroughness of artistic execution with which the details are finished are characteristically Roman. The prose style of Rome, as a vehicle for the continuous narration of events coloured by a rich and picturesque imagination and instinct with dignified emotion, attained its perfection in Livy.

Fourth Period: The Silver Age, A.D. 17 to 130.—For more than a century after the death of Augustus, Rome, though drawing from the provinces, remains the centre of the literary movement. The Silver Age, as it is called, is alternately overpraised and undervalued, as taste swings from one extreme to another. In many respects it resembled the Alexandrian period in Greek literature, more especially in its verse. Here, alongside of great virtuosity and improvements in technical skill, we find a lack of real inspiration, a merely imitative continuation of old forms side by side with a restless search for new ones. In prose the story would be much the same were it not for the appearance of one very great writer, Tacitus. An interesting point is that enough of the work of this period survives to enable us clearly to trace schools and tendencies. We may say, as regards the former, that there was a Ciceronian and an anti-Ciceronian school in prose, a Virgilian school and one which, if not exactly anti-Virgilian, was at least decidedly Ovidian, in verse. As in Greek oratory Atticism and Asianism strove with one another, so in Latin literature we may distinguish very clearly an anti-classical and a classicizing or archaizing school.

The Senecas, Lucan.—Under Tiberius and Caligula, literature did not flourish greatly. Apart from Manilius (*see* p. 752) those principates have left us nothing save the fables of Phaedrus, slight, graceful, and not especially poetical versifyings of the traditional Aesopic apologues by a Macedonian freedman with a mastery of Latin very remarkable in a foreigner, the historical compendium of Velleius Paterculus, a work which expands, when it reaches Tiberius, into a rhetorical panegyric of his military and political career, and one or two trifles like the collection of anecdotes by Valerius Maximus. We have no reason to suppose that the lost literature of the period included any works of first-rate importance. Cremutius Cordus, for instance, wrote a history rabidly republican in tone, which was made a ground for a charge of treason against him in A.D. 25. The public burning of his work, and his own suicide, increased the popularity of his writings enormously, as might have been expected (Tacitus, *Annal.* iv., 34–35), but there is no evidence that they were in themselves remarkable for style or content. The emperor Claudius was himself an author, if a dull and pedantic one, and had a genuine love of learning; under him the Senecas became prominent, particularly the younger, Seneca Philosophus, as he is called to distinguish him from his father, Seneca Rhetor, who has left us a most interesting collection of literary gossip and specimens of compositions then admired, the so-called *Controversiae* and *Suasoriae.* This was published sometime between A D. 34 and 41, and shows us, even in the curtailed form in which we have it, how the taste of the day was formed and training in style given. Rhetorical instruction had long been in vogue, and to make speeches on imaginary topics, the more absurd and paradoxical the better, was the standard method of learning. As political oratory ceased to be necessary, and the great majority of forensic speeches (trials before the Senate were an exception at times) were perforce short and businesslike, these schoolboy themes were cultivated for their own sake, and there were men who grew grey in declaiming, as it was called, but never made a real speech in their lives. This declamation, being wholly artificial, was highly spiced. Cleverly-turned phrases (*sententiae*), ingenious setting of the facts in a particular light (*colores*), and all manner of tricks of language (figurae, σχήματα) were its outstanding characteristics. This not only governed the prose style of that age, it pervaded its verse also. Here Ovid was a pioneer, for his works are full of clever declamations in verse, of which the letter of Phaedra in the *Heroides* and the debate of Ajax and Ulysses in the *Metamorphoses* may serve as specimens.

The elder Seneca was a great admirer of Cicero; his son, whether consciously or not, headed the anti-Ciceronian school. It is highly likely that political ideals had something to do with this; so outstanding a champion of the dying Republic was not likely to be *persona grata* with the Caesars, and at least one prominent Augustan writer, the historian Pollio had vehemently attacked him. But the altered literary tastes induced by too exclusive a fondness for declamation had still more weight. The younger Seneca (L. Annaeus Seneca, about 4 B C.–A D. 65) was banished for a while under Claudius by Messalina's influence but recalled by her successor Agrippina, who made him the tutor of her young son Nero. From that day till his death in the conspiracy of Piso against his former pupil, he was almost literary dictator of Rome. He deserted the stately Ciceronian period for short, elaborately rhythmical, balanced clauses in the Asianic manner. His productions for the most part were essays and open letters on philosophic themes, and he is perhaps the most insincere writer on ethics who ever lived. It is difficult to read without impatience the praises of poverty and simplicity from the richest subject of the Empire, and quite impossible not to be nauseated by the abject flattery of Claudius which, the moment that emperor was dead, gave place to the clever, but mean pasquinade against his memory known as the *Apocolocyntosis.* However, he is highly moral in tone, and later ages valued him for his morality as his own admired him for his style.

A much better writer was his nephew Lucan (M. Annaeus Lucanus, A D. 39–65), author of an unfinished poem on the civil wars between Caesar and Pompey, generally known as the *Pharsalia,* besides several other works now lost. It is versified rhetoric and not poetry; its faults of taste are glaring; and Lucan's sen-

timental republicanism leads him into depreciating Caesar and making a hero out of the impossible pedant, Cato the Younger; yet it is full of passages of the most glowing eloquence and fervid imagination, which all the schoolboy learning and other immaturities cannot efface.[1] For the work of a man under 30, at first favoured and then snubbed by Nero—who wished well by poetry, but was too madly jealous of all whose talents surpassed his own to be a reassuring patron—it is an astonishing achievement.

Manilius, Persius, Statius, etc.—It is interesting to contrast with these three clever Spaniards the work of two men, one of unknown nationality, the other an Etruscan, who wrote verse in the times of Tiberius and Nero respectively. Marcus Manilius, author of the *Astronomica,* in five books, which has come down to us, seems to have been moved to write a counterblast to the Epicureanism of Lucretius, of whose style he has now and then an echo, although his technique in general bears witness that he comes after Ovid. He appears fully to have believed in astrology, which he expounds at length in his poem, and to have been, like many Stoics, a man of a genuine moral earnestness; and these qualities give rise to a certain number of passages not without poetical worth. But in general he was no great poet, and his crabbed subject often results in a most contorted and obscure style.[2] A. Persius Flaccus (Persius), like Lucan, died young; like him, he was a Stoic, and lived in the time of Nero. There the resemblance ends. His surviving work consists of six satires, in a style which, although reminiscent of Horace, is singularly difficult, allusive, and cloudy, yet not without a fascination of its own. The first of these is literary and contains a vigorous onslaught on those who despise the older Roman writers and spend their time over Ovidian prettinesses.[3] The rest are on ethical topics, and marked quite as much by their earnest and obviously sincere tone as by their quaintness of diction. Persius was admired and imitated in antiquity, Manilius neglected.

The old forms of literature, of course, continued one and all to be practised, and several examples have come down to us. Bucolic poetry, neat and pretty but wholly artificial, was written in the time of Nero by T. Calpurnius Siculus, who of course imitated Virgil; much later he himself found an imitator, not wholly contemptible, in the person of M. Aurelius Olympius Nemesianus, who lived in the time of Carus and his sons. Fragments of a third bucolic poet, unknown, are preserved in an Einsiedeln ms.

Epic proper—for the poem of Lucan is rather chronicle-epic—is represented chiefly by P. Papinius Statius, who was exceedingly popular in the time of Domitian and exercised great influence in the middle ages, partly because of his merits as a rhetorician, partly from a legend that he was secretly a Christian.[4] In modern times he has found much less favour. If learning and industry could make a poet, he would be one of the greatest; as it is, his *Thebais* is somewhat heavy reading, although here and there passages genuinely poetical occur. His unfinished *Achilleis,* so far as it goes, is rather better; the five books of occasional poems called *Silvae* ("Leaves from a Notebook") contain much that is of interest. A poet rather neglected since his own day, but admired and regretted by his contemporary Quintilian, is Valerius Flaccus (C. Valerius Flaccus Balbus Sentinus), author of an unfinished *Argonautica,* in which the well-worn theme is handled not without originality, grace and romantic feeling.[5]

Martial, the Plinies.—But the best verse, on the whole, was satiric and epigrammatic. Martial (C. Valerius Martialis, another Spaniard), did most of his work under Domitian. A poor hanger-on of Roman society and distinguished neither for self-respect, elevation of character, or fastidiousness in his choice of topics, he had a mordant and cynical wit, coupled with a genuine fondness for children and a sufficiency of good taste to prevent his *Epigrams,* whereof there are altogether 15 books, degenerating into mere lampoons; while his great skill gave them vividness, polish, variety, and point that have hardly been excelled. A much more bitter commentator on society was his contemporary Juvenal (D. Iunius Iuvenalis), who has left us 16 satires, the last unfinished. His merits, which have won him readers ever since his own day, are remarkable powers of eloquent invective, inspired by a righteous indignation certainly not always simulated, and a mastery of solemn and impressive commonplace, as in the famous tenth Satire, the original of Johnson's *Vanity of Human Wishes.* His defects are a too great fondness for lingering over the details of the vices he attacks, and an utter lack of any sense of proportion, which leads him to inveigh as violently against mere bad form as against the most hideous crimes.

All this time, what may be called scientific prose had continued to flourish. Of the great antiquary, Verrius Flaccus, who wrote under Augustus, we possess only a meagre epitome, made in the 4th century by one Festus, and even that is largely lost and must be supplied as well as may be from the Carolingian epitome of it by Paulus Diaconus, and from sundry glosses which drew upon it.[1] But apart from such writers as Pomponius Mela (? time of Claudius), who wrote a respectable little handbook of geography, L. Iunius Moderatus Columella, contemporary of the younger Seneca and author of a treatise on agriculture, A. Cornelius Celsus, the writer on medicine (part of an encyclopaedia, the rest of which is lost), the jurists, whereof the *Digest* preserves us fragments, and other writers, of whom many are now lost, this age produced the very remarkable *Naturalis Historia* of the elder C. Plinius Secundus (Pliny), dedicated to Vespasian. When Pliny tries to be eloquent and impressive, the result is not happy; he is credulous, uncritical, and very inaccurate; but his prodigious learning makes the book perhaps the most valuable epitome of the science and pseudo-science of a whole age that ever was written. His nephew, the younger Pliny (C. Plinius Caecilius Secundus), who proved a good civil servant and an able barrister, under Trajan, was a faithful imitator of Cicero, whom indeed he resembled alike in his disarmingly childish vanity and in his real honesty and kindness of heart. His letters, including a series of dispatches to Trajan, with the emperor's answers, have obviously been revised for publication, but are none the less full of interest and paint a far less depressing picture of the times than that given by Juvenal or Tacitus; his one surviving speech, a panegyric on Trajan, is of some historical importance, but exceedingly dull. It was, however, much admired at the time.

Tacitus, Other Writers.—But by far the greatest writer of the Silver Age, one of the greatest of all time, is Tacitus (Cornelius Tacitus, friend of the younger Pliny, exact dates unknown). To explain the extreme bitterness with which he handles everything belonging to the Empire, it is necessary to remember that a great part of his manhood was spent under Domitian, and that he lived through the reign of terror, directed especially against the senatorial class, with which that unhappy and morbid prince closed his career. Add to this the sentimental republicanism of the older senatorial families, and the bias against which Tacitus honestly but vainly struggles is easily explained. It is also easily allowed for, and so does not greatly affect the historical worth of his writings. Much more serious than any of his faults as a historian is the lamentable chance which has lost us the greater part of the *Histories* and much of the *Annals.* Of his minor works, the *Germania* is the most important of our scanty documents for the early history of Germany; the *Agricola* holds a corresponding place for Roman Britain; and the *Dialogus* is of especial interest as showing clear traces of the Ciceronian movement in literature of which Quintilian was the foremost champion. A later and much lesser historian was the polymath Suetonius (C. Suetonius Tranquillus) from whom we have *Lives* of the Caesars from Julius to Domitian, brilliant things of their kind, if superficial, also fragments of a biographical work on literary men (*De Grammaticis et Rhetoribus,* a section of a

[1]After much useful work on the mss. by Carl Hosius, the *Pharsalia* has at last been satisfactorily edited by A. E. Housman (first ed., 1926).

[2]A. E. Housman thinks better of him, and in his edition emends away many faults of argument and diction. The mss. are poor.

[4]*See* Dante, *Purgatorio,* xxii., 64 ff.

[5]Modern editions of his text (which is none of the best) by J. B. Bury (in Postgate's *Corpus Poetarum Latinorum*), 1900; C. Giarratano, Milan, Panormus and Naples, 1904; and O. Kramer, Leipzig, 1913.

[1]A large edition by W. M. Lindsay was in course of preparation in 1928.

longer treatise *De Viris illustribus*).[1] A minor writer, Q. Curtius Rufus, wrote a history of Alexander, of more literary than historical merit; one might almost class him among the writers of the Alexander-romance. His date is uncertain.

The drama flourished, but only in its lower forms. It is a pity that we have quite lost the mimes, or farces, which delighted this and the preceding age, and appear to have been very curious and not over-decent performances; but the loss to literature as such is probably not great. Lost also are the libretti of the pieces played by *pantomimi* or dancers, whose writers included Statius. They were the ancient equivalent of our film-dramas. Closet-drama is represented for us by the tragedies of the younger Seneca and his imitators. Despite Seneca's ingenuity of style and good command of metre, they are wretched compositions; but their great influence on later European play-writing makes them important in the history of literature. Of the imitators, one, the author of the *Octavia,* has some merit.

The novel was also of some importance, to judge by the considerable fragments of a picaresque romance, the *Satyricon,* by Petronius, the *arbiter elegantiarum* or semi-official Master of the Revels in Nero's court, and one of those who perished in the conspiracy of Piso. Apart from literary interest, it throws a great light on the colloquial speech of the time.

In literary criticism the great name is that of M. Fabius Quintilianus (Quintilian, *c.* 35–*c.* 100), also the greatest Latin writer, save Cicero, on rhetoric and literary education generally. His chief work, the *Institutio Oratoria* ("Training of an Orator") was written probably about the last decade of the 1st century.[2] He was a classicizer, and a passionate admirer of Cicero's style, yet by no means in favour of mere imitation of classical models; for him, the decay of Latin literature had not begun. Like so many writers of this age, he was a Spaniard.

Later Writers.—For two centuries after Juvenal we can name no verse-writers but Q. Serenus Sammonicus, with his pharmacopoeia in verse (*c.* 225), and M. Aurelius Olympius Nemesianus, who, besides imitating Calpurnius, as mentioned above, wrote (283) a dull piece on the training of dogs for the chase.[3] Towards the middle of the 4th century we have Decimus Magnus Ausonius, a professor of Bordeaux and afterwards consul (379), whose style is as little like that of classical poetry as is his prosody. His *Mosella,* a detailed description of the river Moselle, is the least unattractive of his works. A little better is his contemporary, Rufius Festus Avienus, who made some free translations of astronomical and geographical poems in Greek. A generation later, in what might be called the expiring effort of Latin poetry, appeared two writers of much greater merit. The first is Claudius Claudianus (*c.* 400), the court poet of the emperor Honorius and his minister Stilicho. Claudian may be properly styled the last of the poets of Rome. He breathes the old national spirit, and his mastery of classical idiom and versification is for his age extraordinary. Something of the same may be seen in Rutilius Namatianus, a Gaul by birth, who wrote in 416 a description of his voyage from the capital to his native land, which contains the most glowing eulogy of Rome ever penned by an ancient hand. Of the Christian poets only Aurelius Prudentius Clemens (*c.* 348–410) need be mentioned. He was well read in the ancient literature; but the task of embodying the Christian spirit in the classical form was one far beyond his powers.

Prose.—In prose, the rise of M. Cornelius Fronto (*c.* 100–175), a native of Cirta, marks the beginning of an African influence. Fronto, a distinguished orator and intimate friend of the emperor M. Aurelius, broke away from the traditional Latin of the Silver and Golden ages, and took as his models the pre-classical authors. The reaction was shortlived; but the same affectation of antiquity is seen in the writings of Apuleius, also an African, who lived a little later than Fronto and was a man of much greater natural parts. In his *Metamorphoses,* which were based upon a Greek original, he takes the wonderful story of the adventures of Lucius of Madaura, and interweaves the famous legend of Cupid and Psyche. His bizarre and mystical style has a strange fascination for the reader; but there is nothing Roman or Italian about it. Two epitomists of previous histories may be mentioned; Justinus (of uncertain date) who abridged the history of Pompeius Trogus, an Augustan writer; and P. Annius Florus, who wrote in the reign of Hadrian a rhetorical sketch based upon Livy. The Augustan History (*q.v.*) is marked by puerility and poverty of style. Ammianus Marcellinus (*c.* 330–400) had a higher conception of the historian's function. His narrative of the years 353–378 (all that now remains) is honest and straightforward, but his diction is awkward and obscure. The last pagan prose writer who need be mentioned is Q. Aurelius Symmachus (*c.* 350–410), the author of some speeches and a collection of letters. All the art of his ornate and courtly periods cannot disguise the fact that there was nothing now for paganism to say.

It is in Christian writers alone that we find the vigour of life. The earliest work of Christian apologetics is the *Octavius* of Minucius Felix, a contemporary of Fronto. It is thoroughly classical in style. Quite different is the work of Q. Septimius Florens Tertullianus (Tertullian, *c.* 150–230), a native of Carthage, the most vigorous of the Latin champions of the new faith. His style shows the African revolt of which we have already spoken, and in its medley of archaisms, Graecisms and Hebraisms reveals the strength of the disintegrating forces at work upon the Latin language. A more commanding figure is that of Aurelius Augustinus or St. Augustine (354–430), bishop of Hippo, who for comprehensiveness and dialectical power stands out in the same way as Hieronymus or St. Jerome (*c.* 331 or 340–420), a native of Stridon in Dalmatia, does for many-sided learning and scholarship.

Grammarians and Jurists.—The decline of literature proper was attended by an increased output of grammatical and critical studies. The grammarian M. Valerius Probus (*c.* A.D. 60) was the first critical editor of Latin texts. In the next century we have Velius Longus's treatise *De Orthographia,* and then a very interesting miscellany, the *Noctes Atticae* of Aulus Gellius, and (*c.* 200) a treatise in verse by Terentianus, an African, upon Latin pronunciation, prosody and metre. The tradition was continued in the 4th century by Nonius Marcellus and C. Marius Victorinus, both Africans, Flavius Sosipater Charisius and Diomedes. Commentaries on Terence, Horace, and Virgil have come down to us under the names of Acro, Porphyrio, Donatus, and Servius; of these "Donatus" on Terence and "Servius" on Virgil preserve a great deal of ancient learning. Ambrosius Macrobius Theodosius (*c.* 400) wrote a treatise on Cicero's *Somnium Scipionis* and seven books of miscellanies (*Saturnalia*); and Martianus Capella (*c.* 430), a native of Africa, published a compendium of the seven liberal arts, written in a mixture of prose and verse, with some literary pretensions. The last grammarian who need be named is the most widely known of all, the celebrated Priscianus, who published his text-book at Constantinople probably in the middle of the 5th century.

In jurisprudence, which may be regarded as one of the outlying regions of literature, Roman genius had had some of its greatest triumphs, and, if we take account of the "codes," was active to the end. The most distinguished of the early jurists (whose works are lost) were Q. Mucius Scaevola, who died in 82 B.C., and following him Ser. Sulpicius Rufus, who died in 43 B.C. In the Augustan age M. Antistius Labeo and C Ateius Capito headed two opposing schools in jurisprudence, Labeo being an advocate of method and reform, and Capito being a conservative and empiricist. The strife, which reflects the controversy between the "analogists" and the "anomalists" in philology, continued long after their death. Salvius Iulianus was entrusted by Hadrian with the task of reducing into shape the immense mass of law which had grown up in the edicts of successive praetors—thus taking the first step towards a code. Sex. Pomponius, a contemporary, wrote an important legal manual of which fragments

[1]Editions of the *Life* of Julius (H. E. Butler and M. Cary) and that of Vespasian (A. W. Braithwaite) have been published by the Clarendon Press, 1927.

[2]Good editions are available in English of Book i. (F. H. Colson, 1924) and Book x. (W. Peterson, 1891).

[3]The *Pervigilium Veneris,* or Vigil of Venus, is of unknown date, but probably early in this period. Its 90-odd lines would do credit to any age, but it stands alone.

are preserved. The most celebrated handbook, however, is the *Institutiones* of Gaius, who lived under Antoninus Pius. The most eminent of all the Roman jurists was Aemilius Papinianus, the intimate friend of Septimius Severus; of his works only fragments remain. Other considerable writers were Domitius Ulpianus (*c.* 215) and Iulius Paulus, his contemporary. The last juristical writer of note was Herennius Modestinus (*c.* 240). But the effects of their work remained and are clearly visible long after in the "codes"—the code of Theodosius (438) and that of Justinian (529 and 533), with which is associated the name of Tribonianus.

This vast mass of literature has been studied with more or less intelligence ever since it was written, and especially since the Revival of Letters (*see* CLASSICS). But in the present century there has been a healthy tendency to treat the literature along with the other means open to us of understanding the life and thought of antiquity, and break down the barriers which the 19th century was prone to set up between "pure scholarship," or philology, and history, archaeology, and so forth (*realien*, to use the convenient German title). Thus, the observations on Virgil and on Gallus in this article rest largely on the application to literature of Mommsen's interpretation of an inscription found in Egypt, on first-hand investigations of Virgil's country, and on the works of men such as the late W. Warde Fowler, who have investigated Roman religious ideas.[1]

At the same time, the actual text of the great authors is being set upon a sounder basis than before by the study, not simply of their language, but of their mss. tradition (*uberlieferungsgeschichte*). Thanks to modern methods of palaeographical study and the history of mss., it is often possible to some extent to reverse the process of copying, with its necessary accumulation of small corruptions, and reconstruct, more or less exactly, the text as it was in the 4th century, for instance. The danger of this method is that in the hands of an inferior editor it may be taken as a substitute for, instead of a help to, the sympathetic understanding of the thought and language of the author.[2]

Another aspect of this tendency is the readiness to study authors, not as isolated literary phenomena, but against the background of their own time and in relation to the movements of literature and thought of which they formed a part; to consider Quintilian, for example, not in the abstract as a monument of literary criticism or educational theory, but as part of the long history of the development of certain ideas.

Yet another side of modern research is an abandonment of the last century's excessive classicism, which turned attention away from such interesting fields as the ecclesiastical writers, the grammarians and glossarists, and the monuments of vulgar Latin.[3]

BIBLIOGRAPHY.—The best general history is by Martin Schanz (*Geschichte der romischen Literatur bis zum Gesetzgebungswerk des Kaisers Justinian*), in I. v. Müller's *Handbuch der Altertumswissenschaft;* new (fourth) edition, revised by Carl Hosius, began to appear in 1927. Mention should also be made of W. S. Teuffel, *Geschichte der römischen Literatur* (several editions, the last complete one being the 6th, revised by W. Kroll and F. Skutsch, Leipzig, 1910–16; vol. 2 has appeared in a 7th ed., Leipzig, 1920. English translation, now out of print, by C. C. Warr, of an older revision by L. Schwabe). In English, short histories by J. W. Mackail (1899), C. T. Cruttwell (1910), M. S. Dimsdale (1915), H. N. Fowler (1923) and J. Wight Duff (1925). Note also a French compendium by L. Laurand, in his *Manuel des études grecques et latines* (1925). (Bibl. in most of the above, especially the first, which *see* for the very numerous treatises on parts of the subject.)

For recent progress in the study, *see* the classical periodicals (*Classical Review, Classical Quarterly, Journal of Roman Studies*, England; *American Journal of Philology, Classical Philology, Classical Journal*, U.S.A.); these mostly contain accounts also of Continental periodicals. Good reviews of literature in *Philologische Wochenschrift* (Leipzig, weekly), *Revue de Philologie* (quarterly), *Bursians Jahresberichte* and *Year's Work in Classical Studies* (annual).

(H. J. R.; J. P. P.; W. Y. S.)

[1] *See* for example R. S. Conway, *New Studies of a Great Inheritance* (1921); W. Warde Fowler, *Virgil's Gathering of the Clans* (1916); *Aeneas at the Site of Rome* (1918); *Death of Turnus* (1919).

[2] For vigorous protests against such an error, *see* especially A. E. Housman (Prefaces to his editions of Juvenal, Manilius, and Lucan).

[3] Examples in Great Britain of the new attitude are the works of A. Souter (patristics) and W. M. Lindsay (grammarians and glossators). It has been longer in vogue on the Continent, witness the activities of Traube, Götz, Friedländer and others, and the great Viennese *Corpus scriptorum ecclesiasticorum Latinorum.*

MEDIAEVAL

Latin literature which is classed as "mediaeval" is usually accounted as beginning after the death (A.D. 524) of Boethius, "the last of the Romans," with Cassiodorus (*c.* 480–575), of a noble family in the Abruzzi. While still "in the world" he compiled a universal history and a more particular account of the Goths, and, after retiring to the Benedictine monastery of Vibarium in Squillace (*c.* 540), a series of theological treatises important because he considered the retention of the secular learning then still existing, essential to his fellow monks. His immediate successor in Italy was Pope Gregory the Great (d. 604), the first great Latin writer who knew no Greek; the mission of St. Augustine of Canterbury to England originated the Latin culture there which was to have a great reflex action in western Europe through Aldhelm at the Carolingian revival.

After Gregory the Great, the lamp of learning in Italy was dim for a time; we must look to Africa, where the tradition of St. Augustine of Hippo lingered, and to Spain, the home of the Roman gentleman and poet Prudentius. In the former, Verecundus (d. 552) was an expositor of the Old Testament canticles; Corippus (*c.* 550) wrote historical epics on the wars against the Moors; in the latter, St. Martin of Braga (d. 580) writing on Christian morals and doctrine leads up to the encyclopaedist, St. Isidore of Seville (*c.* 570–636) whose *Chronicle of the World* and *Etymologies* are of magistral authority throughout the middle ages. In Gaul we find the troubador Venantius Fortunatus, whose courtier's trifles in honour of Queen Radegund are redeemed by his magnificent hymns (*Vexilla regis* and *Pange lingua*) for the fragment of the True Cross received at Poitiers in 569, and Gregory of Tours (d. 594) the historian of the Franks.

Latin Culture in the British Isles.—The centre of Latin learning now moves yet further away from Rome. There is some still unexplained connection between the Irish writers and the amusing pedant Virgilius Maro Grammaticus (in the south-west of France, 7th century); but apart from this, scholars fled to the peaceful island to escape the wars and invasions that were devastating Europe; they carried some Greek with them, which was strangely kept alive for centuries. Much of the work of their successors is in Irish: in Latin we may mention at the beginning of the period the fine, rugged cosmogonical and eschatological poem *Altus prosator* of St. Columba (d. 597) and at its end Adamnan (642–704), the prose author of a pilgrimage to the Holy Land, a life of Columba, and commentaries on the *Georgics* and *Eclógues* of Virgil. For 150 years there is a Latin literary culture in Ireland while Europe is sunk in war and ignorance, though the record of England is only less glorious than that of the sister isle; scholars and writers are fewer, but of almost equal merit. Fastidius (5th century, the writer of a tract on the Christian life for widows) is unimportant: in the 6th century Gildas "the Wise" is our authority for the history of the last days of Roman Britain. Later, there is a succession of figures of high literary merit, Aldhelm (640–709), the Venerable Bede (673–735) and Alcuin (730–793): Bede's *Ecclesiastical History* is a work of first-rate importance, and Alcuin was summoned by Charlemagne to his court to revive that learning in Europe which had almost flickered out.

The Birth of Rhyme.—Before considering the writers of the Carolingian revival brief mention must be made of the poets omitted in this historical sketch. St. Ambrose (*c.* 340–397) is before the period ordinarily accounted mediaeval, but his adoption of a Latin iambic measure and modification of it, perhaps under the influence of Hebrew psalmody and music, set a model for hymnology for 1,000 years. He is followed by Sedulius in the 5th century and about this time rhyme begins to appear: first assonance, then time rhyme, monosyllabic only; to the Irish we owe the richer double rhymes found in the rest of the period. At the same time the ancient classical measures were kept in being by such writers as Prudentius in early days and Bede and the

Anglo-Saxon poets later on.

Paul the Deacon, the historian of the Lombards, who died towards the end of the 8th century, was at Charlemagne's court, after the emperor had summoned Alcuin to revive learning by the institution of schools in France and Germany: among Alcuin's more famous pupils were Einhart (d. 840), the biographer of Charlemagne, the Spaniard Theodulf (d. 821), bishop of Orleans and the best poet of his day and Angilbert (d. 814), of less literary merit than the two others; also Hrabanus Maurus (784–856), archbishop of Mayence, possibly the author of the *Veni creator spiritus,* and his pupil Walafrid Strabo (808–849), abbot of Reichenau, a writer in the Virgilian tradition. To this period belong the unfortunate but gifted Godescale of Orbais (*c.* 805–869) the monk persecuted by Hincmax of Rheims for his erroneous doctrine of predestination, a tender poet in his short pieces and possibly, under the assumed name of Theodulus, the author of an *Eclogue* full of classical learning, which was read until the close of the middle ages; and the intriguing figure of Johannes Scotus Erigena, brought in to write against Godescale's doctrine; an Irishman who knew Greek well, almost alone of his age, and a free thinker and untamed spirit beyond his time.

Irish Influence.—The Irish exercised further influence on the Continent through their pupils, such as Heiric of Auxerre (841–876), who had a knowledge of classical writers lost elsewhere and in the monastery of St. Gall, when Notker Balbubus (840–912) wrote the *Gesta Karoli,* anecdotes of the life of Charlemagne, and brought into existence a new form of sacred poetry, the sequence: first a kind of *vers libre,* then taking metrical form, important both for itself and for the influence it afterwards had on secular poetry. At St. Gall also was Ekkehard I. (d. 973), whose *Waltharius,* a poem of heroism and love, is one of the best romances of the middle ages. Luitprand, bishop of Cremona (*c.* 920–972), Lombard, and historian of the Lombards, is the best historian of the time, and gives lively pictures of the Eastern empire, having twice gone on embassy to Constantinople. The nun Hrosvitha (*c.* 960), wrote a series of plays, modelled on Terence with subjects drawn from hagiographical sources, in which the dialogue is lively and sometimes even humorous. To the latter part of the 10th century also belong a few anonymous but beautiful lyrics, such as *Jam dulcis amica venito* and *Levis exurgit zephyrus,* preserved to us by happy chance in a collection called the *Carmina Cantabrigiensia,* which foreshadows the *Carmina Burana* of more than 100 years later. The inspiration of those early love lyrics is the Song of Songs; later, the love poems of Ovid exercise more and more influence.

The next century is, from a purely literary aspect, a period of decline. At the beginning of it the great figure is Gerbert (d. as Pope Sylvester II., 1003), so learned in the ancients and in natural science that he was suspected of being a magician; then Fulbert of Chartres (d. 1029), a great theological teacher, whose influence lasted throughout France for more than one generation, and came through Lanfranc (d. 1089) and Anselm (d. 1109) to England. Much of the intellectual life of this century is connected with the controversies aroused by Fulbert's pupil, Berengarius of Tours (d. 1088), who refused to be bound by the traditional authority of Priscian, Donatus, and Boethius; but the interest of this and of his attack on transubstantiation is philosophical rather than literary, as are the early contests between realists (such as Anselm) and nominalists (such as Roscellinus, d. 1106). In poetry mention may be made of the Burgundian Wipo, who flourished in the middle of the century, best known to us by the Eastern sequence *Victimae paschali,* and Peter Damian (d. 1072), author of two or three hymns of deep religious feeling.

A Century of Revival.—The next century witnesses a revival as important as that of Charlemagne, and Peter Abelard (d. 1142) in the first great figure of it. His controversy with nominalist and realist alike, his struggles with Bernard of Clairvaux, interest us less than his studies of Plato and Aristotle, and his *History of his own misfortunes* in which he relates his tragic love of Heloïse. He was a master of metre, and left a set of six *Dirges* of high merit, and a hymn-book for the nuns of Heloïse's convent, the Paraclete, of which one (*O quanta qualia*) is still famous in western Christendom. The literary revival of the first half of the century was rich in poetry of all kinds: religious, such as that of Bernardus Morlanensis' *De contemptu Mundi,* whence comes *Jerusalem the golden* and other popular hymns; learned, such as the epics of the excellent poet Hildebert (d. 1134), archbishop of Tours; dramatic, such as the mystery plays of the Englishman Hilanus (*c.* 1130), though he lived mostly in France; and purely secular, such as the famous *Phyllis and Flora,* a lively discussion between two girls on the topic whether a soldier or a clerk made the better lover. The second half is no less rich: there is the *Rosy Sequence,* ordinarily attributed to St. Bernard but more probably English, and the works of Adam of St. Victor (1130–80), one of the great hymn-writers of the world. To this period also we may ascribe many of the tender lyrics (most of French, a few of German origin) of the *Carmina Burana,* and the "Goliardic" poems, sung in praise of love and wine, and in satire of the great in Church and State by the "Wandering Scholars." A few stanzas from one of these, beginning *Meum est propositum in taberna mori* has lasted as a drinking song to this day, and is the best-known mediaeval secular poem. Its author, a mysterious figure known as the "Archipoeta," was a man of genius.

It will be difficult even to enumerate the more serious writers of this age, but mention must be made of John of Salisbury (1110–80) friend of St. Thomas of Canterbury and perhaps the ripest scholar of his time, whose *Polycraticus* expounds an important theory of government, supported by use of the Latin classics; of Giraldus Cambrensis, the lively Welsh bishop, historian and reformer (*c.* 1147–1220); and of Walter Map (*c.* 1200), Archdeacon of Oxford and chronicler of the folklore of the Welsh Marches. On the borderline between this century and the next one must place the two authors of *Artes Poeticae,* Matthew of Vendôme and Geoffrey de Vinsauf (an Englishman) whose works were carefully studied and followed for the rest of the mediaeval period.

The Schoolmen.—The 13th century is the age of the recovery of the forgotten works of Aristotle and the perfecting of the work of the schoolmen rather than of pure literature: but mention may be made of the learned figures of Robert Grosseteste (*c.* 1175–1253), bishop of Lincoln, and the encyclopaedist Vincent of Beauvais (d. 1264), a tutor of French princes, who digested into his *Speculа* all the learning of his time, and of the Dominican Albertus Magnus (1193–1280), who first systematized the use of the whole of Aristotle in the scholastic philosophy. His great pupil, St Thomas Aquinas of noble south Italian birth (d. 1274, less than 50 years old) is remembered as much by his noble Eucharistic hymns, *Pange lingua, Verbum Supernum,* and the sequence *Lauda Deum* as by his vast prose philosophical works. The grandest Latin poem of the middle ages, the *Dies irae* is probably the work of Thomas of Celano (d. shortly after 1250), the friend and biographer of St. Francis of Assisi. Two archbishops of Canterbury, Stephen Langton (d. 1228) and John Pecham (d. 1292) wrote hymns of some beauty: a greater hymn-writer than either was Philip de Grève (d. 1236), chancellor of the University of Paris Late in this century we find the scientific and sceptical spirit of Roger Bacon (1214–94), and the beginning of Dante (1265–1321), whose Latin writings must not be forgotten because of his greater Italian works.

We are now on the eve of the Renaissance, and the middle ages near their close with the most typical of schoolmen, Johannes Duns Scotus (possibly from Northumberland, d 1308) and John Wycliffe (1324–84), and the humanist and bibliophile Richard of Bury, bishop of Durham (d. 1345). If Wycliffe was "the morning star of the Reformation," Petrarch (1304–74) was "the morning star of the Renaissance," and with him may be said to be the beginning of a new era.

Modern Latin Literature.—Latin is no longer an instrument to be developed or modified at will (often to be debased), but a revival, and the neo-latin writers confine themselves to the usage of the classical models, attaining a more correct but less flexible medium for thought: with Petrarch, Boccaccio (1313–75) is naturally classed, the greatest recoverer of the classical authors, himself an elegant writer in Latin, and Poggio (1380–1459), who lived

into the time when the whole intellectual world was changed by the Greek immigrants from fallen Constantinople and the discovery of printing. Among these humanists were some true poets, writing in Latin, such as Angelo Poliziano (1454–94), Giovanni Gioviano Pontano (1426–1503), Sannazaro (1458–1530), Giovanni Battista Spagnuoli (John Bastista Mantuanus, 1448–1516), and their prose, after Pope Pius II. (Aeneas Sylvius Piccolomini, d. 1464), culminates in Erasmus (1466–1536), the greatest of the later humanists. For its comical humour and wide effects mention must here be made of the *Epistolae obscurorum virorum,* a terrific and effective, if sometimes unfair, satire on mediaeval piety, learning and style, the work of Johann Reuchlin (1455–1522) and his friends.

After the Reformation and the growth of nationalism, Latin is still more the medium of a learned few than the common language of all cultured persons. In Scotland, George Buchanan (1506–82) is a Latin poet of rare merit; in Wales, the epigrammatist, John Owen (d. 1622); in England, Ascham and Chelse descend in direct succession to Milton. In France, the Estiennes ("Stephens") and the Scaligers; in Spain, Antonio de Lebrixa ("Nebrissensis," 1444–1522) are great writers of Latin as well as classical scholars.

Later, though it keeps a certain position in the world as the official language of the Roman Catholic Church, Latin writing is more an elegant accomplishment than a natural form of expression. Leaving aside the international lawyers, who wrote in Latin on account of the universality of their subject, mention may be made in France of the brothers Santeuïl (second half of the 17th century) and Charles Coffin (1676–1749) who wrote Latin hymns with much of mediaeval spirit and feeling. Elsewhere the tradition of Latin poetry survived in a somewhat narrow stream in Italy and in England; as examples may be mentioned the Westminster and Eton schoolmasters, Vincent Bourne (1695–1747) and William Johnson (later Cory, 1823–92), the works of both of whom were not unworthy to be compared with the minor poets of ancient Rome.

LATIN MONETARY UNION: *see* MONETARY UNION.

LATINUS, in Roman legend, king of the aborigines in Latium, and eponymous hero of the Latin race. In Hesiod (*Theogony,* 1013) he is the son of Odysseus and Circe, and ruler of the Tyrsenians; in Virgil, the son of Faunus and the nymph Marica, a national genealogy being substituted for the Hesiodic, which probably originated from a Greek source. Latinus was a shadowy personality, invented to explain the origin of Rome and its relations with Latium. According to Virgil (*Aeneid,* vii.–xii.), Aeneas, on landing at the mouth of the Tiber, was welcomed by Latinus, the peaceful ruler whose seat of government was Laurentum, and ultimately married his daughter Lavinia.

Other accounts of Latinus are to be found in the fragments of Cato's *Origines* (in Servius's commentary on Virgil) and in Dionysius of Halicarnassus; *see* further in the article by J. A. Hild, in Daremberg and Saglio, *Dictionnaire des antiquités.*

LATITUDE, a word meaning breadth or width, hence, figuratively, freedom from restriction, but more generally used in the geographical and astronomical sense here treated. The latitude of a point on the earth's surface is its angular distance from the equator, measured on the curved surface of the earth. The direct measure of this distance being impracticable, it has to be determined by astronomical observations. As thus determined it is the angle between the direction of the plumb-line at the place and the plane of the equator. This is identical with the angle between the horizontal planes at the place and at the equator, and also with the elevation of the celestial pole above the horizon (*see* ASTRONOMY). Latitude thus determined by the plumb-line is termed *astronomical.* The *geocentric latitude* of a place is the angle which the line from the earth's centre to the place makes with the plane of the equator. *Geographical latitude,* which is used in mapping, is based on the supposition that the earth is an elliptic spheroid of known compression, and is the angle which the normal to this spheroid makes with the equator. It differs from the astronomical latitude only in being corrected for local deviation of the plumb-line.

The latitude of a celestial object is the angle which the line drawn from some fixed point of reference to the object makes with the plane of the ecliptic.

See also GEODESY.

LATIUM, the ancient name of the portion of central Italy, bounded on the north-west by Etruria, on the south-west by the Tyrrhenian sea, on the south-east by Campania, on the east by Samnium and on the north-east by the mountainous district inhabited by the Sabini, Aequi and Marsi. Latium, originally the land of the Latini, a tract of limited extent, was, after the overthrow of the Latin confederacy, when the neighbouring tribes of the Rutuli, Hernici, Volsci and Aurunci were also reduced to the condition of subjects and citizens of Rome, extended to comprise them all. It thus denoted the whole country from the Tiber to the mouth of the Savo, and just included the Mons Massicus. This change was not formally established till Augustus formed of this larger Latium, taken together with Campania, the first region of Italy: but it is already recognized by Strabo as well as by Pliny, who terms the additional territory thus incorporated *Latium Adjectum,* designating the original Latium from the Tiber to Circeii as *Latium Antiquum.*

Latium Antiquum.—This consisted principally of an extensive plain now known as the Campagna di Roma, in the centre of which rise the volcanic Alban hills, bounded towards the interior by the Apennines, which rise very abruptly from it to a height of 4,000–5,000 feet. Several of the Latin cities, including Tibur and Praeneste, were situated on the terrace-like underfalls of these mountains, while Cora, Norba and Setia were placed in like manner on the slopes of the Volscian mountains (Monti Lepini), a rugged and lofty limestone range, which runs parallel to the main mass of the Apennines, being separated from them, however, by the valley of the Trerus (Sacco), and forms a continuous barrier from there to Terracina. No volcanic eruptions are known to have taken place in the Alban hills within the historic period, though Livy sometimes speaks of it "raining stones in the Alban hills" (i. 31, xxxv. 9—on the latter occasion it even did so on the Aventine). It has been recently ascertained, too, that the earliest tombs of the necropolis of Alba Longa (*q.v.*) do not, as has been asserted, lie beneath a stratum of peperino. Earthquakes (not of a violent character within recent centuries, though the ruin of the Colosseum, and many other buildings of ancient Rome is certainly to be ascribed to this cause, and most probably to an earthquake in A.D. 854) are not unknown even at the present day in Rome and in the Alban hills, and there is a seismographic observatory at Rocca di Papa. The surface is by no means a uniform plain, but is a broad undulating tract, furrowed throughout by numerous depressions, with precipitous banks, serving as water-courses, though rarely traversed by any considerable stream. As the general level of the plain rises, these channels by degrees assume the character of ravines.

Geology.—The hills on the right bank of the Tiber culminating in Monte Mario (455 ft.) belong to the Pliocene; they consist of a lower bluish-grey clay and an upper group of yellow sands and gravels. This clay since Roman times has supplied the material for brick-making, and the valleys which now separate the summits (Janiculum, Vatican, Monte Mario) are partly artificial. On the left bank this clay has been reached at a lower level, at the foot of the Pincian hill, while in the Campagna it extends below the later volcanic formations. The earlier eruptions occurred at the bottom of the Pliocene sea, and the tufa, which extends over the whole Campagna to a thickness of 300 ft. or more, was formed. At the same time, hot springs, containing abundant carbonate of lime in solution, produced deposits of travertine. Later, after the Campagna, by a great general uplift, had become a land surface, volcanic energy found an outlet in comparatively few large craters, which emitted streams of hard lava as

well as fragmentary materials, the latter forming sperone (*lapis Gabinus*) and peperino (*lapis Albanus*), while upon one of the former, which runs from the Alban hills to within 2 m. of Rome, the Via Appia was carried. The two main areas near Rome are formed by the group of craters on the north (Bracciano, Bolsena, etc.) and the Alban hills on the south, the latter consisting of one great crater with a base about 12 m. in diameter, in the centre of which a smaller crater was later on built up (the basin is now known as the Campo di Annibale) with several lateral vents (the Lake of Albano, the Lake of Nemi, etc.). The Alban Mount (Monte Cavo) is almost the highest point on the rim of the inner crater, while Mount Algidus and Tusculum are on the outer ring wall of the larger (earlier) crater.

Subsequently, rain and rivers have made gullies in the plain. The communities which inhabited the detached hills and projecting ridges which later on formed the city of Rome were in a specially favourable position. These hills (especially the Palatine, the site of the original settlement) with their naturally steep sides, partly surrounded at the base by marshes and situated not far from the confluence of the Anio with the Tiber, possessed natural advantages not shared by the other primitive settlements of the district; and their proximity to one another rendered it easy to bring them into a larger whole. The volcanic materials available in Rome and its neighbourhood were especially useful in building. The tufa, sperone and peperino were easy to quarry, and could be employed by those who possessed comparatively elementary tools, while travertine, which came into use later, was an excellent building stone, and the lava (*selce*) served for paving stones and as material for concrete. The strength of the renowned Roman concrete is largely due to the use of pozzolana (*see* PUTEOLI), which also is found in plenty in the Campagna.

Between the volcanic tract of the Campagna and the sea there is a broad strip of sandy plain, evidently formed merely by the accumulation of sand from the sea, and constituting a barren tract, still covered almost entirely with wood as it was in ancient times, except for the almost uninterrupted line of villas along the ancient coast-line, which is now marked by a line of sandhills, some ½ m. or more inland. (*See* LAVINIUM, TIBER.) This long belt of sandy shore extends without a break for a distance of above 30 m. from the mouth of the Tiber to the promontory of Antium (Porto d'Anzio), a low rocky headland, projecting out into the sea, and forming the only considerable angle in this line of coast. Thence again a low sandy shore of similar character, but with extensive shore lagoons which served in Roman times and serve still for fish-breeding, extends for about 24 m. to the foot of the Monte Circeo (*Circeius Mons, q.v.*). The region of the Pomptine marshes (*q.v.*) occupies almost the whole tract between the sandy belt on the sea-shore and the Volscian mountains, extending from the southern foot of the Alban hills below Velletri to the sea near Terracina.

Drainage.—The district sloping down from Velletri to the dead level of the Pontine (Pomptine) marshes has not, like the western and northern slopes of the Alban hills, drainage towards the Tiber. The subsoil too is differently formed: the surface consists of very absorbent materials, then comes a stratum of less permeable tufa or peperino (sometimes clay is present), and below that again more permeable materials. In ancient, and probably pre-Roman, times this district was drained by an elaborate system of *cuniculi*, small drainage tunnels, about 5 ft. high and 2 ft. wide, which ran, not at the bottom of the valleys, where there were sometimes streams already, and where, in any case, erosion would have broken through their roofs, but along their slopes, through the less permeable tufa, their object being to drain the hills on each side of the valleys. They had probably much to do with the relative healthiness of this district in early times. Some of them have been observed to be earlier in date than the Via Appia (312 B.C.). When they fell into desuetude, malaria gained the upper hand, the lack of drainage providing breeding-places for the malarial mosquito. Remains of similar drainage channels exist in many parts of the Campagna Romana and of southern Etruria (especially to the north of Veii) at points where the natural drainage was not sufficient, and especially in cultivated or inhabited hills (though it was not necessary here, as in the neighbourhood of Velletri, to create a drainage system, as streams and rivers were already present as natural collectors), and streams very frequently pass through them at the present day. The drainage channels which were dug for the various crater lakes in the neighbourhood of Rome are also interesting in this regard. That of the Alban lake is the most famous; that of Nemi has been cleared in connection with the partial drainage of the lake, and found to be precisely similar; but all the other crater lakes are similarly provided. As the drainage by *cuniculi* removed the moisture in the subsoil, so the drainage of the lakes by *emissaria*, outlet channels at a low level, prevented the permeable strata below the tufa from becoming impregnated with moisture which they would otherwise have derived from the lakes of the Alban hills. The slopes below Velletri, on the other hand, derive much of their moisture from the space between the inner and outer ring of the Alban volcano, which it was impossible to drain; and this in turn receives much moisture from the basin of the extinct inner crater. (*See* R de la Blanchère, in *Dictionnaire des Antiquités, s. vv., Cuniculus, Emissarium.*)

Prehistoric Remains.—Numerous isolated Palaeolithic objects of the Mousterian type have been found in the neighbourhood of Rome in the quaternary gravels of the Tiber and Anio; but no certain traces of the Neolithic period have come to light, as the various flint implements found sporadically round Rome probably belong to the period which succeeded Neolithic (called by Italian archaeologists the Eneolithic period) inasmuch as both stone and metal (not, however, bronze, but copper) were in use. At Sgurgola, in the valley of the Sacco, a skeleton was found in a rock-cut tomb of this period which still bears traces of painting with cinnabar. A similar rock-cut tomb was found at Mandela, in the Anio valley. Both are outside the limits of the Campagna in the narrower sense; but similar tombs were found (though less accurately observed) in travertine quarries between Rome and Tivoli. Objects of the Bronze age, too, have only been found sporadically. The earliest cemeteries and hut foundations of the Alban hills belong to the Iron age, and cemeteries and objects of a similar character have been found in Rome itself and in Etruria, belonging to the civilization of the Villanovans (*q.v.*). It was her possession of the crossing of the Tiber that gave Rome her importance from the first. (*See* ROME.) For the prehistoric period *see* B. Modestov, *Introduction à l'histoire romaine* (Paris, 1907); T. E. Peet, *The Stone and Bronze Ages in Italy* (Oxford, 1909); D. Randall-MacIver, *Villanovans and Early Etruscans* (Oxford, 1924).

The oldest linguistic monument of the Latini is the gold brooch of Praeneste (7th or early 6th century B.C.) and next comes the stele found in the Forum in Rome (6th century B.C.).

It is uncertain to what extent reliance can be placed upon the traditional accounts of the gradual spread of the supremacy of Rome in Latium, and the question cannot be discussed here. Nor can we deal with the list of 30 communities belonging to the Latin league (*c.* 370 B.C.) accounts of which are given by Dionysius of Halicarnassus.

At a still earlier period there existed another confederacy of 30 towns, of which Alba was the supreme head. A list of those who were wont to participate in the sacrifices on the Alban Mount is given us by Pliny (*N.H.* iii. 5. 69) under the name of *populi albenses*, which includes only six or eight of the list of Dionysius; and these among the least known. Many of the rest are unknown; while the more powerful cities of Aricia, Lanuvium and Tusculum, are not included, and appear to have maintained a wholly independent position. This earlier league was doubtless broken up by the fall of Alba; it was probably the increasing power of the Volsci and Aequi that led to the formation of the later league, including all the more powerful cities of Latium, as well as to the alliance concluded by them with the Romans in the consulship of Spurius Cassius (493 B.C.). Other cities of the Latin league had already (according to the traditional dates) received Latin colonies—Velitrae (494 B.C.), Norba (492), Ardea (442), Labici (418), Circei (393), Satricum (385), Setia (382).

The cities of the Latin league continued to hold general meet-

ings or assemblies from time to time at the grove of the Aqua Ferentina, a sanctuary at the foot of the Alban hills, perhaps in a valley below Marino, while they had also a common place of worship on the summit of the Alban Mount (Monte Cavo), where stood the celebrated temple of Jupiter Latiaris. The participation in the annual sacrifices at this sanctuary was regarded as typical of a Latin city (hence the name "prisci Latini" given to the participating peoples); and they continued to be celebrated long after the Latins had lost their independence and been incorporated in the Roman State.

Roman Supremacy.—We are on firmer ground in dealing with the spread of the supremacy of Rome in Latium when we take account of the foundation of new colonies and of the formation of new tribes, processes which as a rule go together. The information that we have as to the districts in which the 16 earliest clans (*tribus rusticae*) were settled shows us that, except along the Tiber, Rome's dominion extended only a few miles beyond the city gates. Thus, the confines of the Roman territory on the right bank of the Tiber, towards the sea, must be fixed at the fifth mile of the Via Portuensis at the grove of the Arvales and towards the S.E. it was again at the fifth milestone

The boundary of the *Ager Romanus antiquus* towards the north-west is similarly fixed by the festival of the Robigalia at the 5th milestone of the Via Clodia. Within this area fall the districts inhabited by the earliest tribes, so far as these are known to us. The *tribus Romilia* was settled on the right bank of the Tiber near the sanctuary of the Arvales, the *Galeria* perhaps a little farther west on the lower course of the stream now known as Galera, and the *Fabia* perhaps on the Cremera towards Veii. We know that the *pagus Lemonius* was on the Via Latina, and that the *tribus Pupinia* dwelt between Tusculum and the city, while the territory of the *Papiria* possibly lay nearer Tusculum, as it was to this tribe that the Roman citizens in Tusculum belonged in later days. It is possible that the *Camilia* was situated in the direction of Tibur, inasmuch as this town was afterwards enrolled in this tribe. The *tribus Claudia*, probably the last of the 16 older *tribus rusticae*, was, according to tradition, founded in 504 B.C. Its territory lay beyond the Anio, between Fidenae and Ficulea. The locality of the *pagi* round which the other tribes were grouped is not known to us.

With the earliest extensions of the Roman territory coincided the first beginnings of the Roman road system. After the Latin communities on the lower Anio had fallen under the dominion of Rome, we may well believe that the first portion of the Via Salaria, leading to Antemnae, Fidenae and Crustumerium, came into existence. The formation of the *tribus Clustumina* (the only one of the earlier 21 tribes which bears a local name) is both a consequence of an extension of territory and of the establishment of the assembly of the plebs by tribes, for which an inequality of the total number of divisions was desirable. The correlative of the Via Salaria was the Via Campana, so called because it led past the grove of the Arvales along the right bank of the Tiber to the Campus Salinarum Romanarum, the salt marshes, from which the Via Salaria took its name, inasmuch as it was the route by which Sabine traders came from the interior to fetch the salt, crossing the Tiber at Rome, just below the island. To this period would also belong the Via Ficulensis, leading to Ficulea, and afterwards prolonged to Nomentum, and the Via Collatina, which led to Collatia. Gabii became Roman in fairly early times, though at what period is uncertain, and with its subjugation must have originated the Via Gabina, afterwards prolonged to Praeneste. The Via Latina, too, must be of very early origin; and tradition places the important conquest of the pass of Algidus through which it led, in 431 B.C. Not long after the capture of Fidenae, the main outpost of Veii, the chief city itself fell (396 B.C.) and a road (still traceable) was probably made thither. The rival trade route from Veii to Fidenae (the Tiber being crossed by a ferry) Collatia, Gabii and Praeneste must then have fallen into desuetude. There was also probably a road to Caere in early times, inasmuch as we hear of the flight of the Vestals thither in 389 B.C. The origin of the rest of the roads is, no doubt, to be connected with the gradual establishment of the Latin league. We find that while the later (long distance) roads bear as a rule the name of their constructor, all the short distance roads on the left bank of the Tiber bear the names of towns which belonged to the league—Nomentum, Tibur, Praeneste, Labici, Ardea, Laurentum—while Ficulea and Collatia do not appear. The Via Pedana, leading to Pedum, may be of much later origin; it was a branch of the Via Praenestina.

There must, too, have been a road, along the line of the later Via Appia, to Bovillae, Aricia, Lanuvium and Velitrae, going thence to Cora, Norba and Setia along the foot of the Volscian mountains; while nameless roads, which can still be traced, led direct from Rome to Satricum and to Lavinium.

We can trace the advance of the Roman supremacy with greater ease after 387 B.C., inasmuch as from this year (adopting the traditional dating for what it is worth) until 299 B.C. every accession of territory is marked by the foundation of a group of new tribes; the limit of 35 in all was reached in the latter year. In 387, after the departure of the Gauls, southern Etruria was conquered, and four new tribes were formed: *Arnensis* (probably derived from Aro, mod. Arrone—the stream which forms the outlet to the lake of Bracciano, anc. *Lacus Sabatinus*), *Sabatina* (called after this lake), *Stellatina* (named from the Campus Stellatinus, near Capena); and *Tromentina*. Four years later were founded the Latin colonies of Sutrium and Nepeta. In 358 B.C. Roman preponderance in the Pomptine territory was shown by the formation of the *tribus Pomptina* and *Publilia*, while in 338 and 329 respectively Antium (founded as a Latin colony in 494 B.C.) and Tarracina became colonies of Roman citizens.

After the dissolution of the Latin league which followed upon the defeat of the united forces of the Samnites and of those Latin and Volscian cities which had revolted against Rome, two new tribes, *Maecia* and *Scaptia*, were created in 332 B.C. in connection with the distribution of the newly-acquired lands. A further advance in the same direction, ending in the capture of Privernum in 329 B.C., is marked by the establishment in 318 B.C. of the *tribus Oufentina* (from the river Ufens which runs below Setia, mod. *Sezze*, and Privernum, mod. *Piperno*, and the *tribus Falerna* (in the Ager Falernus), while the foundation of the colonies of Cales (334) and Fregellae (328) secured the newly-won south Volscian and Campanian territories, and led no doubt to a prolongation of the Via Latina. The moment had now come for the pushing forward of another line of communication, which had no doubt reached Tarracina in 329 B.C. but was now definitely constructed (*munita*) as a permanent military highway as far as Capua in 312 B.C. by Appius Claudius, after whom it was named. To him, no doubt, is due the direct line of road through the Pomptine marshes from Velitrae to Tarracina. Its construction may fairly be taken to mark the period at which the roads of which we have spoken, hitherto probably mere tracks, began to be transformed into real highway.

In the same year (312) the colony of Interamna Lirenas was founded, while Luceria, Suessa (Aurunca) and Saticula had been established a year or two previously. Sora followed nine years later. In 299 B.C. further successes led to the establishment of two new tribes—the *Teretina* in the upper valley of the Trerus (Sacco) and the *Aniensis*, in the upper valley of the Anio—while to about the same time we must attribute the construction of two new military roads, both secured by fortresses. The southern road, the Via Valeria, led to Carsioli and Alba Fucens (founded as Latin colonies respectively in 298 and 303 B.C.), and the northern (afterwards the Via Flaminia) to Narnia (founded as a Latin colony in 299 B.C.). There is little doubt that the formation of the *tribus Quirina* (deriving its name possibly from the town of Cures) and the *tribus Velina* (from the river Velinus, which forms the well-known waterfalls near Terni) is to be connected with the construction of the latter high road, though its date is not certainly known. The further history of Roman supremacy in Italy will be found in the article ROME: *History*. We notice, however, that the continual warfare in which the Roman State was engaged led to the decadence of the free population of Latium, and that the extension of the empire of Rome was fatal to the prosperity of the territory adjoining the city.

Causes of Depopulation.—What had previously, it seems, been a well-peopled region, with peasant proprietors, kept healthy by careful drainage, became in the 4th and 3rd centuries B.C. a district consisting in large measure of huge estates (*latifundia*) owned by the Roman aristocracy, cultivated by gangs of slaves. This led to the disappearance of the agricultural population, to a decline in public safety, and to the spread of malaria in many parts; indeed, it is quite possible that it was not introduced into Latium before the 4th century B.C. The evil increased in the later period of the republic, and many of the old towns of Latium sank into a very decayed condition; with this the continual competition of the provinces as sources of food-supply no doubt had a good deal to do. Cicero speaks of Gabii, Labici and Bovillae as places that had fallen into abject poverty, while Horace refers to Gabii and Fidenae as mere "deserted villages," and Strabo as "once fortified towns, but now villages, belonging to private individuals." Many of the smaller places mentioned in the list of Dionysius, or the early wars of the Romans, had altogether ceased to exist, but the statement of Pliny that 53 communities (*populi*) had thus perished within the boundaries of Old Latium is perhaps exaggerated. By the end of the Republic a good many parts of Latium were infected, and Rome itself was highly malarious in the warm months. The emperors Claudius, Nerva and Trajan turned their attention to the district, and under their example and exhortation the Roman aristocracy erected numerous villas within its boundaries, and used them at least for summer residences. During the 2nd century the Campagna seems to have entered on a new era of prosperity. The roads radiating in all directions from Rome were connected by a network of cross-roads leading to the very numerous villas with which the Campagna was strewn and which seem in large measure to belong to this period. Some of these are of enormous extent, *e.g.*, the villa of the Quintilii on the Via Appia, that known as Sette Bassi on the Via Latina, and that of Hadrian near Tibur, the largest of all.

Latium Novum or Adjectum.—This comprised the territories of the Volsci and Hernici, a rugged and mountainous country, extending from the frontier of the Sabines to the sea-coast between Terracina and Sinuessa. But it was not separated from the adjacent territories by any natural frontier or physical boundaries. It included the Hernican cities of Anagnia, Ferentinum, Alatrium and Verulae—a group of mountain strongholds on the north side of the valley of the Trerus (Sacco); together with the Volscian cities on the south of the same valley, and in that of the Liris, the whole of which, with the exception of its extreme upper end, was included in the Volscian territory. Here were situated Signia, Frusino, Fabrateria, Fregellae, Sora, Arpinum, Atina, Aquinum, Casinum and Interamna; Anxur (Terracina) was the only seaport that properly belonged to the Volscians, the coast from thence to the mouth of the Liris being included in the territory of the Aurunci, or Ausones, who possessed the maritime towns of Fundi, Formiae, Caieta and Minturnae, together with Suessa in the interior, which had replaced their more ancient capital of Aurunca. Sinuessa, on the sea-coast between the Liris (Garigliano) and the Vulturnus, at the foot of the Monte Massico, was the last town in Latium. The Pons Campanus, by which the Via Appia crossed the Savo some 9 m. S.E. of Sinuessa, indicates by its name the position of the old Campanian frontier. In the interior the boundary fell between Casinum and Teanum Sidicinum, at about the 100th milestone of the Via Latina—a fact which led later to the jurisdiction of the Roman courts being extended on every side to the 100th mile from the city, and to this being the limit beyond which banishment from Rome was considered to begin.

The Apennines comprised within the boundaries of Latium form rugged mountain masses from 4,000 to 5,000 ft. high. In them three streams rise; (1) the Anio, now called Teverone, descending from above Subiaco to Tivoli, where it enters the plain of the Campagna; (2) the Trerus (Sacco), rising below Palestrina (Praeneste) and flowing through a valley which separates the main mass of the Apennines from the Volscian mountains or Monti Lepini to join the Liris below Ceprano; (3) the Liris (Garigliano) which enters New Latium about 20 m. from its source and flows past Sora tortuously to the sea at Minturnae. The lower part of its wide valley is fertile, bordered with hills covered with vines, olives and fruit-trees, and well populated. Long after the Latins had ceased to exist as a separate people Roman writers used the phrase *nomen Latinum*, in a purely political sense, to designate the inhabitants of all cities on which the Romans had conferred "Latin rights" (*jus Latinum*), an inferior form of the Roman franchise, granted in the first instance to certain cities of the Latins when they became subjects of Rome, and later to many other cities of Italy, especially the so-called Latin colonies. Later still the same privileges were granted to places in other countries also—*e.g.*, to most of the cities in Sicily and Spain. All persons enjoying these rights were termed in legal phraseology *Latini* or *Latinae conditionis*.

Several of the popes, as Sixtus IV. and Julius III., made unsuccessful attempts to improve the condition of the Campagna, the former making a serious attempt to revive agriculture as against pasture, while in the latter part of the 16th century a line of watch-towers was erected along the coast. In the Renaissance, it is true, falls the erection of many fine villas in the neighbourhood of Rome—not only in the hills round the Campagna, but even in certain places in the lower ground, *e.g.*, those of Julius II., at La Magliana and of Cardinal Trivulzio at Salone —and these continued to be frequented until the end of the 18th century, when the French Revolution dealt a fatal blow to the prosperity of the Roman nobility. The 17th and 18th centuries, however, mark the worst period of depopulation in the more malarious parts of the Campagna, which seems to have begun in the 15th century, though we hear of malaria throughout the middle ages. A new epoch was marked by the discovery of its cause. (*See* MALARIA, MOSQUITO.) The soil in many parts is very fertile, and springs are plentiful and abundant; the water is in some cases sulphurous or ferruginous. In the winter it furnishes abundant pasture to herds of silver-grey oxen and shaggy black horses, as well as to some two million sheep, which pass in the summer to the mountain pastures of the Abruzzi. The shepherds, who live in conical huts, with their fierce dogs, are a characteristic feature of the Campagna. The wool is sold in Rome; the sheep are milked and cheese (*pecorino*) and (*ricotta*) made. A certain amount of horse-breeding is done, and the Government has, as elsewhere in Italy, a certain number of stallions.

The modern "region" of Latium (Lazio) includes the four provinces of Frosinone, Rieti, Rome and Viterbo. (*See* ITALY.) The rise in its population since 1901 has been mainly due to the growth of that of the city of Rome, but also to the enlargement of the "region."

See G. and F. Tomassetti, *La Campagna romana* (Rome, 1910); R. A. Lanciani, *Wanderings in the Roman Campagna* (London, 1909); T. Ashby, "The Classical Topography of the Roman Campagna," in *Papers of the British School at Rome*, i., iii.–v. (London, 1902), and *The Roman Campagna in Classical Times* (London, 1927).

LATONA: *see* LETO.

LA TOUR, MAURICE QUENTIN DE (1704–1788), French pastellist, was born at St. Quentin on Sept. 5, 1704. He went to Paris in 1727 and entered the studio of Spoède, rector of the academy of St. Luke, who still continued the traditions of the old gild of the master painters of Paris. In 1737 La Tour exhibited the first of that splendid series of 150 portraits which formed the glory of the Salon for the succeeding 37 years. In 1746 he was received into the academy; in 1750 he received the title of painter to the king, and in 1751 he was councillor of the academy. La Tour retired at the age of 80 to St. Quentin, where he died on Feb. 17, 1788.

See C. Desmeze, *M. Q. de La Tour, peintre du roi* (1854); "La Tour" in the *Collection des artistes célèbres* (1886); E. and J. de Goncourt, *La Tour* (1867); Guiffrey and M. Tourneux, *Correspondance inédite de M. G. de la Tour* (1885); Tourneux, *La Tour, biographie critique* (1904); Henry Lapauzé, *Les Pastels de Maurice-Quentin de La Tour du Musée a Saint Quentin* (1919).

LA TOUR D'AUVERGNE, THÉOPHILE MALO (1743–1800), French soldier, was born at Carhaix in Brittany on Dec. 23, 1743, the son of an advocate named Corret. In 1771 he assumed the surname of La Tour d'Auvergne, being descended from an illegitimate half-brother of the great Turenne. He entered

the army in 1767, and in the early part of the Revolution he opposed the proposals of his brother officers in the Angoumois regiment to emigrate rather than to swear to the constitution. In 1792 his lifelong interest in numismatics and questions of language was shown by a work which he published on the Bretons while serving under Montesquiou in the Alps. After fighting in the Pyrenees his health broke down and he retired in 1795. On his return by sea to Brittany he was captured by the English and held prisoner for two years. When released, he settled at Passy and published *Origines gauloises,* but in 1797 he served, with the rank of captain, as substitute for a friend, on the Rhine (1797) and in Switzerland (1798–9), and was named by Carnot "first grenadier of France" (April 27, 1800). He was killed in action at Oberhausen, near Donauwörth, on June 27, 1800.

La Tour d'Auvergne's almost legendary courage had captivated the imagination of the French soldier, and his memory was not suffered to die. It was customary for the French troops and their allies of the Rhine Confederation under Napoleon to march at attention when passing his burial-place on the battlefield. The most striking tribute to his memory is paid to-day as it was by order of the first consul in 1800 on all occasions when the colour is taken on parade. "His name is to be kept on the pay list and roll of his company. It will be called at all parades and a non-commissioned officer will reply, *Mort au champ d'honneur.*"

LATREILLE, PIERRE ANDRÉ (1762–1833), French naturalist, was born at Brives-la-Gaillarde (Corrèze), on Nov. 20, 1762. In 1778 he entered the collège Lemoine at Paris, and on taking orders in 1786, retired to Brives, where he devoted his leisure to the study of entomology. In 1788 he returned to Paris, but during the Revolution was imprisoned at Bordeaux. His *Précis des caractères génériques des insectes, disposés dans un ordre naturel,* which appeared at Brives in 1796, led to his being entrusted with the arranging of the entomological collection at the recently organized Muséum d'Histoire Naturelle (Jardin des Plantes). He died in Paris on Feb. 6, 1833.

His other works include: *Histoire naturelle générale et particulière des crustacés et insectes* (14 vols., 1802–05); *Genera crustaceorum et insectorum, secundum ordinem naturalem in familias disposita* (4 vols., 1806–07); *Considérations générales sur l'ordre naturel des animaux composant les classes des crustacés, des arachnides, et des insectes* (1810); *Familles naturelles du règne animal, exposées succinctement et dans un ordre analytique* (1825); *Cours d'entomologie* (vol. i. 1831).

LA TRÉMOILLE, an old French family which derives its name from a village (the modern La Trimouille) in the department of Vienne. Guy, sire de la Trémoille, standard-bearer of France, was taken prisoner at the battle of Nicopolis (1396), and Georges, the favourite of King Charles VII., was captured at Agincourt (1415). Louis (2), called the *chevalier sans reproche,* defeated and captured the duke of Orleans at the battle of Saint-Aubin-du-Cormier (1488), distinguished himself in the wars in Italy, and was killed at Pavia (1525). In 1521 François (2) acquired a claim on the kingdom of Naples by his marriage with Anne de Laval, daughter of Charlotte of Aragon. Louis (3) became duke of Thouars in 1563, and his son Claude turned Protestant, was created a peer of France in 1595, and married a daughter of William the Silent in 1598. To this family belonged the lines of the counts of Joigny, the marquises of Royan and counts of Olonne, and the marquises and dukes of Noirmoutier.

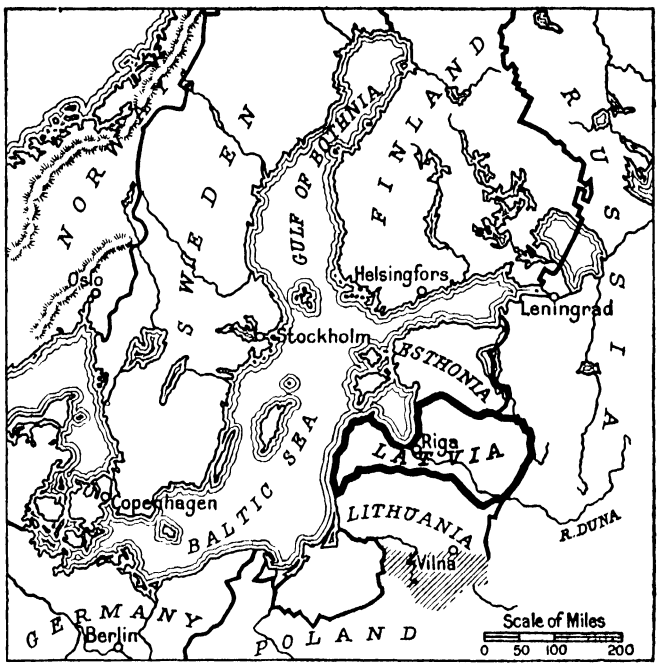
LATROBE, CHARLES JOSEPH (1801–1875), Australian governor, was born in London on March 20, 1801. The Latrobes belonged to the Moravian community. C. J. Latrobe was an excellent mountaineer, and made some important ascents in Switzerland in 1824–1826. In 1832 he went to America with Count Albert Pourtales, and in 1834 crossed the prairies from New Orleans to Mexico with Washington Irving. In 1837 he was invested with a government commission in the West Indies, and in 1839 was made superintendent of the Port Philip district of New South Wales. When Port Philip was erected into a separate colony as Victoria in 1851, Latrobe became lieutenant-governor. He retired in 1854 and died in London on Dec. 2, 1875.

See *Brief Notices of the Latrobe Family* (1864), a privately printed translation of an article revised by members of the family in the Moravian *Brüderbote* (November 1864).

LATROBE, a borough of Westmoreland county, Pennsylvania, U.S.A., 41m. E.S.E. of Pittsburgh, served by the Ligonier Valley and the Pennsylvania railways. The population was 9,484 in 1920 (86% native white) and was estimated at 12,500 in 1928. It is in a fertile agricultural region, which is also an important coking-coal district. In the immediate vicinity are numerous collieries, each with its coking ovens and employing many men. The borough has also steel works, woollen mills and other manufacturing industries. At Beatty, 2m. W., is St. Vincent college (founded 1847). Latrobe was settled about 1851 and was incorporated as a borough in 1854.

LATTEN, a mixed metal like brass, composed of copper and zinc, generally made in thin sheets, and used especially for monumental brasses and effigies. A fine example is in the screen of Henry VII.'s tomb in Westminster abbey. There are three forms of latten, "black latten," unpolished and rolled, "shaven latten," of extreme thinness, and "roll latten," of the thickness either of black or shaven latten, but with both sides polished.

LATTICE LEAF PLANT, in botany, the common name for *Aponogeton fenestralis,* an aquatic monocotyledonous plant belonging to the small family Aponogetonaceae and a native of Madagascar. It has a singular appearance from the structure of the leaves, which are oblong in shape, from 6 to 18 in. long and from 2 to 4 in. broad; they spread horizontally beneath the surface of the water, and are reduced to little more than a lattice-like network of veins. The tuberculate roots are edible. The plant is grown in cultivation as a stove- or greenhouse-aquatic, as is also the closely allied Cape pond-weed or water-hawthorne (*A. distachyus*), of South Africa.



LATVIA, an independent European republic, lying east and south of the Gulf of Riga, with Estonia to the north, Russia to the east, Lithuania to the south, and the Baltic Sea on the west. Area 24,440 sq.m. Pop. (1925) 1,844,805, of whom about 75·6% are Letts, 12·3% Russians, 4% Jews, 3% Germans and 2% Poles. The coast line extends for 338 m., and has three important harbours, Riga, the capital, Liepaja, and Ventspils. Transit trade with Russia goes by rail from Riga to Stalingrad, from Ventspils to Moscow and from Liepaja to Romni, and also by waterways. The surface is low-lying, with a small patch of higher land lying west of the Mitau plain, and with a wide extension of the Russian plateau in the east, but no part is over 1,000 ft. above sea-level. The republic lies in a morainic region, with boulder clays, marshes, numerous lakes and much evidence of glacial striation.

The climate is damp and foggy, and the Gulf of Riga is ice-bound from December to March, though Liepaja and Ventspils, lying on the open Baltic sea are ice-free all the year round. Spring is cold and dry, and rain falls in July and August; this is a disadvantage for grain cultivation, and makes stock-raising and poultry-keeping more suitable to the country. The chief crops raised are rye, barley, oats and flax. Horses, cattle, sheep and pigs are bred and there is some dairying. Before 1914, Riga was the greatest timber port of the world, fed by the Daugava (Dwina) and its waterways which drew on Russian supplies, a source now much diminished.

Latvia possesses about 5,000,000 acres of forest suitable for exploitation, and one-third of its surface is forest-covered. The trees are chiefly coniferous, though there is some oak, elder and birch. Latvia was devastated during the 1914–1920 war period, and the demand for timber for new farm buildings is at present heavy. The republic has no coal, and in the past much timber was consumed as fuel on the railways and in factories. The State Forestry Department is endeavouring to prevent undue exploitation, since timber is a valuable export and asset of the country. Coal is now imported, peat is increasingly used, and a project for an electric station utilizing the waterpower of the Daugava, is being considered. The former paper mills, cellulose and match factories, and wood distilleries were, in the majority of cases, ruined and dismantled during the World War, and timber is mainly exported in the raw, though manufactures are reviving. Timber and flax are the two chief exports of Latvia, and coal, fish, textiles, and metal goods, the chief imports.

In order to encourage transit trade through Latvian ports, the

lines converging on Riga and Ventspils from Russia have been altered to the Russian gauge, while those for the Riga-Ostend-Paris line and for internal communications are normal gauge. The railway net is comparatively good, and there are several macadamized roads. Navigable inland waterways (211 m.) carried over 1,150,000 tons of goods in 1925. In January 1925, 36 steamboats, 52 sailing vessels and 12 motor vessels were sailing under the Latvian

MAP SHOWING THE BOUNDARIES OF THE LATVIAN REPUBLIC, PROCLAIMED NOV. 18, 1918, AND THE POSITION OF THE PORT OF RIGA

flag, and the republic owns 5 ice-breakers. The export trade of Latvia is mainly with the United Kingdom, Belgium and Germany and the import trade with Germany, the United Kingdom, Soviet Russia and Lithuania. The chief towns are Riga, Liepaja (Libau), Daugavpils (Dvinsk), Jelgava (Mitau), Ventspils (Windau), Rezekne and Cesis (Wenden) (*qq.v.*).

Administration, Education, etc.—There are some 6,000 State officials. Teachers, judges, foresters, railwaymen, the agents and employees of government enterprises and monopolies are paid by the state.

The whole country is divided into 19 administrative districts and 3 prefectures: Riga, Libau, Daugavpils. Extensive autonomy is granted to the towns and parishes. The smallest units of rural self-government are the rural communes, of which there are about 510 in all. Markets are held in 80 towns and villages, 37 of these having town councils.

Justice.—The administration of justice is entrusted to the justices of the peace, four district courts, the Court of Appeals and the Senate. The judges cannot be dismissed from office. The old local Baltic provincial law is still in force; and in Latgale the Russian law in part, pending codification. As the constitution provides only for a single legislative Chamber, the *Saeima*, the functions of a second Chamber are to some extent fulfilled by various committees in the different departments, as, for example, the financial council attached to the Ministry of Finance, the Agricultural Council to the Ministry of Agriculture, special committees for music, theatres, etc., attached to the Ministry of Education, and so forth.

Vital Statistics.—The bulk of the population of Latvia are engaged in agriculture, only 35% of the population being urban. 41,172 births and 28,399 deaths were registered in 1924.

Co-operation.—The co-operative system is widespread and both consumers' and agricultural societies are largely developed. The system of social clubs and unions is extensively adopted in rural districts, and is generously supported by the so-called "Culture Fund" created by levying a 3% tax on railway tickets. It has thus been possible to establish public libraries, co-operative houses, etc., in the country. Education is further promoted by an itinerant theatre, several provincial theatres, and an opera house in Libau ranking second to the national opera house in Riga.

Education and Culture.—The official language is Lettish, a branch of the Aestian or Baltic grŏup of the Aryan language, closely related to Lithuanian and old Prussian. The name Livonia formerly given to part of the district was derived from the Russian name Live given to a people, calling themselves Lib, who were possibly a transition group between the Ugro-Finnish Estonians, and the Finnish Koreli. Their language is now extinct and they have become merged with the Letts. The Kurs, from whose folk name the place-name Courland was derived, are an admixture of Livs and Letts, whose language is Lettish. School attendance is compulsory in Latvia. In addition to the public elementary schools there are secondary schools, commercial colleges, several language institutes, and other advanced and specialized educational institutions including the university at Riga, created in 1919. Illiterates form only 8·5% of the population, and for every 100,000 of the population there are 300 university students. The study of German or English is compulsory in the middle schools, German holding the first place; French and Russian are optional. Due encouragement is also given to the elementary and middle schools of the national minorities in the form of state grants to German, Russian, Jewish and Polish schools. *See* also LITHUANIANS and LETTS; LETTISH LITERATURE.

Defence.—The Letts have a strong sense of nationality, which as early as the 13th century (Battle of Durbe, 1260) brought them in conflict with the Germans, who were followed by others in securing dominance over what is now Latvia. From 1795 the country was under Russian rule, and its military history until the close of the World War belonged to that of Russia (*q.v.*). The present-day independent Latvian Army dates from the creation of the new Republic in November 1918, followed in September 1921 by admission to membership of the League of Nations.

Recruitment, Service and Organization. Military service ranging between the ages of 20 and 50 is compulsory for all male citizens of Latvia. Nominally 18 months, but in practice 15 months are spent with the colours. The next 18 years are spent in the reserve, followed by service in the territorial army up to the age of 50 years. According to latest information (1927) the budget effectives in the Latvian army numbered about 20,000, which included 2,000 officers. The cost of the army increased from 34,500,000 lats in 1924–25 to 41,100,000 in 1927–28, the increase in expenditure being explained by increase in the cost of living, new military construction and increase of military stores. The largest military formation is the division, of which there are four, in addition to certain army troops. A division contains 3 infantry regiments and a field artillery regiment, which contains 6 four-gun batteries. The army troops include 1 cavalry regiment of 4 squadrons, and 1 machine-gun squadron, 1 regiment of heavy artillery with 3 four-gun batteries, 1 regiment of two armoured trains, a battalion of sappers, electro-technical detachment, company of tanks (with 4 tanks and 3 armoured cars) and a small motor-transport company. In 1927 the chief naval forces of Latvia consisted of two submarines and two mine-layers.

The President of the Republic is chief of the armed forces of the state. He appoints a commander-in-chief of the army in time of war, which can only be declared by Parliament (*Saeima*). There is a minister of war with the usual subordinates. There is a small military air force numbering 450, with 13 bombing machines, 7 reconnaissance and 6 fighting machines.

FINANCIAL AND ECONOMIC CONDITIONS

Latvia lost nearly 40% of her population in the World War, mainly by emigration in consequence of the German invasion.

Hardly 300,000 have returned out of the refugee population of 1915–7. The greater part of the missing, near 650,000, perished. Almost all the industries and the industrial population were evacuated to Russia; 10,000 farms were utterly destroyed. Machinery and equipment of industries employing over 100,000 factory hands were sent to Russia in 20,000 railway trucks. Of these the Bolsheviks have restored barely 200 trucks under the Peace Treaty of Aug. 13, 1920. In Courland the population and cultivated areas at the time of the German occupation, 1915 to 1918, had diminished to one-third. Over half of the farms were destroyed or stood empty.

Production—Cultivated Areas

	1909–13	1920	1927
	hectares	hectares	hectares
Rye	351,000	196,000	256,000
Wheat	33,000	16,000	58,700
Barley	191,000	124,000	185,300
Oats	306,000	216,000	305,200
Mixed grain		46,000	67,700
Peas	23,000	20,000	36,600
Potatoes	80,000	49,000	85,500
Flax	70,000	30,000	63,200

The total cultivated area was thus in 1927, except for mixed grain, 990,500 hectares, as against 1,054,000 in 1909–13.

The harvests were:—

	1909–13	1920	1927
	metric tons	metric tons	metric tons
Rye	325,000	119,000	259,000
Wheat	38,000	11,000	72,000
Barley	173,000	66,000	130,000
Oats	279,000	113,000	177,200
Mixed grain	..	29,000	57,100
Peas	18,000	13,000	26,400
Potatoes	639,000	375,000	717,000
Flax fibre	30,000	10,000	18,500
Flax seed	25,000	10,000	16,600

The grain harvest, apart from mixed grain, reached 833,000 metric tons in 1909–13, in 1920 only 322,000, in 1924 and 1927 only 710,000 and 724,000. Only the potato harvest reached its pre-war figure, the linseed crop was the same, the flax fibre one-sixth less. Four-fifths of the flax fibre harvest is exported.

Finances.—When the Latvian Republic was formed on Nov. 18, 1918, the country was greatly impoverished owing to the requisitioning of corn, cattle, horses, etc., by the German armies of occupation, though part of the supplies which could not be carried away were sold back to the peasants on the evacuation of the troops. In April 1919, a new paper currency, the Latvian rouble, was issued by the Government, which continued for a considerable period to finance its requirements by this means, with the result that the exchange in terms of sterling rose from 215·5 roubles on Jan. 1, 1920, to 2,000–2,400 roubles in May 1921. After the demobilization of the army in the autumn of 1920, the fresh issues of currency were mainly for production purposes, and flax, hides and linseed were purchased by this means from the peasants. The sale of the stocks thus acquired brought in 2,000,000,000 paper roubles to the State and enabled the finance minister in office in March 1921, Ringold Kalning, to raise the value of the rouble to 1,140 to the pound sterling, at which point it was stabilised. The currency was backed by gold to the value of 15,000,000 gold francs and by foreign balances amounting to 7,730,000 gold francs. The lat (=gold franc) was fixed at a value of 50 paper roubles, and the 2,270,000,000 paper roubles in circulation were thus covered to the extent of about 50% in gold. In 1923 the Bank of Latvia was founded and provided by the State with a capital of 10,000,000 lats.

The total foreign debt amounted to 39,360,000 lats in the middle of 1922, of which one-third had been paid off by the middle of 1925. At the end of 1925 there remains a debt of 5,500,000 dollars to the United States for famine relief in the summer of 1919, and of about £1,350,000 newly regulated debt to England for war deliveries. The finances in 1922–8 have been very soundly handled; not only has the foreign debt been considerably reduced, but loans to the value of 30,000,000 lats were made from current revenue. The budgets of 1925–8 provide for further loans amounting to 35,000,000 lats from current revenue for agricultural purposes and for the construction of railways. The actual revenue for 1924–25 amounted to 215,680,000 lats and expenditure to 214,000,000. The budgets for 1925–26 and 1927–28 balanced at 160,000,000 lats (excluding railway receipts and the expenses of the spirits monopoly).

Trade.—Latvia's trade balance has been adverse since 1920. The official figures showed the following results:—

Calendar year	Imports (In millions of gold lats)	Exports (In millions of gold lats)
1920	97·0	62·3
1921	73·4	28·9
1922	107·4	102·0
1923	211·9	162·0
1925	280·5	179·6
1927	283·5	220·2

But an inquiry undertaken by the Latvian "Ekonomists" in 1925 No. 22 showed that the import figures were 10% too high. By reducing the import figure by 10%, and raising the export figure by 10%, the adverse balance is reduced from 70,000,000 to 41,000,000 lats. But unsold imported goods valued at 70,000,000 are said to be in Latvian warehouses. Meanwhile the adverse balance created such anxiety, that parliament decided in 1926 to increase the existing high customs duties of 20% to 100%.

Latvia's chief exports are timber amounting to about 60,000,000 lats, about four-fifths of which goes to England, and flax export amounting to about 20,000 tons, valued at 50,000,000 lats. In the calendar year (1927) the butter export was estimated to be 10,761,000 kg. valued at 41,262,000 lats.

The chief imports are textiles, 50,000,000 lats, machines 24,000,000, foodstuffs 70,000,000. In 1925–27 110,000 tons of rye and wheat were imported, 35,000 tons of sugar, 4,000,000 lats worth of tobacco. The imports of tea and coffee are small, also of fruits, on account of the high customs duties.

Agrarian Reform.—Under the agrarian laws, 499 private estates were appropriated in Courland with an area of 1,124,000 hectares; in Livonia 1,300,000 hectares; in Latgale about 750,000 hectares. But from this area must be deducted the old peasant properties, also forest and uncultivable land. In reality there remained for division among the newly established peasant properties in Livonia and Courland only an area of 832,000 hectares of agricultural land, *i.e.*, arable, meadow and grazing land; in Latgale rather more than 250,000 hectares. Up to June 15, 1925, 82,761 new farms were established, enclosing 100,000 hectares of forest land. The newly founded peasant properties consisted of 15 to 17 hectares, the largest to 22 hectares. But included in the above-mentioned 82,761 new farms are about one-third garden and artisans' holdings with an area of about 2 to 3 hectares. A further 20,000 small holdings are to be established. The State has retained about 1,500,000 hectares of forest and about 500,000 hectares of uncultivable land, chiefly peat moor; the former landowning nobility have only retained 50 hectares of land each.

HISTORY

Latvia has no political annals throughout the seven centuries which preceded the formation of the present republic in 1918. Lettish tribes, racially akin to the Lithuanians, inhabited the territory which now constitutes Latvia from about the 10th century, but were neither the sole nor the oldest inhabitants, and there was no cohesion between them. Hence they became a subject people who, from 1158 to 1918, suffered four distinct periods of foreign domination. (*a*) During the period of pure German

rule (1158–1562) the conquerors were the knights of the Teutonic Order and the prince-bishops, now in alliance, now in feud, with the knights. What is now Latvia consisted then of two States: Livonia and Courland. During this period the former became powerful and, though German-ruled, wholly independent during 1347–1494. It fought Poland and Moscovy (1411–94), but exhausted itself in the effort and eventually fell a prey to powerful neighbours. (*b*) The period of Polish rule lasted from 1562 to 1795 in Courland under the dynasties of Kettler and Biron; from 1562 to 1795 in Livonia under Polish governors. (*c*) The period of Swedish rule, 1629–1721, extended over Livonia only, which was administered by Swedish governors-general. (*d*) The period of Russian rule, which first comprised Livonia after the Peace of Nystadt, and included Courland after the partition of Poland (1795), lasted until 1918.

Throughout this time, the cultural superiority of the Germans remained unchallenged, the Teutonic knights and their descendants, the Hanseatic merchants and their successors being the privileged representatives of the public power and overlords on the land. The Letts, on the other hand, being serfs, obtained personal freedom only in Russian times, in Courland in 1817, in Livonia in 1819, in Latgalia in 1861. Even then, as cultivators, they remained small holders dependent upon the big landowners, mostly of German extraction. This inequality before the law survived even after the liberation, the landlords having power to impress labour for road construction and transport. They maintained their game rights intact and obtained exclusive licences for the sale of alcohol.

From about 1860 onwards, the Letts, through associations of their own which met with the support of an active and alert press, encouraged Lettish enterprise in parochial and municipal affairs; Lettish co-operatives and savings banks; Lettish gatherings for the propagation of folk-lore and song. By this means was attained a level of education and an economic standard which placed the Letts of Courland and Livonia far ahead of the Russian peasantry, and out of it arose, during the insurrectionary movement of 1905, the idea of independence, or at least of autonomy.

Latvia Independent.—The opportunity came with the World War. Lettish national units were formed within the Russian army in 1915 and fought gallantly, but later turned against the independence of their country, largely because of the influence of Bolshevik propaganda. It was left to the Baltic *Landwehr* (a territorial force of pro-German leanings and under the command of Col. Alexander, a British officer) to restore order. Riga was liberated on May 22, 1918, and red rule came to an end after 4½ months' duration. The Lettish patriots, Chakste, Meierovics, and Ulmanis, as delegates of the National Council, approached the Entente Powers. The *de facto* recognition of the National Council by Great Britain on Nov. 11, and shortly afterwards by other Powers, led to the solemn proclamation of the Latvian Republic on Nov. 18, 1918.

By this time, the Russian and German imperial armies, the Bolshevik troops who followed in their wake and, lastly, the *soldateska* of the adventurer, Bermondt, had between them completed the ruin of this formerly prosperous agricultural country.

Nevertheless, the founders of Latvian independence were justified in believing that the political frontier which now separated their country from Soviet Russia would not wreck all the former economic advantages and that their people, under a free democratic institution, would make good the ravages of war. So great have been the effects of intermittent lulls in commercial activity that even the port of Libau (so important and prosperous in pre-war Russia) has become impoverished and its waterways have become impaired.

Commercial Treaties.—A notable change set in after 1920 when the first commercial treaties between the Powers and the Baltic and other Succession States were signed; and in 1922, the fourth year of her independence, the preliminaries for the conclusion of economic treaties by Latvia were commenced, a normal project being drafted and negotiations begun with several countries.

The policy of the Latvian government was based on the following requirements: (1) the regulating of economic relations between the Baltic States; (2) the obtaining of every possible advantage in the principal export countries; and (3) the regulating of import trade. At present (1928), attention is drawn only to such parts of the commercial treaties as relate to the exchange of goods. All the treaties of commerce so far concluded have been based on the most favoured nation principle. This principle is applicable to the citizens of both contracting parties, in conformity with local laws, in all matters relating to travel, sojourn, study, craft, profession, industry and trade in all permissible articles. Latvian commercial treaties also contain the so-called Baltic clause, conceding to Finland, Estonia, Lithuania and Russia privileges over and above the most favoured nation principle, and in article 7 of the treaty with Great Britain (signed on June 22, 1923) it is laid down that though most favoured nation treatment is accorded to British commerce "it is understood that His Britannic Majesty will not claim the benefit of any Customs preferences or other facilities of whatever nature, which are or may be granted by Latvia in favour of Russia, Finland, Estonia or Lithuania in regard to Russian, Finnish, Estonian or Lithuanian goods respectively, so long as such preferences or facilities are not extended by Latvia to any other foreign country," a similar clause being inserted in all Latvian commercial treaties. Such a limitation of the most favoured nation principle is nothing new in the history of commercial treaties, but it is more frequent now than before the World War.

LAUBAN, a town of Germany in the Prussian province of Silesia, is situated at the junction of the lines of railway from Görlitz and Sorau, 16 m. E. of the former. Pop. (1925) 15,904. It was founded in the 10th and fortified in the 13th century; it was devastated by the Hussites and by the Swedes. Lauban has a town hall, dating from 1541, and a conventual house of the order of St. Magdalene, dating from the 14th century. Its industries comprise machinery, yarn, thread, linen and woollen cloth manufactories, bleaching and dyeing works and flour mills.

LAUBE, HEINRICH (1806–1884), German dramatist, novelist and theatre-director, was born at Sprottau, Silesia, on Sept. 18, 1806 He studied theology at Halle and Breslau (1826–29), and settled in Leipzig in 1832. Some early writings and his share in the literary movement known as *Das junge Deutschland* brought him under police surveillance and his works were confiscated. On his return, in 1834, from a journey to Italy, undertaken in the company of Karl Gutzkow, Laube was expelled from Saxony and imprisoned for nine months in Berlin. In 1837 he was again imprisoned for his revolutionary sympathies In 1839 he returned to Leipzig, and began to write plays Chief among his earlier productions are the tragedies *Monaldeschi* (1845) and *Struensee* (1847); the comedies *Rokoko, oder die alten Herren* (1846); *Gottsched und Gellert* (1847); and *Die Karlsschüler* (1847), of which the youthful Schiller is the hero. In 1848 Laube was elected to the national assembly at Frankfurt-on-Main for the district of Elbogen, but resigned in the spring of 1849, when he was appointed artistic director of the Hofburg theatre in Vienna. This office he held until 1867, and in this period fall his finest dramatic productions, notably the tragedies *Graf Essex* (1856, still occasionally acted), and *Montrose* (1859), and his historical romance *Der deutsche Krieg* (1865–66, 9 vols.), which graphically pictures a period in the Thirty Years' War. In 1869 he became director of the Leipzig Stadttheater, but returned to Vienna in 1870, where in 1872 he was director of the new Stadttheater; with

the exception of a short interval he managed this theatre with brilliant success until his retirement from public life in 1880. Laube's work as theatre manager left its mark on the German stage, and he has given an invaluable record of his work in Vienna and Leipzig in *Das Burgtheater* (1868), *Das norddeutsche Theater* (1872) and *Das Wiener Stadttheater* (1875). He died at Vienna on Aug. 1, 1884. To his later years belong the novels *Die Böhminger* (1880), *Louison* (1881), *Der Schatten-Wilhelm* (1883), and his *Erinnerungen, 1841–1881* (1882).

His *Gesammelte Schriften* (excluding his dramas) were published in 16 vols. (1875–82); his *Dramatische Werke* in 13 vols. (1845–75); *see* also M. Moorman, *Die Bühnentechnik Heinrich Laubes.*

LAUD, WILLIAM (1573–1645), English archbishop, only son of William Laud, a clothier, was born at Reading on Oct. 7, 1573. He was educated at Reading free school, matriculated at St. John's college, Oxford, in 1589, gained a scholarship in 1590, a fellowship in 1593, and graduated B.A. in 1594, proceeding to D.D. in 1608. In 1601 he took orders, in 1603 becoming chaplain to Charles Blount, earl of Devonshire. Laud early took up a position of antagonism to the Calvinistic party in the church, and in 1604 was reproved by the authorities for maintaining in his thesis for the degree of B.D. "that there could be no true church without bishops," and again in 1606 for advocating "popish" opinions in a sermon at St. Mary's. Laud obtained rapid advancement. In 1607 he was made vicar of Stanford in Northamptonshire, and in 1608 he became chaplain to Bishop Neile, who in 1610 presented him to the living of Cuxton, when he resigned his fellowship. In 1611, in spite of the influence of Archbishop Abbot and Lord Chancellor Ellesmere, Laud was made president of St. John's, and in 1614 obtained in addition the prebend of Buckden, in 1615 the archdeaconry of Huntingdon, and in 1616 the deanery of Gloucester. Here he repaired the fabric and changed the position of the communion table from the centre of the choir to the east end. In 1617 he went with the king to Scotland, and aroused hostility by wearing the surplice. In 1621 he became bishop of St. David's, when he resigned the presidentship of St. John's.

In April 1622 Laud, by the king's orders, took part in a controversy with Percy, a Jesuit, known as Fisher, to prevent the conversion of the countess of Buckingham to Romanism. While refusing to acknowledge the Roman Church as *the* true church, he allowed it to be *a* true church and a branch of the Catholic body, at the same time emphasizing the perils of knowingly associating with error; and with regard to the English Church he denied that the acceptance of all its articles was necessary. The foundation of belief was the Bible, and when dispute on matters of faith arose, "a lawful and free council, determining according to Scripture, is the best judge on earth." A close intimacy between Laud and Buckingham now began, and proved the chief instrument of Laud's advancement. On the accession of Charles, Laud's activities were allowed free scope. A list of the clergy was prepared by him for the king, in which each name was labelled with an O or a P, distinguishing the Orthodox to be promoted from the Puritans to be suppressed. Laud defended Richard Montague, whose pamphlet against Calvinism had angered Parliament. He supported the king's prerogative throughout the conflict with the parliament, preached in favour of it before Charles's second parliament in 1626 and assisted in Buckingham's defence. In 1626 he was nominated bishop of Bath and Wells, and in July 1628 bishop of London. On April 12, 1629 he was made chancellor of Oxford University.

At Oxford Laud carried out many useful reforms, including the codification of the statutes, the statute by which public examinations were rendered obligatory for university degrees, and the ordinance for the election of proctors, the revival of the college system, of moral and religious discipline and order, and of academic dress. He founded or endowed various professorships, including those of Hebrew and Arabic, and the office of public orator, encouraged English and foreign scholars, such as Voss, Selden and Jeremy Taylor, founded the university printing press, procuring in 1633 the royal patent for Oxford, and obtained for the Bodleian library over 1,300 mss., adding a new wing to the building to contain his gifts. His rule at Oxford was marked by a great increase in the number of students. In his own college he erected the new buildings, and was its second founder. Of his chancellorship he himself wrote a history, and the Laudian tradition long remained the great standard of order and good government in the university. Elsewhere he showed his liberality and his zeal for reform. He was an active visitor of Eton and Winchester, and endowed the grammar school at Reading, where he was himself educated. In London he procured funds for the restoration of the dilapidated cathedral of St. Paul's.

As a judge he showed a tyrannical spirit both in the star chamber and high-commission court, threatening Felton, the assassin of Buckingham, with the rack, and showing special activity in procuring a cruel sentence in the former court against Alexander Leighton in June 1630 and against Henry Sherfield in 1634 His power was greatly increased after his return from Scotland, whither he had accompanied the king, by his promotion to the archbishopric of Canterbury in Aug. 1633. "As for the state indeed," he wrote to Wentworth on this occasion, "I am for *Thorough.*" In 1636 the privy council decided in his favour his claim of jurisdiction as visitor over both universities. Soon afterwards he was placed on the commission of the treasury and on the committee of the privy council for foreign affairs. He was all-powerful both in church and state. He proceeded to impose by authority the religious ceremonies and usages to which he attached so much importance. His vicar-general, Sir Nathaniel Brent, went through the dioceses of his province, noting every dilapidation and every irregularity. The pulpit was no longer to be the chief feature in the church, but the communion table. The Puritan lecturers were suppressed. He showed great hostility to the Puritan Sabbath, and supported the reissue of the *Book of Sports,* especially odious to that party. He insisted on the use of the prayer-book among the English soldiers in the service of Holland, and forced strict conformity on the church of the merchant adventurers at Delft, endeavouring even to reach the colonists in New England. He tried to compel the Dutch and French refugees in England to unite with the Church of England, advising double taxation and other forms of persecution. In 1634 the justices of the peace were ordered to enter houses to search for persons holding conventicles and bring them before the commissioners. In 1637 he took part in the sentence of the star chamber on Prynne, Bastwick and Burton, and in the same year in the prosecution of Bishop Williams. He urged Strafford in Ireland to carry out the same reforms and severities.

He was now to extend his ecclesiastical system to Scotland. The new prayer-book and canons were drawn up by the Scottish bishops with his assistance and enforced in the country. The attack not only on the national religion, but on the national independence of Scotland, proved to be the point at which the system, already strained, broke and collapsed. Laud continued to support Strafford's and the king's arbitrary measures to the last. Though at first opposed to the sitting of convocation, after the dissolution of parliament, as an independent body, on account of the opposition it would arouse, he yet caused to be passed in it the new canons which both enforced his ecclesiastical system and assisted the king's divine right, resistance to his power entailing "damnation." Laud's infatuated policy could go no further, and the *et cetera* oath, according to which whole classes of men were to be forced to swear perpetual allegiance to the "government of this church by archbishops, bishops, deans and archdeacons, etc.," was long remembered and derided. He was attacked and reviled as the chief author of the troubles on all sides. In October he was ordered by Charles to suspend the *et cetera* oath. The same month, when the high commission court was sacked by the mob, he was unable to persuade the star chamber to punish the offenders. On Dec. 18, he was impeached by the Long Parliament, and on March 1, imprisoned in the tower. On May 12, at Strafford's request, the archbishop appeared at the window of his cell to give him his blessing on his way to execution, and fainted as he passed by. On May 31, 1643 Prynne received orders from the parliament to search his papers, and published a mutilated edition of his diary. The articles of impeachment were sent up to the Lords in October, the trial beginning on March 12, 1644, but the attempt

to bring his conduct under a charge of high treason proving hopeless, an attainder was substituted and sent up to the Lords on Nov. 22. In these proceedings there was no semblance of respect for law or justice, the Lords yielding (Jan. 4, 1645) to the menaces of the Commons. Laud now tendered the king's pardon, which had been granted to him in April 1643. This was rejected, and it was with some difficulty that his petition to be executed with the axe, instead of undergoing the ordinary brutal punishment for high treason, was granted. He suffered death on Jan. 10, on Tower Hill, asserting his innocence of any offence known to the law, repudiating the charge of "popery," and declaring that he had always lived in the Protestant Church of England. He was buried in the chancel of All Hallows, Barking, whence his body was removed on July 24, 1663 to the chapel of St. John's, Oxford.

Laud never married. He is described by Fuller as "low of stature, little in bulk, cheerful in countenance (wherein gravity and quickness were all compounded), of a sharp and piercing eye, clear judgment and (abating the influence of age) firm memory." His personality, on account of the sharp religious antagonisms with which his name is inevitably associated, has rarely been judged with impartiality. His severities were the result of a narrow mind and not of a vindictive spirit, and their number has certainly been exaggerated. His career was distinguished by uprightness, by piety, by a devotion to duty, by courage and consistency. In particular it is clear that the charge of partiality for Rome is unfounded. Laud's complete neglect of the national sentiment, in his belief that the exercise of mere power was sufficient to suppress it, is a principal proof of his total lack of true statesmanship. The hostility to "innovations in religion" was probably a far stronger incentive to the rebellion against the arbitrary power of the crown, than even the violation of constitutional liberties; and to Laud, therefore, more than to Strafford, to Buckingham, or even perhaps to Charles himself, is especially due the responsibility for the catastrophe. He held fast to the great idea of the catholicity of the English Church, to that conception of it which regards it as a branch of the whole Christian church, and emphasizes its historical continuity and identity from the time of the apostles, but here again his policy was at fault; for his despotic administration not only excited and exaggerated the tendencies to separatism and independentism which finally prevailed, but excluded large bodies of faithful churchmen from communion with their church and from their country. The emigration to Massachusetts from 1629 onwards was not composed of Separatists but of Episcopalians. Thus what Laud grasped with one hand he destroyed with the other.

Spiritual influence, in Laud's opinion, was not enough for the church. The church as the guide of the nation in duty and godliness, even extending its activity into state affairs as a mediator and a moderator, was not sufficient. Its power must be material and visible, embodied in great places of secular administration and enthroned in high offices of state. Thus the church, descending into the political arena, became identified with the doctrines of one political party in the state—doctrines odious to the majority of the nation—and at the same time became associated with acts of violence and injustice. Equally disastrous to the state was the identification of the king's administration with one party in the church, and that with the party in an immense minority not only in the nation but even among the clergy themselves.

BIBLIOGRAPHY.—All Laud's works are to be found in the *Library of Anglo-Catholic Theology* (7 vols.), including his sermons (of no great merit), letters, history of the chancellorship, history of his troubles and trial, and his remarkable diary, the mss. of the last two works being the property of St. John's College. Various modern opinions of Laud's career can be studied in T. Longueville, *Life of Laud, by a Romish Recusant* (1894); *Congregational Union Jubilee Lectures*, vol. i. (1882); W. H. Hutton, *Wm. Laud* (1895); *Archbishop Laud Commemoration*, ed. by W. F. Collins (lectures, bibliography, catalogue of exhibits, 1895); Hook, *Lives of the Archbishops of Canterbury;* and H. Bell, *Archbishop Laud and Priestly Government* (1907); A. S. Duncan-Jones, *Archbishop Laud* (1927).

LAUD, a term meaning praise, now rarely found in this sense except in poetry or hymns. Lauds is the name for the second of the offices of the canonical hours in the Roman breviary, so called from the three *laudes* or psalms of praise, cxlviii.–cl., which form part of the service (*see* BREVIARY and HOURS, CANONICAL).

LAUDANUM, originally the name given by Paracelsus to a famous medical preparation of his own, composed of gold, pearls, etc. (*Opera,* 1658, i. 492–2), but containing opium as its chief ingredient. The term is now only used for the alcoholic tincture of opium (*q.v.*).

LAUDER, SIR HARRY MACLENNAN (1870–), Scottish variety actor, was born at Portobello on Aug. 4, 1870. After working as mill-boy and coal-miner, he took to the variety stage, where he became a great favourite on account of his Scottish songs, written and composed by himself on folk-song foundations, and sung in character. During the World War he worked hard to assist recruiting, and the death in action of his only son elicited widespread sympathy. He was knighted in 1919.

LAUDER, royal burgh and parish, Berwickshire, Scotland, on the Leader, 29 m. S.E. of Edinburgh. Pop. (1921) 759. The burgh is said to date from William the Lion (1165–1214); its charter was granted in 1502. In 1482 James III. with his court and army rested here on the way to raise the siege of Berwick. Robert Cochrane, earl of Mar, was hanged with other obnoxious favourites by Douglas, earl of Angus and other nobles at Lauder Bridge, in sight of his royal master.

LAUDERDALE, JAMES MAITLAND, 8TH EARL OF (1759–1839), a member of parliament from 1780 until August 1789, when he succeeded his father in the earldom. In 1806 he was made a peer of the United Kingdom as Baron Lauderdale of Thirlestane and for a short time he was keeper of the great seal of Scotland. He was one of the founders of the Society of the Friends of the People in 1792; but he gradually changed his principles and actually voted against the Reform bill of 1832. He died on Sept. 13, 1839. He wrote an *Inquiry into the Nature and Origin of Public Wealth* (1804 and 1819); *The Depreciation of the Paper-currency of Great Britain Proved* (1812); and other writings of a similar nature.

LAUDERDALE, JOHN MAITLAND, DUKE OF (1616–1682), eldest surviving son of John Maitland, 2nd Lord Maitland of Thirlestane (d. 1645), who was created earl of Lauderdale in 1624, and of Lady Isabel Seton, daughter of Alexander, earl of Dunfermline, and great-grandson of Sir Richard Maitland (*q.v.*), the poet, was born on May 24, 1616, at Lethington. He began public life as a zealous adherent of the Presbyterian cause, took the covenant, sat as an elder in the assembly at St. Andrews in July 1643, and was sent to England as a commissioner for the covenant in August, and to attend the Westminster assembly in November. In Feb. 1644 he was a member of the committee of both kingdoms, and was one of the commissioners appointed to treat with the king at Uxbridge, when he tried to persuade Charles to agree to the establishment of Presbyterianism. In 1645 he advised Charles to reject the proposals of the Independents, and in 1647 approved of the king's surrender to the Scots.

At this period Lauderdale veered round completely to the king's cause, offering the aid of the Scots, on the condition of Charles's consent to the establishment of Presbyterianism, and on Dec. 26, he obtained from Charles at Carisbrooke "the engagement" with the Scots on these lines Returning to Scotland, in the spring of 1648, Lauderdale joined the party of Hamilton in alliance with the English royalists. Their defeat at Preston postponed the arrival of the prince of Wales; but Lauderdale had an interview with the prince in the Downs in August, and he persuaded him later to accept the invitation to Scotland from the Argyll faction, accompanied him thither in 1650 and in the expedition into England. He was taken prisoner at Worcester in 1651, remaining in confinement till March 1660. He joined Charles in May 1660 at Breda. On his accession Charles made him secretary of State. He was lodged at Whitehall and was "never from the king's ear nor council." He abandoned Argyll to his fate, permitted, if he did not assist in, the restoration of episcopacy in Scotland, and after triumphing over all his opponents in Scotland drew into his own hands the whole administration of that kingdom; he imposed on Scotland the absolute supremacy of the Crown in Church and State, and took severe measures against the Covenanters.

Lauderdale was a member of the cabal ministry, but took little part in English affairs. In 1672 he was created duke of Lauderdale and earl of March, and knight of the garter. In 1673, on the resignation of James in consequence of the Test Act, he was appointed a commissioner for the admiralty. In October he visited Scotland to suppress the dissenters and obtain money for the Dutch war. In 1674 he was created earl of Guilford and Baron Petersham in the peerage of England. His ferocious measures having failed to suppress the conventicles in Scotland, he summoned to his aid in 1677 a band of Highlanders, who were sent into the western country. He held his place in spite of all efforts to dislodge him. On June 22, 1679 the last attempt of the unfortunate Covenanters was suppressed at Bothwell Brig. In 1680, however, failing health obliged Lauderdale to resign; in 1682 he was stripped of all his offices, and he died in August. Lauderdale left no male issue, consequently his dukedom and his English titles became extinct, but he was succeeded in the earldom by his brother Charles (d. 1691).

See *Lauderdale Papers Add. mss.* in Brit Mus., 30 vols., a small selection of which, entitled *The Lauderdale Papers*, were edited by Osmond Airy for the Camden Society in 1884–85; *Hamilton Papers* published by the same society; "Lauderdale Correspondence with Archbishop Sharp," *Scottish Hist. Soc. Publications*, vol. 15 (1893); Burnet's *Lives of the Hamiltons* and *History of his Own Time;* R. Baillie's *Letters;* S. R. Gardiner's *Hist. of the Civil War and of the Commonwealth;* Clarendon's *Hist. of the Rebellion;* and the *Quarterly Review*, clvii. 407. Several speeches of Lauderdale are extant.

LAUE, MAX VON (1879–), German physicist, was born Oct. 9, 1879, at Pfaffendorf near Coblenz. He attended the universities of Strasbourg, Göttingen and Munich, and became an assistant in the University of Berlin, and later in Munich, being subsequently called to the University of Zurich as professor. From here he went to the newly formed University of Frankfurt (on the Main), finally proceeding to Berlin University as a director of the Institute for Theoretical Physics. He specialized in theoretical physics, and is a champion of the modern school of Einstein's theory of relativity. He also devoted his attention to the quantum theory, to the Compton-effect (alteration of the frequency of Röntgen rays), to Bohr's atomic model, to the "Einstein-Bohr equation" and the disintegration of atoms. In 1914 he was awarded the Nobel prize for physics. Besides his work for various scientific publications, he also writes for the daily Press.

He was the first to suggest the use of a crystal to act as a "grating" for the diffraction of X-rays. He showed that if a pencil of X-rays passed through a crystal diffraction would take place and a pattern formed on a photographic plate placed at right angles to the direction of the pencil. This was verified experimentally in 1912 by Friedrich and Knipping, who worked under the direction of von Laue, and was the starting point of much subsequent work on X-rays and crystal structure.

Since 1910 he has published the following books: *Ueber e. Versuch z. Optik d. bewegten Korper* (1911); *Die Beugungserscheinungen an vielen unregelmässig verteilten Teilchen* (1915); *Ueber d. Moglichkeit neuer Versuche an Gluhelektroden* (1919); *Die Relativitatstheorie* (1919); *Ueber d. Auffindung d. Rontgen-strahlinterferenzen* (1920); *Das physikalische Weltbild* (1921); *Die Bedeutung d. Nullkegels in d. allgemeinen Relativitatstheorie* (1922); *Die Lösungen d. Feldgleichungen d. Schwere v. Schwarzschild* (1923); *Zur Theorie d. v. gluhenden Metallen ausgesandten positiven Ionen und Elektronen* (1924); and with Dr. W. Gordon, *Ein Verfahren z. Bestimmung d. Wärmeleitfähigkeit bei Glühtemperaturen* (1922).

LAUENBURG, a former duchy of Germany, at one time also belonging with Holstein to Denmark, but from 1865 to Prussia, and now included in the province of Schleswig-Holstein in the republic of Prussia. It lies on the right bank of the Elbe and has an area of 453 sq.m. The surface is an undulating plain with fertile alluvial soils. (*See* PRUSSIA.)

The earliest inhabitants of the district were a Slav tribe, the Polabes, who were gradually replaced by colonists from Saxony. About the middle of the 12th century the country was subdued by the duke of Saxony, Henry the Lion, who founded a bishopric at Ratzeburg, and after Henry's fall in 1180 it formed part of the smaller duchy of Saxony, which was governed by Duke Bernhard. In 1203 it was conquered by Waldemar II., king of Denmark, but in 1227 it reverted to Albert, a son of its former duke. When Albert died in 1260 Saxony was divided. Lauenburg (Saxe-Lauenburg) became a separate duchy ruled by his son John, and had its own lines of dukes for over 400 years, one of them, Magnus I. (d. 1543), being associated with the Renaissance movement. The reigning family, however, became extinct when Duke Julius Francis died in September 1689, and there were at least eight claimants for his duchy, chief among them being John George III., elector of Saxony, and George William, duke of Brunswick-Lüneburg-Celle, the ancestors of both these princes having made treaties of mutual succession with former dukes of Saxe-Lauenburg. George William was ultimately recognized as duke. Lauenburg next passed to his nephew, George Louis, elector of Hanover, afterwards king of Great Britain as George I, whose rights were recognized by the emperor Charles VI. in 1728. In 1803 the duchy was occupied by the French, and in 1810 it was incorporated with France. It reverted to Hanover after the battle of Leipzig in 1813, and in 1816 was ceded to Prussia, the greater part of it being at once transferred by her to Denmark in exchange for Swedish Pomerania. In 1848, when Prussia made war on Denmark, Lauenburg was occupied at her own request by Hanoverian troops, and was administered for a time by the German confederation, being restored to Denmark in 1851. Definitely incorporated with this country in 1853, it experienced another change of fortune after the war of 1864 between Denmark on the one side and Prussia and Austria on the other, as by the peace of Vienna (30th of October 1864) it was ceded with Schleswig and Holstein to the two German powers By the convention of Gastein (1865) Austria surrendered her claim to Prussia in return for payment and in 1865 King William I took formal possession of the duchy. Lauenburg entered the North German confederation in 1866 and the German empire in 1870. It retained its constitution and its special privileges until 1876, when it was incorporated with the kingdom of Prussia. It ceased to be a duchy in 1918.

LAUFF, JOSEF (1855–), German poet and dramatist, born in Cologne on Nov. 16, 1855, served in the German army until 1898 when William II. summoned him to the royal theatre at Wiesbaden He composed dramas in honour of the Hohenzollerns: *Der Burggraf* (1897) and *Der Eisenzahn* (1900). His novels are better than his plays Among them are *Im Rosenhag* (1897); *Marie Verwahnen* (1903); *Sankt Anne* (1908); *Kevelaer* (1910). He also wrote peasant epics: *Jan van Calker* (1887); *Der Helfensteiner* (1887) and others

See A. Schroeter, *Josef Lauff, ein literarisches Zeitbild* (1899); B. Sturm, *Josef Lauff* (1903), and Spielmann, *J. von Lauff, ein rheinischer Dichter* (1915).

LAUGHTER is commonly regarded as the expression of various feelings, such as sheer joy, lightness of heart, amusement, and feelings more grave than any of these. It is mainly *a human phenomenon.* Among lower animals laughter is a very rare occurrence if, indeed, it is met with at all. Man is the laughing animal *par excellence.* And man is also the principal butt of laughter, though not the only one. He is the most *laughed at* as well as the chief or sole *laughing animal.* From the point of view of the student of psychology laughter presents the following main problems: (1) What is it that provokes laughter? Intimately connected with this problem is the question whether or no there are different varieties of laughter. (2) The second main problem is: What is the function of laughter?

(1.) **The Causes of Laughter.**—One obvious cause of laughter barely deserves passing mention, namely, tickling. This sort of laughter is a purely physiological or reflex reaction, and not the spontaneous expression of a feeling. And here we are only concerned with laughter as an expression of feeling induced by the observation, memory, imagination, or contemplation of something or other. The problem before us is, what kind of things or situations make us laugh, or are felt to be ludicrous, when we observe or contemplate them? Some writers have attempted to reduce them all to one class, or to find in them all one common characteristic which makes them ludicrous or provokes us to laughter. But these writers do not agree among themselves; each identifies the common cause or essential character-

istic with some other feature of the ludicrous situation. Thus Hobbes, for instance, held that any awkwardness or other deformity or imperfection in others makes one laugh because it heightens his self-esteem and so pleases him. The same sort of "sudden glory" (as Hobbes calls it) may be produced more directly by the apprehension of some excellence in oneself. Such exultation may account for some cases of laughter, but certainly not for all cases. Schopenhauer, on the other hand, found the cause of laughter in the incongruity of what is apprehended. The sudden perception of incongruity certainly is a frequent source of laughter, and a common device for provoking it. Recently Bergson has attempted another general explanation. According to him, it is always the perception of the substitution of mere mechanism for adaptive pliancy that provokes laughter. Many cases of laughter caused by observed awkwardness, carelessness, thoughtless routine, etc., would certainly come under Bergson's description. But as an all-inclusive theory Bergson's view cannot be regarded as satisfactory. *Prima facie*, it seems unlikely that any uniform explanation will fit all the facts. Everyday language seems to bear witness to the existence of different kinds of laughter, provoked by different kinds of causes or situations. We commonly distinguish somehow between the ridiculous, the comic, the humorous, etc., on the one hand, and between laughter that is gay or grave, derisive or scornful, etc., on the other hand. In Heine's poem called "Woman," the four stanzas of which it is made up depict each a totally different situation, passing from gaiety to tragedy, but each ends "and she laughed." Needless to say, the laughter is very different in each case, as every good recitation of the poem makes the hearer realize.

(2.) **The Function of Laughter.**—For the merely physiological function of laughter a passing reference must suffice—laughter benefits the lungs and is an outlet for some forms of superfluous energy. But we are concerned with the mental function or functions of laughter. In a general sort of way it is commonly realized that laughter has a useful function in human life. Laughter enables man to beguile the present, just as forgetfulness shields him from the past, and hope helps him to face the future. But, leaving aside such vague popular philosophy, various theories have been put forward by psychologists and philosophers. The most interesting of them is the view of Bergson. Bergson begins by pointing out that laughter is mainly a *social* phenomenon. "Our laughter" (he says) "is always the laughter of a group. It may, perchance, have happened to you, when sitting in a railway carriage or at a *table d'hôte*, that you heard travellers relating to one another stories which must have appeared comic to them, for they laughed heartily. If you had been one of their company, you would have laughed with them; but, as you were not, you felt no desire whatever to do so. A man who was once asked why he did not weep at a certain sermon, when everybody else was shedding tears, replied: 'I don't belong to this parish.' What that man felt about tears is even more true of laughter. However spontaneous it seems, laughter always implies a kind of freemasonry, or even complicity, with other laughers, real or imaginary. It has often been remarked that the fuller the house, the more uncontrolled is the laughter of the audience. On the other hand, as has also often been remarked, many comic effects cannot be translated from one language into another, because they refer to the habits and thoughts of a particular social group." It seems, therefore, natural that Bergson should attribute to laughter a special *social* function. And so he does. Laughter, according to Bergson, is a kind of social "ragging," a method of "breaking in" people to the forms and conventions of society, a way of curing eccentricity and unsociability in their early stages. "What life and society require of each of us is a constantly alert attention, that discerns the outlines of the present situation, together with a certain elasticity of mind and body to enable us to adapt ourselves accordingly. *Tension* and *elasticity* are two mutually complementary forces which life brings into play. If these two forces are lacking in the body to any considerable extent, we have sickness and infirmity and accidents of every kind. If they are lacking in the mind, we find every degree of mental deficiency, every variety of insanity. Finally, if they are lacking in the character, we have cases of the gravest inadaptability to social life. . . . Society is therefore suspicious of all *inelasticity* of character, of mind, and even of body, because it is the possible sign of a slumbering activity as well as of an activity with separatist tendencies that inclines to swerve from the common centre round which society gravitates. . . . And yet society cannot intervene at this stage by material repression, since it is not affected in a material fashion. It is confronted with something that makes it uneasy, but only as a symptom—scarcely a threat; at the very most a gesture. A gesture, therefore, will be its reply. Laughter must be something of this kind, a sort of *social gesture*."

LAUMONT, FRANÇOIS PIERRE NICHOLAS GILLET DE (1747–1834), French mineralogist, was born in Paris on May 28, 1747. He was educated at a military school and served in the army from 1772–84, when he was appointed inspector of mines. His leisure was given to mineralogy, and he assisted in organizing the new École des Mines in Paris. The mineral laumontite was named after him by Haüy. He died in Paris on June 1, 1834.

He was author of numerous mineralogical papers in the *Journal* and *Annales des Mines*.

LAUNCESTON (lahn'ston), a market town and municipal borough in Cornwall, England, 35½ m. N.W. of Plymouth, on the South Western and Southern railways. Pop. (1921) 3,979.

A silver penny of Aethelred II. witnesses to the fact that the privilege of coining money was exercised by Launceston (Dunheved, Lanscaveton, Lanstone) more than half a century before the Norman conquest. At the time of the Domesday survey the canons of St Stephen held Launceston, and the count of Mortain held Dunheved. The number of families settled on the former is not given, but attention is called to the market which had been removed thence by the count to the neighbouring castle of Dunheved, which had two mills, one villein and 13 bordars. It is not known when the canons settled here nor whether the count's castle, then newly erected, replaced some earlier fortification. Reginald, earl of Cornwall (1140–75) granted to the canons rights of jurisdiction in all their lands and exemption from suit of court in the shire and hundred courts. Richard (1225–72), king of the Romans, constituted Dunheved a free borough, and granted to the burgesses freedom from pontage, stallage and suillage, liberty to elect their own reeves, exemption from all pleas outside the borough except pleas of the crown, and a site for a gild-hall. In 1205 the market which had been held on Sunday was changed to Thursday. An inquisition held in 1383 discloses two markets, a merchant gild, pillory and tumbrel. In 1555 Dunheved, otherwise Launceston, received a charter of incorporation, the common council to consist of a mayor, 8 aldermen and a recorder By its provisions the borough was governed until 1835. The parliamentary franchise which had been conferred in 1294 was confined to the corporation and a number of free burgesses.

In 1832 Launceston was shorn of one of its members, and in 1885 merged in the county. Separated from it by a small bridge over the Kensey lies the hamlet of Newport which, from 1547 until 1832, also returned two members. These were swept away when the Reform Bill became law. Launceston was the assize town until Earl Richard, having built a palace at Restormel, removed the assize to Lostwithiel. In 1386 Launceston regained the privilege by royal charter. From 1715 until 1837, eleven years only excepted, the assize was held alternately here and at Bodmin. Since that time Bodmin has enjoyed the distinction.

Launceston lies in a hilly district by and above the river Kensey, an affluent of the Tamar, with the keep of the ancient castle crowning the summit of a hill. On the northern slope lies the parish of St. Stephen. The castle, the ruins of which are in part of Norman date, was the seat of the earls of Cornwall, and was frequently besieged during the civil wars of the 17th century. In 1656 George Fox the Quaker was imprisoned in the north-east tower for disturbing the peace at St. Ives by distributing tracts. Fragments of the old town walls and the south gateway are

standing. The church of St. Mary Magdalen, built of granite, was erected early in the 16th century, but possesses a detached tower dated 1380. A Norman doorway, now appearing as the entrance to a hotel, is preserved from an Augustinian priory founded in the reign of Henry I. The parish church of St. Stephen is Early English, with a Perpendicular tower.

LAUNCESTON (lahn'ston) a city in the north-east of Tasmania at a point where the confluence of two river systems (Macquarie and Esk) forms the Tamar, a "drowned valley" which leads out, as a fairly broad but tortuous estuary some 41 m. long, upon the north coast. The town is most picturesquely situated on low and originally marshy ground, which lies amid stream-cut hills of romantic charm. At the natural drainage centre of a radial system of valleys, which are mostly roomy and nearly all fertile, Launceston is the outlet of a productive agricultural and fruit-growing (mainly apple) area, its climate also being very favourable. (Av. ann. temps.: 64·5°–44° F; av. ann. rainfall: 28 in. evenly distributed) Its position on Bass Strait and opposite Melbourne is commercially advantageous and Launceston has aspirations as a port, tempered by the somewhat imperfect navigability of its water-approach for vessels of over 5,000 tons. The city (founded *c.* 1805, was proclaimed a city in 1888; pop. with suburbs, *c.* 27,000, second largest in Tasmania), is well laid out and substantially built, possesses numerous open spaces, an electricity supply, and other amenities which, in co-operation with its position, climate and surroundings make it a favourite tourist and holiday resort. The Mount Bischoff (tin) smelting works, as well as other industries (woollen mills, potteries, etc.) have been in existence here for over 50 years, but the recent (1921–2) augmentation of the electric-power supply (Great Lake Supply scheme: *see* TASMANIA) has encouraged numerous industries (sawmilling and furniture making; iron and railway engineering works; paint factories, etc.). The annual shipping (of all classes) amounts to some 380,000 tons and the trade to about £4,750,000 (27·6% of the total of Tasmania), of which about £1,000,000 represents overseas (*i.e.*, extra-Commonwealth) trade. Exports are mainly agricultural produce, wool and fruit (apples).

LAUNCH. (1) A verb meaning originally to hurl a missile or other object, or to shoot out suddenly. (Lat. *lanceare*, to hurl, from *lancea*, a spear.) It is particularly used of the setting afloat a vessel from the stocks on which she has been built. (2) The name of a type of boat, usually the largest size of ships' boats, or a large boat moved by electricity, steam or other power. The word is an adaptation of the Span. *lancho*, pinnace.

LAUNDRY WORK in its modern commercial aspect requires an elaborate mechanical plant very different from the crude appliances which were the first outgrowth of domestic processes of treading, pounding or rubbing. Its success owes much also to chemistry which has evolved suitable soaps, bleaches and solvents.

Machinery.—The washing-machine consists of a horizontal outer drum in which revolves an inner cylindrical cage. All garments of each owner are marked for identification and are placed in this cage which is divided into compartments of various sizes, thereby offering a means for sorting the clothes into like kinds. Within each compartment of the washer cage, wash bags or "nets" are frequently used to hold similar fabrics. These "nets" prevent the pulling and tearing of delicate pieces, and make marking less necessary. The machine is equipped with hot and cold water, and with high-pressure steam—the latter serving as a heating as well as a sterilizing medium. Large inflow and outlet pipes allow a rapid filling and emptying of the water. By easily regulated steam cocks, the correct temperature for the various processes is almost instantly obtainable. The direction of rotation of the cage is reversed automatically every few revolutions, displacing dirt by forcing soap and water through the fabric. The operations of soaking, washing, bleaching (when needed), sterilizing, rinsing, blueing and even starching are done in this machine.

Sterilizing (formerly accomplished by boiling at 212° which tends to weaken the fabric) is effected by keeping the garments at about 160°–180° for a time sufficient to secure the desired result. Stains insoluble in soap and water require special chemical cleaning by expert "spotters," or by dry cleaning (*q.v.*) where naphtha replaces water as the solvent cleanser. In place of twisting by hand or pressing between hard rubber revolving wringers, drying is effected industrially by an extractor which consists of a metal basket revolving in a closed drum. The basket revolves at a speed of 1,000 to 1,400 revolutions per minute, the water being expelled centrifugally. The drying is completed in heated boxes ventilated by means of electric fans and flues or in a heated revolving cage, or "tumbler," into which hot air is forced.

Ironing.—Having been washed, starched and dried, the garments are transferred to the ironer. The earlier form of ironer was the box or cold mangle, which pressed the creases from dampened clothing without heat. This mangle, sometimes known as the "flat work ironer," has been replaced in the modern laundries by gas or steam-heated revolving rolls.

While it was formerly customary for laundries to charge for work by the piece, a "rough dry" service has been widely offered in which the cost is based on weight, none of the work being ironed. Another service is "float iron," in which everything is pressed by the "flat work ironer," the cost being considerably less than for work finished by hand. The "float iron" is equipped with special springs which permit irregular thicknesses—belts and gathers for example—to "ride" through without strain.

According to the Census of Production report of 1924 the value of the work done in commercial laundries in Great Britain amounted to £20,717,000.

Statistics.—The volume of business done by laundries in the United States in 1925 was approximately $500,000,000, an increase of 100% over 1919. These increases reflect several economic and social factors, the more important being an increase in wealth and the scarcity of domestic help, both of which have operated to transfer laundering from the home to central plants. The same factors have led to the installation of numerous electric washers and ironers in the home.

LA UNIÓN, a port of the Republic of El Salvador, Central America, and the southern terminus of the International Railways of Central America, which traverse Salvador and Guatemala, the northern termini being Puerto Barrios on the Caribbean sea and the Sonsonate river on the Mexican border; through connections at the Mexican border it is thus possible to travel by rail from any point in the United States to La Unión, which is therefore the present terminus of the completed lines of the Pan-American Railway. Pop. (1928) about 6,500. La Unión lies 137 m. E.S.E. of San Salvador, the national capital, with which it is connected by railway and highway. It is the best port of the republic, lying on the shores of the great Bay of Fonseca and has a concrete and steel pier belonging to the railway that enables steamers to load and unload without lighters, the only port of Salvador where this is possible. The region produces coffee, maize, rice and beans. Above the town rises one of the volcanoes which cross Salvador in an almost direct line from east to west, this cone being known variously as Conchagua, Pinos and Meanguera.

LA UNION, a town of eastern Spain in the province of Murcia, 5 m. by rail E. of Cartagena and close to the Mediterranean Sea. Pop. (1920) 24,837. Numerous metal works and mines of iron, manganese, calamine, sulphur and lead, are included within the municipal boundaries. La Union sprang up in the second half of the 19th century.

LAUPEN, BATTLE OF. For an account of this battle of June 21, 1339, *see* SWISS WARS.

LAURACEAE, a family of dicotyledonous trees and shrubs, the best-known members of which are the laurels (*q.v.*). There are 40 genera and 1,000 species, nearly all tropical and subtropical and especially numerous in south-eastern Asia and in Brazil. The leaves are leathery and evergreen; the tissues contain oil-cavities; the flowers are without petals, the parts usually arranged in threes; the fruit is a berry. Besides the laurel (*Lau-*

rus), the family includes the cinnamon, cassia and camphor (*Cinnamomum*), the avocado-pear (*Persea*) and numerous valuable medicinal plants. In North America the family is represented by several trees and shrubs, found chiefly in the southern United States, like the sassafras, spice-bush and Oregon myrtle (*qq.v.*).

LAUREL, a city of south-eastern Mississippi, U.S.A., about 100m. N.W. of Mobile; one of the county seats of Jones county. It is on Federal highway 11, and is served by the Gulf, Mobile and Northern, the Illinois Central and the Southern railways. The population was 13,037 in 1920 (39% negroes), and 18,000 in 1928, according to a local census. It is an important centre of the lumber industry (especially long-leaf pine), and its mills have a daily capacity of 1,300,000 feet. There are other manufacturing industries, numerous and diversified. The factory output in 1925 was valued at $12,961,748. The city was founded in 1882 and incorporated in 1890.

LAUREL. At least four shrubs or small trees are called by this name in Great Britain, viz. the common or cherry laurel (*Prunus Laurocerasus*), the Portugal laurel (*P. lusitanica*), the bay or sweet laurel (*Laurus nobilis*) and the spurge laurel (*Daphne Laureola*). The first two belong to the rose family (Rosaceae), and to the section *Cerasus* (to which also belongs the cherry) of the genus *Prunus*.

The common laurel is a native of the woody and sub-alpine regions of the Caucasus, of the mountains of northern Persia, of north-western Asia Minor and of the Crimea. It was received into Europe in 1576, and flowered for the first time in 1583. Ray in 1688 relates that it was first brought from Trebizond to Constantinople, thence to Italy, France, Germany and England. Parkinson in his *Paradisus* records it as growing in a garden at Highgate in 1629; and in Johnson's edition of Gerard's *Herball* (1633) it is recorded that the plant "is now got into many of our choice English gardens, where it is well respected for the beauty of the leaues and their lasting or continuall greennesse" (*see* Loudon's *Arboretum*, ii. 717). The leaves of this plant are rather large, broadly lance-shaped and of a leathery consistence, the margin being somewhat serrated. They are remarkable for their poisonous properties, giving off the odour of bitter almonds when bruised; the vapour thus issuing is sufficient to kill small insects by the prussic acid which it contains. The leaves when cut up finely and distilled yield oil of bitter almonds and hydrocyanic (prussic) acid. Sweetmeats, custards, cream, etc., are often flavoured with laurel-leaf water, as it imparts the same flavour as bitter almonds; but it should be used sparingly, as it is a dangerous poison, having several times proved fatal.

FROM COOPER AND WESTELL, "TREES AND SHRUBS OF THE BRITISH ISLES"

FLOWERING BRANCH OF THE COMMON CHERRY LAUREL (PRUNUS LAUROCERASUS) A. DETAIL OF FRUIT (DRUPE)

The following varieties of the common laurel are in cultivation: the Caucasian (*Prunus Laurocerasus*, var. *caucasica*), which is hardier and bears very rich dark-green glossy foliage; the Versailles laurel (var. *latifolia*), which has larger leaves; the Colchican (var. *colchica*), which is a dwarf-spreading bush with narrow sharply serrated pale-green leaves. There is also the variety *rotunaifolia* with short broad leaves, the Grecian with narrow leaves and the Alexandrian with very small leaves.

The Portugal laurel is a native of Portugal and Madeira. It was introduced into England about the year 1648, when it was cultivated in the Oxford Botanic Gardens.

The bay or sweet laurel (*Laurus nobilis*) belongs to the family Lauraceae, which contains sassafras, benzoin, camphor and other trees remarkable for their aromatic properties. It is a large evergreen shrub, sometimes reaching the height of 60 ft., but rarely assuming a truly tree-like character. The leaves are smaller than those of the preceding laurels, possessing an aromatic and slightly bitter flavour, and are quite devoid of the poisonous properties of the cherry laurel. The small yellowish-green flowers are produced in axillary clusters, are male or female, and consist of a simple 4-leaved perianth which encloses nine stamens in the male, the anthers of which dehisce by valves which lift upwards as in the common barberry, and carry glandular processes at the base of the filament. The fruit consists of a succulent berry surrounded by the persistent base of the perianth. The bay laurel is a native of Italy, Greece and North Africa, and is abundantly grown in the British Isles as an evergreen shrub, as it stands most winters. The date of its introduction is unknown, but must have been previous to 1562, as it is mentioned in Turner's *Herbal* published in that year. It was carried to North America by the early colonists.

This laurel is generally held to be the *Daphne* of the ancients, though Lindley, following Gerard (*Herball*, 1597, p. 761), asserted that the Greek *Daphne* was *Ruscus racemosus*. Among the Greeks the laurel was sacred to Apollo, especially in connection with Tempe, in whose laurel groves the god himself obtained purification from the blood of the Python. This legend was dramatically represented at the Pythian festival once in eight years, a boy fleeing from Delphi to Tempe, and after a time being led back with song, crowned and adorned with laurel. The victors in the Pythian games were crowned with the laurels of Apollo, and thus the laurel became the symbol of triumph in Rome as well as in Greece. As Apollo was known as the god of poets, the *Laurea Apollinaris* naturally belonged to poetic merit. The various prerogatives of the laurel among the ancients are collected by Pliny (*Hist. Nat.* xv. 30). It was a sign of truce, like the olive branch; letters announcing victory and the arms of the victorious soldiery were garnished with it; it was thought that lightning could not strike it, and the emperor Tiberius always wore a laurel wreath during thunderstorms. From its association with the divine power of purification and protection, it was often set before the doors of Greek houses, and among the Romans it was the guardian of the gates of the Caesars (Ovid, *Met.*, i. 562 *et seq.*).

The last of the plants mentioned above under the name of laurel is the so-called spurge laurel (*Daphne Laureola*). This and one other species (*D. Mezereum*), the mezereon, are the sole representatives of the family Thymelaeaceae in Great Britain. The spurge laurel is a small evergreen shrub, with alternate somewhat lanceolate leaves with entire margins. The green flowers are produced in early spring, and form drooping clusters at the base of the leaves. The calyx is four-cleft, and carries eight stamens in two circles of four each within the tube. The pistil forms a berry, green at first, but finally black. The mezereon differs in blossoming before the leaves are produced, while the flowers are lilac instead of green.

LAURENS, HENRY (1724–1792), American statesman, was born in Charleston, S.C., on Feb. 24, 1724, of Huguenot ancestry. When 16 he became a clerk in a counting-house in London, and later engaged in trade and planting at Charleston until 1771, when he retired. He spent the next three years travelling in Europe and in superintending the education of his sons in England. In spite of his attachment to England, he united with 37 other Americans in a petition to parliament against the passing of the Boston Port bill. Convinced that a peaceful settlement was impracticable, he returned to Charleston at the close of 1774, and joined the conservative element of the Whig party.

He was made president of the South Carolina council of safety, and in 1776 vice-president of the State. He was sent as a delegate to the Continental Congress at Philadelphia, of which he was president from Nov. 1777 until Dec. 1778. In Aug. 1780 he started on a mission to negotiate on behalf of Congress a loan of $10,000,000 in Holland; but he was captured off Newfoundland and imprisoned in the Tower. His papers were found to contain a sketch of a treaty between the United States and Holland. This discovery led to war between Great Britain and the United Provinces. On Dec. 31, 1781, he was released on parole, and finally exchanged for Cornwallis. In June 1782 he was appointed one of

the American commissioners for negotiating peace with Great Britain, but he did not reach Paris until Nov. 28, 1782, only two days before the preliminaries of peace were signed by himself, John Adams, Franklin and Jay. On account of failing health he did not remain for the signing of the definitive treaty. He died at Mepkin plantation near Charleston Dec. 8, 1792.

His son, JOHN LAURENS (1754–1782), American revolutionary officer, was born at Charleston, S.C., on Oct. 28, 1754. He was educated in England, and on his return to America in 1777, joined Washington's staff, and was entrusted with the delicate duties of a confidential secretary, which he performed with much tact and skill. He was present in all Washington's battles, from Brandywine to Yorktown, and his gallantry on every occasion gained him the title of "the Bayard of the Revolution." He wounded Gen. Charles Lee in a duel, fought on account of that officer's disrespectful conduct towards Washington. Laurens distinguished himself further at Savannah, and at the siege of Charleston in 1780. After the capture of Charleston by the English, he was selected by Washington as a special envoy to appeal to the king of France for supplies for the relief of the American armies. The more active co-operation of the French fleets with the land forces in Virginia, which was one result of his mission, brought about the disaster of Cornwallis at Yorktown. Laurens rejoined the army, and at Yorktown was at the head of an American storming party which captured an advanced redoubt. He was designated with the vicomte de Noailles to arrange the terms of the surrender, which virtually ended the war. In a skirmish on Aug. 27, 1782, on the Combahee river, before peace was formally concluded, Laurens was killed. Washington lamented deeply his death, saying of him, "He had not a fault that I could discover, unless it were intrepidity bordering upon rashness."

The most valuable of Henry Laurens's papers and pamphlets, including the important "Narrative of the Capture of Henry Laurens, of his Confinement in the Tower of London, etc., 1780, 1781, 1782," are in vol. i. of *Collections of South Carolina Historical Society* (1857). John Laurens's military correspondence, with a brief memoir by W. G. Simms, was privately printed by the Bradford Club, New York, in 1867 (D. D. W.)

LAURENS, a city in the hills of western South Carolina, U.S.A.; the county seat of Laurens county. It is served by the Charleston and Western Carolina and the Columbia, Newberry and Laurens railways. The population was 4,629 in 1920 (36% negro) and was estimated locally at 6,000 in 1928. It has cotton and cotton-seed oil mills and glass factories. The city was founded about 1845 and incorporated in 1880.

LAURENT, AUGUSTE (1807–1853), French chemist, was born at La Folie, Haute Marne, on Nov. 14, 1807; he was first an *ingénieur des mines,* and then *préparateur* at the central school of arts and manufactures in Paris. He occupied various industrial positions, and was appointed professor of chemistry at Bordeaux in 1838, a post which he held until 1846. He was appointed warder of the mint at Paris in 1848, and there he stayed until his death, on April 15, 1853. Although he made a number of important discoveries in organic chemistry, his greatest contribution to chemistry was his clarification of the obscure ideas concerning equivalent, atomic and molecular weights. In this way he assisted in bringing to light Avagadro's hypothesis (*see* CHEMISTRY: *Physical*), which played a great part in the accurate fixing of atomic weights (*q.v.*). In conjunction with C. F. Gerhardt (*q.v.*) he helped to develop the systematic classification of organic compounds (*see* CHEMISTRY: *Organic*).

His son, PAUL MATHIEU HERMANN LAURENT, French mathematician, was born on Sept. 2, 1841, and died Feb. 19, 1908; he was *répétiteur* at the Polytechnic school of Paris, and published a number of papers on various aspects of mathematics.

LAURENT, FRANÇOIS (1810–1887), Belgian historian and jurisconsult, was born at Luxemburg on July 8, 1810. He served in the ministry of justice for some time before he became professor of civil law in the university of Ghent in 1836. His advocacy of liberal and anti-clerical principles both from his chair and in the press made him bitter enemies, but he retained his position until his death on Feb. 11, 1887. His chief historical work is *Études sur l'histoire de l'humanité* (18 vols., Ghent and Brussels, 1855–70). His fame as a lawyer rests on his authoritative exposition of the Code Napoléon in his *Principes de droit civil* (Brussels, 33 vols., 1869–78), and his *Droit civil international* (Brussels, 8 vols., 1880–81).

For a complete list of his works, *see* G Koninck, *Bibliographie nationale* (Brussels, vol. ii., 1892).

LAURENTINA, VIA, ancient southward road from Rome. The nomenclature of roads between the Via Ardeatina and the Via Ostiensis is difficult. Probably the Via Laurentina proper is that which led out of the postern generally called the Porta Ardeatina of the Aurelian wall and went direct to Lavinium, while the road branching from the Via Ostiensis at the third mile, and leading past Decimo to Lavinium, is that called Via Laurentina by Pliny (*see* LAVINIUM). On this latter road, beyond Decimo, two milestones, one of Tiberius, the other of Maxentius, each bearing the number 11, have been found.

LAURENTIUS JUSTINIANUS: *see* GIUSTINIANI.

LAURIA (LURIA or **LORIA) ROGER DE** (d. 1305), admiral of Aragon and Sicily, was the most prominent figure in the naval war which arose directly from the Sicilian Vespers. Brought up at the court of Aragon, after the submission of Sicily to Peter III., in 1283 he was made admiral and in the same year defeated a French naval force in the service of Charles of Anjou, off Malta. In 1284 Roger defeated the Angevine fleet in the Bay of Naples, taking prisoner the heir to the kingdom, Charles of Salerno. In 1285 he fought on the coast of Catalonia one of the most brilliant campaigns in all naval history. The French king Philippe le Hardi had invaded Catalonia with a large army, which relied almost wholly for its stores on the co-operation of its allies stationed in squadrons along the coast. Roger de Lauria, recalled from Palermo by Peter III. fell on the central squadron of the French fleet near the Hormigas: the Catalan and Sicilian squadrons gained a complete victory.

This campaign, which was followed up by destructive attacks on the French coast, saved Catalonia from the invaders and completely ruined the French naval power for the time being.

After the death of Peter III. (1286), Roger de Lauria adhered for a time to Fadrique, younger brother of the new king, James, who had accepted the Sicilian crown in defiance of both the Angevines and his senior. Fadrique's arrogant temper and his own large estates in Valencia (which were a strong reason for not offending the king of Aragon) led to Lauria's secession. His Sicilian estates were confiscated by Fadrique and one of his nephews was put to death as a traitor. Roger de Lauria died at Valencia on Jan. 2, 1305.

See M. Amari, *La guerra del Vespro Siciliano* (Paris, 1843, 2 vols.); Ramon de Muntaner, *Chronica,* ed. K. Lanz (Stuttgart, 1844); Ch. de la Roncière, *Histoire de la marine française,* i. 189–217.

LAURIER, SIR WILFRID (1841–1919), Canadian statesman, was born on Nov. 20, 1841, at St. Lin, Quebec, of French Roman Catholic parents. He attended the elementary school of his native parish and for eight or nine months the Protestant elementary school at New Glasgow to learn English; his association with the Presbyterian family with whom he lived during this period had a permanent influence on his mind. At 12 years of age he entered L'Assomption college, which he left in 1860 to study law at McGill university. At graduation he delivered the valedictory address which, like so many of his later utterances, closed with an appeal for sympathy and union between the French and English races as the secret of the future of Canada. He practised law in Montreal, but owing to ill-health soon removed to Athabaska, where he opened a law office and edited *Le Défricheur.*

While at Montreal Laurier joined the *Institut Canadien,* a literary and scientific society which, owing to its liberal discussions and the fact that certain books upon its shelves were on the Index, was finally condemned by Roman Catholic authorities. *Le Défricheur* was an organ of extreme French sentiment, opposed to confederation, and also under ecclesiastical censure. One of its few surviving copies contains an article by Laurier opposing confederation as a scheme designed in the interest of the English colonies in North America, and certain to prove the tomb of the French and of Lower Canada.

Laurier was elected to the Quebec legislature in 1871, and his first speech aroused attention both by its literary qualities and the attractive manner and logical method of the speaker. He was equally successful in the Dominion House of Commons, to which he was elected by a small majority in 1874. During his first two years in the federal parliament his chief speeches were in defence of Riel and the French halfbreeds who were concerned in the Red river rebellion, and on fiscal questions. Sir John Macdonald, then in opposition, had committed his party to a protectionist policy, and Laurier, notwithstanding that the Liberals stood for a low tariff, avowed himself to be "a moderate protectionist," because he felt that a young country needed protection for the development of its manufactures. In the bye-election which followed Laurier's admission to the cabinet he was defeated—the only personal defeat he ever sustained; but a few weeks later he was returned for Quebec East, a constituency which he held thenceforth by enormous majorities. In 1878 his party went out of office and Sir John Macdonald entered upon a long term of power, with protection as the chief feature of his policy, to which was added afterwards the construction of the Canadian Pacific railway.

After the defeat of the Mackenzie government, Laurier sat in Parliament as the leader of the Quebec Liberals and first lieutenant to the Hon. Edward Blake, who succeeded Mackenzie in the leadership of the party. He was associated with Blake in his sustained opposition to high tariff, and to the Conservative plan for the construction of the Canadian Pacific railway, and was a conspicuous figure in the long struggle between Sir John Macdonald and the Liberal leaders to settle the territorial limits of Ontario and the legislative rights of the provinces under the constitution. He was also in conflict with the ultramontane element in Quebec, which was closely allied with Conservative politicians.

In 1887, upon the resignation of Blake, Laurier became Liberal leader. He was the first French Canadian to lead a federal party in Canada since confederation. Apart from the fear that he would arouse prejudice in the English-speaking provinces, the second Riel rebellion was then still fresh in the public mind, and the fierce nationalist agitation which Riel's execution had excited in Quebec had hardly subsided. Laurier could hardly have come to the leadership at a more inopportune moment, but from the first he won great popularity even in the English-speaking provinces, and showed unusual capacity for leadership. His party was beaten in the first general election held after he became leader (1891), but even with its policy of unrestricted reciprocity with the United States, and with Sir John Macdonald still at the head of the Conservative party, it was beaten by only a small majority. Five years later, with unrestricted reciprocity relegated to the background, and with a platform which demanded tariff revision so adjusted as not to endanger established interests, and which opposed the federal measure to restore in Manitoba the separate or Roman Catholic schools which the provincial government had abolished, Laurier carried the country, and in July 1896 was called by Lord Aberdeen, then governor-general, to form a government.

FIRST FRENCH-CANADIAN PREMIER

He was the first French-Canadian to become premier; and his personal supremacy was shown by his long continuance in power. From 1896–1910 he held a position within the British Empire which was in its way unique, and in this period he had seen Canadian prosperity advance progressively by leaps and bounds. The chief features of his administration were the fiscal preference of 33⅓% in favour of goods from Great Britain, the despatch of Canadian contingents to South Africa during the Boer War, the contract with the Grand Trunk railway for the construction of a second transcontinental road, the assumption by Canada of the imperial fortresses at Halifax and Esquimault, the appointment of a federal railway commission with power to regulate freight charges, express rates and telephone rates, and the relations between competing companies, the reduction of the postal rate to Great Britain from 5 to 2 cents and of the domestic rate from 3 to 2 cents, a substantial contribution to the Pacific cable, a practical policy of settlement and development in the Western territories, the division of the North-west territories into Alberta and Saskatchewan and the enactment of the legislation necessary to give them provincial status, and finally (1910) a tariff arrangement with the United States, which, if not all that Canada might claim in the way of reciprocity, showed how entirely the course of events had changed the balance of commercial interests in North America.

During his first visit to Great Britain on Queen Victoria's diamond jubilee (1897), he received the grand cross of the Bath, and secured the denunciation of the Belgian and German treaties, thus obtaining for the colonies the right to make preferential trade arrangements with the mother country. His personality made a powerful impression in Great Britain and also in France, which he visited before his return to Canada. Some of his speeches in Great Britain, coming as they did from a French-Canadian, and revealing delicate appreciation of British sentiment and of the genius of British institutions, excited great enthusiasm, while one or two impassioned speeches in the Canadian parliament during the Boer War profoundly influenced Canada and had a pronounced effect throughout the empire.

At the general election of 1911 the Liberals were defeated over the reciprocity agreement with the United States and the naval question, but Laurier remained leader until his death. At the outbreak of the World War in 1914 he eloquently defended Great Britain's cause and supported the urgent measures adopted for the maintenance of Canadian troops. However, he strongly opposed conscription on the ground that it was a departure from the enactments of the Military Service Act, and a still wider departure from the principles of constitutional government. When Sir Robert Borden was invited to attend continuous meetings of the war cabinet in London, Sir Wilfrid expressed his desire to facilitate public business in Canada in order to make the absence of the Premier possible. He declined, however, to enter the cabinet in the Coalition government. In 1918 Sir Wilfrid took part in the debate on hereditary titles and honours in Canada and opposed them. He died in Ottawa on Feb 17, 1919.

A skilful party-leader, Laurier kept from the first the respect of his opponents; while enforcing the orderly conduct of public business, he was careful as first minister to maintain the dignity of parliament. In office he proved more of an opportunist than his career in opposition would have indicated, but his political courage and personal integrity remained beyond suspicion. His jealousy for the political autonomy of Canada was noticeable at the Colonial conference held at the time of King Edward's coronation, and marked his diplomatic dealings with the mother country. But he strove for sympathetic relations and general legislative and fiscal co-operation between the two countries. He strove also for good relations between the two races in Canada, and between Canada and the United States. Although he was classed in Canada as a Liberal, his tendencies in England would have been considered strongly conservative; an individualist, he opposed the intrusion of the State into private enterprise, and showed no sympathy with State operation of railways, telegraphs and telephones, or with kindred proposals for the extension of the obligations of the central government.

LAURISTON, JACQUES ALEXANDRE BERNARD LAW, MARQUIS DE (1768–1828), French soldier and diplomatist, was born at Pondicherry on Feb. 1, 1768. He obtained his first commission about 1786, served in the earlier Revolutionary campaigns, and became brigadier of artillery in 1795. Resigning in 1796, he was brought back into the service in 1800 as aide-de-camp to Napoleon. Lauriston became director of the Le Fère artillery school and afterwards special envoy to Denmark, and he was selected to convey to England the ratification of the peace of Amiens (1802). In 1805, having risen to the rank of general of division, he took part in the war against Austria. He was made governor-general of Venice (1807), took part in the Erfurt nego-

tiations (1808), was made a count, served with the emperor in Spain (1808–1809) and held commands in the Italian campaign and the advance to Vienna in the same year. At the battle of Wagram he commanded the guard artillery in the famous "artillery preparation" which decided the battle. In 1811 he was made ambassador to Russia; in 1812 he held a command in the *Grande Armée*. He was captured in the retreat from Leipzig, held a prisoner of war until the fall of the Empire, and then joined Louis XVIII., to whom he remained faithful in the Hundred Days. His reward was a seat in the house of peers and a command in the royal guard. In 1817 he was created marquis and in 1823 marshal of France. During the Spanish War he commanded the corps which besieged and took Pamplona. He died at Paris on June 12, 1828.

LAURIUM, a town in Attica, Greece, famous for the silver mines which were one of the chief sources of revenue of the Athenian state. After the battle of Marathon, Themistocles persuaded the Athenians to devote this revenue to shipbuilding, and thus made possible the victory of Salamis. The mines were state owned, and leased for a fixed sum with a percentage on the working; slave labour was employed. The ancient shafts and galleries for extracting the metal may still be seen. The mines are now worked by French and Greek companies, but mainly for lead, manganese and cadmium. Pop. (1917) about 11,200.

See E. Ardaillon, "Les Mines du Laurion dans l'antiquité," *Bibliothèque des écoles françaises d'Athènes et de Rome*, lxxvii.

LAURIUM, a village of Houghton county, Michigan, in the northern part of the Upper peninsula, adjoining Calumet, on the Copper Range railroad. The population was 6,696 in 1920 (25% foreign-born white) and was estimated locally at 8,200 in 1928. It is in the heart of the Lake Superior copper district, which to the end of 1925 had produced 7,504,977,527 pounds of copper, 21% of the entire output of the United States. Immediately west of Laurium is the Calumet and Hecla mine The village was incorporated as Calumet in 1889, but in 1895 the name was changed to Laurium, in allusion to the mineral wealth of Laurium in Greece.

LAURUSTINUS, the popular name of a common, hardy, evergreen garden shrub known botanically as *Viburnum Tinus*, with rather dark-green ovate leaves in pairs and flat-topped clusters (or corymbs) of white flowers, which are rose-coloured before expansion, and appear very early in the year. It is a native of the Mediterranean region, and was in cultivation in Britain at the end of the 16th century. In milder parts of the United States it is grown in gardens as an ornamental plant and for low hedges, especially in California, and in the north is often cultivated as a pot plant. The genus *Viburnum* belongs to the family Caprifoliaceae and includes the wayfaring tree (*V. Lantana*), the guelder rose (*V. Opulus*) and other attractive shrubs. (*See* VIBURNUM.)

LAURVIK, LARVIK or **LAURVIG,** a seaport of Norway, in Jarlsberg and Laurvik *amt* (county), at the head of a short fjord near the mouth of the Laagen river, 98 m. S.S.W. of Oslo by the Skien railway. Pop. (1927) 10,900. It has various industries, including saw and planing mills, shipbuilding, glassworks and factories for wood-pulp, barrels and potato flour; and an active trade in exporting timber, ice, wood-pulp and granite, chiefly to Great Britain, and in importing from the same country coal and salt. The port has a depth of 18 to 24 ft.

LAUSANNE, the capital of the Swiss canton of Vaud. It is the junction of the railway lines from Geneva, from Brig and the Simplon, from Fribourg and Berne, and from Vallorbe (for Paris). A funicular railway connects the upper town with the central railway station and with Ouchy, the port of Lausanne on the lake of Geneva. Lausanne takes its name from the Flon stream flowing through it, which was formerly called Laus (water). The older or upper portion of the town is built on the crest and slopes of five hillocks which form part of the Jorat range.

The original town (mentioned in the Antonine Itinerary) was on the shore of the lake, south-west of the present city. It was burnt in the 4th century by the Alamanni. Some of the inhabitants took refuge in the hills above and there founded a new town, which acquired more importance when Bishop Marius about 590 chose it as his see city. Across the Flon was a Burgundian settlement, later known as the Bourg, while to the west was a third colony around the church of St. Laurent. These three elements joined together to form the present city. The bishops obtained gradually great temporal powers, becoming in 1125 princes of the empire. But in 1368 the bishop was forced to recognize various liberties and customs that had been gradually won by the citizens, the *Plaid Général* of that year showing that there was already some kind of municipal government, save for the *cité*, which was not united with the *ville inférieure* or the other four *quartiers* (Bourg, St. Laurent, La Palud and Le Pont) in 1481. In 1536 the territory of the bishop (as well as the Savoyard barony of Vaud) was forcibly conquered by the Bernese, who at once introduced Protestantism. The Bernese occupation lasted till 1798, when Lausanne became a simple prefecture of the canton Léman of the Helvetic republic. But in 1803, on the creation of the canton of Vaud, it became its capital. The bishop of Lausanne resided after 1663 at Fribourg, while from 1821 onwards he added "and of Geneva" to his title.

The railways were built between 1856 and 1862, while the opening of the Simplon tunnel (1906) greatly increased the commercial importance of Lausanne, which is now on the great international highway from Paris to Milan. The town is still rapidly extending, especially towards the south and west. Since the days of Gibbon, Lausanne has become a favourite place of residence for foreigners and in 1920 they numbered 11,410 out of a total of 68,533. In 1709 it is said that the inhabitants numbered but 7,432 and 9,965 in 1803, while the numbers were 20,515 in 1860, 33,340 in 1888, and in 1928 77,300. Of the population in 1920 the great majority was French speaking (only 3,448 German speaking and 2,775 Italian speaking) and Protestant. There were 14,126 Roman Catholics and 1,099 Jews.

The principal building is the cathedral church (now Protestant) of Notre Dame, which stands 500 ft. above the lake. Earlier buildings were more or less completely destroyed by fire, but the present edifice was consecrated in 1275 by Pope Gregory X. in the presence of the emperor Rudolf of Habsburg. It was sacked after the Bernese conquest (1536), but many ancient tapestries and other precious objects are still preserved in the Historical Museum at Berne. The church was well restored from 1873 onwards. Close by is the castle, built in the early 15th century by the bishops, later the residence of the Bernese bailiffs and now the seat of the various branches of the administration of the canton of Vaud. Near both is the Palais de Rumine, opened in 1906 and now housing the university as well as the cantonal library, the cantonal picture gallery and collections of archaeology, natural history, etc. The university was raised to that rank in 1890, but, as an academy, dates from 1537. Among its former teachers may be mentioned Theodore Beza, Conrad Gesner, J. P. de Crousaz, Charles Monnard, Alexandre Vinet, Eugène Rambert, Juste Olivier and several members of the Secretan family.

To the south-west of the cathedral is the seat of the cantonal courts, a building which was from 1886 to 1927 the Federal Palace of Justice. The Federal courts have now been moved to the new Palace of Justice in the *Parc Mon Repos*. The house, La Grotte, which Gibbon inhabited 1783–1793, and on the terrace of which he completed (1787) his famous history, was demolished in 1896 to make room for the new post office that stands on the Place St. François. The first book printed in Lausanne was the missal of the cathedral church (1493), while the *Gazette de Lausanne* (founded 1798) took that name in 1804. Lausanne has been the birthplace of many distinguished men, such as Benjamin Constant, the Secretans, Vinet and Rambert.

LAUSANNE, CONFERENCE OF. The Conference of Lausanne between the Turkish Government established at Angora and the Governments of the four principal Allied Powers (Great Britain, France, Italy, Japan), Greece, Bulgaria, and Yugoslavia, with the United States represented by an observer, lasted, with a break in the middle from Nov. 20, 1922, to July 24, 1923, and resulted in the signing of no fewer than 17 diplomatic instruments.

The most important of these were:—

1. The Treaty of Peace itself (July 24, 1923).

2. Convention respecting the régime of the Straits (July 24, 1923). (*See* STRAITS: *Diplomatic.*)

3. Convention respecting the Thracian frontiers (July 24, 1923) under which neutralised and demilitarised zones were established.

4. Convention respecting conditions of residence and business and jurisdiction in Turkey (July 24, 1923) to replace the capitulations.

5. Commercial convention (July 24, 1923).

6. Convention respecting the exchange of Greek and Turkish populations and protocol (Jan. 30, 1923).

7. Graeco-Turkish agreement on the restitution of interned civilians and the exchange of prisoners of war (Jan. 30, 1923).

8. Declaration relating to the administration of justice (July 24, 1923) to replace the capitulations (No. 11).

9. A protocol relating to the evacuation of the Turkish territory occupied by the British, French, and Italian forces, and declaration (July 24, 1923) (No. 14).

10. Protocol relating to the Karagach territory, and to the islands Imbros and Tenedos (July 24, 1923) (No. 15).

11. Protocol relating to treaties regarding the protection of minorities in Greece, and regarding Thrace, which had been concluded on Aug. 10, 1920, between Greece and the principal Allied Powers (July 24, 1923) (No. 16). (*See* STRAITS: *Diplomatic;* DEDEAGATCH; MOSUL; TURKEY.)

Conditions Before the Conference.—At the conference of San Remo (*q.v.*) a peace treaty between the Allies and Turkey had been drawn up, and after the representatives of the Ottoman Government of Constantinople had submitted their observations, and these observations had been rejected, they were compelled, at Sèvres, on Aug. 10, 1920, to sign the terms presented to them. When the Lausanne Conference assembled power in Turkey had passed to the National Government at Angora, and this Government was carrying on a war against the Greeks (who had landed at Smyrna on May 16, 1919, at the invitation of Great Britain, France, and the United States).

The Angora Government repudiated the Treaty of Sèvres and continued to fight for the terms laid down in the Turkish National Pact of Jan 28, 1920. In Sept. 1922 the Graeco-Turkish war in Anatolia ended in the complete victory of the Turkish Nationalist forces, who drove the Greeks into the sea and came into direct contact with the British forces in the zone of the Straits. On Sept. 23, 1922, the principal Allied Powers invited the Angora Government to a peace conference on two bases: (1) the restoration of Turkish sovereignty over Constantinople and Thrace up to the line of the river Maritsa; (2) the exclusion, pending the final settlement, of Turkish military forces from Thrace and respect by the Turks for certain zones adjoining the Straits which the Allied authorities had declared neutral during the Graeco-Turkish conflict. On Sept. 23 the Angora Government accepted this invitation and proposed a preliminary armistice conference, which met at Mudania on Oct. 3 and resulted in the signature of an armistice convention on the 11th.

Results of the Conference.—Thus the Turkish delegates arrived at Lausanne as victors in their recent local war with the Greeks and on an equal footing with the principal Allied Powers. Indeed, throughout the conference, the Turks were less unwilling to resume hostilities than were the principal Allied Powers, who had demobilised the greater part of their forces in the East.

The Turkish Gains.—In brief, the Turks secured at Lausanne practically everything which they had demanded in their national pact. The former Arab provinces of Asiatic Turkey, which had been mandated to France and Britain, were not restored, but otherwise Turkey recovered everything which she had possessed in 1914, particularly Smyrna, Constantinople, and Eastern Thrace; and the Treaty confirmed the rectification of the northern frontier of Syria in Turkey's favour, which had been made by the so-called "Franklin-Bouillon" Agreement of Oct. 20, 1921, while the destiny of Mosul was referred, by agreement between Turkey and Great Britain, to the League of Nations.

The settlement made at Lausanne about the Dardanelles and the Bosporus is described elsewhere (*see* STRAITS: *Diplomatic*). The special spheres of influence in Anatolia, which had been assigned to France and Italy by a tripartite agreement of Aug. 10, 1920, between those two Powers and Great Britain, were tacitly dropped, and there was no further question of giving autonomy to Northern Kurdistan or of ceding Turkish territory to the Armenian Republic of Erivan, which had since been included in the dominions of Turkey's ally, the Union of Socialist Soviet Republics. No restrictions were imposed on the Turkish naval and military forces, and no control was asserted by the Allies over Turkish finance. Meanwhile, on Jan. 30, 1923, the Greek and Turkish delegations had signed a separate convention providing for the compulsory interchange of minorities left on the wrong side of the new frontier, with a special exemption in favour of Christians domiciled in the city of Constantinople and of Muslims domiciled in Western Thrace.

Temperley, *History of the Peace Conference at Paris,* vol. 6, pp. 104–116 (1924); Earl of Ronaldshay, *The Life of Lord Curzon,* 3 vols., (1928–29).

LAUTREC, HENRI DE TOULOUSE (1864–1901), French lithographer, was born on Nov. 24, 1864, at Albi, the son of a nobleman. He was a delicate boy and during his childhood broke his legs and became a cripple. He studied art under Cormon in Paris. His style, formed by his admiration for the works of Princeteau and Degas, and for Japanese woodcuts, developed on decorative lines and was very effective in the design of posters, of which he executed a great number. His lithographs, which at the time found little favour, have now an extraordinary value. He took for his subjects almost exclusively the night life of Paris, the types of Montmartre and circus scenes. He spent the last years of his life in an asylum and died in Paris on Sept. 9, 1901.

Some of his work is in the Luxembourg museum; the Bibliothèque Nationale has 300 of the lithographs. Among the books illustrated by his lithographs we may mention Jules Renard, *Les Histoires Naturelles.*

LAUTREC, ODET DE FOIX, VICOMTE DE (1485–1528), French soldier. Odet de Foix and his two brothers, the seigneur de Lescun and the seigneur de l'Esparre or Asparros, served Francis I. as captains; and the influence of their sister, Françoise de Châteaubriant, who became the king's mistress, gained them high offices. In 1515 Lautrec took part in the campaign of Marignano. In 1516 he received the government of the Milanese, and by his severity made the French domination insupportable. In 1521 he defended the duchy against the Spanish army, but in 1522 he was defeated at the Bicocca, and was forced to evacuate the Milanese. Created marshal of France, he received again, in 1527, the command of the army of Italy, occupied the Milanese, and was then sent to undertake the conquest of the kingdom of Naples. The defection of Andrea Doria and the plague which broke out in the French camp brought on a fresh disaster. Lautrec caught the infection, and died on Aug. 15, 1528.

There is abundant ms. correspondence in the Bibliothèque Nationale, Paris. *See* the Works of Brantôme (Coll. Société d'Histoire de France, vol iii., 1867); *Memoirs* of Martin du Bellay (Coll Michaud and Poujoulat, vol. v., 1838).

LAUZUN, ANTONIN NOMPAR DE CAUMONT, MARQUIS DE PUYGUILHEM, DUC DE (1632–1723), French courtier and soldier, was the son of Gabriel, comte de Lauzun, and his wife Charlotte, daughter of the duc de La Force. He was brought up with the children of his kinsman, the maréchal de Gramont, of whom the comte de Guiche became the lover of Henrietta of England, duchess of Orleans, while Catherine Charlotte, afterwards princess of Monaco, was the object of the one passion of Lauzun's life. He served under Turenne, also his kinsman, and in 1655 succeeded his father as commander of the *cent gentilshommes de la maison du roi.* Puyguilhem (or Péguilin, as contemporaries simplified his name) rapidly rose in Louis XIV.'s

favour, became colonel of the royal regiment of dragoons and was gazetted *maréchal de camp*. He and Mme. de Monaco belonged to the coterie of the young duchess of Orleans. He prevented a meeting between Louis XIV. and Mme. de Monaco, and it was jealousy in this matter, rather than hostility to Louise de la Vallière, which led him to promote Mme. de Montespan's intrigues with the king. He was disgraced for a time, but, after a short sojourn in the Bastille, he returned to his functions of court buffoon. Meanwhile, the duchess of Montpensier (La Grande Mademoiselle) had fallen in love with the little man. The wedding was fixed for Dec. 20, 1670, when on the 18th Louis sent for his cousin and forbade the marriage. Lauzun was arrested, and was imprisoned at Pignerol, where excessive precautions were taken to ensure his safety. A fellow-prisoner, from communication with whom he was supposed to be rigorously excluded, was Eustache Dauger. (*See* IRON MASK.)

Mademoiselle agreed to the immediate settlement of the principality of Dombes, the county of Eu and the duchy of Aumale—three properties assigned by her to Lauzun—on the little duc de Maine, eldest son of Louis XIV. and Mme. de Montespan, in the hope of securing Lauzun's release. But Lauzun, even after ten years of imprisonment, refused to sign the documents, when he was brought to Bourbon for the purpose. A short term of imprisonment at Chalon-sur-Saône made him change his mind, but when he was set free Louis XIV. was still set against the marriage, which is supposed to have taken place secretly. In 1685 Lauzun went to the court of James II. In 1688 he was again in England, and arranged the flight of Mary of Modena and the infant prince, whom he accompanied to Calais. In 1689 he commanded the expedition fitted out at Brest for service in Ireland, and he sailed in 1690. Lauzun was honest, but inexperienced in war. After the battle of the Boyne he fled with Tyrconnel to Limerick, and thence to the west, leaving Patrick Sarsfield to show a brave front. Mademoiselle died in 1693, and two years later Lauzun married Geneviève de Durfort, a child of fourteen, daughter of the maréchal de Lorges Lauzun died on Nov. 19, 1723.

See the letters of Mme. de Sévigné, the memoirs of Saint-Simon, who was Lauzun's wife's brother-in-law; also J Lair, *Nicolas Fouquet*, vol. ii. (1890); Martin Hailes, *Mary of Modena* (1905), and M. F. Sandars, *Lauzun, Courtier and Adventurer* (1908).

LAVA, an Italian word applied to the liquid products of volcanic activity (from Lat. *lavare*, to wash). Streams of rain-water, formed by condensation of exhaled steam often mingled with volcanic ashes so as to produce mud, are known as *lava d'acqua*, whilst the streams of molten matter are called *lava di fuoco*. The term lava is applied by geologists to all matter of volcanic origin, which is, or has been, in a molten state. (*See* VOLCANO and PETROLOGY.)

LAVABO, a vase or fountain for ablutions; also applied to the hall or shelter in which such a basin is placed.

LAVAGNA, a seaport of Liguria, Italy, province of Genoa, 25½ m. S.E. from it by rail. Pop (1921) 5,644, town; 7,809, commune. It has a small shipbuilding trade, and exports great quantities of slate (*lavagna*, taking its name from the town). It also has a large cotton-mill. It was the seat of the Fieschi family, independent counts, obliged at the end of the 12th century to recognize the supremacy of Genoa. Sinibaldo Fieschi became Pope Innocent IV. (1243–1254), and Hadrian V. (1276) was also a Fieschi.

LAVAL, ANDRÉ DE, SEIGNEUR DE LOHÉAC (*c.* 1408–1485), French soldier. In 1423 he served in the French army against England, and in 1428 was taken prisoner by John Talbot, 1st earl of Shrewsbury, after the capitulation of Laval, which he was defending. After paying his ransom he was present with Joan of Arc at the siege of Orleans, at the battle of Patay, and at the coronation of Charles VII. He was made admiral of France in 1437 and marshal in 1439. He served Charles VII. faithfully in all his wars, even against the dauphin (1456), and when the latter became king as Louis XI., Laval was dismissed from the marshal's office. After the War of the Public Weal he was restored to favour, and recovered the marshal's bâton, the king also granting him the offices of lieutenant-general to the government of Paris and governor of Picardy, and conferring upon him the collar of the order of St. Michael. In 1472 Laval was successful in resisting the attacks of Charles the Bold, duke of Burgundy, on Beauvais.

LAVAL, a town of north-western France, capital of the department of Mayenne, on the Mayenne river, 188 m. W.S.W. of Paris by rail. Pop. (1926) 24,142. Laval is not known to have existed before the 9th century. It was taken by John Talbot, earl of Shrewsbury, in 1428, changed hands several times during the wars of the League, and played an important part at the end of the 18th century in the war of La Vendée. The old feudal city, with its ancient castle, is situated on the right bank while the new town is on the opposite bank. There is communication by steamer as far as Angers. The old castle with a donjon of the 12th century, the roof of which presents an example of timber work superseded afterwards by stone machicolation, used as a prison from 1792 till 1919, is now being transformed into a museum. The "new castle," dating partly from the Renaissance, serves as court-house. The transept and nave of the Trinity church, which serves as a cathedral, are of the 12th century while the choir is of the 16th; St. Vénérand (15th century) has good stained glass; Notre-Dame des Cordeliers, which dates from the end of the 14th century or the beginning of the 15th, has some marble altars. Half-a-mile below the Pont Vieux is the 12th century church of Avenières, with an ornamental spire of 1534. The finest remaining relic of the ancient fortifications is the Beucheresse gate near the cathedral. The narrow streets around the castle are bordered by many old houses of the 15th and 16th centuries, chief among which is that named the "Maison du Grand Veneur." There are an art-museum, a museum of natural history and archaeology and a library. Laval is the seat of a prefect, a bishopric created in 1855, and a court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce and a board of trade-arbitrators. The principal industry of the town is the cloth manufacture, introduced from Flanders in the 14th century.

Seigneurs and Counts of Laval.—The castle of Laval was founded at the beginning of the 11th century by a lord of the name of Guy, and remained in the possession of his male descendants until the 13th century. In 1218 the lordship passed to the house of Montmorency by the marriage of Emma, daughter of Guy VI. of Laval, to Mathieu de Montmorency, the hero of the battle of Bouvines. Of this union was born Guy VII. seigneur of Laval, the ancestor of the second house of Laval. Anne of Laval (d. 1466), the heiress of the second family, married John de Montfort, who took the name of Guy (XIII.) of Laval. At Charles VII.'s coronation (1429) Guy XIV., who was afterwards son-in-law of John V, duke of Brittany, and father-in-law of King René of Anjou, was created count of Laval, and the countship remained in the possession of Guy's male descendants until 1547. After the Montforts, the countship of Laval passed by inheritance to the families of Rieux and Sainte Maure, to the Colignys, and finally to the La Trémoilles, who held it until the Revolution.

LA VALLIÈRE, LOUISE FRANÇOISE DE (1644–1710), mistress of Louis XIV, born at Tours on Aug. 6, 1644, the daughter of an officer, was brought up at the court of Gaston d'Orléans at Blois, with the younger princesses, the step-sisters of La Grande Mademoiselle. After Gaston's death his widow moved with her daughters to the palace of the Luxembourg in Paris, and with them went Louise, who was now a girl of sixteen. She was named maid of honour to Henrietta of England, who was about her own age and had just married Philip of Orleans, the king's brother. Henrietta joined the court at Fontainebleau, and was soon on the friendliest terms with her brother-in-law; to avoid scandal it was determined that Louis should pay marked attentions elsewhere. The person selected was Madame's maid of honour, Louise, who became the king's mistress. The affair, begun on Louis's part as a blind, developed into real passion on both sides. It was Louis's first serious attachment, and Louise was an innocent, religious-minded girl, who brought neither coquetry nor self-interest to their relation, which was sedulously concealed. In February 1662 there was a storm when Louise refused to tell her

lover, the relations between Madame (Henrietta) and the comte de Guiche. She fled to an obscure convent at Chaillot, where Louis followed her. Her enemies secured her removal from the service of Madame, and she was established in a small building in the Palais Royal, where in December 1663 she gave birth to a son, Charles, who was entrusted to two faithful servants of Colbert.

Within a week of Anne of Austria's death in January 1666, La Vallière appeared at mass side by side with Maria Theresa. She had given birth to a second child in January 1665, but both children were dead before the autumn of 1666. A daughter born at Vincennes in October 1666, who received the name of Marie Anne and was known as Mlle. de Blois, was recognized by Louis as his daughter in letters-patent making the mother a duchess in May 1667 and conferring on her the estate of Vaujours. In October of that year she bore a son, but by this time her place in Louis's affections was definitely usurped by Athénaïs de Montespan (*q.v.*). She was compelled to remain at court as the king's official mistress, and even to share Mme. de Montespan's apartments at the Tuileries. She made an attempt at escape in 1671, when she fled to the convent of Ste. Marie de Chaillot, only to be compelled to return. In 1674 she was finally permitted to enter the Carmelite convent in the Rue d'Enfer.

La Vallière's *Réflexions sur la miséricorde de Dieu,* written after her retreat, were printed by Lequeux in 1767, and in 1860 *Réflexions, lettres et sermons,* by M. P. Clement (2 vols.). Some apocryphal *Mémoires* appeared in 1829, and the *Lettres de Mme la duchesse de la Vallière* (1767) are a corrupt version of her correspondence with the maréchal de Bellefonds. Of modern works on the subject *see* Arsène Houssaye, *Mlle de la Vallière et Mme de Montespan* (1860); Jules Lair, *Louise de la Vallière* (3rd ed., 1902, Eng. trans. 1908); and C. Bonnet, *Documents inédits sur Mme de la Vallière* (1904).

LAVATER, JOHANN KASPAR (1741–1801), poet, theologian, mystic, physiognomist, was born at Zürich on Nov. 15, 1741, and died there on Jan. 2, 1801. He was educated at the Zürich Gymnasium; J. J. Bodmer and J. J. Breitinger were among his teachers. Lavater took orders in 1769 and for the rest of his life he was deacon or pastor in one or other of the Protestant churches of Zürich. In 1767 he aroused great patriotic enthusiasm by his ardent *Schweizerlieder,* which quickly became popular. His oratorical fervour and genuine depth of conviction gave him an extraordinary personal influence; and he was consulted as a spiritual adviser by many thousands of Swiss and Germans, either in person or by correspondence. His mystical writings were also widely popular. Lavater's name, however, is now chiefly remembered by a by-product of his genius—his work on physiognomy, *Physiognomische Fragmente zur Beförderung der Menschenkenntnis und Menschenliebe* (1775–78). This book found many enthusiastic admirers in France and England, as well as in Germany. Goethe, who was long a warm friend of Lavater, contributed a chapter to it. It left, however, the science of physiognomy as desultory and unscientific as it found it. More characteristic of Lavater's genius and religious temperament are his somewhat mystical *Aussichten in die Ewigkeit* (1768–78), which went through several editions; *Geheimes Tagebuch von einem Beobachter seiner selbst* (1772–73); and *Pontius Pilatus, oder der Mensch in allen Gestalten* (1782–85). On the capture of Zürich by Masséna in 1799, Lavater was shot by a French grenadier. He lingered for more than a year and died on Jan. 2, 1801.

More or less complete collections of his works were published both in his lifetime and after, the last in 1841–44. Lives of him have been written by G. Gessner (1802–03), F. W. Bodemann (2nd edt., 1877), F. Muncker (1883), P. I. Heisch (1842, in English), and A. Vomel (1923). *See* also the studies by V. Hegner (1836), F. D. Pestalozzi (1915), F. Behrend (1916), and C. Janentzsky (1916); also *Goethe und Lavater* (1901), published by the Goethegesellschaft. The *Physiognomie* and the *Geheimes Tagebuch* have been translated into English (the former by H. Hunter and Thos. Holcroft).

LAVAUR, a town of France, on the Agout in the department of Tarn, 37 m. S.E. of Montauban by rail. Pop. (1926) 3,776. From 1317 till the Revolution it was the seat of a bishopric, and there is a cathedral dating from the 13th, 14th and 15th centuries. Lavaur was taken in 1211 by Simon de Montfort during the wars of the Albigenses, and several times during the religious wars of the 16th century.

LAVEDAN, HENRI LÉON ÉMILE (1859–), French dramatist and man of letters, was born at Orleans, the son of Hubert Léon Lavedan, a well-known Catholic and liberal journalist. He contributed to various Parisian papers a series of witty tales and dialogues of Parisian life, many of which were collected in volume form. In 1891 he produced at the Théâtre Français *Une Famille,* followed at the Vaudeville in 1894 by *Le Prince d'Aurec,* a satire on the nobility, afterwards re-named *Les Descendants.* Later brilliant and witty pieces were *Les Deux noblesses* (1897), *Catherine* (1897), *Le Nouveau jeu* (1898), *Le Vieux marcheur* (1899), *Le Marquis de Priola* (1902), and *Varennes* (1904), written in collaboration with G Lenôtre. Lavedan was admitted to the French Academy in 1898.

LAVELEYE, EMILE LOUIS VICTOR DE (1822–1892), Belgian economist, was born at Bruges on April 5, 1822, and educated at the Collège Stanislas in Paris and the Catholic university of Louvain. In 1864 he was elected to the chair of political economy at the State university of Liége, where were written his most important works. He died at Doyon, near Liége, on Jan. 3, 1892. Although Laveleye's name is chiefly associated with bimetallism and primitive property, he took a special interest in the revival and preservation of small nationalities, and his activity included the whole realm of political science In early life he was attached to Socialism, acknowledging himself a "Socialist of the chair," but he grew to view its later developments with distrust. His most important works are: *La Russie et l'Autriche depuis Sadowa* (1870); *Essai sur les formes de gouvernement dans les sociétés modernes* (1872); *Des Causes actuelles de guerre en Europe et de l'arbitrage* (1874); *De la propriété et de ses formes primitives* (1874); *Le Parti clerical en Belgique.*

See article on Laveleye by A. Courtois, *fils,* in Palgrave's *Dict. of Pol. Econ.* (1925).

LAVENDER, botanically *Lavandula,* a genus of the family Labiatae distinguished by an ovate tubular calyx, a two-lipped corolla, of which the upper lip has two and the lower three lobes, and four stamens bent downwards.

The plant to which the name of lavender is commonly applied, *Lavandula vera,* is a native of the mountainous districts of the countries bordering on the western half of the Mediterranean, extending from the eastern coast of Spain to Calabria and northern Africa, growing in some places at a height of 4,500 ft. above the sea-level, and preferring stony declivities in open sunny situations. It is cultivated in the open air as far north as Norway and Livonia. Lavender forms an evergreen under-shrub about 2 ft. high, with greyish-green hoary linear leaves, rolled under at the edges when young; the branches are erect and give a bushy appearance to the plant. The flowers are borne on a terminal spike at the summit of a long naked stalk, the spike being composed of 6–10 dense clusters in the axils of small, brownish, rhomboidal, tapering, opposite bracts, the clusters being more widely separated towards the base of the spike. The calyx is tubular, contracted towards the mouth, marked with 13 ribs and 5-toothed, the posterior tooth being the largest. The corolla is of a pale violet colour, but darker on its inner surface, tubular, two-lipped, the upper lip with two and the lower with three lobes. Both corolla and calyx are covered with stellate hairs, amongst which are imbedded shining oil glands to which the fragrance of the plant is due. The dried flowers have long been used in England, the United States and other countries for perfuming linen, and the characteristic cry of "Lavender! sweet lavender!" can still be heard in London streets in the second quarter of the 20th century. In England lavender is cultivated chiefly for the distillation of its essential oil, of which it yields on an average of 1½% when freed from the stalks, but in the south of Europe the flowers form an object of trade.

In Great Britain lavender is grown in the parishes of Mitcham, Carshalton and Beddington in Surrey, and in Hertfordshire in the Parish of Hitchin, where lavender is said to have been grown in 1568, but as a commercial speculation its cultivation dates back only to 1823. The plants at present in cultivation do not produce seed, and the propagation is always made by slips or by dividing the roots.

The flowers are collected in the beginning of August, and taken

direct to the still. The yield of oil depends in great measure upon the weather. From 12 to 30 lb. of oil per acre is the average amount obtained. Oil of lavender is distilled from the wild plants in Piedmont and the South of France.

Oil of lavender is a mobile liquid having a specific gravity from 0·85 to 0·89. Its chief constituents are linalool acetate, which also occurs in oil of bergamot, and linalool, $C_{10}H_{17}OH$, an alcohol derived by oxidation from myrcene, $C_{10}H_{16}$, which is one of the terpenes.

FROM KOEHLER, "MEDIZINAL PFLANZEN"

LAVENDER (LAVANDULA VERA)

Lavender water consists of a solution of the volatile oil in spirit of wine with the addition of the essences of musk, rose, bergamot and ambergris, but is very rarely prepared by distillation of the flowers with spirit.

In the climate of New York lavender is scarcely hardy, but in the vicinity of Philadelphia considerable quantities are grown for the market. In American gardens sweet basil (*Ocimum basilicum*) is frequently called lavender.

Lavandula Spica, a species which differs from *L. vera* chiefly in its smaller size, more crowded leaves and linear bracts, is also used for the distillation of an essential oil, which is known in England as oil of spike and in France under the name of *essence d'aspic.* It is used in painting on porcelain and in veterinary medicine. *L. Spica* does not extend so far north, nor ascend the mountains beyond 2,000 ft. It cannot be cultivated in Britain except in sheltered situations. A nearly allied species, *L. lanata,* a native of Spain, with broader leaves, is also very fragrant.

Lavandula Stoechas, a species extending from the Canaries to Asia Minor, is distinguished from the above plants by its blackish purple flowers, and shortly stalked spikes crowned by conspicuous purplish sterile bracts. The Stoechades (now called the isles of Hyères near Toulon) owed their name to the abundance of the plant growing there.

Other species of lavender are known, some of which extend as far east as to India. A few which differ from the above in having divided leaves, as *L. dentata, L. abrotanoides, L. multifolia, L. pinnata* and *L. viridis,* have been cultivated in greenhouses.

Sea lavender is a name applied in England to several species of *Statice,* a genus of littoral plants belonging to the family Plumbaginaceae. Lavender cotton is a species of the genus *Santolina.*

LAVERAN, CHARLES LOUIS ALPHONSE (1845–1922), French physician, was born in Paris on June 18, 1845, and was educated at the Strasbourg faculty of medicine. In 1874 he joined the staff of the Val-de-Grâce military school of medicine, and four years later was sent to Algeria. He remained there until 1883, and in 1884 was appointed professor of military hygiene and clinical medicine at Val-de-Grâce. In 1894 he relinquished these posts and took up work at Lille and Nantes. He was, in 1895, elected a member of the French Academy of Science. His chief contribution to medical science was his discovery (1880), while serving in Algeria, of the *hématozoaire,* a parasite that causes malarial fever. He was the author of important studies on sleeping sickness and on the rôle played by mosquitoes in epidemics. Laveran, who retired from active practice in 1897, and received the Nobel prize for medicine in 1907, died in Paris May 18, 1922.

His works include *Traité des maladies et des épidémies des armées* (1875); *Du Paludisme et son hématozoaire* (1891); *La prophylaxie du Paludisme* (1903); with Félix Mesnil, *Trypanosomes et trypanosomiases* (1912).

LAVERNA, an old Italian divinity, perhaps one of the spirits of the nether world. A cup found in an Etruscan tomb bears the inscription "Lauernai pocolom," and in a fragment of Septimius Serenus Laverna is expressly mentioned in connexion with the *di inferi.* By an easy transition, she came to be regarded as the protectress of thieves, whose operations were associated with darkness. She had an altar on the Aventine hill, near the gate called after her Lavernalis, and a grove on the Via Salaria.

See Wissowa, *Rel. u. Kultus der Römer* (2nd ed.), 236.

LA VERNA: *see* VALLOMBROSA.

LAVERY, SIR JOHN (1856–), British painter, was born in Belfast, and received his art training in Glasgow, London and Paris. He was elected R.A. in 1921, having won a considerable reputation as a painter of portraits and interiors. In 1918 he was created a knight. He is represented in the National Galleries at Brussels, Berlin and Edinburgh, in the Carnegie Institute at Pittsburgh, the Philadelphia gallery, the New South Wales gallery, the Modern gallery, Venice; the Pinakothek, Munich; the Glasgow Corporation gallery, the Luxembourg and the Tate gallery.

LAVIGERIE, CHARLES MARTIAL ALLEMAND (1823–1892), French divine, cardinal archbishop of Carthage and Algiers and primate of Africa, was born at Bayonne on Oct. 31, 1825, and was educated at St. Sulpice, Paris. He was ordained priest in 1849, and was professor of ecclesiastical history at the Sorbonne from 1854 to 1856. In 1856 he accepted the direction of the schools of the East, and was thus for the first time brought into contact with the Mohammedan world. Shortly after his return to Europe, was appointed French auditor at Rome. Two years later he was raised to the see of Nancy, where he remained for four years. While bishop of Nancy he met Marshal MacMahon, then governor-general of Algeria, who in 1866 offered him the see of Algiers, just raised to an archbishopric. Lavigerie landed in Africa on May 11, 1868, when the great famine was already making itself felt, and he began in November to collect the orphans into villages. MacMahon feared that the Arabs would resent this action as an infraction of the religious peace, and thought that the Mohammedan church, being a state institution in Algeria, ought to be protected from proselytism; it was intimated to the prelate that his sole duty was to minister to the colonists. Lavigerie, however, continued his self-imposed task, refused the archbishopric of Lyons, which was offered to him by the emperor, and won his point. Lavigerie now offered to resign his archbishopric in order to devote himself entirely to the missions. Pius IX. refused this, but granted him a coadjutor, and placed the whole of equatorial Africa under his charge. In 1874 Lavigerie founded the Sahara and Sudan mission, and sent missionaries to Tunis, Tripoli, East Africa and the Congo.

The order of African missionaries thus founded, for which Lavigerie himself drew up the rule, has since become famous as the *Pères Blancs.* From 1881 to 1884 his activity in Tunisia so raised the prestige of France that it drew from Gambetta the celebrated declaration, *L'Anticléricalisme n'est pas un article d'exportation,* and led to the exemption of Algeria from the application of the decrees concerning the religious orders. On March 27, 1882, the dignity of cardinal was conferred upon Lavigerie, but the great object of his ambition was to restore the see of St. Cyprian; by a bull of Nov. 10, 1884, the metropolitan see of Carthage was re-erected, and Lavigerie received the pallium on Jan. 25, 1885. The later years of his life were spent in ardent anti-slavery propaganda. Lavigerie died at Algiers on Nov. 26, 1892.

LAVINIUM, ancient town of Latium (*see* LAURENTINA, VIA), 19 m. S. of Rome, the modern Pratica, situated 300 ft. above sea-level and 2½ m. N.E. from the sea-coast. It was the city of King Latinus and Aeneas ritually refounded it, naming it after his wife Lavinia, Latinus' daughter. Consuls and praetors or dictators sacrificed on the Alban Mount and at Lavinium to the Penates and to Vesta, before they entered upon office or departed for their province, and the cults of Lavinium were kept up largely by the imperial appointment of honorary non-resident citizens to hold the priesthoods. The citizens of Lavinium were known as

Laurentes and under the empire as Laurentes Lāvinates, and the place itself at a late period as Laurolavinium. It was deserted or forgotten not long after the time of Theodosius.

A separate city of Laurentum never existed, though it has often been sought at Tor Paterno, close to the sea coast, 5 miles north by west. Even in ancient times its territory was famous for salubrious groves of bay-trees (*laurus*) to which both Vitellius and Commodus resorted. Under the empire a portion must have been imperial domain and forest in which elephants were kept, and the imperial villa may be identified with the extensive ruins at Tor Paterno. Remains of other villas lie along the ancient coast-line (half a mile inland of the modern, now marked by a row of sand-hills, and followed by the Via Severiana), both north-west and south-east of it, and indeed from the mouth of the Tiber to Antium, and thence again to Astura. In one of these villas, excavated by the king of Italy in 1906, was found a fine replica of the famous discobolus of Myron. Some way to the northwest was the village of Vicus Augustanus Laurentium, taking its name probably from Augustus himself, and probably identical with the village mentioned by Pliny the younger as separated by only one villa from his own. This village was brought to light by excavation in 1874, and its forum and curia are still visible. The remains of the villa of Pliny, too, were excavated in 1713 and in 1802–10. It is impossible without further excavation to reconcile the remains—mainly of substructions—with the elaborate description of his villa given by Pliny, *Ep.* ii. 1 (*cf.* H. Winnefeld in *Jahrbuch des Instituts*, 1891, 200 *seq.*).

The site of the ancient Lavinium, 300 ft. above sea-level and 2½ m. inland, is healthy. It possesses considerable natural strength, and consists of a small hill, the original acropolis, occupied by the modern castle and the village surrounding it, and a larger one, now given over to cultivation, where the city stood. On the former there are now no traces of antiquity, but on the latter are scanty remains of the city walls. The necropolis, too, has been discovered, but not systematically excavated; but objects of the first Iron age, including a sword of Aegean type have been found.

See R. Lanciani in *Monumenti dei Lincei*, xiii. (1903), 133 *seq.*; xvi. (1906), 241 *seq.*; J. Carcopino, *Virgile et les origines d'Ostie* (Paris, 1919), 171–387. (T. A.)

LAVISSE, ERNEST (1842–1922), French historian, was born at Nouvion-en-Thiérache, Aisne, on Dec. 17, 1842, and died in Paris on Aug. 18, 1922. He was educated at the École Normale Supérieure, and after working as private secretary to Victor Duruy for a time, he returned there in 1876 as *maître de conférence*, succeeding Fustel de Coulanges. In 1883 he was appointed assistant professor of modern history at the Sorbonne, and in 1888 full professor. In this post, and as director of the École Normale (1904–19), after its incorporation in the University of Paris, he played an important part in the revival of higher studies in France after 1871, and showed himself to be not only a brilliant historian but also an extraordinarily able organizer and teacher. On his retirement in 1919 he was made honorary director of the École Normale.

His thesis for his doctor's degree in 1875, a study on the origin of the Prussian monarchy, was crowned by the Academy in 1879, in which year he published his *Études sur l'histoire de la Prusse*. Other works on German history were *Trois empereurs d'Allemagne* (1888), *La Jeunesse du grand Frédéric* (1891, Eng. trans. 1891) and *Frédéric II. avant son avènement* (1893); but Lavisse is best known for the *Histoire générale du IVe siècle jusqu' à nos jours* (1893–1901, 12 vols.), which he edited with his friend Alfred Rambaud, and for the *Histoire de France depuis les origines jusqu'à la Révolution* (1908–11, 9 vols.). His greatest work was completed in the *Histoire de France contemporaine depuis la Révolution jusqu' à la paix de 1919* (1920–22, 10 vols.), of which he was also the editor. Lavisse was admitted to the Académie Française in 1892, and after the death of James Darmesteter, became editor of the *Revue de Paris* (1894).

LAVOISIER, ANTOINE LAURENT (1743–1794), French chemist, was born in Paris on Aug. 26, 1743. His father, an *avocat au parlement*, gave him an excellent education at the collège Mazarin, and he studied mathematics and astronomy with N. L. de Lacaille, chemistry with the elder Rouelle and botany with Bernard de Jussieu. In 1766 he received a gold medal from the Academy of Science for an essay on the best means of lighting a large town; and among his early work were papers on the analysis of gypsum, on thunder, on the aurora and on congelation, and a refutation of the prevalent belief that water by repeated distillation is converted into earth. He also assisted J. E. Guettard (1715–1786) in preparing his mineralogical atlas of France. In 1768 he was nominated *adjoint chimiste* to the Academy, and became *adjoint* to Baudon, one of the farmers-general of the revenue, subsequently becoming a full titular member of *ferme générale*. Appointed *régisseur des poudres* in 1775, he abolished the vexatious search for saltpetre in the cellars of private houses, increased the production of the salt and improved the manufacture of gunpowder.

In 1778 he started a model farm at Fréchine where he demonstrated the advantages of scientific agriculture. In 1785 he was nominated to the committee on agriculture, and as its secretary drew up reports and instructions on the cultivation of crops, and promulgated various agricultural schemes. Chosen a member of the provincial assembly of Orleans in 1787, he planned the improvement of the social and economic conditions of the community by means of savings banks, insurance societies, canals, workhouses, etc.; and advanced money to the towns of Blois and Romorantin, for the purchase of barley during the famine of 1788. Attached in this same year to the *caisse d'escompte*, he presented the report of its operations to the national assembly in 1789, and as commissary of the treasury in 1791 he established a system of accounts of unexampled punctuality. He was also asked to draw up a new scheme of taxation in connection with which he produced a report *De la richesse territoriale de la France*, and he was associated with committees on hygiene, coinage, the casting of cannon, etc., and was secretary and treasurer of the commission appointed in 1790 to secure uniformity of weights and measures.

Lavoisier's membership of the *ferme générale* was alone sufficient to make him an object of suspicion; his administration at the *régie des poudres* was attacked; and Marat accused him of putting Paris in prison and of stopping the circulation of air in the city by the *mur d'octroi* erected at his suggestion in 1787. In August 1792 he had to leave his house and laboratory at the Arsenal. In November the Convention ordered the arrest of the ex-farmers-general, and on May 2, 1794, they were sent to be tried by the Revolutionary tribunal. Within a week Lavoisier and 27 others were condemned to death, and on the 8th of the month Lavoisier and his companions were guillotined at the Place de la Révolution.

Lavoisier's name is indissolubly associated with the overthrow of the phlogistic doctrine that had dominated the development of chemistry for over a century (*see* CHEMISTRY: *History of*), and with the establishment of the foundations upon which the modern science reposes.

On Nov. 1, 1772, he deposited with the Academy a note which stated that sulphur and phosphorus when burnt increased in weight because they absorbed "air," while the metallic lead formed from litharge by reduction with charcoal weighed less than the original litharge because it had lost "air." The exact nature of the airs concerned in the processes he did not explain until after the preparation of "dephlogisticated air" (oxygen, *q.v.*) by Priestley in 1774. Then, perceiving that in combustion and the calcination of metals only a portion of a given volume of common air was used up, he concluded that Priestley's new "air" was what was absorbed by burning phosphorus, etc., "non-vital air," azote, or nitrogen remaining behind.

In a memoir presented to the Academy in 1777, but not published till 1782, he assigned to dephlogisticated air the name oxygen, or "acid-producer," on the erroneous supposition that all acids were formed by its union with a simple, usually non-metallic, body. Combustion was explained by Lavoisier as due, not to the liberation of the hypothetical "phlogiston," but to the result of the combination of the burning substance with oxygen. On June 25, 1783, in conjunction with Laplace, he announced to the Acad-

emy that water was the product formed by the combination of hydrogen and oxygen; by that time, however, he had been anticipated by Cavendish. From his knowledge of the composition of water Lavoisier was led to the beginnings of quantitative organic analysis. He burnt alcohol, and other combustible organic compounds, in oxygen and from the weight of water and carbon dioxide produced calculated their composition.

Up to about this time Lavoisier's work, mainly quantitative in character, had appealed most strongly to physicists, but it now began to win conviction from chemists also. C. L. Berthollet, L. B. Guyton de Morveau and A. F. Fourcroy, his collaborators in the reformed system of chemical terminology set forth in 1787 in the *Méthode de nomenclature chimique,* were among the earliest French converts to the new theory of combustion; they were followed by M. H. Klaproth and the German Academy, and by most English chemists except Cavendish, who rather suspended his judgment, and Priestley, who clung to the old ideas. The spread of Lavoisier's doctrines was greatly facilitated by the defined and logical form in which he presented them in his *Traité élémentaire de chimie (présenté dans un ordre nouveau et d'après les découvertes modernes)* (1789), and eventually they were adopted universally. The list of simple substances (elements), which could not be further decomposed by any known process of analysis, contained in the first volume of this work, includes "light" and "caloric" with oxygen, azote and hydrogen. Under the head of "oxidable or acidifiable" substances, the combination of which with oxygen yielded acids, were placed sulphur, phosphorus, carbon, and the muriatic, fluoric and boracic radicles. The metals, which by combination with oxygen became oxides, were antimony, silver, arsenic, bismuth, cobalt, copper, tin, iron manganese, mercury, molybdenum, nickel, gold, platinum, lead, tungsten and zinc; and the "simple earthy salifiable substances" were lime, baryta, magnesia, alumina and silica. The simple nature of the alkalies he considered so doubtful that he did not class them as elements. It is to Lavoisier that we owe to a great extent the modern concept of an element as against the old Greek idea.

In addition to his purely chemical work, Lavoisier, mostly in conjunction with Laplace, devoted considerable attention to physical problems, especially those connected with heat. The two carried out some of the earliest thermochemical investigations, devised apparatus for measuring linear and cubical expansions, and employed a modification of Joseph Black's ice calorimeter in a series of determinations of specific heats (*see* CALORIMETRY). Regarding heat as a peculiar kind of imponderable matter, Lavoisier held that the three states of aggregation—solid, liquid and gas—were modes of matter, each depending on the amount of *matière de feu* with which the substances concerned were associated. He also worked at fermentation, respiration and animal heat, looking upon the processes concerned as essentially chemical in nature. A paper discovered many years after his death showed that he had anticipated later thinkers in explaining the cyclical process of animal and vegetable life.

A complete edition of the writings of Lavoisier, *Oeuvres de Lavoisier, publiées par les soins du ministre de l'instruction publique,* was issued at Paris (6 vols. 1864–93), comprising his *Opuscules physiques et chimiques* (1774), many memoirs from the Academy volumes, and numerous letters, notes and reports. At the time of his death he was preparing an edition of his collected works, and the portions ready for the press were published in two volumes as *Mémoires de chimie* in 1805. *See* also E. Grimaux, *Lavoisier 1743–1794, d'après sa correspondance, ses manuscripts,* etc. (1888), which gives a list of his works; P. E. M. Berthelot, *La Révolution chimique: Lavoisier* (1890), which contains an analysis of and extracts from his laboratory notebooks; and Tilden's *Famous Chemists* (1921).

LA VOISIN. CATHERINE MONVOISIN, known as "La Voisin" (d. 1680), French sorceress, whose maiden name was Catherine Deshayes, was one of the chief personages in the famous *affaire des poisons,* which disgraced the reign of Louis XIV. Her husband, Monvoisin was a jeweller, and she practised chiromancy and face-reading. She gradually added the practice of witchcraft, in which she had the help of a renegade priest, Étienne Guibourg, whose part was the celebration of the "black mass." She practised medicine, especially midwifery, procured abortion and provided love powders and poisons. Her chief accomplice was one of her lovers, the magician Lesage, whose real name was Adam Coeuret. The great ladies of Paris flocked to La Voisin, who accumulated enormous wealth. Among her clients were Olympe Mancini, comtesse de Soissons, who sought the death of the king's mistress, Louise de la Vallière; Mme. de Montespan, Mme. de Gramont (*la belle* Hamilton) and others.

In April 1679 a commission appointed to inquire into the subject and to prosecute the offenders met for the first time. Its proceedings, including some suppressed in the official records, are preserved in the notes of one of the official *rapporteurs,* Gabriel Nicolas de la Reynie. The revelation of the treacherous intention of Mme. de Montespan to poison Louis XIV. and of other crimes, planned by personages who could not be attacked without scandal which touched the throne, caused Louis XIV. to close the *chambre ardente,* as the court was called, on Oct. 1, 1680. It was reopened on May 19, 1681 and sat until July 21, 1682. Many of the culprits, Marie Anne Mancini, duchess of Bourbon, and Madame de Montespan among others, escaped through private influence. Some hundred prisoners, among them the infamous Guibourg and Lesage, escaped the scaffold through the suppression of evidence insisted on by Louis XIV. and Louvois. Some innocent persons were imprisoned for life because they had knowledge of the facts. La Voisin herself was executed at an early stage of the proceedings, on Feb. 20, 1680.

See F. Ravaisson, *Archives de la Bastille,* vols. iv.–vii. (1870–74); the notes of La Reynie, preserved in the Bibliothèque Nationale; F. Funck-Brentano, *Le Drame des poisons* (1899); A. Masson, *La Sorcellerie et la science des poisons au XVIIe siècle* (1904). Sardou made the affair a background for his *Affaire des poisons* (1907). There is a portrait of La Voisin by Antoine Coypel, which has been often reproduced.

LAW, ANDREW BONAR (1858–1923), British statesman, was born in New Brunswick, Canada, on Sept. 16, 1858, the son of a Presbyterian minister, the Rev. James Law, by his marriage with Eliza, daughter of William Kidston of Glasgow. A Scot on both sides, he came to Scotland when still a boy and finished his education at Glasgow High school After acquiring a sufficient competence in business, he went into parliament in 1900 as Conservative member for the Blackfriars division of Glasgow.

His commercial experience had led him to the conclusion that free trade, in the Cobdenite sense, was no longer beneficial for Great Britain. A speech made on April 22, 1902, in favour of Hicks-Beach's corn duty, led to his appointment as parliamentary secretary to the board of trade in the Conservative Government. When Chamberlain started his tariff reform movement in 1903, he found a supporter in Bonar Law.

Bonar Law shared in the general conservative rout in Jan. 1906, and had another electoral mishap in Dec. 1910; but in each case came back to the House shortly at a by-election, and took his full share in the opposition attack on Lloyd George's 1909 budget and on the Parliament Bill. He kept aloof from the "Die-hard" movement, and warmly defended his leader, Balfour, from the reproaches cast upon him. This loyal attitude, no doubt, was one of the reasons, and his strong tariff reform programme was another, which recommended him to his party as Balfour's successor in the leadership when the claims of Austen Chamberlain and Walter Long appeared to divide the Conservatives pretty evenly. Both the rivals stood aside, and on Nov. 13, 1911, Bonar Law was unanimously elected leader in the Commons, Lord Lansdowne continuing to lead the party in the Lords.

As opposition leader, Bonar Law was very trenchant in his criticism of the Government, and put up a strong fight against the Home Rule bill on Ulster's behalf, when civil war was ahead or threatened. At Easter 1912 he went to Belfast, and, at a great demonstration which was presided over by Carson, he encouraged the Ulstermen to trust to themselves; and at a large unionist gathering at Blenheim on July 27 he said that the Ulster people would submit to no ascendancy, and that he could imagine no lengths of resistance to which they might go in which he would not be ready to support them, and in which they would not be supported by the overwhelming majority of the British people. Meanwhile, he had to deal with differences inside his own party as to the extent to which the tariff reform policy should be car-

ried. A considerable section, especially strong in Lancashire, was definitely against any duties on food; and the assurances which Bonar Law gave in a speech at Ashton-under-Lyne on Dec. 16, 1912, did not convince them that there was no possibility of food taxes being imposed without reference to the people. As the party dreaded a split, Bonar Law and Lord Lansdowne, in response to a general appeal, gave on Jan. 14, 1913, a formal promise that food duties should not be imposed without the approval of the electors at a subsequent general election. The imminent danger of the Ulster problem, on which Bonar Law had insisted for two years, brought ministers in 1914 to express a readiness for compromise; but no settlement, satisfactory to the opposition, had been formed when the World War supervened.

Directly the crisis became acute Bonar Law wrote, on Aug. 2, on behalf of Lord Lansdowne and their colleagues, tendering to Asquith the unhesitating support of the opposition in any measures necessary to support France and Russia; and when hostilities began he aided the national cause and promoted recruiting by speeches at the Guildhall, London, and in Belfast and elsewhere. Even when criticism of the management of the war began legitimately to spring up in the early months of 1915 he used his influence to repress or moderate its expression in parliament. He promptly accepted Asquith's proposal in 1915 to assist in forming a Coalition Government and brought seven of his colleagues into the cabinet, himself accepting the colonial secretaryship. He took charge in the House of Commons of the first military service bill in Jan. 1916 and got it through all its stages with little difficulty. He promoted the economic conference in Paris in June 1916 and, as principal representative of his country, was largely influential in carrying through the co-operative and protective resolutions then adopted He was a member of the War Committee of the cabinet, but, like Lloyd George, he was far from satisfied with its organization and powers. It was natural therefore that he should be one of the four persons, besides Lloyd George, to whom that statesman, forcing the issue on Dec. 1, 1916, asked Asquith to confide the absolute conduct of the war In the confused crisis which followed, the premiership was offered to Bonar Law; but he recognized that Lloyd George was the prime minister whom the nation demanded, and to a ministry formed under him, the Conservative leader brought the full co-operation of his party.

In this second coalition, Bonar Law, whose followers supplied the main body of the ministerial supporters, was partner rather than second-in-command of his chief. He was chancellor of the Exchequer and member of the War Cabinet, and also undertook the leadership of the House of Commons, so as to enable the prime minister to devote the whole of his energies to the prosecution of the war. The House was at first disposed to resent this arrangement; but before long its respect and indeed affection were won by its new leader's business habits, his courtesy, his readiness to yield in non-essentials coupled with firmness in essentials, his exceptional clearness of head and of expression, and his extraordinary capacity for impromptu reply, without taking a note, at the close of a long debate on an intricate subject involving perhaps complicated figures.

It was his duty, as chancellor of the Exchequer, to find the money to meet the gigantic cost of the war, and this was done principally by means of two great loans and by numerous increases of taxation. Consequently, it must have been with peculiar gratification that Bonar Law announced in April 1917 that the Imperial War Cabinet had accepted the principle of imperial preference. Throughout the war he opposed a firm front both to pacifists and to pessimists, and never doubted that there could be no peace "until the Germans are beaten and know that they are beaten."

As the general election of 1918 approached he responded heartily to Lloyd George's proposal that the Coalition should be continued to forward post-war reconstruction. The Coalition obtained an immense majority, and among the Coalitionists Bonar Law's special followers, the Unionists, predominated. When the ministry was reconstituted in Jan. 1919 the arrangement by which Bonar Law led the House was continued, as the prime minister would be much away at the Peace Conference; but he was relieved of the Exchequer, and took the sinecure office of Privy Seal. He was one of the British peace plenipotentiaries, though his duties at Westminster seldom permitted him to go to Paris; and he appended his signature to the Treaty of Versailles. During 1919 and 1920 he handled post-war disorders and projects, and the passing of the Home Rule Act of 1920, constituting two subordinate Governments and Parliaments in Ireland.

Bonar Law's incessant labours during and after the war undermined his health, which suddenly broke down in March 1921; on the advice of his medical advisers, he resigned office at once, and went away to rest in the south of France. He returned in the autumn greatly restored, and took part in recommending the Irish treaty to the House of Commons. During the first half, and more, of 1922 he only spoke occasionally, but he watched carefully the increasing reluctance of the Conservative party to support Lloyd George and the Coalition; a reluctance which had indeed resulted in the formation of a large group of independent "Die-hards" under Lord Salisbury's leadership. When the question was brought to an issue at the Carlton Club meeting on Oct. 19, the decisive factor was Bonar Law's declaration that the only method of preserving the unity of the party was to come out of the Coalition and to appeal to the country as an independent body. Lloyd George at once resigned, and Bonar Law, after being unanimously elected to his old post of party leader, formed a purely Conservative Government, which did not include the most prominent Conservative Coalitionists. His action was endorsed by the country at the general election in November, when the Conservatives returned 344 strong, a majority of 74 over all other parties put together. He at once reduced the cabinet secretariat, and restored the Foreign Office to its former position in the official hierarchy; and he carried through Parliament the bill to establish the Irish Free State Constitution.

Though he proclaimed the policy of his Government to be one of tranquillity and stability, he found himself, in the winter, deeply involved in political troubles. Unemployment was rampant, with labour unrest and housing problems threatening; a European conference at Lausanne proved impotent in face of the obstinacy of nationalist Turkey; and M. Poincaré, the French premier, insisted, in spite of Bonar Law's personal intervention at Paris, on despatching a French military expedition to the Ruhr to exact reparations from Germany. Baldwin, his chancellor of the Exchequer, did indeed succeed in concluding in Jan. 1923 at Washington an arrangement to fund the British war debt to the United States; but the terms were so severe that the prime minister was at first reluctant to accept them. After such an anxious winter it is not surprising that in the spring of 1923 his health once more gave way, and he resigned office on Whitsunday, May 20, after a ministry which only lasted 209 days. He survived for five months, dying on Oct. 30, 1923. He was buried in Westminster Abbey, with every sign of general and genuine mourning, the pallbearers including the prince of Wales, and past, present and future holders of the office of prime minister. He married in 1891 Annie Pitcairn, daughter of Harrington Robley, of Glasgow, by whom he had a family; but he was left a widower in 1909. Two sons perished in the world war. (G. E. B)

LAW, JOHN (1671–1729), Scottish economist, the originator of the "Mississippi scheme," was born at Edinburgh in April 1671. He studied mathematics, commerce and political economy in London, and banking operations at Amsterdam, whither he fled (1694) after killing Edward Wilson in a duel. On his return to Scotland in 1705, he submitted a scheme for a national bank to the Scottish parliament, but owing to Paterson's influence it was rejected, and similar proposals made to other European Governments met with a like fate. On May 20, 1716, however, Law obtained letters patent to establish a *Banque générale* in France. The capital of six million livres was divided into 1,200 shares of 5,000 livres each, payable in four instalments, one-fourth in cash, three-fourths in *billets d'état*. The bank was empowered to issue notes payable at sight in the weight and value of the money mentioned at the day of issue, and on April 10, 1717, it was decreed that Law's notes should be received in payment of taxes. So successful was the undertaking that not only did the rate of interest fall to

4½%, but the note issue rose to 60 million livres. Law, having gained the full confidence of the Regent, now proceeded with his Mississippi scheme.

In Aug. 1717, he founded the *Compagnie de la Louisiane ou d'Occident*, which absorbed both the company founded by Antoine Crozat in 1712, and the *Compagnie du Canada*. Extensive powers over the area drained by the Mississippi, the Ohio and the Missouri were granted, and in 1718 they were extended by the company's purchase of the tobacco monopoly. The success of this scheme was sufficient to arouse hostility in Paris, resulting in the formation of a rival company, and a consequent drop in the shares of Law's undertaking. He proceeded with his plans, however, and in Dec. 1718, when the *Banque générale* was converted into the *Banque royale*, whose notes were guaranteed by the king, he became director of the new institution. A further step was made towards consolidation in the following year, when the *Compagnie d'Occident* absorbed the *Compagnies des Indes Orientales et de la Chine*, taking the name of the *Compagnie des Indes*. Shortly after, the company was granted the management of the mint and the coin issue for nine years, and the farming of the national revenues, on undertaking the payment of the national debt. Speculation reached an unparalleled height, and when the climax came in 1720, with the amalgamation of the *Compagnie des Indes* and the *Banque royale*, reaction had already set in. The public becoming alarmed, drastic measures were taken to check the drain of coin, but the decree of May 21, 1720, by which the value of the bank notes was to be gradually reduced to one half, precipitated the panic, and a week later the bank suspended payment. Law was removed from his office, and the whole system was demolished by his enemies. In Dec. 1720 Law left France secretly, resumed his wandering life, and died at Venice on March 21, 1729.

Of Law's writings the most important is *Money and Trade Considered* (1720). Though subject to the errors of his time, he was undoubtedly a financial genius.

The fullest account of the Mississippi scheme is that of Thiers, *Law et son système des finances* (1826, American trans. 1859). *See* also Heymann, *Law und sein System* (1853); Pierre Bonnassieux, *Les Grandes Compagnies de commerce* (1892); S. Alexi, *John Law und sein System* (1885); E. Levasseur, *Recherches historiques sur le système de Law* (1854); and Jobez, *Une Préface au socialisme, ou le système de Law et la chasse aux capitalistes* (1848). Full biographical details are given in Wood's *Life of Law* (1824). All Law's later writings are to be found in Daire, *Collection des principaux économistes*, vol. i. (1843). Other works on Law are: A. W. Wiston-Glynn, *John Law of Lauriston* (1908); P. A. Cachut, *The Financier Law, his Scheme and Times* (1856); A. Macf. Davis, *An Historical Study of Law's System* (Boston, 1887); A. Beljame, *La Prononciation du nom de Jean Law le financier* (1891); A. Martineau, *Mém. sur quelques affaires de L'Empire mogol, 1756–61* (1913); G. Oudard, *La très curieuse Vie de Law* (1927). *See* also article on Law by W. A. S. Hewins in Palgrave's *Dictionary of Political Economy* (1925).

LAW, WILLIAM (1686–1761), English divine, was born at King's Cliffe, Northamptonshire. In 1705 he entered as a sizar at Emmanuel college, Cambridge; in 1711 he was elected fellow of his college and was ordained. He resided at Cambridge, teaching and taking occasional duty until the accession of George I., when his conscience forbade him to take the oaths of allegiance to the new government and of abjuration of the Stuarts. His Jacobitism had already been betrayed in a tripos speech (1713) which led to his being suspended from his degrees; and he was now deprived of his fellowship and became a non-juror. For the next few years he is said to have been a curate in London. By 1727 he was domiciled with Edward Gibbon (1666–1736) at Putney as tutor to his son Edward, father of the historian, who says that Law became "the much honoured friend and spiritual director of the whole family." In the same year he accompanied his pupil to Cambridge, and resided with him for the next four years. His pupil then went abroad, but Law was left at Putney, where he remained in Gibbon's house for more than ten years, acting as a religious guide not only to the family but to a number of earnest-minded folk. The most eminent of these were the two brothers John and Charles Wesley, John Byrom the poet, George Cheyne the physician and Archibald Hutcheson, M.P. for Hastings. The household was dispersed in 1737. Law was parted from his friends, and in 1740 retired to King's Cliffe, where he had inherited from his father a small property.

Law's writings fall under three heads:—1. *Controversy.*—In this field he had no contemporary peer save perhaps Richard Bentley. The first of his controversial works was *Three Letters to the Bishop of Bangor* (1717), a most powerful contribution to the Bangorian controversy (*see* HOADLY, BENJAMIN) on the high church side. In his *Remarks on Mandeville's Fable of the Bees* (1723), Law vindicates morality on the highest grounds; for pure style, caustic wit and lucid argument this work is remarkable; it was enthusiastically praised by John Sterling, and republished by F. D. Maurice. Law's *Case of Reason* (1732), in answer to Tindal's *Christianity as old as the Creation* is to a great extent an anticipation of Bishop Butler's famous argument in the *Analogy*. In this work Law shows himself at least the equal of the ablest champion of Deism.

2. *Practical Divinity.*—The *Serious Call to a Devout and Holy Life* (1728), together with its predecessor, *A Treatise of Christian Perfection* (1726), deeply influenced the chief actors in the great Evangelical revival. The Wesleys, George Whitefield, Henry Venn, Thomas Scott and Thomas Adam all express their obligation to the author. Samuel Johnson, Gibbon, Lord Lyttelton and Bishop Horne all spoke enthusiastically of its merits; and it is still the only work by which its author is popularly known. It has high merits of style, being lucid and pointed to a degree. His tract *The Absolute Unlawfulness of Stage Entertainments* (1726) provoked some effective criticism from John Dennis in *The Stage Defended*

3. *Mysticism*.—Though the least popular, by far the most interesting and original of Law's works are those which he wrote in his later years, after he had become an enthusiastic admirer (not a disciple) of Jacob Boehme (*q.v.*). These mystical works include *A Demonstration of the Gross and Fundamental Errors of a late Book called a "Plain Account, Etc., of the Lord's Supper"* (1737); *The Spirit of Prayer* (1749, 1752); *The Way to Divine Knowledge* (1752); *The Spirit of Love* (1752,1754); a *Dialogue between a Methodist and a Churchman* (1760); and *An Humble, Earnest and Affectionate Address to the Clergy* (1761).

See the edition of his *Works* by G. H. Morgan (1892–93). *See* C. Walton, *Notes and Materials for a Complete Biography of W. Law* (1848); Sir Leslie Stephen, *English Thought in the 18th century* (1876); W. H. Lecky, *History of England in the 18th Century* (1878 foll.); C. J. Abbey, *The English Church in the 18th Century*; J. H. Overton, *William Law, Nonjuror and Mystic* (1881); A. Whyte, *Character and Characteristics of William Law, Nonjuror and Mystic* (1893; a selection with introd. by Whyte).

LAW, a word used in English in two main senses—(1) as a rule prescribed by authority for human action, and (2) in scientific and philosophic phraseology, as a uniform order of sequence (*e.g.*, "laws" of motion). In this work the laws of uniformities of the physical universe are dealt with in the articles on the various sciences. The general principles of law in the legal sense are discussed under JURISPRUDENCE. What may be described as "national systems" of law are dealt with historically and generally under ENGLISH LAW, AMERICAN LAW, ROMAN LAW, GREEK LAW, MOHAMMEDAN LAW, INDIAN LAW, etc. Certain broad divisions of law are treated under CONSTITUTION AND CONSTITUTIONAL LAW, CANON LAW, CIVIL LAW, COMMON LAW, CRIMINAL LAW, ECCLESIASTICAL LAW, EQUITY, INTERNATIONAL LAW, MILITARY LAW AND MARTIAL LAW, etc. And the particular laws of different countries on special subjects are stated under the headings for those subjects (BANKRUPTCY, etc.). For courts of law and procedure, *see* JURISPRUDENCE, LAW, KING'S BENCH, PRACTICE AND PROCEDURE, etc.

In science and philosophy, law has several meanings, all of which are different from the sense it has when used with reference to legislation. (1) In most sciences a law is simply the formulation of some uniform character, mode of behaviour, or uniform correlation of certain natural phenomena or events. The uniformity is in the nature of things themselves, and there is no law outside them to obey or disobey. If there is no such objective uniformity, then the law is a blunder on the part of those men of science who have formulated or accepted it. In science, then, the term law has nothing whatever to do with an imperative or a command, backed by sanctions or not. To speak of natural

phenomena as "obeying" certain laws is just loose thought or loose language influenced by legal analogy. (2) In the more complex biological and human sciences (including psychology, sociology and economics) the term law must be understood to denote the formulation of a certain general tendency rather than a rigid uniformity, in the sense of (1) above. It may be that such uniformities are actually operative under certain conditions, but the conditions may be partly variable, and in any case, owing to the extreme complexity of the phenomena and the impossibility of studying them under sufficiently controlled and varied conditions, the laws actually formulated cannot be regarded as expressing uniformities, less still as expressing ideals or norms, in sense (3) below, but just certain general tendencies which are subject to modification with changing conditions. When people speak of "iron laws of economics" they confound economic laws with the laws of mechanics; and when they exploit them with a good conscience, they confound economic with moral laws. (3) In the so-called philosophical sciences, or normative sciences, logic, ethics and aesthetics, the term law is used rather in the sense of a regulative ideal or norm.

See J. S. MacKenzie, *Manual of Ethics* (1924). (A. Wo.)

LAW (PRIMITIVE). For the purposes of comparative jurisprudence, law may be defined as the authoritative regulation of social relations. Thus, in any account of its development, three main points have to be considered: the nature of the authority or "sanction" involved; the mode of regulation or "procedure"; and the social function or "scope."

The Legal Sanction.—Whereas analytic jurists dispute whether constraint or consent is in the last resort the principle from which law derives its validity, the student of history inclines rather to regard the spirit of legality as the joint outcome of both these influences acting simultaneously. Walter Bagehot has in mind this correspondence between an outer and an inner necessity when, in *Physics and Politics,* he recognizes a "persecuting tendency" and an "imitative tendency" as together constituting the legal fibre of a primitive society. The sanction, in a word, is custom; and custom is social habit, resting partly on a general inclination to conform, and partly on a no less general disinclination to suffer as a nonconformist. Now a certain amount of customary law survives in the modern State by the side of the positive enactments of the legislature, and in such a case the maxim "what the sovereign permits, he commands" may be justifiably held to cover the anomaly. But in a savage community it is often hard to distinguish any sovereign, any determinate person or body of persons vested with the power either of making or of maintaining the laws. Nevertheless, the result is not anarchy. On the contrary, such a society is normally so law-abiding, in the sense of responsive to the social routine, that it might seem almost superfluous to provide a legal machinery that must actually but rust in disuse. A closer scrutiny, however, would disclose a considerable degree of coercive power, diffused through the body politic if not yet centralized in official hands, such as reinforces the strong natural propensity of the unreflective to keep in the fashion. Any youth, for instance, who has gone through the rites of initiation has acquired the sense of discipline at the price of no little pain; the tribal elders being quite ready to mete out death to the hopelessly recalcitrant. Again, all custom is more or less sacred; and, since the violation of a taboo is held to pollute not only the sinner but all who come into contact with him, the threat of excommunication is ever present to curb unruliness. Finally, every crowd has its leader, so that even the least coherent of human societies looks for guidance to certain headmen. These, so to speak, control the collective luck, having in virtue of their age, outstanding courage or skill, impressiveness, personality, prestige—in a word, their *mana*—the gift of making the rest come to heel. Such a government may hardly be aware of its own directive functions, since its conscious efforts are mostly concerned with the consecration of custom. Reform, however, creeps in under the guise of re-interpretation. For the rest, there are very various degrees of consolidation under a clan-system, as that type of organization may be termed in which co-ordinate groups severally retain a more or less considerable measure of autonomy. As compared, for instance, with the Arunta of central Australia, the Iroquois of North America, with their elaborate scheme of graded councils, family, gentile, tribal and even federal, were far more closely knit together; yet never so completely that the separatist tendencies arising from the co-existence of so many semi-independent jurisdictions were altogether overcome. On the other hand, as soon as a class-system has come into being, as usually happens through the imposition of a higher culture on another through immigration or conquest, a governing aristocracy with a monarch at its head is on the way to be formed. Thereupon, however much he continues to defer to custom, the sovereign's will becomes in theory absolute.

Legal Procedure. (a) Public Versus Private Justice.—From the standpoint of the modern lawyer, the strangest feature of the social conventions of the primitive world is their habit of allowing private parties to fight out their quarrels according to certain set rules, which to a corresponding extent control what would otherwise amount to downright war. Such private justice, as it is termed, has a validity somewhat analogous to that of international law in Europe, seeing that no machinery exists for its enforcement, though even the strongest cannot afford in the long run to disregard the accepted decencies of the common life. For private justice is justice of a kind, seeing that social expediency and moral reason alike must approve the substitution of retaliation for unlimited self-redress. "Tit for tat" at least implies that it is unfair to exact more than the equivalent of the wrong done—a principle roughly construed by primitive society to mean that the vendetta should end when, a life having been taken for a life, equilibrium as regards numbers and consequent strength is restored between the groups at variance.

Such a view, however, deals with responsibility as wholly collective, and, even at the primitive level of thought, this is apt to seem hardly fair. Hence some attempt is made to bring home his culpability to the actual offender, as typically in the regulated combat. Yet the duel can hardly be regarded as a satisfactory method of justice, offering, as it does, to the stalwart villain, the opportunity of adding a second crime to the first; were it not that the issue of the fight, as in the mediaeval "judgment of God," might be taken as the verdict of a higher court, a mystic pronouncement in favour of the innocent. Even so, in Australia it was deemed more seemly that the defendant should play a passive part and merely ward off the blows directed against him by his victim's kinsmen. Should he escape, as he often managed to do, the self-exposure was accounted as expiation; no doubt in large part because a symbolic amounts to a real retribution at the mental stage at which purposive energy is chiefly occupied with the discharge of repressed emotion. It remains to add that as soon as property has sufficiently developed, to suffer in one's goods instead of in one's person becomes a recognized means of compensating for injury inflicted; and, though an aggressor caught red-handed is ever likely to have short shrift, it becomes the normal procedure under a clan-system of the more advanced type to admit the principle of composition. Even if negotiations about blood-fines lead to endless wrangling, this is at least more conducive to public order than mutual waylaying That settlement is rendered easier by the aid of some impartial arbitrator comes to be apparent even at this stage, just as turbulent Corsica had recourse to *paci* or pacifiers. A class-system, however, greatly assists the substitution of public for private justice, since the lower orders at least, and gradually the members of the aristocracy, are obliged to observe "the king's peace," and to submit all causes of dispute to the decision of him and his representatives, with the burden of providing court fees as a salutary check to litigiousness. In proportion as the supreme ruler is powerful he will not merely arbitrate, that is, deliver a sentence which may or may not be carried out, but will see that his judgment is duly executed by the agency of those accustomed to obey him.

(b) Law of Evidence.—Little of course can be found in primitive jurisprudence that corresponds at all to the modern insistence on relevancy, on the competence of witnesses, on the disregard of hearsay statement, and so forth. Indeed, at the level of rudimentary law the distinction between trial and punishment is imperfectly drawn. A judicial process is normally conceived as a mode of bringing a conditional curse into operation, so that a man

is automatically declared guilty by the very fact that he suffers. As was already noted in the case of the duel, to win is to be innocent, to lose is to be convicted of wrong-doing on a supernatural showing. So too, then, the ordeal involves the principle that contact with something spiritually potent, such as fire, water, or a brew of magic herbs, will reveal alike the pure nature that is akin to it and the impure nature that it rejects. The sinner, in other words, is held to lack the *mana*, the strong heart, whereby he could stand up to the test; and, if for *mana* the word "confidence" be substituted, it will be seen that there is some psychological justification for such a method of criminal investigation. Sometimes both plaintiff and defendant are subjected to the ordeal, but more commonly the latter only. In the second case, primitive justice, acting on a presumption of guilt, is apt to make the chances of escape nearly impossible; a European parallel is the notorious ducking of the witch. It is only fair to add that the tortures which likewise disgraced these witch-trials, and indeed were a usual feature of mediaeval procedure, are almost unknown among so-called savages. As for the oath, which to-day retains its use as a legal precaution against false witness, the principle involved is similar; the only difference being that an oral replaces a material symbol as the vehicle of the conditional curse. When the Chinese in a London court is made to blow out a candle, or break a plate, he is supposed to be calling down upon himself a like fate such as must inevitably overtake him if he is lying. Given sufficient faith in the mystic power of the act, or at any rate in the power of agencies set in motion by the act, it is psychologically possible that a guilty conscience will have the result contemplated. Many instances of what Dr. Roth has termed *thanatomania* may be cited from the primitive world, a conviction of being doomed whether by an enemy or by one's own fault being enough to depress the will to live to the point of actual extinction. An interesting form of the oath is that in which the king's *mana*—or as the Romans phrased it his *majestas*—is invoked, as when the Zulu swore by the name of his dread king, Chaka. Here the sacred and the secular sides of the royal authority combine so as to re-inforce each other. Since to break the king's law and to disturb his peace is likewise to diminish the mystic power whereby he maintains the luck of the whole community, no penalty can be too severe for a disloyalty thus amounting to sacrilege. Indeed, the noticeable increase in the harshness of the discipline that marks the appearance of monarchical rule is to be ascribed not only to better organization, but at least as much to the fact that a human and a divine authority, like the two swords of the Holy Roman empire, are wielded by the same hands. As regards primitive legal procedure in general, it only remains to add that it is characterized by an extreme formalism, due largely to close association with magico-religious beliefs

Scope of Primitive Law. (a) Civil Department.—Passing on to substantive law as contrasted with the adjective law which deals with procedure, a twofold function of any legal code as it bears on social relations can be distinguished according as it either establishes just conditions in respect to personal status and the use of possessions, or maintains public order by repressing violence and fraud. The former purpose delimits the province of civil law, the latter that of criminal law. Being, then, in its main essence a law of persons and of property, civil law under the former head defines the civic rights of the individual, which in the modern democratic State tend to be treated as equal for all concerned; so that contract, or the power of each to give in proportion as he receives from the rest, is assumed as the logical basis of their mutual relations. But, as Sir Henry Maine has observed, whereas contract is the principle underlying the modern State, the primitive community rests on quite another principle, that of status, in the sense of unequal privilege depending on unequal station in life. Superficially, indeed, an extreme form of democracy might seem to prevail at the tribal level of society, but on a closer view it will be found that the individual has little or no freedom of choice in determining what his place in society is to be, but must conform strictly to what is expected from one occupying once for all a given position. In particular, the ties of kinship and affinity, which vary according to the marriage system in vogue, bind each man and woman fast in a network of obligations, to which religion conspires with law to impart a most solemn sanction. The field-observer has only to ask, "Who are your relations, and what must you do for them, and they for you?" and he has a key to the whole system of rights and duties which renders that society organic. Incidentally he can by so doing acquaint himself at the same time with their methods of holding and distributing property. Thus in the primitive community the individual by no means enjoys, as would occur under a regime of contract, a free use of what he earns, and still less of what he inherits. Under conditions of mother-right, for instance, the father is usually debarred from enriching his own offspring at the expense of his sister's children; and, even when custom concedes him a limited power of sharing his acquired property with his wife and the children she bears him, his own family possessions, being more or less collectively owned by those of his own name and kin, can under no circumstances be alienated. Or, again, under the kind of father-right that involves so-called wife purchase—though it is really the right to own the woman's children that is bought—the change of status that she undergoes is so complete that henceforth she has no claim on her own family; but on the contrary is so identified with the group that she has joined that, if her husband dies, she is passed on to a kinsman as if a burden on the estate.

(b) Criminal Department.—So long as private justice prevails, it remains hard for the primitive community to realize that one and all have a common interest in suppressing any sort of outrage prejudicial to the social order. Nevertheless certain offences are perceived so directly to affect tribal welfare as a whole that even the most loosely organized societies take steps to punish them. Thus, on the one hand, treason or cowardice in the face of the enemy is bound to provoke an outburst of universal indignation. On the other hand—and this is the more typical occasion of one of those "wild spasms of wild justice" of which Bagehot speaks—certain types of immoral conduct awake deep-seated feelings of disgust and horror in humanity at large. Incest, for example, and sundry other breaches of sexual decency, are felt to be so generally polluting that to extirpate the cause of pollution seems the natural cure. The fear of witchcraft, again, impels men at all stages of culture to purify their spiritual surroundings by wiping out the witch. Proceeding, then, on these lines, one might draw up a considerable list of what Hobhouse describes as "public and sacral offences," which have a socially dangerous character so obvious that collective action tends to be taken against them even in the more undeveloped societies. Apart from these crimes that manifestly have a bearing on the common weal, there are other crimes which, though they primarily affect private welfare, yet do so in a way so fraught with evil consequences for all that eventually it becomes public policy to take the initiative in suppressing them. Homicide provides a case in point. So long as it is merely punishable according to the law of blood-revenge, it counts as a tort rather than as a crime. Sooner or later, however, the central authority hunts down the murderer on its own account, partly, it may be, in order to avoid the general disturbance caused by blood-feuds, but chiefly, it would seem, because on the principle that "blood defileth the land," bloodshed has been confined to the class of sacral offences. Indeed, seeing how the sacred predominates over the secular aspect of all authority and government of the rudimentary type, the crime is almost invariably envisaged as a sin. In short, what early law prescribes and enforces is essentially a ritual—a system of observances, positive and negative, which in intention assimilates the human to the divine order.

LAWES, HENRY (1596–1662), English musician, was born at Dinton in Wiltshire in Dec. 1595, and received his musical education from John Cooper, better known under his Italian pseudonym Giovanni Coperario (d. 1627), a famous composer of the

day. In 1626 he was received as one of the gentlemen of the chapel royal, a place he held until the Commonwealth put a stop to church music. Lawes wrote the music for Thomas Carew's masque *boelum Britannicum*, produced at court on Feb. 18, 1634, and for the more famous production of Milton's *Comus* at Ludlow Castle (1634), the music to George Sandys version (1637) of the Psalms; and in 1648 the *Choice Psalmes put into music*, composed by Henry and William Lawes. This latter contained elegies on William, Henry's half-brother, killed at Chester in 1645, and among the commendatory verses printed with it is Milton's sonnet: "Harry, whose tuneful and well-measured song." The famous collection of his vocal pieces, *Ayres and Dialogues for One, Two and Three Voyces*, was published in 1653, and was followed by two other books under the same title in 1655 and 1658 respectively. In 1656 he was one of those who provided the music for Davenant's first entertainment at Rutland House. When in 1660 the king returned, Lawes once more entered the royal chapel, and composed the anthem *Zadok the Priest*, for the coronation. He died on Oct. 21, 1662, and was buried in Westminster Abbey. In the famous sonnet already referred to Milton exactly indicates the great merit of Lawes.

His brother, WILLIAM LAWES, (d. 1645), was also a pupil of Coperario. He was in the choir of Chichester cathedral until 1602, and afterwards became a gentleman of the Chapel Royal. The music to Shirley's masque *The Triumph of Peace* (performed in 1634) he composed with Simon Ives. The music to D'Avenant's masque *The Triumph of the Prince d'Amour* (performed in 1635 in the Middle Temple) was also of his composition. He lost his life fighting for the Royalist cause in the Civil War, Sept. 1645. None of his music was published until after his death, the first to appear being his brother Henry's edition of "Choice Psalmes" (1648). Many of his songs, among which the best known is *Gather ye Rosebuds while ye May*, are contained in books published by Playford: *Court Airs* (1656), *Courtly Masquing Ayres* (1662), etc. His most important works are short pieces for viols, lutes, etc., but his *Royal Consort*, containing a collection of 66 of these, exists only in manuscript.

LAWES, SIR JOHN BENNET, BART. (1814–1900), English agriculturist, was born at Rothamsted on Dec. 28, 1814. Even before leaving Oxford he had begun to interest himself in growing various medicinal plants on the Rothamsted estates, which he inherited on his father's death in 1822. About 1837 he began to experiment on the effects of various manures on plants growing in pots, and a year or two later the experiments were extended to crops in the field. In 1842 he patented a manure, generally known as "superphosphate," formed by treating phosphates with sulphuric acid, and thus initiated the artificial manure industry. In the succeeding year he enlisted the services of Sir J. H. Gilbert (*q.v.*), with whom he carried on for more than half a century those experiments in raising crops and feeding animals which have rendered Rothamsted famous (*see* AGRICULTURE). In 1854 he was elected a Fellow of the Royal Society, which in 1867 bestowed a Royal medal on Lawes and Gilbert jointly, and in 1882 he was created a baronet. Lawes died on Aug. 31, 1900, but in 1899 he took measures to ensure the continued existence of the Rothamsted experimental farm by setting aside £100,000 for that purpose and constituting the Lawes Agricultural Trust; his work has been expanded with the aid of the Government.

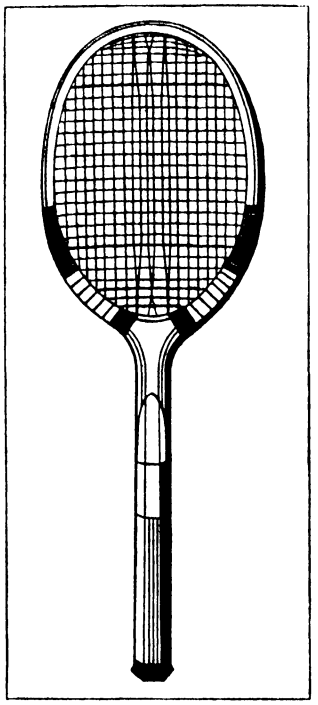
LAWLESS, EMILY (1845–1913), Irish novelist and poet, was born at Lyons, Co. Kildare, on June 17, 1845, the daughter of the 3rd Baron Cloncurry. She wrote a number of novels and verses dealing with Irish life. *Hurrish* (1886), *With Essex in Ireland* (1890) and *Grania* (1902) are her most important novels, and *With the Wild Geese* (1902) the best-known volume of her verses. She died at Gomshall, Surrey, on Oct. 19, 1913.

LAW MERCHANT or **LEX MERCATORIA,** originally customary rules and principles relating to merchants and mercantile transactions, adopted by merchants themselves for the purpose of regulating their dealings. The law merchant owed its origin to the fact that trade in pre-mediaeval times was practically in the hands of those who might be termed cosmopolitan merchants, who wanted a prompt and effective jurisdiction. It was administered for the most part in special courts, such as those of the gilds in Italy, or the fair courts of Germany and France or, as in England, in courts of the staple or piepowder. (*See* also SEA LAWS.) The history of the law merchant in England is divided into three stages: the first prior to the time of Coke, when it was a special kind of law—as distinct from the common law—administered in special courts for a special class of the community (*i.e.*, the mercantile); the second stage was one of transition, the law merchant being administered in the common law courts, but as a body of customs, to be proved as a fact in each individual case of doubt; the third stage, which has continued to the present day, dates from the presidency over the king's bench of Lord Mansfield (*q.v.*), under whom it was moulded into the mercantile law of to-day.

See G. Malynes, *Consuetudo vel lex mercatoria* (1622); W. Mitchell, *The Early History of the Law Merchant* (1904); J. W. Smith, *Mercantile Law* (ed. Hart and Simey, 1905); and particularly *The Romance of the Law Merchant*, by Wyndham A. Bewes (1923).

LAWN, a very thin fabric made from level linen or cotton yarns. It is used for light dresses and trimmings, also for handkerchiefs. The terms lawn and cambric (*q.v.*) are often intended to indicate the same fabric. In this sense of the term the derivation is from the name of the French town, Laon. In the older sense of a glade or clearing in a forest (in which form it still survives in the New Forest in England, where it is used of the feeding-commons of cattle), the word lawn is cognate with land (Celtic *lann*, waste or enclosure), now used of a closely mown grass expanse for ornamental or playing use. (*See* GREENS.)

LAWN TENNIS and **TENNIS.** These two games are closely connected by origin—lawn tennis may indeed be regarded as the descendant and supplanter of tennis—but their practice is widely different. The more popular, lawn tennis, will be considered first.



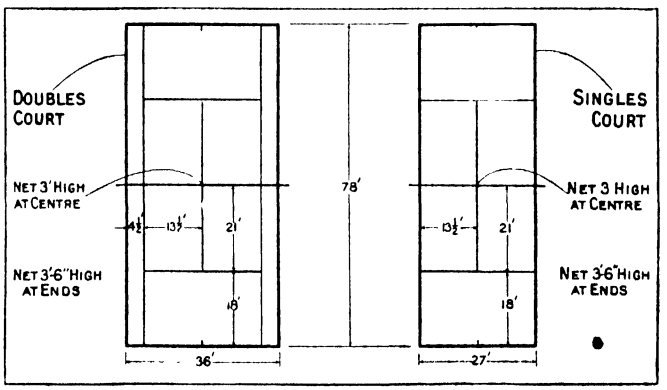
As an independent member of the family of ball-games, of which the parent root was probably buried in Egypt or Persia 500 years before the Christian era, lawn tennis is relatively modern and its struggles for corporate existence are well within the memory of living men. Lawn tennis had its beginning in England as a pleasant and not too taxing variant to old-established games. Now lawn tennis can claim more adherents throughout the world than any other independent ball-game; it has become a pastime for all civilized races. It is practised much more extensively on non-turf than on turf surfaces; it is played indoors as well as out-of-doors, by night as well as by day, by women even more than by men. The name of lawn tennis is still honoured and officially adopted in Anglo-Saxon countries, but throughout the Continent of Europe, in South Africa, in the East (except among British residents in India), and with increasing habit in America, the contraction of tennis has been employed

HISTORY AND EVOLUTION

To Maj. Walter Wingfield, M.V.O., must be given the credit for first realizing that lawn tennis could be adapted to the needs of society. If he was not the inventor of the game, for precursors of it had been played informally some years previously, he deposited specifications in Feb. 1874, with a view to obtaining a patent for "a new and improved portable court for playing the ancient game of tennis." The principle involved the erection of two standards, 21 ft. apart, with an oblong net between them Triangular nets forming side walls to the courts were to be placed at right angles to the oblong net on either side; there were to be also a serving crease, in and out courts, right and left courts, and boundaries, marked with paint, coloured cord or tape. This was the hour-glass or "waist" court, introduced to the public by Maj. Wingfield under the ungainly name of Sphairistike. Neither court nor name was destined to live long, but the cult of lawn tennis was established. Croquet's supersession was for a time complete.

Conflicting Codes.—The worshippers, however, were not of one creed. Methods were various and laws were non-existent. The court was of no prescribed length or breadth, while the length of the net and the position of the service line were a matter of discretion. Relief in some measure was forthcoming in 1875, when

a sub-committee of the Marylebone cricket club framed a code of rules. It provided that the court be divided into two equal parts by posts seven feet in height, and 24 ft. apart, with a net five feet high at the posts and four feet high at the centre. Base-lines 30 ft. in length were to be drawn at a distance of 39 ft., and service lines at a distance of 26 ft. from the net. The players were to be distinguished as hand-in and hand-out. Hand-in alone could serve or score; and on losing a stroke he became hand-out. The service was to be delivered with one foot outside the base-line, and was required to drop between the net and the service line of the court diagonally opposite to that in which the server stood. If he failed to serve the ball over the net, he lost the stroke and became hand-out, but it was a fault only if the ball dropped in the wrong court or over the service line. The balls were to be two and a quarter inches in diameter and one and a half ounces in weight. The game was 15 up, as in rackets, but instead of being "set" at 14 all, the score was to be called deuce, then advantage as in tennis. In doubles matches, the partner of the striker out, might take a service dropping in the wrong court.



RACKET USED IN LAWN TENNIS

But the M.C.C. code, by retaining a combination of rackets and tennis scoring and adopting the hour-glass court, did not please more progressive opinion, and the discussions went on. Meanwhile, through the agency of Henry Jones, better known as "Cavendish," the game had been introduced into the ground of the All England croquet club at Wimbledon—an event destined to have a vital and permanent influence on its future. Early in 1877 the committee of the All England club added "Lawn Tennis" to their title and for a time all mention of croquet was dropped, members finding on the well-tended lawns an agreeable if rather too yielding surface for the practice of the new game. A little later in the same year the first championship meeting at Wimbledon was announced, the proprietors of the *Field* offering a silver challenge cup to the value of 25 guineas. Before the competition was decided—the first of an illustrious line which in 1928, 51 years later, was to attract a daily crowd of nearly 20,000 spectators and aspirants for the titles from 15 different nations—a sub-committee of the All England club devised a set of rules which, differing fundamentally from those of the M.C.C., introduced three principles that were to remain inviolate. These were: (1) the adoption of a rectangular court 26 yd. long by 9 yd. wide, the net being suspended from posts placed 3 ft. outside the court; (2) the adoption of tennis scoring in its entirety; and (3) the allowance of one fault without penalty, whether the service dropped in the net, in the wrong court, or beyond the service line.

First Championship Meeting.—The service line was still fixed 26 ft. from the net and the server still had his feet *à cheval* the base-line, but the height of the net was lowered to 3 ft. 3 in. at the centre and the balls were to be of not less than two and a half inches and not more than two and five-eighths inches in diameter, their weight ranging from one and a quarter to one and a half ounces. The first balls of india-rubber, used in the earliest days, were uncovered. The first mention of a white flannel cover appeared in the *Field* of Dec. 5, 1874. The balls used at the first championship meeting, made especially for the occasion, had white cloth covers sewn with unbleached carpet thread; the dyed thread used by certain makers was barred. The rackets of wooden frames strung with gut were pear-shaped, like tennis rackets; they did not become oval-shaped until 1880, and even later leading players remained loyal to a slight curve.

Fifty Years of Wimbledon.—Such were the conditions under which the first championship meeting was held—a meeting attracting 22 competitors of whom the majority were tennis or rackets players. The Wimbledon of 1877, with its standless courts, and its general air of calm, bore little resemblance to the Wimbledon of 1928, with its crowds of spectators of all races and its giant concrete stadium, the largest match arena in the world. The All England club had a decisive influence on the history of the game. For the first critical decade, when rules had to be amended, traditions founded and a new cult consolidated, the committee of the All England club was the sole legislative authority. The Lawn Tennis Association was not founded until 1886; the International Lawn Tennis Federation, with headquarters in Paris, not until 1912. It was at the All England club's instigation that, in 1878, the height of the net was reduced to 4 ft. 9 in. at the posts and to 3 ft. at the centre; simultaneously the service line was brought 4 ft. nearer the net and the balls increased in weight to two ounces. In 1880 the net was lowered at the posts to 4 ft., the service line brought in to a distance of 21 ft. from the net; the limits of variation in the size and weight of the balls were fixed; the server, though still required to have one foot behind the base-line, was allowed the option of placing the other foot either within or upon it; a service not delivered in accordance with the laws was declared a fault, and a service touching the net, but otherwise good, was declared a "let"; a player was forbidden under penalty of losing the stroke to touch the net or to volley the ball before it had passed the net; and on application by either party before tossing for choice the umpire might direct the players to change sides after every game. In three respects—in the lowering of the net at the posts to 3 ft. 6 in., in bringing both feet of the server behind the base-line, and in ordaining that players shall change sides after every odd game—these laws have been changed since, but in principle the code of 1880 is the code of 1929—not only in England but throughout the world.

The Renshaw's Influence.—The first champion was Spencer W. Gore, an old Harrovian and a rackets player. Like his rivals, he used a service delivered from a point level with his shoulder, but "kept up his sleeve" an underhand cut service He was also the first to realize, as the fundamental principle of lawn tennis, the necessity of forcing his opponent to the base-line; he would then approach the net and, by using his long reach and flexible wrist, volley the ball for a winning point Thus the volley was vindi-

THE GROUND PLANS AND MEASUREMENT OF DOUBLES AND SINGLES COURTS OF LAWN TENNIS

cated at the first Wimbledon, but its success was mainly due to the loop-shaped net and to the inability of the opponent to drive down the side lines. The lowering of the net at the posts and the introduction of the lob (P. F. Hadow, the second champion, beat Gore with its aid in 1878) temporarily ousted the volley and it was not revived until, with spectacular effect, the Renshaw brothers, William and Ernest, appeared on the scene in 1880. Their advent enabled the game to shake itself free from the shackles of tennis and rackets. They were young and agile enough to invent new and devastating strokes; the real parents of the modern game,

they revealed its potentialities of speed and courtcraft. William was champion for seven years, Ernest for only one, but both in singles and doubles the twins dominated the game for a decade.

But in killing safety play and long rests (*i.e.*, rallies)—in a match at Prince's club in 1880 between Lawford and E. Lubbock a rest of no less than 81 strokes was witnessed—the Renshaws introduced a "reign of terror." Older players, lacking the sprightliness of the brothers, were inclined to revolt. They could not achieve three or four sharp repartees from the service line, followed by a smash from the vicinity of the net—the Renshaw prerogative. The lowering of the net six inches at the posts in 1882—a decree which cost the brothers their Irish titles at Dublin and their English at Oxford—allowed back-court players to find openings down the side lines, but the brothers were adventurous enough to move their volleying base forward; they were doubles champions in all for seven years. In 1885 Bagnall Wild's system of drawing, with the bye in the later round eliminated, was introduced at Wimbledon; it is now in universal vogue for championship and tournament play. In the same year the server was permitted to lift the foot from the ground behind the base-line without a penalty, and a ball hit round the net post and falling into court was declared to be valid.

Ireland was the first to establish a women's championship event in Dublin in 1879; Wimbledon did not follow suit until 1884 when, from a field of 13, Miss Maud Watson emerged victorious. Her nearest rival was Miss Bingley (afterwards Mrs. G. W. Hillyard), who was destined to win the title six times—a record eclipsed by Mrs. Lambert Chambers, who won it seven times, and equalled by Mlle. Lenglen.

For the first 30 years of its existence (1877 to 1906) the men's singles championship at Wimbledon was won by an English or Irish player; during the next 18 years (1907 to 1928, the war period closing the championship for four years) the title was only twice won by a home competitor—A. W. Gore in 1908 and 1909. From 1905 (when Miss M. Sutton, of California, was victorious) to 1928 the women's championship went to an overseas competitor ten times. These relative figures were a remarkable tribute to developing skill in other lands. Australia, through Norman Brookes, was the first to break through the citadel at Wimbledon in 1907; New Zealand followed with Capt. A. F. Wilding (killed in action in Flanders in 1915), who held the title for four successive years. After the World War it was won twice by Australia (G. L. Patterson in 1919 and 1922), three times by the United States (W. T. Tilden in 1920 and 1921, and W. M. Johnston in 1923), and five times by France (J. Borotra in 1924 and 1926, R. Lacoste in 1925 and 1928, H. Cochet in 1927). The reasons for "oversea" success at Wimbledon and elsewhere, notably in the Davis cup, the international team championship of the world, were several and varied. There was no reluctance in America to cultivate lawn tennis in the schools and universities, nor had the youth of America, nor of France, to shed the disturbing habits of other games like cricket, with its different footwork and stroke-play. Climatic stability was another material factor; conditions were more uniform and tractable, development more rapid. In California, the home of many great players, for example, it was possible to pursue lawn tennis under consistent conditions the whole year round. France had a winter outdoor season on the Riviera as well as a winter indoor season in Paris; her young players had increasing facilities for keen competition. Australia and South Africa were also favoured by climate, beneficial alike to continuous practice and physical training.

Handicapping.—The original handicapping, it may be noted, was by bisques, borrowed from tennis. A bisque was one stroke which might be claimed at any time during a set, except that it might not be taken after the delivery of the service, nor by the server after a fault, though in this case the receiver might take it. In 1890 bisques were abolished, and instead of the alternating odds of half-15, half-30, etc., smaller fractional parts—one-quarter, two-quarters, and three-quarters of 15—were introduced, these being given or owed in augmentation of other odds. This system was superseded in 1894 by substituting sixths of 15 for quarters, to be given or owed in accordance with a differential table. For example, if A received three-sixths and B received 30, A would concede B 15 and four-sixths in every set—that is, B would receive two strokes in four games out of six and one stroke in each of the remaining two games.

CHAMPIONS OF MARK

Wimbledon's championship roll, which is appended, reveals, in both sexes, the dominating influence of individual players. Their styles and personalities were distinctive, but each successive champion expressed the development of stroke play and tactics. If the Renshaws were the first to quicken movement, introduce the volley as a decisive complement of the drive, and reveal the winning efficacy of the "all-court" game, their successors have built boldly on this foundation and evolved an art which, in its highest expression, demands the agility and stamina of youth, the wisdom of experience and the tenacity and resource of a strong character. The brothers Doherty (champions in singles and doubles for a decade) typified the effortless ease of a natural style. Dr. Joshua Pim, of Ireland, though less consistent in his play, had the same inborn capacity and required even less practice to exploit his skill. W. A. Larned (U.S.A), A. F. Wilding and R. Lacoste were, on the other hand, champions who cultivated expert talent by constant practice. Pioneers in advancing the science of the game had been N. E. Brookes, of Australia, who, through the service and the volley to its reply, accelerated the attack; Holcombe Ward (champion of America in 1904), who used the break service in its most sinister form; Beals C. Wright (champion of America in 1905), who made the chop-stroke and the lob deadly accessories in a tactical campaign; W. M. Johnston, of California, who, by his perfect timing, proved that maximum speed can be acquired by a small man; William T. Tilden (champion of America for six successive years, 1920–25), the most versatile player of his age, endowed with great strength and stamina, and a master of tactics; J. Borotra, of France, who, by mobility and courage, revealed the volleying game in a new and spectacular light; André Gobert, the French stylist, whose fast service and polished volleying, exploited on a wood surface under cover, inspired his compatriots; and M. E. McLoughlin, of California, and G. L. Patterson, of Australia, who were pioneers of the "cannon-ball" service. Women players who have left their mark on the game, advancing its standard in their own epoch, include Miss L. Dod, of England, who was a champion (1887) at 15 years of age; Mrs. G. W. Hillyard, the most tenacious base-line player of the first two decades; Mrs. Lambert Chambers (née Douglass), whose driving strokes, perfectly timed and graduated in speed, had their consistent accuracy; Miss May Sutton (afterwards Mrs. Bundy), the first American to win a championship at Wimbledon; Mlle. Suzanne Lenglen (born at Compiègne, France, May, 1899), who won her first championship at St. Cloud in 1914, was undefeated in singles at Wimbledon from 1919 to 1925, was mistress of every orthodox stroke, executed with effortless ease and unfailing judgment, and gave women's lawn tennis, and indeed the game itself, a wide and progressive publicity; Miss Helen Wills, of California, who increased the pace of women's driving to that of her male contemporaries; and Señorita Elia de Alvarez, born of Spanish parents in Italy, a brilliant and versatile stroke-player possessing a natural genius for the game.

CHAMPIONSHIP ROLL AT WIMBLEDON FROM 1910

Singles	*Women's Singles*
1910. A. F. Wilding	1910. Mrs. Lambert Chambers

1925. J. Borotra and Mlle. Lenglen
1926. L. A. Godfree and Mrs. Godfree
1927. F. T. Hunter and Miss Ryan
1928. P. D. B. Spence and Miss Ryan

The Davis Cup.—The Davis cup, the international team championship, was founded in 1900, originally to promote an annual contest between America and the British Isles. The donor was Dwight F. Davis, of St. Louis, Mo., American doubles champion from 1899–1901, afterwards secretary of war in President Coolidge's cabinet. From two, in its first three years, the competing countries increased steadily until, in 1928, the total number was 34. In 1923, to ease the time and expense of travelling teams, the challenging nations were divided into two zones (Europe and America), the winner of each meeting to decide which should challenge the champion country. The appended table shows the results of the challenge rounds. America has won the cup 10 times, England (with Ireland) five times, Australia (with New Zealand) six times, and France twice. Until 1927, when France gained her first victory, the championship had always been held by an English-speaking country, employing turf courts for the challenge round. In 1928 the decisive round was played for the first time on an artificial surface (tennisol), manufactured by a French company in Paris. All Davis cup ties comprise five matches, four singles and one doubles match. From 1925 to 1927 the draw was made at the White House, Washington, those present including the President of the United States and the diplomatic representatives of the competing countries. In 1928 the draw was made at the Elysée, the president of the French Republic taking part.

DAVIS CUP CHALLENGE ROUNDS

Date	*Place*	*Result*
1900	Boston, U.S.A.	America beat British Isles †3–0
1902	New York	America beat British Isles 3–2
*1903	Boston, U.S.A	British Isles beat America ‡4–1
1904	Wimbledon	British Isles beat Belgium 5–0

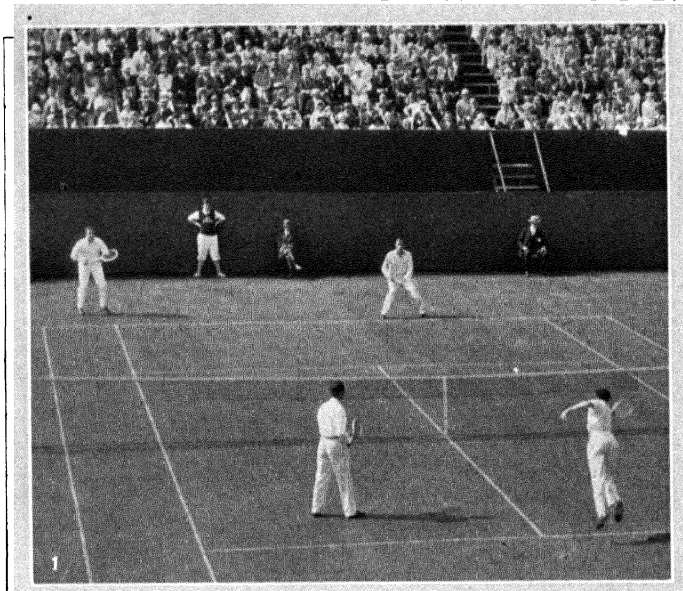
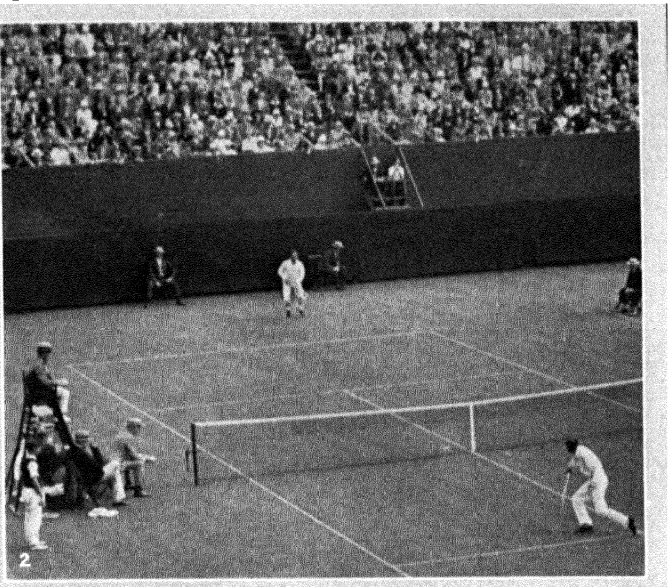
1926	Philadelphia	America beat France 4–1
*1927	Philadelphia	France beat America 3–2
1928	Paris	France beat America 4–1

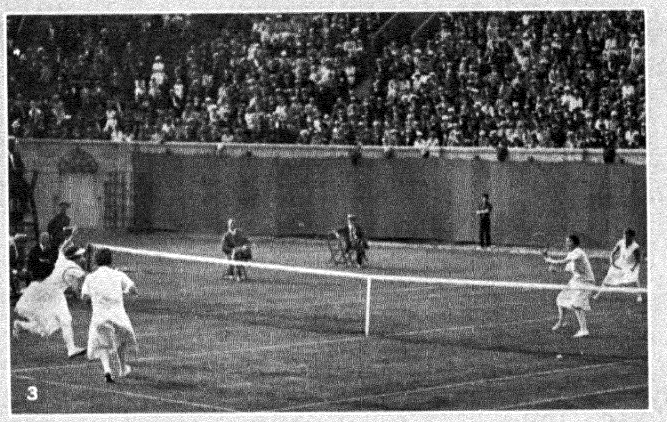
In 1901, 1910, 1915, 1916, 1917 and 1918 there were no matches.
*Holders defeated.
†One match drawn.
‡One match won by default.



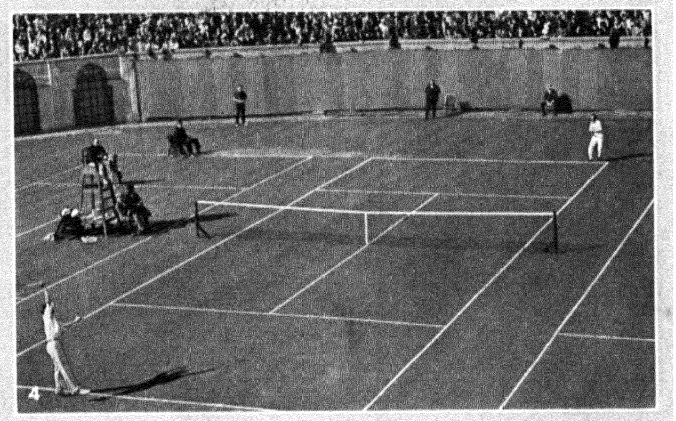
The Wightman Cup.—An international match between British and American women players was founded in 1923, Mrs. George W. Wightman, of Boston, American champion for four years, presenting a cup for annual competition, decided alternately in the two countries. Five singles and two doubles matches are contested. America won the first contest at Forest Hills (N.Y.), by seven matches to nil; England in 1924 at Wimbledon by six matches to one; England at Forest Hills in 1925 by four matches to three; America at Wimbledon in 1926 by four matches to three; America in 1927 at Forest Hills by five matches to two; England in 1928 at Wimbledon by four matches to three.



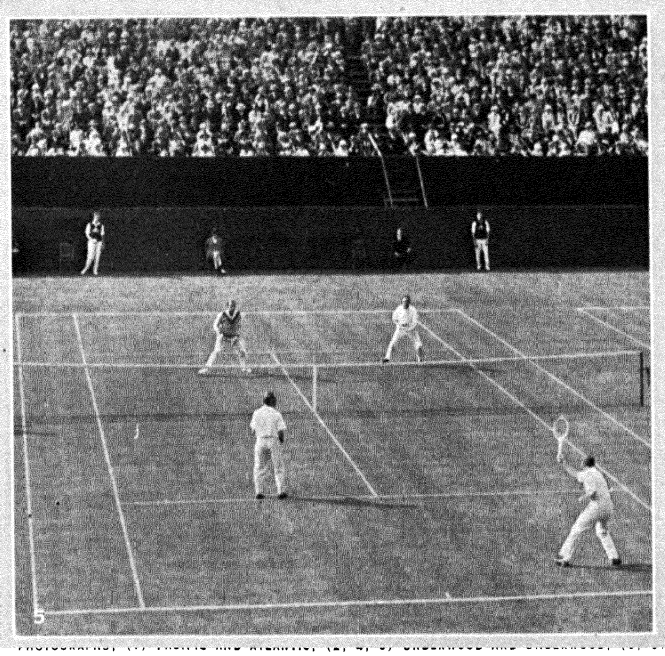
(A. W. M.)



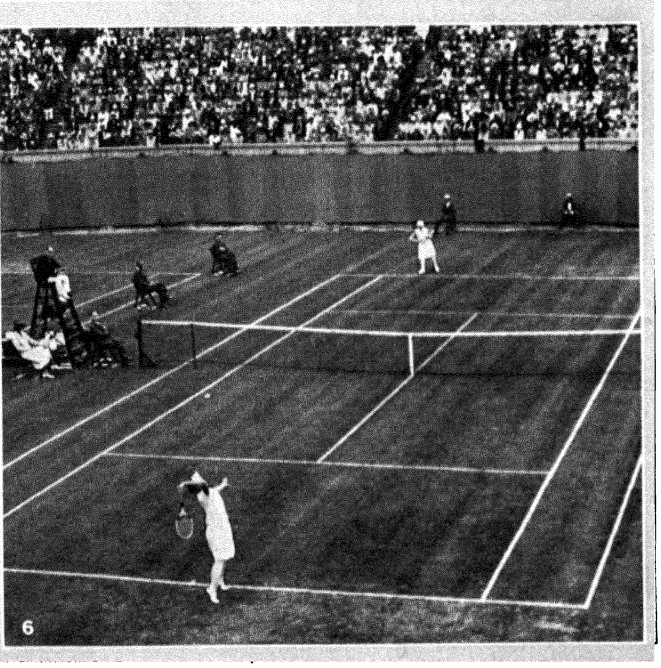
THE UNITED STATES



Just when lawn tennis was introduced into the United States, and by whom, is a matter of conjecture. It is said that Miss Outerbridge spent the winter in Bermuda in 1874, and found the game being played there by British officers attached to the regiments stationed in Bermuda. She obtained from the regimental supply, some racquets and a net, which she brought back with her in the spring of that year. There was some difficulty in getting the outfit through the custom house, as no one knew what it was, or at what rate to assess duty on it. Miss Outerbridge obtained permission from her brother, who was a director of the Staten island cricket and baseball club, to mark off a court, and to set up her net in a corner of the grounds.



Shortly afterwards, James Dwight obtained a set from England. Dwight always claimed that the first court in the United States was laid out along one side of the Longwood cricket club's grounds. Others claimed the distinction for Nahant, near Boston. In the autumn of that year (1874), Sherman of Newport had imported a set and within the following year Newport could boast of three sets of equipment, all privately owned. It is generally agreed that lawn tennis made its appearance in America a few months after its introduction in England. By 1878 it was being actively played by a few enthusiasts. The first two players on record in America were James Dwight, and F. P. Sears, the brother of R. D. Sears who was later to be the first national champion. Tournaments were held as the interest in tennis grew, but conditions varied at each meeting, and the implements and equipment were not standardized. On May 21, 1881, a meeting was called, 33 clubs taking part, and the United States Lawn Tennis association was formed, with Gen. Oliver as its first president. From that time the association has had control of all national championship tournaments played in the United States.



TOURNAMENT MATCHES

1. View of the match in which W. T. Tilden, 2nd, and Francis T. Hunter defeated J. Brugnon and J. Borotra. Davis Cup matches, Germantown, Pa., 1927
2. General view of the Tilden-Cochet match for the Davis cup, Germantown, Pa., 1927, won by Tilden. Tilden may be seen in the foreground
3. Doubles matches in the Women's National Tennis Tourney (1925) at Forest Hills, Long Island. Helen Wills and Mary K. Brown (foreground) beat May Sutton Bundy and Elizabeth Ryan in the final match
4. Tilden beating Johnston in the match for the National championship (1925). Forest Hills, Long Island
5. Tilden and Johnston beating Gerald Patterson and Ohara Wood (Australians) in the Davis Cup tournament held at Germantown, Pa., 1924
6. General view of the Wills-Godfree match at the Wightman Cup tournament, Forest Hills, L.I., 1927. Helen Wills is in the foreground

Championships.—The first championships for men, sanctioned by the new association, which were open to all-comers and played under uniform conditions, were held at the Casino, Newport, R.I., in Aug. 1881, the winner in the singles being R. D. Sears, and the winners in the doubles, C. M. Clark and F. W. Taylor. The championship was held at Newport for 34 consecutive years. From 1915 to 1920, the contest took place at the West Side Tennis Club at Forest Hills, L.I., and from 1921 to 1923 at the Germantown Cricket Club in Philadelphia. In 1924, after the completion of the West Side Tennis Club stadium, the championship contest returned to Forest Hills. National championships have been held each year since 1881, with the exception of 1917. In that year, only patriotic tournaments were sanctioned by the association, on account of the World War. The "challenge round" was instituted in 1884, and abandoned after the 1911 championship. During these years, the champion "stood out"—did not play through the tournament—and met the winner of the "all-comers" in a challenge round for the title. The development of women's tennis has followed, more or less, the same course as has that of men's tennis. The first national women's championship was held at the Philadelphia cricket club in 1887, and was won by Miss Ellen F. Hansell. The meeting was held there annually until 1921 when it was changed to Forest Hills.

The annual events for the various championship titles of the United States which are sanctioned by the Tennis Association are —the men's singles and doubles, the women's singles and doubles, the mixed doubles, the veterans' singles and doubles, the father and son doubles, the junior singles and doubles, the boys' singles and doubles, the girls' singles and doubles, the indoor singles and doubles for men and for women, the indoor mixed, the indoor junior singles and doubles, the boy's indoor singles, the girls' indoor singles and doubles, the hard-court girls' singles and doubles, the men's clay court singles and doubles, the intercollegiate singles and doubles, first held at Hartford in 1883, the public parks singles and doubles and the interscholastic singles, first held at Cambridge in 1891.

A word must be said of the part that the U.S. Lawn Tennis Association has played in the advancement of the game. It is responsible for the organized development of tennis in the United States, and has furthered and encouraged the sport since 1881. It has a constitution and its officers are elected annually. It is a member of the International Federation of Lawn Tennis Playing Countries. The lawn tennis clubs throughout the United States belong to sectional associations, which in turn, are members of the national association. Each section has its championship meetings, and the winning players are eligible to compete in the national championships.

Not only has the association furthered tennis at home; it has also encouraged both men and women players in international competition. The Davis and Wightman Cups are examples of this. The Davis Cup matches were inaugurated in 1900, the cup being presented by Dwight F. Davis. With the exception of 1901 and 1910, contests were held annually until 1914, the challenge round of that year being played just prior to the outbreak of the World War. Competition was suspended during the war, and was not resumed until 1919. In 1904, 1912 and 1919, the United States did not compete. The United States won the cup ten times, the British Isles five times, Australia six, and France twice, up to the year 1928. The plan of play is that the holding country stands out, while the competing countries play off in two zones, for the right to meet the holders in the "challenge round," which is played in the holder's country.

What the Davis Cup has done for men's tennis, the Wightman Cup has done for women's tennis. It was presented by Mrs. George W. Wightman for competition between women players of England and America, and was played for first at Forest Hills in 1923. The matches, which are annual, are played alternately at Wimbledon and at Forest Hills. In each series of matches, there are five singles and two doubles. The cup, which is a perpetual trophy, was won by the United States in 1923, 1926, 1927 and by England in 1924, 1925 and 1928.

COVERED COURTS

The game was planted in France at Cannes by English visitors in 1881; it took root in Paris some years later. The French championship, played on hard courts and confined to nationals, was instituted in 1891; in 1925 entries were accepted from all countries. The "World's hard court championship" was founded at the Stade Français, St. Cloud, in 1912, but when America joined the International Federation after the World War, this title, by general agreement, was abandoned. The Tennis Club de Paris at Auteuil was the first recognized covered court in France; it started an open tournament in 1895; it was the visits of British players to this meeting at Easter which first fired French zeal. The Racing Club and the Sporting Club de Paris (with well-appointed covered courts) are other leading clubs which have produced fine players. A. H. Gobert and J. Borotra have both been French holders of the British covered court championship, decided at Queen's club, West Kensington; and M. Decugis, another French champion, won the London covered court championship as well as the doubles championship at Wimbledon. Sweden, Denmark, Germany and Switzerland have covered courts, of which the oldest and best known is the Royal club, at Stockholm, founded by the crown prince of Sweden (afterwards King Gustav). Covered courts in England were originally transformed roller-skating rinks. The earliest was in Portsdown road, Maida Vale; the run-back and side-room were painfully inadequate and the roof too low, but the floor of black asphalt made an ideal surface—fast and glossy, with little or no reflection. The Hyde Park court in Dorchester square was opened in 1885 on the occasion of the first covered court championship, won by H. F. Lawford in the absence of the Renshaws. Two covered courts were constructed at Queen's club in 1889 and the championship transferred there in 1895.

RULES OF LAWN TENNIS

THE SINGLES GAME

1. The court shall be a rectangle, 78 ft. long and 27 ft. wide. It shall be divided across the middle by a net, suspended from a cord or metal cable of a maximum diameter of one-third of an inch, the ends of which shall be attached to, or pass over, the tops of two posts, 3 ft. 6 in. high, which shall stand 3 ft. outside the court on each side. The height of the net shall be 3 ft. at the centre, where it shall be held down taut by a strap not more than 2 in. wide. There shall be a band covering the cord or metal cable at the top of the net for not less than 2 in. nor more than 2½ in. in depth on each side. The lines bounding the ends and sides of the court shall respectively be called the base-lines and the side-lines. On each side of the net, at a distance of 21 ft. from it and parallel with it, shall be drawn the service-lines. The space on each side of the net between the service-line and the side-lines shall be divided into two equal parts called the service-courts by the centre-service-line, which must be two inches in width drawn half-way between, and parallel with, the side-lines. Each base-line shall be bisected by an imaginary continuation of the centre-service-line to a line 4 in. in length and 2 in. in width called the centre-mark drawn inside the court, at right angles to and in contact with such base-line. All other lines shall be not less than 1 in. nor more than 2 in. in width, except the base-lines, which may be 4 in. in width, and all measurements shall be made to the outside of the lines.

Note.—In the case of the International Lawn Tennis championship (Davis cup) or other official championships of the International Federation, there shall be a space behind each base-line of not less than 21 ft., and at the sides of not less than 12 feet.

2. The permanent fixtures of the court shall include not only the nets, posts, cord or metal cable, strap and band, but also, where there are any such, the back and side stops, the stands, fixed or moveable seats and chairs round the court, and their occupants, all other fixtures around and above the court, and the umpire, foot-fault judge and linesmen when in their respective places.

3. The ball shall be more than 2½ in. and less than 2⅝ in. in

diameter, and not less than 2 oz. nor more than $2\frac{1}{16}$ oz. in weight. The ball shall have a minimum bound of 50 in. and a maximum bound of 60 in., when dropped 100 in. at a temperature approximating to 68° F upon a concrete base, and a deformation of not less than ·290 in. and not more than ·315 in. when subjected to a pressure of 18 lb. applied to each end of any diameter at a temperature approximating to 68° F. All tests for deformation shall be carried out in accordance with the instructions contained in the Appendix hereto.

4. The players shall stand on opposite sides of the net; the player who first delivers the ball shall be called the server, and the other the receiver.

5. The choice of sides and the right to be server or receiver in the first game shall be decided by toss. If the winner of the toss choose the right to be server or receiver, his opponent shall have the choice of sides. If the winner of the toss take the choice of sides his opponent shall have the right to be server or receiver. The winner of the toss may, if he prefer it, require his opponent to make the first choice.

6. The service shall be delivered in the following manner. Immediately before commencing to serve, the server shall stand with both feet at rest behind (*i.e.*, farther from the net than) the base-line, and within the imaginary continuations of the centre-mark and side-line. The server shall then project the ball by hand into the air *in any direction* and strike it with his racket, and the delivery shall be deemed to be completed at the moment of the impact of the racket and the ball. A player with the use of only one arm may utilize his racket for the projection.

7. The server shall throughout the delivery of the service: (*a*) not change his position by walking or running; (*b*) maintain contact with the ground; (*c*) keep both feet behind (*i.e.*, farther from the net than) the base-line.

8. In delivering the service, the server shall stand alternately behind the right and left courts, beginning from the right in every game. The ball served shall pass over the net and hit the ground within the service-court which is diagonally opposite, or upon any line bounding such court, before the receiver returns it.

9. The service is a fault: (*a*) if the server commit any breach of rules 6, 7, or 8; (*b*) if he miss the ball in attempting to strike it; (*c*) if the ball served touch a permanent fixture (other than the net, strap or band) before it hits the ground.

10. After a fault (if it be the first fault) the server shall serve again from behind the same half of the court from which he served that fault, unless it was a fault because he served from behind the wrong half, when he shall be entitled to deliver one service from behind the other half. A fault may not be claimed after the next service has been delivered.

11. The server shall not serve until the receiver is ready. If the latter attempt to return the service, he shall be deemed ready. If, however, the receiver signify that he is not ready, he may not claim a fault because the ball does not hit the ground within the limits fixed for the service.

12. The service is a let: (*a*) if the ball served touch the net, strap or band, provided the same be otherwise good; (*b*) if a service or fault be delivered when the receiver is not ready (*see* rule 11). In case of a let, the service counts for nothing, and the server shall serve again, but a let does not annul a previous fault.

13. At the end of the first game the receiver shall become server, and the server receiver; and so on alternately in all the subsequent games of a match. If a player serve out of turn, the player who ought to have served shall serve as soon as the mistake is discovered, but all points scored before such discovery shall be reckoned. If a game shall have been completed before such discovery, the order of the service remains as altered. A fault served before such discovery shall not be reckoned.

14. A ball is in play from the moment at which it is delivered in service (unless a fault or a let) and remains in play till the point is decided.

15. The server wins the point: (*a*) if the ball served touch the receiver or anything which he wears or carries before it hits the ground; (*b*) if the receiver otherwise lose the point as provided by rule 17.

16. The receiver wins the point: (*a*) if the server serve two consecutive faults; (*b*) if the server otherwise lose the point as provided by rule 17.

17. A player loses the point if: (*a*) he fail, before the ball in play has hit the ground twice consecutively, to return it directly over the net (except as provided in rule 20 [*c*]); or (*b*) he return the ball in play so that it hits the ground, a permanent fixture, or other object, outside any of the lines which bound his opponent's court; or (*c*) he volley the ball and fail to make a good return even when standing outside the court; or (*d*) he touch or strike the ball in play with his racket more than once in making a "stroke"; or (*e*) he or his racket (in his hand or otherwise) or anything which he wears or carries, touch the net, posts, cord or metal cable, strap or band, or the ground within his opponent's court at any time while the ball is in play; or (*f*) he volley the ball before it has passed the net: or (*g*) the ball in play touch him or anything that he wears or carries, except his racket in his hand or hands; or (*h*) he throws his racket at and hits the ball.

18. A ball falling on a line is regarded as falling in the court bounded by that line.

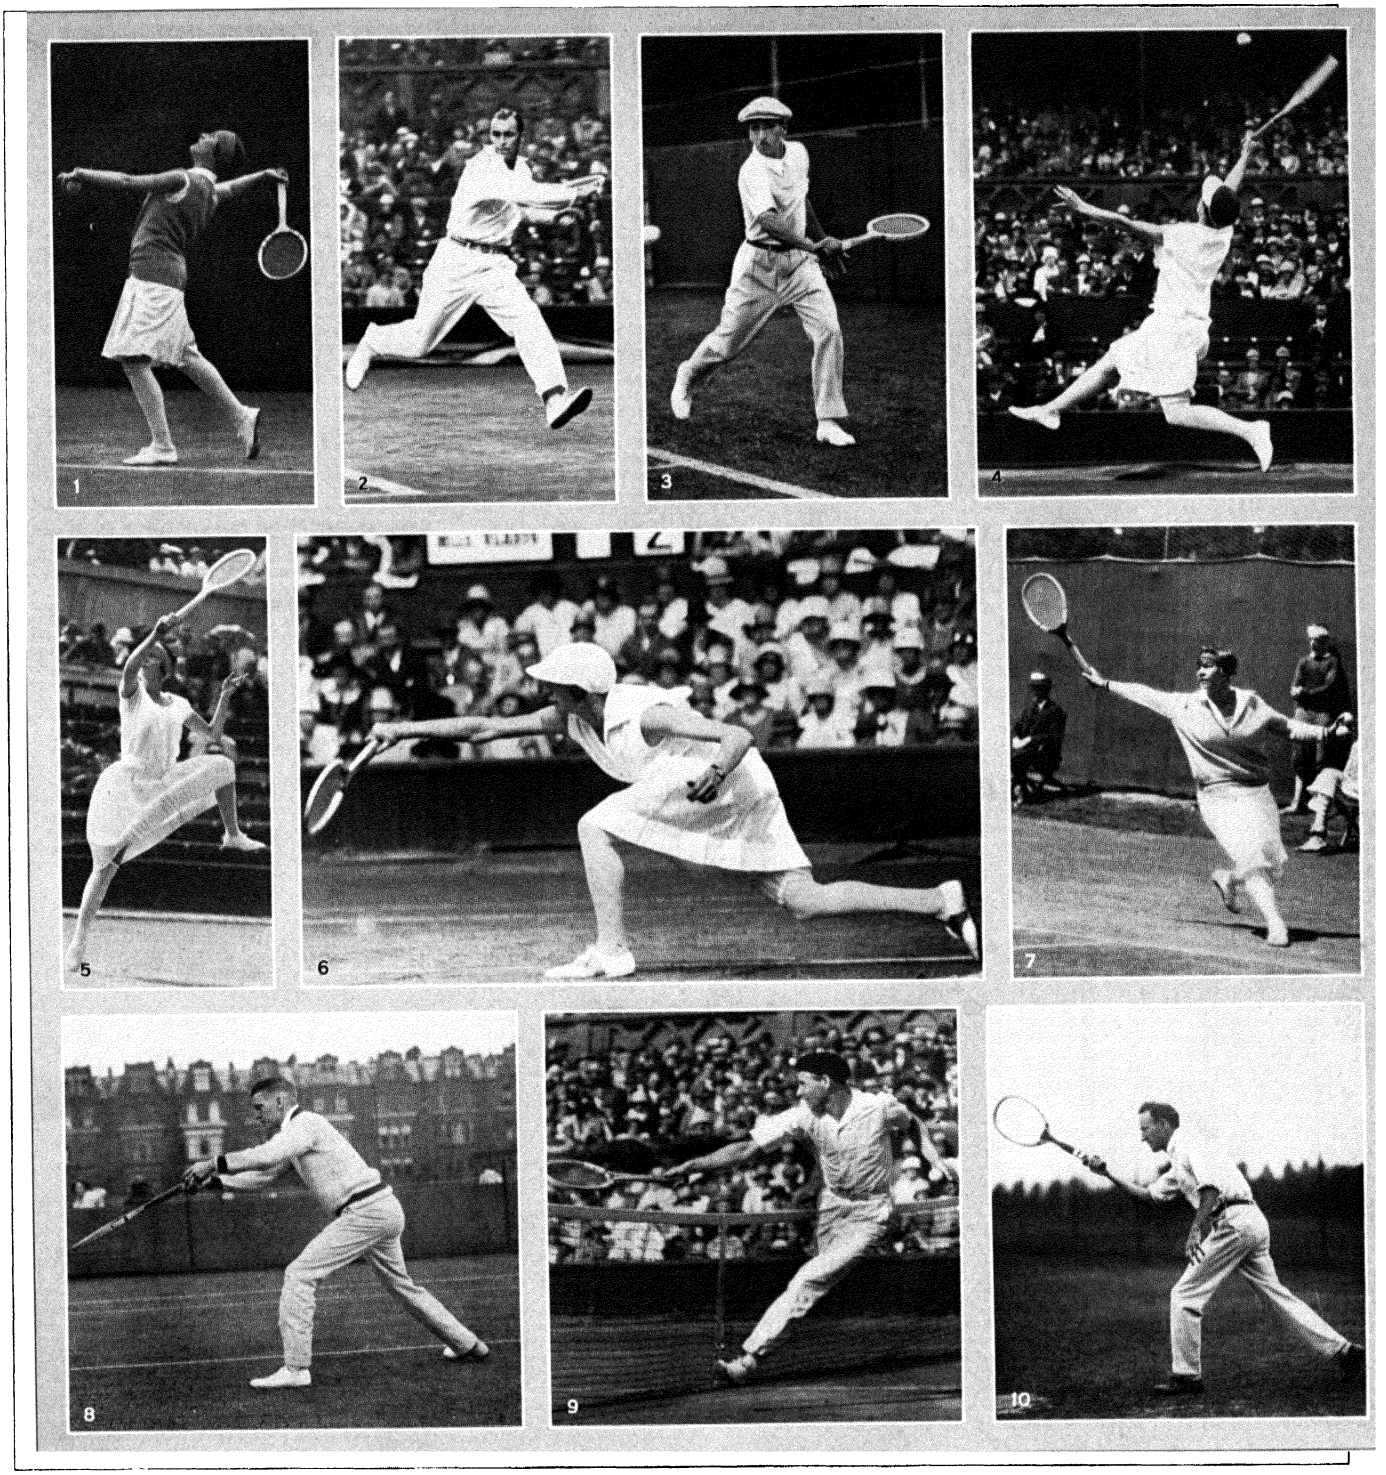
19. If the ball in play touch a permanent fixture (other than the net, posts, cord or metal cable, strap or band) after it has hit the ground, the player who struck it wins the point; if before it hits the ground his opponent wins the point.

20. It is a good return: (*a*) if a ball touch the net, posts, cord or metal cable, strap or band, provided that it passes over any of them and hits the ground within the court; (*b*) if the ball, served or returned, hit the ground within the proper court and rebound or be blown back over the net, and the player whose turn it is to strike reach over the net and play the ball, provided that neither he nor any part of his clothes or racket touch the net, posts, cord or metal cable, strap or band or the ground within his opponent's court, and that the stroke be otherwise good; (*c*) if the ball be returned outside the post, either above or below the level of the top of the net, even though it touch the post, provided that it hits the ground within the proper court; (*d*) if a player's racket pass over the net after he has returned the ball provided the ball pass the net before being played and be properly returned; (*e*) if a player succeed in returning the ball, served or in play, which strikes a ball lying in the court.

21. In case a player is hindered in making a stroke by anything not within his control, except a permanent fixture of the court, the point shall be replayed.

22. If a player wins his first point, the score is called 15 for that player; on winning his second point, the score is called 30 for that player; on winning his third point, the score is called 40 for that player, and the fourth point won by a player is scored game for that player, except as below:—

If both players have won three points, the score is called deuce; and the next point won by a player is scored advantage for that player. If the same player wins the next point, he wins the game; if the other player wins the next point the score is again called deuce; and so on until a player wins the two points immediately following the score at deuce, when the game is scored for that player.



23. The player who first wins six games wins a set except as below:—

If both players have won five games, the score is called games-all, and the next game won by a player is scored advantage game for that player. If the same player wins the next game, he wins the set; if the other player wins the next game, the score is again called games-all; and so on until a player wins two games more than his opponent, when the set is scored for that player.

24. The players shall change sides at the end of the first, third and every subsequent alternate game of each side, and at the end of each set unless the total number of games in such set be even, in which case the change is not made until the end of the first game of the next set.

25. The maximum number of sets in a match shall be five, or, where women take part, three.

26. Except where otherwise stated, every reference in these rules to the masculine includes the feminine gender.

*

27. In matches where an umpire is appointed, his decision shall be final; but where a referee is appointed, an appeal shall lie to him from the decision of an umpire on a question of law, and in all such cases the decision of the referee shall be final. The referee, in his discretion, may at any time postpone a match on account of darkness or the condition of the ground or the weather. In any case of postponement the previous score and previous occupancy of courts shall hold good, unless the referee and the players unanimously agree otherwise.

28. Play shall be continuous from the first set until the match be concluded; provided that after the third set, or when women take part, the second set, either player is entitled to a rest, which shall not exceed ten minutes, and provided further that when necessitated by circumstances not within the control of the players, the umpire may suspend play for such a period as he may consider necessary. These provisions shall be strictly construed, and play shall never be suspended for the purpose of allowing a player to recover his strength or his wind. The umpire shall be the sole judge of intentional delay, and after giving due warning he may disqualify the offender.

Note.—Any nation is at liberty to modify the first provision of this rule or omit it from its regulations governing tournaments, matches or competitions held in its own country, other than the International Lawn Tennis Championship (Davis cup).

THE DOUBLES GAME

29. The above rules shall apply to the doubles game except as below.

30. For the doubles game, the court shall be 36 ft. in width, *i.e.*, 4½ ft. wider on each side than the court for the singles game, and those portions of the singles side-lines which lie between the two service-lines shall be called the service-side-lines. In other respects the court shall be similar to that described in rule 1, but the portions of the singles side-lines between the base-line and the service-line on each side of the net may be omitted if desired.

31. The pair who have the right to serve in the first game of each set may decide which partner shall do so, and the opposing pair may decide similarly for the second game. The partner of the player who served in the first game shall serve in the third; the partner of the player who served in the second game shall serve in the fourth, and so on in the same order in all the subsequent games of a set. The order of service having been arranged may not be altered during the set, but it may be changed at the beginning of each new set. Similarly, the receivers may not change places with each other for the purpose of receiving the service before the end of a set, but they may do so at the beginning of a new set.

32. The service is a fault as provided for by rule 9, or if the ball served touch the server's partner or anything which he wears or carries; but if the ball served touch the partner of the receiver or anything which he wears or carries, before it hits the ground, the server wins the point.

33. If a partner serve out of his turn, the partner who ought to have served shall serve as soon as the mistake is discovered, but all points scored, and any fault served before such discovery, shall be reckoned. If a game shall have been completed before such discovery, the order of service remains as altered.

34. The players to receive the service shall receive it alternately throughout each game. The order thus established shall not be altered during the set.

35. The ball shall be struck alternately by one or other player of the opposing pairs, and if a player touch the ball in play with his racket in contravention of this rule, his opponents win the point.

APPENDIX TO RULES

1. In all tests for deformation conducted under rule 3, the machine designed by Percy Herbert Stevens and patented in Great Britain under patent No. 230,250, together with the subsequent additions and improvements thereto, shall be employed.

2. The test shall be conducted at a temperature of approximately 68° F and any ball to be tested shall be of that temperature throughout when the test is commenced.

3. Immediately before any ball is tested it shall be dropped four times from a height of 100 in. on a concrete base.

4. To ascertain the deformation of any ball, three readings shall be taken—one each of three diameters at right angles to one another—so chosen that initially neither platen of the machine shall be in contact with any part of the cover seam. The average of these three readings shall be the deformation reading.

5. After the ball has been placed in position, the contact weight applied, the beam brought to the pointer level, the pointers set at zero, and the test weight placed on the beam, the pressure shall then be applied to the ball by turning the hand wheel at a uniform speed, and exactly five seconds shall elapse from the instant the beam leaves its seat until it is brought to the pointer level, whereupon the turning shall cease and the reading shall be taken.

6 The limits specified are fixed for a test conducted in an atmospheric pressure resulting in a barometric reading of approximately 29·95.

Heathcote, "Lawn Tennis," in the *Badminton Library* (1903); *Ayres' Lawn Tennis Almanack* (1908 and annually); A. Wallis Myers, *The Complete Lawn Tennis Player* (1908, revised ed., 1912). (A. W. M.)

TECHNIQUE OF PLAYING TENNIS

The technique of lawn tennis is based on two distinct factors,—the proper application of energy to the flight and control of the ball, and the proper application of energy to play in relation to an opponent. The first factor presents two basic phases: soundness and variety.

Soundness.—If the ball is not correctly stroked, successful tennis cannot result. Sound stroking controls the ball without conscious thought and with a minimum of expended energy. Unsound stroking produces erratic play and results in premature exhaustion. Soundness is usually acquired by stroke development through years of practice, although occasionally it is a natural gift. Suzanne Lenglen is an outstanding example of the former; Vincent Richards of the latter.

Variety.—By use of the spin, imparted to the ball by wrist movements during the production of the stroke, the actual flight and bound of the ball may be greatly varied. By using different types of strokes from the same court position, the style of play may be varied. By increasing or modifying the energy applied, the speed of the ball may be varied. Variety of all these sorts is essential. Sameness of stroke nullifies effectiveness no matter how excellent the unvaried stroke may be. The unexpected scores, as witness William T. Tilden, II, master of variety in play.

The second factor also presents two basic phases: adaptation and psychology.

Adaptation.—Style of play must be adapted first to that of an opponent, second to weather conditions and third to the physical condition of player and opponent. The type of game of one opponent may be such that he prefers straight drives; another twists; another soft shots; another lobs; another speed. Or conversely, the type of an opponent's game may be quite unsuited to one or more of these. As soon as a correct diagnosis has been made, adaptation may be commenced. Weather conditions may modify or even reverse the style of play to be employed against a given opponent. Over-exertion by net play may be fatal to success in extreme heat. A player must strive to avoid it in himself and create it in his opponent under such conditions. René La Coste always adapts his play to the temperature. Rain, in affecting the surface of the court, directly affects play and strokes, and tactics must be adapted to the soft or hard surface.

Psychology.—Effectiveness under pressure is the determining factor in match play. Pressure may come from an opponent's play (often the case when against Gerald Patterson), from an opponent's personality (often the case when against Tilden), from the gallery or other elements off the court (the Murray-Church match in 1916 is a striking example), or from the strain within one's self

(such as Hennessey exhibited against Cochet in their Davis Cup match, 1928).

The Strokes in Lawn Tennis.—The strokes in lawn tennis may be divided into five principal classes: service, forehand, backhand, volley and smash.

Service.—This stroke is usually executed by swinging the racket from behind over the head, finishing with a downward sweep in front of the body. Occasionally the player uses what is known as the underhand service, which is a low forehand stroke. There are almost as many varieties of service as there are players, but fundamentally the result of the swing is to impart top-spin, under-spin, or side-spin to a ball, each of which results in a distinctly different bound. Rhythm in this stroke is the most important factor.

Forehand.—This is the primary stroke in keeping the ball in play after it has been served. It is the stroke which is most natural, being simply a swing of the racket on the same side of the body as the hand in which it is held. The most important feature of this stroke is the follow-through after the ball has been struck.

Backhand.—This stroke is a swing of the racket from the side of the body away from which it is held. It is a more difficult stroke than the forehand, and is less natural. It is oftentimes employed more than the forehand, due to the fact that an opponent seeks to play to the weaker side. Rhythm and follow-through enter into this stroke, but even more important is body position and the back swing.

Volley.—This is the stroke made close to the net and before the ball has bounced. It requires far greater speed of eye, of racket and of foot than any other stroke, and is a much more difficult stroke to execute properly than any of the ground strokes. Wrist motion is the most essential factor in the volley, as it is only through this that control of flight and direction can be attained.

Smash.—This apparently simple stroke presents all the difficulties of the service with the additional factor of timing. It is used to return a ball that has been hit high into the air (lobbed) by an opponent and must therefore be struck overhead and brought down. (F. T. Hu.)

TENNIS

Tennis, sometimes called royal tennis, and in America Court Tennis, is one of the oldest of ball games It is played in a walled and roofed court, 110ft. by 38ft. 8in., the floor, however, measuring but 96ft. by 31ft. 8in., the difference being the width of a roofed corridor, the "penthouse" which runs along the two end walls and one of the side walls. Across the middle of the court a net is stretched, and the first object of the game is to strike the ball over this with a racket. The net is 5ft. high at the ends, 3ft. at the middle, and divides the floor into two equal parts, the "service" side and the "hazard" side. The floor and walls are made of cement and should be smooth, but not polished.

There is no standard size for a tennis court, and courts vary considerably in dimensions, though the more modern ones have all been built on the same plan. The dimensions given here are those of the most suitable existing courts.

The court is lighted from the roof and sides. The height of the court to the tie-beam is 30ft., the height of the play-line, above which the ball must not go, 18ft. at the sides and 23ft. at the ends. The roof of the penthouse, which is made of wood, slopes downwards towards the court, the lower edge being 7ft. 1½in. from the floor, the upper 10ft. 7in, the width 7ft. The *dedans* consist of an opening in the end wall on the service side, under the penthouse, where provision is made for spectators, who are protected by a net. It is 21ft. 8in. in width; the upper edge is 6ft. 10in. from the floor, the lower edge 3ft. 3in. The opening of the dedans is 4ft. 6in. from the main wall, 5ft. 6in. from the other side wall. Looking from the dedans (*i.e.*, from the service side), the right-hand or main wall has one peculiarity, the "tambour," a sloping buttress, to form which the wall is built inward, reducing the breadth of that part of the court to 30ft. 2in. In the right-hand corner of the hazard side-end wall (as viewed from the dedans) is the *grille*, an opening lined with wood, 3ft. 1in. square; and on this wall is painted a continuation of the *pass-line*. The left-hand wall, along which runs the pent-house, is not continuous, being broken by a long opening between the floor and the penthouse similar to the dedans, and at the same height from the ground. The low walls under this opening and the dedans are called the *batteries*. There is no wall in front of the marker's box, through which the court is entered on either side of the net-post. This long opening in the left-hand wall is divided into galleries and doors, the latter situated where the entrances to the court used to be in early times. The measurements in order from the dedans are as follows, the numbers of the galleries being counted from the net: Service side: last gallery 9ft. 6in., second gallery 9ft. 6in.; door 3ft. 6in.; first gallery 5ft. 8in.; marker's box or line-opening 7ft. 10in.; hazard side: first gallery 5ft. 8in.; door 3ft. 6in.; second gallery 9ft. 6in.; last gallery (also called winning gallery) 9ft. 6in. The last galleries are 15ft. 11in. each from their respective end walls. The galleries are marked by posts, which also serve to support the penthouse. The galleries, dedans and grille are known as the openings; three of these—the grille, dedans and winning gallery—are *winning-in openings;* for if a ball in play is struck into one of these, the striker scores a point. In the earlier French courts were other winning openings, *l'ais* (the board), an upright board 9ft. by 1ft. in the left-hand corner of the dedans-wall, *le petit trou* or *le trou*, a hole 16in. square at the bottom of the other side of the wall, and *la lune*, a round opening high up by the play-line, one at each end of the court. The regulation court has certain lines painted on the floor, which are also continued perpendicularly on the walls. On the hazard side is the half-court line, the pass-line, and the service-line. The first is only required when one player gives the other the odds of "half the court" (vide infra, *Scoring and Handicapping*). The pass-line is drawn 7ft. 8in. from the main wall, the service-line 21ft. 1in. from the grille-wall. The rectangle contained by the pass and service lines forms the service-court. The other lines, both on the hazard side and service side, mark the chases, which will be explained below.

Implements.—The balls vary in the three countries where the game is chiefly played, England, America and France. In England balls weigh approximately 2½oz. and are 2½in. in diameter. They are made of strips of cloth wound tightly together and tied with twine, in a special way, to keep them together. Over this "tie" in modern days is placed a little more twine wound round the ball and the outside cover is of white Milton cloth. Black balls are used in two courts (neither full sized) where the floor of the court is white. The French ball is harder and faster than the English, and the American ball, which is machine made, lies somewhere between the two. The racket is usually about 27in. long and weighs about 16 oz. The head is about 9in. long and 6in. broad, but there are no restrictions as to size or weight. The head is somewhat pear-shaped, but its centre line does not correspond with the centre line of the handle, as it is curved upward. Some of the early rackets were strung diagonally, *i.e.*, in diamonds; later, vertical-horizontal stringing was universally adopted; then followed knotting at the points of intersection, which has now disappeared.

Scoring and Handicapping.—A match consists ordinarily in England and America of the best of three or the best of five sets, a set being scored by the player who gets six games first. Sets of "eight games," *i.e.*, the set won by the player who gets eight games first, are generally played in France and sometimes in England.

Often *vantage* sets are played, *i.e.*, when each player has scored five games or seven games as the case may be; the set continues until one player gets an advantage of two games. In these conditions sets sometimes continue for a very long time, and sets where over 60 games have been played are recorded. In matches for the world's championship the best of 13 sets of six games are generally played on three different days with an interval between them. A game consists ordinarily of four winning strokes, called by the marker as "15," "30," "40," "game"; if the score is "40-all" the marker calls "deuce" and two strokes have to be won in succession by one of the players. When one has won a stroke his score is called "vantage"; if he wins the next, he wins the game; if he loses it, the score reverts to deuce. The score of the player who won the last stroke or made the last chase is called first. In handicapping, the usual odds are (1) bisques, which may also be given in addi-

tion to other odds, or to balance odds received; (2) half-15, or one point to be taken at the beginning of the second and every alternate game; (3) 15, or one point in every game; (4) half-30, or one point in every odd game and two points in every even game; (5) 30, or two points in every game; (6) half-40, or two points in every odd game and three in every even game; (7) 40, or three points in every game. Other handicaps are: *Round services,* the giver of odds having to serve so that the ball hits both side and end penthouse; *half the court,* the giver of the odds confining his strokes, except service, to one side of the court as divided by the half-court line, a stroke played into the other half counting to his adversary; *touch no walls,* the giver of odds confining his play except service to the floor; *bar the openings,* the giver of odds losing a point if his ball goes into a gallery or into the dedans or grille; *bar winning openings,* which are closed to the giver of odds, who loses a point if the ball enters them; *side walls,* the giver of odds losing a point if he plays the ball on to any side wall, the end penthouses being open to him, and the dedans and grille. In these *cramped* odds, the rules do not apply if the ball goes out of limits after the second bound.

The Game and Hints on Play.—The players decide who shall serve by spinning a racket on its head. One spins and the other calls "rough" or "smooth," the rough side of the head of the racket showing the knots of some of the lower strings. The winner takes the service side, service being an advantage. In four-handed games the winners of the spin often take the hazard size, as by doing so they can decide which of their opponent's service each one will elect to take He serves from any part of the court and in any way he thinks best, and the ball must go over the net, strike the side penthouse, and fall into the service-court. His opponent ("striker-out") tries to return the ball over the net before it has touched the ground a second time; he may volley or half-volley it. For a stroke to be good, it must be made before the second bound of the ball, and the ball must go over the net (even if it touches it), and must not strike the wall above the play-line, nor touch the roof or rafters. The first point to be attained is to be sure of getting the ball over the net, the next to do so in such a way as to defeat the opposing player's attempt to make a good return.

It often happens that a player, either intentionally or from inability, does not take or touch a ball returned to him over the net. In this event, chiefly on the service side a *chase* (in Italian *caccia,* in French *chasse*) is made, the goodness or the badness of which depends upon the spot on the floor which the ball touches next after its first bound. The nearer this spot is to the end wall the better the chase. The chase lines are numbered, being one yard apart, the shorter lines representing the half-distance. The chases are noted and called by the marker. Thus if a ball fell on the line marked 4, he would call "chase 4"; if between 4 and 3, he would call "better than 4," if it fell nearer to 4 than the short line, "worse than 3" if it fell on the short line or between the short line and 3, for if the ball falls on a line the striker is credited with the better stroke. Strokes into the galleries and doors, with the exception of the winning gallery (last gallery, hazard side), count as chases. The making or, in technical language, the "laying down" of a chase does not immediately affect the score; it has to be won first, *i.e.,* the other player tries to make a better chase; if he fails, the original maker wins. For this purpose after two chases have been laid down (or one, if either player's score is at 40) the players change sides, *e.g.,* if X has been serving and Y has laid down two chases, Y becomes the server and tries to defend them, X to win them by making the ball fall nearer to the back wall after its first bound than Y did. Either player wins the chase if he finds (*i.e.,* hits the ball into) one of the winning openings, or if his opponent fails to make a good return. The winner of the chase scores a point. The chases are played off in the order in which they are made. Should X in trying to win a chase make the same chase as Y originally laid down, the chase is off and neither side scores. In France the chase is played again. The rest goes on till one of the players fails to make a good return, or deliberately leaves the ball alone in order that his opponent may lay down a chase (a procedure to be followed at the discretion of a player in whose judgment the chase will be a bad one), or lose a chase already laid down and in the course of being played off. Either player can score, there being no "hand-in" or "hand-out" as at racquets. A point is scored by that player whose opponent fails to make a good return stroke in a rest, or who strikes the ball into a winning opening, or wins a chase, or to whom two faults are served in succession. A player loses a stroke who strikes the ball twice, or allows it to touch himself or his clothes.

"He who would excel as a tennis-player must learn to serve," is the *dictum* of an amateur champion, but the necessary variations, the difference between the "railroad," the "giraffe," the "side wall," the "drop" can only be explained by an experienced player and on the court. It is most important to know what sort of service is most valuable in defending a particular chase. Most forms of service require cut, or twist, or combinations of the two. For the winning of hazard-side chases, indeed for all purposes, the nick service is useful, the endeavour being to make the service drop at the nick of the grille-wall and the floor. It is wise to cultivate one sort of service to perfection, if possible, with a reserve of others to suit the occasion. Again, the tennis stroke, differing essentially as it does from the racket stroke, can only be learnt in the court from a good teacher; but it is an axiom that tennis is not a game in which hard hitting necessarily tells, though force may be usefully employed in trying to find the winning openings. This, however, is an important point of etiquette—it is not correct to force for the dedans when the striker is close to the net, unless the force is boasted or there is no danger of hitting the opponent.

History.—Tennis may well be called a royal game, having been popular with various kings of England and France. In the ball-games of the Greeks and Romans we may see the rudiments of the French *jeu de paume,* which is in all probability the ancestor of modern tennis in a direct line. The origin of the name is quite obscure. The most probable derivation is from the word *Tenez!* (Take it! Play!), especially when we remember the large number of French terms that adhere to the game, *e.g., grille, tambour* (drum, from the sound on the board that formed the face of that buttress), and *dedans.* Further, a poem dealing with the game, written in Latin elegaics by R. Frissart, makes the striker cry "Excipe!" (Take it!) after each stroke; this seems to correspond with the custom which enjoins the racquet-marker to call "play" whenever a legitimate stroke has been made. In the *Alexiad* of Anna Comnena (about A.D. 1120) is a reference to a game played on horseback in which a staff, curved at the end and strung with strings of plaited gut was used. This game was played in a court called "a court for goff" (*sic*) (according to the Lexicon of *Alexandrine Greek*) and some similar game, corrupted through *tchangan* into *chicane,* was played in France. Good authorities also find a more ancient derivation of the game in Egypt, in Persia, and among the Arabs before Charlemagne. In A.D. 1300 the game was also known as *La boude.* Throughout the century indeed it was played in France and by the highest in the land. Thus Louis X. died from a chill contracted after playing and Charles V. was devoted to the game. In England the game, or some form of it, was known, Chaucer alluding to it in the words "But canstow playen racket to and fro."

Tennis was at this epoch frequently played in some crude form in the moats of castles where Charles VIII. used to watch the game. Henri II. is described as the best player in France, and worthy of the silver ball given to the finest players. Later, Henri IV. and Louis XIV. (who kept a regular staff to look after his court) were patrons and players of tennis; indeed, in Henri VI.'s reign so popular was the sport that it was said that there were "more tennis-players in Paris than drunkards in England." The 16th and 17th centuries were the heyday of the game both in France and England. The word "tennis"—the game having hitherto been described as *luens pilae*—is first found in Gower's "Balade unto the worthy and noble kynge Henry the fourth" (1400), but Shakespeare's allusion to tennis as known to Henry V. must not be omitted. Henry VII. played the game and revoked the edicts that forbade it; there was a court at Windsor Castle in his time, which still existed in 1607. It was in that reign that the king of Castile played a match with the marquis of Dorset, the king, who used a racket conceding 15 to the marquis, who played with his hand.

The king won the set. Henry VIII. built the court at Hampton Court Palace, 1529–30. This court is still in use to-day. In 1615 there were a number of courts in London of various sizes, and a picture of James II. as a boy represents him standing in a tennis-court holding a short-handled racket strung diagonally. Pepys frequently alludes to tennis at a time when there were two courts at Oxford and five at Cambridge. In the 19th century the game lost some of its popularity, mainly through the demolition of courts as building operations increased; moreover, courts complete in every detail alone were built, the play being consequently confined to the members of the clubs that could afford the expense.

Tennis was introduced to America in the '70s of last century.

An open amateur championship was started at Queen's club in 1889, and this became the blue riband of amateur tennis early in this century. The winners of this have been:—

1899–1903. E. H Miles.	1911. Hon N. S. Lytton.
1904. V. H. Pennell.	1912. E. M. Baerlein
1905–06 E. H. Miles.	1913 Hon. N. S Lytton.
1907–08. Jay Gould.	1914. E M. Baerlein
1909–10. E. H. Miles.	1919–27. E. M. Baerlein.

The greatest of all amateur court tennis players has been Jay Gould (America) who won the U S. national American championship (singles) uninterruptedly from 1906–25. Other noted American amateurs since the championship was started in 1892 have been R. D. Sears, Fiske Warren, B. S. de Garmendia, L. M. Stockton, E. A. Thomson, G R. Fearing, Joshua Crane, Jr., C. E Sands, C. S. Cutting, J. Hewitt Morgan and W. C. Wright The winner in 1927 was an English player, G. D. Huband, in 1928, H. Morgan.

The doubles championship which started in 1916 was won by Jay Gould and W. A. J. Huhn; in 1920–24, Jay Gould and J. W. Wear; in 1925 Fulton Cutting and C. A. Cutting; in 1926 Jay Gould and J. W. Wear, in 1928, Jay Gould and W. C. Wright.

See *Treatise on Tennis*, by a member of the Rodwell Tennis Club (1826); E. B. Noel and J. O M. Clark, *A History of Tennis* (1924).

LAW OF HIGHWAY, THE, defines the rights of the public on a highway, which may be described as a public road over which all persons have full right of way—walking, riding or driving. Such roads in England for the most part either are of immemorial antiquity or have been created under the authority of an act of parliament. But a private owner may create a highway at common law by dedicating the soil to the use of the public for that purpose; and the using of a road for a number of years, without interruption, will support the presumption that the soil has been so dedicated. At common law the parish is required to maintain all highways within its bounds; but by special custom the obligation may attach to a particular township or district, and in certain cases the owner of land is bound by the conditions of his holding to keep a highway in repair. Breach of the obligation is treated as a criminal offence, and is prosecuted by indictment. Bridges, on the other hand, and so much of the highway as is immediately connected with them, are as a general rule a charge on the county; and by 22 Henry VIII. c. 5 the obligation of the county is extended to 300 yd. of the highway on either side of the bridge. A bridge, like a highway, may be a burden on neighbouring land *ratione tenurae*. Private owners so burdened may sometimes claim a special toll from passengers, called a "toll traverse."

Extensive changes in the English law of highways have been made by the Highway Act 1835, and amending acts of 1862, 1864, 1878 and 1891. The Highway Act 1835 places the highways under the direction of parish surveyors, and provides for the necessary expenses by a rate levied on the occupiers of land. It is the duty of the surveyor under summary penalty to keep the highways in repair. The amending acts, while not interfering with the operation of the principal act, authorize the creation of highway districts on a larger scale. By the Local Government Act 1888 the entire maintenance of main roads was thrown upon county councils. The Public Health Act 1875 vested the powers and duties of surveyors of highways and vestries in urban authorities, while the Local Government Act 1894 transferred to the district councils of every rural district all the powers of rural sanitary authorities and highway authorities. (*See* UNITED KINGDOM: *Local Government.*)

The Highway Act of 1835 specified as offences for which the driver of a carriage on the public highway might be punished by a fine, in addition to any civil action that might be brought against him—riding upon the cart, or upon any horse drawing it, and not having some other person to guide it, unless there be some person driving it; negligence causing damage to person or goods being conveyed on the highway; quitting his cart, or leaving control of the horses, or leaving the cart so as to be an obstruction on the highway; not having the owner's name painted up; refusing to give the same; and not keeping on the left or near side of the road, when meeting any other carriage or horse.

The "rule of the road" given above is peculiar to the United Kingdom. The general rule on the continent of Europe and in America is that when vehicles approach and are about to pass each shall keep to the right of the centre of the highway.

By the Road Transport Lighting Act, 1927, every vehicle on any road must during the hours of darkness (in summer from one hour after sunset to one hour before sunrise and in winter from half-an-hour after sunset to half-an-hour before sunrise) carry two lamps showing to the front a white light and one lamp showing to the rear a red light. No red light may be shown to the front or any light other than a red light to the rear. Bicycles not having a side-car, tricycles not propelled by mechanical power and invalid carriages need carry only one white light and tricycles and bicycles not propelled by mechanical power may carry a red reflector instead of a red lamp. Special provisions apply to vehicles towing and being towed or with overhanging or projecting loads. The provisions are modified for horse-drawn vehicles especially those used for agriculture. The minister of transport is given power, moreover, by regulation to add to or vary the requirements of the act.

The Ministry of Transport was created in 1919 with wide powers which have from time to time been extended. Some of its most important powers arise under the London Traffic Act, 1924, passed in an attempt by more systematic regulation to deal with the growing congestion in London and the country surrounding it. The public have a right to pass along a highway freely, safely and conveniently, and any wrongful act or omission which prevents them doing so is a nuisance, for the prevention and abatement of which the highways and other acts contain provisions. Generally, nuisance to highway may be caused by encroachment, by interfering with the soil of the highway, by attracting crowds, by creating danger or inconvenience on or near the highway, by placing obstacles on the highway, by unreasonable use, by offences against decency and good order, etc. At common law a highway once created could not be diverted or stopped up. By compliance with strict conditions laid down in the Highway Act, 1835, under which public rights are carefully safeguarded, a highway may, however, now be diverted or stopped.

Formerly under the Turnpike Acts many of the more important highways were placed under the management of boards of commissioners or trustees. By the Highways and Locomotives Act of 1878 disturnpiked roads became "main roads." Ordinary highways might be declared to be "main roads," and "main roads" be reduced to the status of ordinary highways. Of recent years a number of main arterial roads have been built, a large part of the expense being borne by the "road fund," a national fund formed by the proceeds of taxation of motor vehicles.

In Scotland the highway system is regulated by the Roads and Bridges Act, 1878, and amending acts. The management and maintenance of the highways and bridges is vested in county road trustees, viz., the commissioners of supply, certain elected trustees representing ratepayers in parishes and others. One of the consequences of the act was the abolition of tolls, statute-labour, causeway mail and other exactions for the maintenance of bridges and highways, and all turnpike roads became highways, and all highways became open to the public free of tolls and other exactions. The county is divided into districts under district committees, and county and district officers are appointed. The expenses of highway management in each district (or parish), together with

a proportion of the general expenses of the act, are levied by the trustees by an assessment on the lands and heritages within the district (or parish).

See Glen, *Law Relating to Highways;* Pratt, *Law of Highways, Main Roads and Bridges.* (X.)

United States.—Until 1900 there was little regulation of the use of highways. The rule of the road that vehicles must keep to the right and pass each other on the left when going in the same direction, was early recognized by legislation in the various States. The first comprehensive regulation of street traffic was adopted by the City of New York in 1903, which with minor changes is still in force. Since then traffic regulations have been widely adopted. Such regulation falls into two categories: "general highway traffic regulations" or those regarded as applicable to large and small cities and towns alike, and "special highway traffic regulations" or those additional regulations deemed necessary for facilitating the movement of traffic in specially congested districts. The lack of uniformity in general highway regulations among the several States has led to efforts to secure a uniform code for adoption by the several States, for the exercise of powers by the national Government in this field would be strenuously contested. In 1924 a general code was prepared by the Eno Foundation for Highway Traffic Regulation. In 1926 and 1927 a Uniform Motor Vehicle Act governing the use of highways by motor vehicles, their registration, size and equipment, rules of the road, violations and highway traffic signs, was drafted and approved by the National Conference of Commissioners on Uniform State Laws. It awaits adoption by the various States.

See Jenks, *Road Legislation* (1895); Brindley, *History of Road Legislation* (1912); Elliott, *Law of Roads and Streets* (2nd. ed., 1926). (J. M. La.)

LAW OF SUCCESSION. Succession, in law, is the transmission or passing of rights from one to another.

Succession, or the partition or redistribution of the property of a former owner is the subject of many rules, which may be based on the will of a deceased person and are detailed in such articles as ADMINISTRATION; ASSETS; EXECUTORS AND ADMINISTRATORS; INHERITANCE; INTESTACY; LEGACY; WILL; etc. There are cases, however, in which a will cannot be expressed; this eventuality is discussed in the present article, and there can be no doubt that it is the most characteristic one from the point of view of social conditions. It represents the view of society at large as to what *ought to be* the *normal* course of succession in the readjustment of property after the death of a citizen. We shall dwell chiefly on the customs of succession among the nations of Aryan stock. Other customs are noticed in the articles on VILLAGE COMMUNITIES; INDIAN LAW; etc.

In Primitive Conditions.—We have to start from a distinction between personal goods and the property forming the economic basis of existence for the family which is strongly expressed in early law. War booty, proceeds of hunting, clothes and ornaments, implements fashioned by personal skill, are taken to belong to a man in a more personal way than the land on which he dwells or his herds. It is characteristic that even in the strict law of paternal power formulated by the Romans an unemancipated son was protected in his rights in regard to things acquired in the camp (*peculium castrense*) and later on this protection spread to other chattels (*peculium quasi-castrense*). The personal character of this kind of property has a decisive influence on the modes of succession to it. This part of the inheritance is widely considered in early law as still in the power of the dead even after demise. We find that many savage tribes simply destroy the personal belongings of the dead (Post, *Grundriss der ethnologischen Jurisprudenz,* pp. 174–5), and sometimes the goods of deceased persons have to be taken away by strangers which leads to curious customs of looting the house of the dead. Such customs were prevalent, *e.g.,* among the Indians of the Delaware and Iroquois tribes; the nearer relations dared not take over such things on account of *tabu,* while strangers might appropriate them, as it were, by right of conquest.

The continuance of the relation of the deceased to his former belongings gives rise in most cases to provisions made for the dead out of his personal succession. The habit of putting arms, victuals, clothes and ornaments in the grave seems almost universal, and there can be no doubt that the idea underlying such usages consists in the wish to provide the deceased with all matters necessary to his existence after death. A very characteristic illustration of this conception may be given from the customs of the ancient Russians, as described about 921 by the Arabian traveller Ibn Fadhlan. The whole of the personal property was divided into three parts: one-third went to the family, the second was used for making clothes and other ornaments for the dead, while the third was spent in carousing on the day when the corpse was cremated. The corpse was gorgeously dressed and put into a boat in which were placed intoxicants, fruit, bread, meat and a dog cut into two parts. Then, all the weapons of the dead man were brought in, as well as the flesh of two horses, a cock and a chicken; the concubine of the deceased was also sacrificed, and ultimately all were burned in a huge pile, and a mound thrown up over the ashes. This description is the more interesting because it starts from a division of the goods of the deceased, one part of them being affected, as it were, to his personal usage; the rule continues to be observed in Germanic law in later times and became the starting point of the doctrine of succession to personal property in English law. According to Glanville (vii. 5, 4) the chattels of the deceased have to be divided into three equal parts, of which one goes to his heir, one to his wife and one is reserved to the deceased himself. The last named reservation is observed in Magna Charta (*c.* 26) and in Bracton's statement of Common Law (fol. 60), but in Christian surroundings the reservation of "the dead man's part" was taken to apply to the property which had to be spent for his soul and of which, accordingly, the Church had to take care. This lies at the root of the common law doctrine observed until the passing of the Court of Probate Act 1857. On the strength of this doctrine the bishop was the natural administrator of this part of the personalty.

The succession to real property, if we may use the English legal expression, is not governed by such considerations or the needs of the dead. Roughly speaking, three different views may be taken as to the proper readjustment in such cases. Taking the principal types in a logical sequence, which differs from the historical one, we may say that the aggregate of things and claims relinquished by a deceased person may—(1) pass to relatives or other persons who stood near him in a way determined by law; should several persons of the kind stand equally near in the eye of the law the consequence would be a division of the inheritance. The personal aspect of succession rules in such systems. (2) The deceased may be considered as a subordinate member of a higher organism—a kindred, village, state, etc. In such a case there can be no succession proper as there has been no individual property to begin with; there will be only a relapse of certain goods used by the member of a community to that community, and a consequent rearrangement of rights of usage. The law of succession will again be constructed on a personal basis, but this basis will be supplied not only by the single individual whose death has had to be recorded but by some community or union to which this individual belonged (3) The aggregate of goods and claims constituting what is commonly called an inheritance may be considered as a unit having an existence and an object of its own. The circumstance of the death of an individual owner will, as in case 2, be treated as an accidental fact. The unity of the inheritance and the social part played by it will constitute the ruling considerations in the arrangement of succession. The personal factor will be subordinated to the real one.

In practice pure forms corresponding to these main conceptions occur seldom, and the actual systems of succession mostly appear as combinations of these various views We shall try to give briefly an account of the following arrangements: (1) the *joint family* in so far as it bears on succession; (2) *voluntary associations* among co-heirs; (3) *division* of inheritance; (4) united succession in the shape of *primogeniture* and of *junior right.*

In the East, Greece and Rome.—The large mass of Hindu juridical texts representing customs and doctrines ranging over nearly 5,000 years contains many indications as to the existence

of a *joint family* which was considered as the corporate owner of property and therefore did not admit in principle of the opening of succession through the death of any of its members. In practice it was otherwise. For conflicting theories, *see* the article INDIAN LAW. In Greek law the most drastic expression of the joint family system is to be found in the arrangements of Spartan households, where brothers clustered round the eldest or "keeper of the hearth" (ἑστιοπάμων, a term illustrating the intimate connection between inheritance and household religion in ancient Aryan custom), and not only the management of family property but even marriages were dependent on the unity of the shares and on the necessity of keeping down the offspring of the younger brothers. With the Romans there are hardly any traces of a primitive family community excluding succession, but the Celtic tribal system was to a great extent based on this fundamental conception. During three generations the offspring of father, grandfather and great-grandfather held together in regard to land. The consequence was that, although separate plots and houses were commonly reserved for the uses of the smaller families included within the larger unit, the death of the principal brought about an equalization of shares first *per stirpes* and ultimately *per capita* until the final break-up of the community when it reached the stage of the great-grandsons of the original founder.

But the most elaborate system of family ownership is to be observed in the history of the latest comers among the Aryan races—the Slavs. In the mountain regions of the Balkan Peninsula and the forests and moors of Eastern Europe they developed many characteristic tribal institutions and, among these, the joint family, the *Zadruga, inokoshtina,* a huge community of which there can be no doubt that their roots go back to a distant past (*see* VILLAGE COMMUNITIES). There was no room in them for succession proper: what had to be provided for was the continuity of business management by elders and the repartition of rights of usage and maintenance, a repartition largely dependent on varying customs and on the policy of the above-mentioned elders. In Russia the so-called *large family* appeared as a much less extensive application of the same idea.

Early European Systems.—In Germanic law we catch a glimpse of a state of things in which side relations were not admitted to succession at all. The Frankish Edict of Chilperic (A.D. 571) tells us that if somebody died without leaving sons or daughters, his brother was to succeed him and not his neighbours (*non vicini*), which must be construed as a modification of an older rule of succession by neighbours. Under "neighbours" we cannot understand merely people connected with a person by proximity of settlement, but rather his kinsmen, and the fact that kinsmen forming a settlement have precedence of brothers is characteristic enough, especially as even sons and daughters are mentioned in a way which shows that there was still some doubt whether neighbouring kinsmen should not take inheritance instead of them These are systems of a very archaic arrangement based on a close tribal community between the members of a kindred; such a community is not apparent in later legal custom, but there are many signs of a close union between members of the same family. The law of Scania, a province of southern Sweden, shows us a group settled around a grandfather; his sons even when married hold part of the property under him and it is with some difficulty that they and their wives succeed in separating from the rest of the household property goods acquired by personal work or by marriage (Scanian Law, Dan. text i. 5); the same arrangement appears in Lombard law as regards brothers who remain settled in a common house (Edict of Rothari c. 167) Of course, in all such cases there could be no real inheritance and succession, but merely the stepping in of the next generation into the rights and duties of the representative of an older generation on the latter's demise. In legal terminology this is accretion, not succession.

The next stage in the development of succession is presented by an arrangement which was common in Germany, viz., by the management of property under the rule of so-called *Ganerbschaft. Ganerben* is the same as the Latin *coheredes, comparticipes, consortes.* A capitulary of 818 mentions such communities of heirs holding in common (*cf.* Boretius Capitularia, i. 282). While the community lasted none of the shareholders could dispose of any part of the property by his single will. Legally and economically all transactions had to proceed from common consent and common resolve. This did not preclude the possibility of any one among the shareholders claiming his own portion, in which case part of the property had to be meted out to him according to fair computation (*swascara*). There was no legal constraint over the shareholders to remain in common; division could be brought about either by common consent or by claims of individuals, and yet the constant occurrence of these settlements of co-heirs shows that it was more profitable to keep together and not to break up the unit of property by division. The customary union of co-heirs appears in this way as a corrective of the strict legal principle of equal rights between heirs of the same degree. In English practice the joint management of co-heirs is not so fully described, but there can be no doubt that under the older Saxon rule admitting heirs of the same degree to equal rights in succession the interests of economic efficiency were commonly preserved by the carrying on of common husbandry without any realization of the concurrent claims which would have broken up the object of succession. This accounts for the fact that notwithstanding the prevalence among the early English of the rule admitting all the sons or heirs in the same position to equal shares in the inheritance, the organic units of hides, yardlands, etc., are kept up in the course of centuries. In the management of the so-called *gavelkind* succession in Kent partition was legally possible and was sometimes effected, but there was the customary reaction against it in the shape of keeping up the "yokes" and "sulungs" A trace of the same kind of union between co-heirs appears in the so-called *parage* communities so often mentioned in Domesday Book.

In all these cases the principle of union and joint management is kept up by purely economic means and considerations. The legal possibility of partition is admitted by the side of it. It is interesting to watch two divergent lines of further development springing from this common source; on the one side we see the full realization of individual right resulting in frequent divisions; on the other side we watch the rise of legal restraints on subdivision resulting in the establishment, in respect of certain categories of property, of rules excluding the plurality of heirs for the sake of preserving the unity of the household. The first system is, of course, most easily carried out in countries where individualistic types of husbandry prevail. In Europe it is especially prevalent in the south with its intense cultivation of the arable and its habits of wine and olive growing. We shall not wonder, therefore, that the unrestricted subdivision among heirs is represented most completely by Roman law. Not to speak of the fact that already in the XII. Tables the principal mode of inheritance was considered to be inheritance by will while intestate succession came in as a subsidiary expedient, we have to notice that there is no check on the dispersion of property among heirs of the same degree. The only survival of a régime of family community may be found in the distinction between *heredes sui* (heirs of their own) and *heredes extranei* (outside heirs of the deceased). The first entered by their own right and took possession of property which had belonged to them potentially even during their ancestor's life; the latter drew their claims from their relationship to the deceased, which did not give them a direct hold on the property in question. Apart from that, the civil law of ancient Rome favoured complete division and the same principle is represented in all European legislation derived from Roman law or strongly influenced by it. Sometimes, as in the French *Code Civil,* even the wish of the owner cannot alter the course of such succession as no person can make a will depriving any of his children of their legal share.

Odal.—In contrast with this mode of succession in romanized countries we find the nations proceeding from Germanic stock and strongly influenced by feudalism developing two different kinds of restraints on subdivision. In Scandinavian law this point of view is expressed by the Norwegian customs as to Odal. The principal estates of the country, which, according to the law of

the Gulathing have descended through five generations in the same family, cannot be dispersed and alienated at pleasure. They are considered as rightly belonging to the kindred with which a historical connection has been established. In order to keep these estates within the kindred they descended chiefly to men; women could inherit only in exceptional cases, such as the daughter of a man who has left no sons or the sister of one who has left no children and no brothers. Nieces and first-cousins were admitted in the sense that they had to pass the property to their nearest male heir, and they might, in certain eventualities, be bought out by the nearest male relative. A second peculiarity of Odal consists in the right of relations descending from one of the common ancestors to prevent strangers from acquiring Odal estate. Among the peasants however it is felt that a farm ought not to be parcelled up into smaller holdings, and in the common case of several heirs succeeding to the farm, they generally decide among themselves who is to remain in charge of the ancestral household; the rest are compensated.

Mediaeval Europe.—In mediaeval England, France and Germany the same considerations of economic efficiency are felt as regards the keeping up of united holdings, and it may be said that the lower we get in the scale of property the stronger these considerations become, till it is almost impossible to break up the smaller holdings. By such process land loses in value, and it is impossible to divide one ox or one horse *in specie* without selling it. No wonder that we find practices and customs of united succession arising in direct contradiction with the ancient rule that all heirs of the same degree should be admitted to equal shares. Glanville mentions expressly that the socagers of his time held partly by undivided succession and partly by divided inheritance. The relations of feudalism and serfdom contributed strongly towards creating such individual tenancies. It was certainly in the interest of the lord that his men, whether holding a military fief or an agricultural farm, should not weaken the value of their tenancies by dispersing the one or the other among heirs. The question whether the successor should be the eldest son or the youngest son is a secondary one The latter practice was very prevalent all through Europe and was known in England as the rule of Borough English (*q.v.*). The succession of the youngest appears very characteristic in so far as it illustrates the break up into small tenancies, as the youngest in the family is certainly not a fit representative of hierarchy and authority and could not have been meant to rule anything but his own restricted household.

Woman and Succession.—One more feature of the ancient law of succession has to be noticed, viz., the exclusion of women from inheritance in land. There can be no doubt that as regards movable goods women held property and transmitted it on a par with males from the earliest time; but their exclusion from inheritance in land seems as ancient as the patriarchal system itself, whatever we may think about the position of affairs in prehistoric times when rules of matriarchy were prevalent. A common-sense explanation of one side of this doctrine is tendered by the law of the Thuringians (*Lex Anglorum et Werinorum*, c. 6), where it is stated that inheritance in land goes with the duty of taking revenge for the homicide of relatives and with the power of bearing arms. One of the most potent adversaries of this system of exclusion proved to be the Church. It favoured all through the view that land should be transmitted in the same way as money or chattels. A Frankish formula (Marculf) shows us a father who takes care to endow his daughter with a piece of land according to natural affection in spite of the strict law of his tribe. Such instruments were strongly backed by the Church, and the view that women should be admitted to hold land on certain occasions had made its way in England as early as Anglo-Saxon times.

LAWRENCE (LAURENTIUS, LORENZO), **ST.,** Christian martyr, whose name appears in the canon of the mass, and whose festival is on Aug. 10. The basilica reared over his tomb at Rome is still visited by pilgrims. Deacon of the pope (St.) Sixtus (Xystus) II., he was called upon by the judge to bring forth the treasures of the church which had been committed to his keeping. He thereupon produced the church's poor people. Seeing his bishop, Sixtus, being led to punishment, he cried: "Father! whither goest thou without thy son? Holy priest! whither goest thou without thy deacon?" Sixtus prophesied that Lawrence would follow him in three days. The prophecy was fulfilled, and Lawrence was sentenced to be burnt alive on a gridiron. In the midst of his torments he addressed the judge ironically with the words: *Assum est, versa et manduca* ("I am roasted enough on this side; turn me round, and eat"). All these details of the well-known legend are already related by St. Ambrose (*De Offic.* i. 41, ii. 28). The date of the martyrdom is usually put at the persecution of Valerian in 258. The punishment of the gridiron and the speech of the martyr are probably a reminiscence of the story of the Phrygian martyrs as related by Socrates (iii., 15) and Sozomen (v., 11). But even the fact of the martyrdom has been questioned.

The Escurial was built in honour of St. Lawrence by Philip II. of Spain, in memory of the battle of St. Quentin, which was won in 1557 on the day of the martyr's festival. The meteorites which appear annually on or about the 10th of August are popularly known as "the tears of St. Lawrence."

LAWRENCE, AMOS (1786–1852), American merchant and philanthropist, was born in Groton (Mass.) on April 22, 1786, a descendant of one of the first settlers of Groton. Leaving Groton academy (founded by his father, Samuel Lawrence, and others) in 1799, he went to Boston and there set up in business for himself in Dec. 1807. In the next year he took into his employ his brother, Abbott (*see* below), whom he made his partner in 1814, the firm name being at first A. and A. Lawrence and afterwards A. and A. Lawrence and Co. In 1831 Amos retired from active business, and Abbott was thereafter the head of the firm. The firm became the greatest American mercantile house of the day, and did much for the establishment of the cotton textile industry in New England; in 1830 by coming to the aid of the financially distressed mills of Lowell, Massachusetts, where Luther Lawrence, the eldest brother, represented the firm's interests; and in 1845–47 by establishing and building up Lawrence, Massachusetts, named in honour of Abbott Lawrence, who was a director in the Essex Company which controlled the water power of Lawrence, and afterwards was president of the Atlantic Cotton Mills and Pacific Mills there. In 1842 Amos Lawrence decided not to allow his property to increase any further He gave freely to Williams college, to Bowdoin college, to the Bangor theological seminary, to Wabash college, to Kenyon college and to Groton academy, which was re-named Lawrence academy in honour of the family, and especially in recognition of the gifts of William Lawrence, Amos's brother; to the Boston children's infirmary, which he established, and to the Bunker Hill monument fund. He died in Boston on Dec. 31, 1852.

See Extracts from the *Diary and Correspondence of the late Amos Lawrence, with a Brief Account of Some Incidents in his Life* (1856).

His brother, ABBOTT LAWRENCE (1792–1855), was born in Groton (Mass.) on Dec. 16, 1792. Besides being a partner in the firm established by his brother, and long its head, he promoted various New England railways, notably the Boston and Albany. The town of Lawrence (Mass.) was named after him. He was a representative in Congress (1835–37, 1839–40); in 1842 he was

one of the commissioners for Massachusetts who settled with Lord Ashburton, the British plenipotentiary, the question of the north-eastern boundary. In 1842 he was presiding officer of the Massachusetts Whig Convention; he broke with President Tyler, rebuked Daniel Webster for remaining in Tyler's cabinet after his colleagues had resigned, and recommended Henry Clay as the nominee of the Whig party in 1844—an action that roused Webster to make his famous Faneuil Hall address. He refused the portfolios of the navy and of the interior in President Taylor's cabinet, but from 1849 to 1852 he served as United States minister to Great Britain. He died in Boston on Aug. 18, 1855, leaving as his greatest memorial the Lawrence scientific school of Harvard, which he had established in 1847.

See Hamilton A. Hill, *Memoir of Abbott Lawrence* (Boston, 1884).

LAWRENCE, AMOS ADAMS (1814–1886), American philanthropist, son of Amos Lawrence, was born in Groton (Mass.) on July 31, 1814. He graduated from Harvard in 1835, went into business in Lowell, and in 1837 established in Boston his own counting-house. Lawrence established a hosiery and knitting mill at Ipswich—the first of importance in the country. In 1849 he founded at Appleton (Wis.) a school named in his honour Lawrence university (now Lawrence college). He also contributed to funds for the colonization of free negroes in Liberia. In 1854 he became treasurer of the Massachusetts Emigrant Aid Company (reorganized in 1855 as the New England Emigrant Aid Company), which sent 1,300 settlers to Kansas, where the city of Lawrence was named in his honour He contributed personally for the famous Sharp rifles, which, packed as "books" and "primers," were shipped to Kansas and afterwards came into the hands of John Brown, who had been a *protégé* of Lawrence. Though he deplored John Brown's fanaticism, when Brown was arrested he appealed to the governor of Virginia to secure for him a lawful trial. He repeatedly urged the necessity of offering no armed resistance to the Federal Government. Till the very outbreak of the Civil War he was a "law and order" man, and he did his best to secure the adoption of the Crittenden compromise. In 1862 he raised a regiment of cavalry which became the 2nd Massachusetts Regiment of Cavalry. Lawrence built (1873–80) Lawrence hall, Cambridge, for the Episcopal theological school, of which he was treasurer. From 1857 to 1862 he was treasurer of Harvard college, and from 1879 to 1885 was an overseer. He died in Nahant (Mass.) on Aug. 22, 1886.

See William Lawrence, *Life of Amos A. Lawrence with Extracts from his Diary and Correspondence* (Boston, 1888).

LAWRENCE, DAVID HERBERT (1885–), British novelist, was born at Eastwood, Nottinghamshire, on Sept. 11, 1885, and educated at Nottingham high school and University college, Nottingham. With his first books, *The White Peacock* (1911), *The Trespasser* (1912) and *Sons and Lovers* (1913), it became evident that a writer of great force and originality was rising in the younger generation. A police prosecution of *The Rainbow* (1915) seemed for a time to check Lawrence's fertility, but he issued *Amores,* poems, and travel impressions, *Twilight in Italy,* in 1916, further poems, *Look! We have Come Through!* in 1917, and another novel, *The Lost Girl,* 1920. Hereafter Lawrence's outlook and style were being deeply influenced by a study of psychoanalytical doctrine and by travel in Italy, Sardinia, New Mexico and Australia. A new note is evident in *Women in Love* (1921), *Aaron's Rod* (1922), *Kangaroo* (1923), *The Ladybird* (1923), *England, My England!* (1924), *St. Mawr* (1925) and *The Plumed Serpent* (1926). Miscellaneous writings include *Sea and Sardinia* (1921), *Psychoanalysis and the Unconscious* (1921), *Fantasia of the Unconscious* (1922), *Studies in Classic American Literature* (1923); three plays, *The Widowing of Mrs. Holroyd* (1914), *Touch and Go* (1920) and *David* (1926); and a volume of essays, *Mornings in Mexico* (1927). He wrote also a historical study, *Movements in European History,* which was issued as by "Lawrence H. Davison" in 1921, and under his real name in 1925. Lawrence is undoubtedly one of the most powerful of the novelists who came into prominence just before the World War. He was increasingly obsessed by the problems of sex, especially in his later works the scene of which was laid in Mexico. His powerful analysis of the sex motive was possibly the most characteristic feature of his work; but he had a great gift in the interpretation of natural scenery, and the many fine descriptive passages in his books show spiritual insight as well as artistic power of expression.

See H. J. Seligmann, *D. H. Lawrence* (1924). *The Collected Poems of D. H. Lawrence* were published in 2 vols. in 1928.

LAWRENCE, GEORGE ALFRED (1827–1876), English novelist, was born at Braxted, Essex, on March 25, 1827, and was educated at Rugby and at Balliol college, Oxford. In 1857 he published, anonymously, his first novel, *Guy Livingstone, or Thorough.* The book achieved a very large sale, and had nine or ten successors of a similar type, the best perhaps being *Sword and Gown* (1859). He died at Edinburgh on Sept. 23, 1876.

LAWRENCE, SIR HENRY MONTGOMERY (1806–1857), British soldier and statesman in India, brother of the 1st Lord Lawrence (*q.v.*), was born at Matara, Ceylon, on June 28, 1806. Early in 1823 he joined the Bengal Artillery at the Calcutta suburb of Dum Dum, where Henry Havelock was stationed. Henry Lawrence served in the first Burmese campaign, where he contracted a fever which never really left him. After a short period at home he was appointed revenue surveyor by Lord William Bentinck. At Gorakhpur he made many fast friends. He was recalled to a brigade by the outbreak of the first Afghan War towards the close of 1838. As assistant to Sir George Clerk, he administered the district of Ferozepore; and when disaster came he was sent to Peshawar in order to push up supports for the relief of Sale and the garrison of Jalalabad. The war had been begun under the tripartite treaty signed at Lahore on June 20, 1838. But the Sikhs were slow to play their part after the calamities in Afghanistan. No one but Henry Lawrence could manage the disorderly contingent which they reluctantly supplied to Pollock's avenging army in 1842. He helped to force the Khyber Pass on April 5, playing his guns from the heights, for 8 and 20 m. He then became assistant to the envoy at Lahore, at Umballa, where he reduced to order the lapsed territory of Kaithal. Soon he received the office of resident at the protected court of Nepal, where, assisted by his wife, née Honoria Marshall, he began a series of contributions to the *Calcutta Review,* a selected volume of which forms an Anglo-Indian classic. There, too, he elaborated his plans which resulted in the erection and endowment of the Lawrence military asylums at Sanawar (on the road to Simla), at Murree in the Punjab, at Mount Abu in Rajputana, and at Lovedale on the Madras Nilgiris.

Lawrence had published the results of his experience of Sikh rule and soldiering in a vivid work, the *Adventures of an Officer in the Service of Ranjit Singh* (1845). After the doubtful triumphs of Moodkee and Ferozshah, Lawrence was summoned from Nepal to take the place of Major George Broadfoot, who had fallen. Aliwal came; then the guns of Sobraon chased the demoralized Sikhs across the Sutlej. Throughout, Lawrence was at the side of the new governor-general, Lord Hardinge. He gave his voice, not for annexation, but for the reconstruction of the Sikh government, and was himself appointed resident at Lahore, and president of the council of regency till the maharaja Dhuleep Singh should come of age. Soon disgusted by the "venal and selfish durbar" who formed his Sikh colleagues, he summoned to his side assistants like Nicholson, James Abbott and Edwardes, till they all did too much for the people, as he regretfully confessed. But "my chief confidence was in my brother John, . . . who gave me always such help as only a brother could." Wearied out he went home with Lord Hardinge, when he was made K.C.B. The second Sikh War summoned him back at the end of 1848, to see the whole edifice of Sikh "reconstruction" collapse. Lord Dalhousie proclaimed the Punjab up to the Khyber British territory on March 29, 1849. But still another compromise was tried. Henry Lawrence was made president of the new board of administration with charge of the political duties, and his brother John was entrusted with the finances. John could not find the revenue necessary for the rapid civilization of the new province so long as Henry would, for political reasons, insist on granting life pensions and alienating large estates to the needy remnants of Ranjit Singh's court. Lord Dalhousie therefore removed Sir Henry Lawrence to the charge of the great nobles of Rajputana, and installed John as chief commissioner.

In the comparative rest of Rajputana he wrote two important articles (March–Sept., 1856) on army reform, the outcome of conversations with Lord Dalhousie at Calcutta. Henry Lawrence pointed out the latent causes of mutiny, and uttered warnings to be too soon justified. In March 1857 he took the helm at Lucknow, but it was too late. In ten days his magic rule put down administrative difficulties indeed, as he had done at Lahore. But what could even he effect with only 700 European soldiers, when the epidemic spread after the Meerut outbreak of mutiny on the 10th of May? In one week he had completed the preparations for the defence of the Lucknow residency, and he was appointed provisional governor-general. On May 30, mutiny burst forth in Oudh, and he was ready. On June 29, he led 336 British soldiers with 11 guns and 220 natives out of Chinhat to reconnoitre the insurgents, when the natives joined the enemy and the residency was besieged. On July 2, a shell struck him, and he died two days later. A baronetcy was conferred on his son. A marble statue was placed in St. Paul's as the national memorial of one who has been declared to be the noblest man that has lived and died for the good of India.

His biography was begun by Sir Herbert Edwardes, and completed (2 vols. 1872) by Herman Merivale. *See* also J. J. McLeod Innes, *Sir Henry Lawrence* ("Rulers of India" series), 1898.

LAWRENCE, JAMES (1781–1813), naval officer, was born in Burlington, N.J., Oct. 1, 1781. He entered the navy as midshipman in 1793, and was promoted lieutenant in 1802. He took part in the war with Tripoli as first lieutenant of the schooner "Enterprise" and spent altogether five years on the Barbary coast. Selected by Decatur (*q.v.*) as his first lieutenant, Lawrence took a conspicuous part in the destruction of the frigate "Philadelphia" when she had run aground in the harbour at Tripoli, and had been captured by the enemy. The declaration of war against Great Britain in 1812 found Lawrence in command of the frigate "Hornet," and in 1813 he distinguished himself in a sharp engagement in which he captured the British ship "Peacock." As a result he was commissioned captain and put in command of the frigate "Chesapeake." Shortly afterwards he engaged in a battle with the British ship "Shannon" off Boston harbour Lawrence's ship was defeated and he was mortally wounded, and as he lay dying, he enjoined his men "Don't give up the ship." He died June 5, 1813.

See A. Gleaves, *J. Lawrence, Captain U.S. Navy* (1904).

LAWRENCE, JOHN LAIRD MAIR LAWRENCE, 1ST BARON (1811–1879), viceroy and governor-general of India, was born at Richmond, Yorkshire, on March 24, 1811, son of Sir Alexander Lawrence and his wife, *née* Letitia Knox Three of the young Lawrences became famous in India, Sir George St. Patrick, Sir Henry (*q.v.*) and Lord Lawrence Irish Protestants, the boys were trained at Foyle college, Derry, and at Clifton, and received Indian appointments. John Lawrence landed at Calcutta in 1829; and became assistant-collector at Delhi. The titular court of the pensioner who represented the Great Mogul was the centre of that disaffection and sensuality which found their opportunity in 1857. A Mussulman rabble filled the city. The district around, stretching from the desert of Rajputana to the Jumna, was slowly recovering from the anarchy to which Lord Lake had given the first blow. When not administering justice in the city courts or under the village tree, John Lawrence was scouring the country after the marauding Meos and Mohammedan freebooters. He detected the murderer of his official superior, William Fraser, in 1855, in the person of Shams-uddin Khan, the nawab of Lahore, whose father had been raised to the principality by Lake, and the assassin was executed. The first twenty years, from 1829 to 1849, during which John Lawrence acted as magistrate and land collector of the most turbulent part of India at that time coincided with the period of Lord William Bentinck's reforms. A permanent settlement of the land-tax, similar to that carried out in Bengal, was promised in the North-West.

In 1833 Merttins Bird and James Thomason introduced into the north-western provinces, as they then were, the system of thirty years' land leases based on a careful survey of every estate by trained civilians, and on the mapping of every village holding by native subordinates. These two revenue officers created a school of enthusiastic economists who rapidly registered and assessed an area as large as that of Great Britain, with a rural population of twenty-three millions. Of that school John Lawrence proved the most ardent and the most renowned. Intermitting his work at Delhi, he became land revenue settlement officer in the district of Etawah, and there began, by buying out or getting rid of the talukdars, to realize the ideal which he did much to create throughout the rest of his career—a country "thickly cultivated by a fat contented yeomanry, each man riding his own horse, sitting under his own fig-tree, and enjoying his rude family comforts." This and a quiet persistent hostility to the oppression of the people by their chiefs formed the two features of his administrative policy.

When the first Sikh War broke out, John Lawrence was still collector of Delhi The critical engagements at Ferozeshah, following Moodkee, and hardly redeemed by Aliwal, left the British army somewhat exhausted at the gate of the Punjab, in front of the Sikh entrenchments on the Sutlej. During the early months of 1846 Lawrence found men, munitions and supplies. The victory of Sobraon was the result, and at thirty-five Lawrence became commissioner of the Jullundur Doab, the fertile belt of hill and dale stretching from the Sutlej north to the Indus. He accomplished for the newly annexed territory what he had long before accomplished in and around Delhi. He restored it to order, without one regular soldier. By his personal influence he organized levies of the defeated Sikhs, led them now against a chief in the upper hills and now to storm the fort of a raja in the lower, till he so welded the people into a loyal mass that he was ready to repeat the service of 1846 when, three years after, the second Sikh War ended in the conversion of the Punjab up to Peshawar into a British province.

Lord Dalhousie made John Lawrence chief commissioner of the new province. It was mapped out into districts, now numbering thirty-two, in addition to thirty-six tributary states, small and great. To each the thirty years' leases of the north-west settlement were applied, after a patient survey and assessment by skilled officials. The revenue was raised on principles so fair to the peasantry that Ranjit Singh's exactions were reduced by a fourth, while agricultural improvements were encouraged A police force was organized; roads were cut through every district, and canals were constructed. Commerce followed on increasing cultivation and communications, the courts brought justice to every man's door, and crime hid its head. The adventurous and warlike spirits, Sikh and Mohammedan, found a career in the new force of irregulars directed by the chief commissioner himself, while the Afghan, Dost Mohammed, kept within his own fastnesses, and the long extent of frontier was patrolled.

Seven years of this work prepared the lately hostile and always anarchic Punjab under John Lawrence not only to weather the storm of the mutiny of 1857 but to lead the older provinces into port. On May 12, the news of the revolts at Meerut and Delhi reached him at Rawalpindi. The position was critical, for of 50,000 native soldiers 38,000 were Hindustanis of the very class that had mutinied elsewhere, and the British troops were few and scattered. For five days the fate of the Punjab hung upon a thread, for the question was, "Could the 12,000 Punjabis be trusted and the 38,000 Hindustanis be disarmed?" Not an hour was lost in beginning the disarming at Lahore; and, as one by one the Hindustani corps succumbed to the epidemic of mutiny, the sepoys were deported or disappeared, or swelled the military rabble in and around the city of Delhi. The remembrance of the ten years' war which had closed only in 1849, a bountiful harvest, the old love of battle, the offer of good pay, but, above all, the personality of Lawrence and his officers, raised the Punjabi force into a new army of 59,000 men, and induced the non-combatant classes to subscribe to a 6% loan. Delhi was invested, but for three months the rebel city did not fall Under John Nicholson, Lawrence sent on still more men to the siege, till every available European and faithful native soldier was there, while a movable column swept the country, and the border was held by militia.

At length, when even in the Punjab confidence became doubt, and doubt distrust, and that was passing into disaffection, John

Lawrence was ready to consider whether we should not give up the Peshawar valley to the Afghans as a last resource, and send its garrison to recruit the force around Delhi. Another week and that alternative must have been faced. But on Sept. 20, the city and palace of Delhi were again in British hands. Lawrence received a baronetcy, the G.C.B., the thanks of parliament and a life pension of £2,000 a year in addition to his ordinary pension of £1,000. He spent the years 1859 to 1864 at home, as a member of the secretary of state's council; he was sent out again in 1864 as viceroy and governor-general on the death of Lord Elgin. His five years' administration of the whole Indian empire was worthy of the ruler of the Punjab. Lawrence's name is associated with the "close border" as opposed to the "forward" policy. His internal administration was remarkable for financial prudence, a jealous regard for the interests of the masses of the people, and a keen interest in education.

In 1854 Lawrence had, in obedience to Lord Dalhousie, but against his judgment, signed a treaty of peace and friendship with Dost Mohammed. When in 1863 Dost Mohammed's death let loose the factions of Afghanistan he recognized both the sons, Afzul Khan and Shere Ali, at different times, and the latter fully only when he had made himself master of all his father's kingdom. The steady advance of Russia from the north, notwithstanding the Gorchakov circular of 1864, led to severe criticism of this cautious "buffer" policy. It fell to Lord Mayo, his successor, to hold the Umballa conference in 1869. When, nine years after, the second Afghan War unexpectedly broke out, the retired viceroy gave the last days of his life to an unsparing exposure, in the House of Lords and in the press, of a policy which he had striven to prevent in its inception, and which he did not cease to denounce in its course and consequences.

On his final return to England early in 1869, after forty years' service in and for India, he was created Baron Lawrence of the Punjab, and of Grately, Hants. He sat on the London school board, of which he was the first chairman. Lawrence died on June 27, 1879, and he was buried in the nave of Westminster Abbey. He had married the daughter of the Rev. Richard Hamilton, Harriette-Katherine, who survived him, and he was succeeded as 2nd baron by his eldest son, John Hamilton Lawrence.

See Bosworth Smith, *Life of Lord Lawrence* (1885); Sir Charles Aitchison, *Lord Lawrence* ("Rulers of India" series, 1892); L. J Trotter, *Lord Lawrence* (1880); and F. M. Holmes, *Four Heroes of India.*

LAWRENCE, STRINGER (1697–1775), English soldier, was born at Hereford on March 6, 1697. He seems to have entered the army in 1727, and served in Gibraltar and Flanders, and at Culloden. In 1748, he went out to India to command the East India Company's troops. Lawrence foiled an attempted French surprise at Cuddalore, but was captured by a French cavalry patrol at Ariancopang near Pondicherry and kept prisoner till the peace of Aix-la-Chapelle. In 1749 he was in command at the capture of Devicota. On this occasion Clive served under him and a life-long friendship began. In 1750 Lawrence returned to England, but in 1752 he was back in India. Here he found Clive in command of a force intended for the relief of Trichinopoly. As senior officer Lawrence took over the command, but allowed Clive every credit for his share in the operations, which included the relief of Trichinopoly and the surrender of the entire French besieging force. In 1752 with an inferior force he defeated the French at Bahur (Behoor) and in 1753 again relieved Trichinopoly. For the next seventeen months he fought a series of actions in defence of this place, finally arranging a three months' armistice, which was afterwards converted into a conditional treaty. He had commanded in chief up to the arrival of the first detachment of regular forces of the crown. In 1757 he served in the operations against Wandiwash, and in 1758–1759 was in command of Fort St. George during the siege by the French under Lally. After two years at home he resumed his command in 1761 as major-general and commander-in-chief. He retired in 1766, and died in London on Jan. 10, 1775. The East India Company erected a monument to his memory in Westminster Abbey.

See Biddulph, *Stringer Lawrence* (1901).

LAWRENCE, SIR THOMAS (1769–1830), English painter, was born at Bristol on May 4, 1769. His father was an innkeeper, first at Bristol and afterwards at Devizes, and at the age of six Thomas was already shown off to the guests of the Black Boar as an infant prodigy who could sketch their likenesses and declaim speeches from Milton. In 1779 the elder Lawrence had to leave Devizes, having failed in business and the precocious talent of the son, who had gained a sort of reputation along the Bath road, became the support of the family. His debût as a crayon portrait painter was made at Oxford, and in 1782 the family settled in Bath, where the young artist found many patrons. In 1785 he began to paint in oil. He came to London in 1787, was kindly received by Reynolds and entered as a student at the Royal Academy. He began to exhibit almost immediately, and his reputation increased so rapidly that he became an associate of the Academy in 1791. The death of Sir Joshua in 1792 opened the way to further successes. He was at once appointed painter to the Dilettanti society, and principal painter to the king in succession to Reynolds. In 1794 he was a Royal Academician, and he became the fashionable portrait painter of the age, having as his sitters all the rank, fashion and talent of England, and ultimately most of the crowned heads of Europe. In 1815 he was knighted; in 1818 he went to Aix-la-Chapelle to paint the sovereigns and diplomatists gathered there, and visited Vienna and Rome. After 18 months he returned to England, and on the very day of his arrival was chosen president of the Academy in place of West, who had died a few days before. This office he held from 1820 to his death on Jan. 7, 1830.

Among his famous portraits are "Mrs. Siddons" and "Princess Lieven" in the National Gallery and "Cardinal Gonsalir" at Windsor Castle. Interest in his work was stimulated by the sensational sale in London (1925) of "Pinkie," a fancy portrait of Miss Mary Moulton Barrett.

The best display of Lawrence's work is in the Waterloo gallery of Windsor. The Tate gallery, the National gallery and the National Portrait gallery contain a number of his works.

See D. E. Williams, *The Life and Correspondence of Sir T. Lawrence* (1831).

LAWRENCE, THOMAS EDWARD (1888–), British explorer and scholar, was born in Wales on Aug. 15, 1888, of a Leicestershire family, one branch of which had moved to the neighbourhood of Dublin and thence to Oxford. The second of five brothers, he was educated at the Oxford high school and at Jesus college, Oxford, where, in 1910, he took a first class in modern history. In order to study Crusading architecture he made in that year a tour through Syria on foot; and the colloquial Arabic, which he then picked up, and his interest in and knowledge of archaeology, commended him to D. G. Hogarth, who was about to lead an expedition to Jerablus on the Euphrates and excavate the site of Carchemish for the British Museum. Thither Lawrence went in 1911, with the assistance of a post-graduate endowment at Magdalen college; and at Carchemish he worked on and off till 1914, taking several opportunities to explore Syria and Mesopotamia in native company and accepting for a few weeks an appointment under the Palestine Exploration Fund, which attached him to the Survey of North Sinai carried out by Col. Newcombe, R.E., for the War Office in the winter of 1913–14. Though naturally inclined to scholarship and letters, he showed singular practical ability and capacity for leadership, and a remarkable power of inspiring confidence in Arabs.

On the outbreak of the World War, Lawrence, being below standard height, obtained at first no more active service than a post in the geographical section of the War Office. But soon after Turkey had joined the Central Powers he was sent by Lord Kitchener to Egypt and attached to a rudimentary Military Intelligence Section. He was a moving spirit in the negotiations leading to an Arab revolt and in organizing the Arab Bureau which, as finally constituted early in 1916, acted as staff and intelligence office for the Arab campaigns. In the autumn Lawrence, feeling that stalemate would ensue if closer liaison between the British and the Arabs were not effected, asked leave to go down to Jidda, and once there, was transferred to the Arab Bureau,

which was under the Foreign Office. Hearing good accounts of the Emir Faisal, he persuaded Sharif Hussain to let him go inland and visit the force which had been driven back from Medina. He soon won the confidence of Faisal, and induced him to reorganize his army and move north so as to threaten the communications of Medina by attacking the Hejaz Railway. With his chief established at Wejh, and the army of another brother, 'Abdulla, brought to Wadi Ais to co-operate, Lawrence rode off into the interior to raise the northern tribes, and so extend the area to be held and defended against the Turks. He pushed right up to and beyond Ba'albek, *i.e.*, behind the enemy lines in Syria, and on his return, having picked up a Huweitat force under the famous raider, Auda Abu Tayyi, he routed a Turkish battalion near Ma'an, and forced a passage to 'Aqaba which was occupied for Faisal in Aug. 1917. For this exploit he was promoted to field rank and given decorations, British and French, which, however, he would not accept.

Lawrence, now cordially helped by General Allenby, prompted the successive forward moves made by Faisal's force, after 'Aqaba had become its base, and himself organized and led a battle in Wadi el-Hesa, near Esh Shobek, in which the enemy suffered his worst defeat in the open. He turned his attention in particular to train-wrecking and had such success that Medina became virtually isolated, and a large reward was advertised for the capture of "El-Orens, destroyer of engines." Early in 1918 he made a desperate attempt to cut the Turkish Palestine army's railway communication with Damascus, and failed only by a hair's breadth. In that summer, in concert with Allenby, he induced Faisal to move up to Qasr Azraq and organize a new force to advance on Damascus. This duly moved up in the autumn side by side with Allenby and after breaking up the enemy's trans-Jordan army, entered Damascus some hours ahead of the British. Lawrence took charge of the city till Allenby could reach it, and suppressed attempts at reaction.

Called to the Peace Conference, Lawrence became one of its outstanding figures during the spring of 1919. His legendary fame as organizer and inspirer of guerrilla tactics was enhanced by the forcible part that he played when Faisal, whom he had accompanied on a British tour, came to Paris. But fight as Lawrence might against French plans for Syria, he could not prevail in that milieu, and at last, retiring to his tent, he sat down to write the narrative of his adventures. The first ms. was subsequently lost; but he began again, and after many recensions, it was announced that the book, under the title *The Seven Pillars of Wisdom*, would be issued in 1926. He was elected a Research Fellow of All Souls, Oxford, in 1919, and resided there for a year, but without entering much into the college life. In 1921 Winston Churchill called him to the Colonial Office as adviser on Arab affairs, in which capacity he had a large share in making Faisal king of 'Iraq. But, disgusted with the failure of the Allies to fulfil adequately what he considered their moral obligations to the Arabs, and remorseful for the part he himself had played in leading them on, Lawrence abruptly left Government service in 1922 and, abjuring all official rank and decorations and even his surname, enlisted as a mechanic in the Royal Air Force. Thence in 1923 unwelcome publicity drove him to hide in the Tank Corps, but, in 1925, he was re-transferred to the R.A.F., still as a mechanic, this being the only grade that he would accept. He was eventually sent to India, where he served on the north-western frontier. Here again popular rumour became busy with his name, and he was recalled to England in April 1928. (D. G. H.; X.)

The *Seven Pillars of Wisdom* was published in 1926 in a very limited edition and immediately began to fetch fantastic prices. A much abridged and expurgated edition was published for the general public under the title *Revolt in the Desert* in 1927. *See* also P. Graves, *Lawrence and the Arabs* (1927).

LAWRENCE, WILLIAM (1850–), American Episcopalian bishop, was born in Boston, Mass., on May 30, 1850. He graduated at Harvard in 1871 and received his theological training at Andover Theological Seminary and the Episcopal Theological School at Cambridge. He served as rector of Grace Church, Lawrence, Mass., from 1876 to 1884 and then became professor of homiletics, 1884–93, and dean, 1888–93, of Episcopal Theological School. He was also preacher at Harvard University, 1888–91. On Oct. 5, 1893 he was consecrated bishop of Massachusetts. He is the author of a *Life of Amos A. Lawrence* (1889), his father (*q.v.*); *Visions and Service* (1896); *Life of Roger Wolcott* (1902); *Study of Phillips Brooks* (1903); *The American Cathedral* (1919); *Fifty Years* (1923); *Henry Cabot Lodge* (1925); and, *Memories of a Happy Life* (1926).

LAWRENCE, a city of eastern Kansas, U.S.A., on the Kansas (Kaw) river, 40 m. W. of Kansas City; county seat of Douglas county and the seat of the State university. It is on Federal highways 40 and 73W, and is served by the Rock Island, the Santa Fe and the Union Pacific railways. The population in 1925 (State census) was 12,341.

From the plateau bordering the river the city slopes up to heights which command a fine view. In the south-western part of the city, on the ridge called Mt. Oread, is the University of Kansas (*q.v.*), which has an enrolment of 5,000. Haskell Institute (est. 1884), a boarding school for Indians conducted by the Federal Government, with an attendance of about 1,000, is in the southern part of the city. Lawrence is the commercial centre of a rich farming country, and has manufactures of importance.

Lawrence was founded in 1854 by the New England Emigrant Aid Society, and was named after Amos A. Lawrence of Boston, a prominent member of the society. The first colonists were ardent abolitionists, and during the territorial period Lawrence was the political centre of the free-state cause and the object of several attacks from the pro-slavery forces. After the Free-State Party got control of the legislature in 1857, it was practically the capital of the territory (until 1861), as the legislature regularly, after convening in Lecompton, the legal capital, 13 m. up the river, would adjourn to Lawrence for the rest of the session. It was a noted station on the "underground railway" by which slaves escaped from Missouri and other slave States into free territory. On Aug. 21, 1863, it was the scene of a most distressing episode in the border warfare, when William C Quantrell, with 400 mounted Missouri bushrangers, raided the town by night and killed 150 defenceless citizens. The city adopted a charter of its own in 1857, as its application to the free-state legislature at Topeka had been denied and it refused to recognize the authority of the pro-slavery legislature which had twice granted one. This action was declared by Gov. Walker to constitute rebellion against the United States, and he placed the town under martial law; but as perfect order prevailed the troops were withdrawn after a few weeks, by order of President Buchanan, and in Feb. 1858, the legislature legalized the city's charter.

See F. W. Blackmer, "The Annals of an Historic Town," in the *Annual Report* of the American Historical Association for 1893.

LAWRENCE, a city of Massachusetts, U.S.A., on the Merrimack river, 30m. from its mouth, and 25m N.N.W. of Boston; one of the county seats of Essex county; served by the Boston and Maine railroad. The population was 94,270 in 1920 (41% foreign-born white, chiefly from Italy, Canada, Ireland and England). It is one of the great manufacturing centres of the State and the nation, specializing in worsted cloth Its aggregate factory output in 1925 was $175,674,023, of which over 60% represented worsteds and about 5% cotton goods. Most of the mills (representing an investment of $162,000,000) are along the river and the canals which parallel it on either side. Around a 20-acre common are most of the public buildings. The assessed valuation of property in 1927 was $130,734,973. The city operates under a commission form of government. Lawrence has an unusual history. It was planned as an industrial centre by Boston capitalists, including Abbott Lawrence, for whom it was named The site was chosen at the series of falls which offered water-power An area of 6·75 sq m. was taken (1845) from Andover and Methuen, south and north of the river, to form a town (incorporated 1847), and straightway a company was organized for the control of the water-power and the construction of a great dam. In 1848 the dam was completed; in 1850 the population was 8,282; and in 1853 the town was incorporated as a city. The population more than doubled in the decade 1850–60, and again in the 20 years 1860–80, and then again in the 30 years 1880–1910. Cotton manufacturing pre-

dominated in the early days, but since 1865 the production of worsted cloth has become by far the most important industry.

LAWRENCEBURG, a city of south-eastern Indiana, U.S.A., on the Ohio river, 22m. W. of Cincinnati; the county seat of Dearborn county. It is on Federal highway 50, and is served by the Baltimore and Ohio and the Big Four railways. The population in 1920 was 3,466 (95% native white). Lawrenceburg is one of the oldest towns in the State. It was founded in 1802 and incorporated as a city in 1846. From about 1820 it had a thriving river trade with New Orleans, which increased after the building of the Whitewater canal (begun in 1836).

LAWRENCEVILLE, a city of south-eastern Illinois, U.S.A., on the Embarrass river, near the Wabash; the county seat of Lawrence county. It is on Federal highway 50, and is served by the Baltimore and Ohio and the Big Four railways. The population was 5,080 in 1920 (98% native white), and was estimated locally at over 7,600 in 1928. Lawrenceville is the trading and shipping point for an agricultural region and a neighbouring oilfield. It has oil refineries with a daily capacity of 20,000 barrels, machine shops and various other manufacturing industries.

LAWS OF WAR. The law of war, in strict usage, does not apply to all armed conflicts, but only to such conflicts as, by the usage of states, constitute war. War exists when the organized armed forces of one state are opposed to the organized armed forces of another state. War also exists within the bounds of a single state when organized armed forces of sufficient power to make the issue doubtful, place themselves in opposition to the armed forces of the existing government.

Neutral Attitude Toward Insurgents.—The position of neutral governments towards insurgent forces is always a delicate one. If they are not recognized as belligerents by the state against which they are arrayed, the state in question theoretically accepts responsibility for the consequences of their acts in respect of neutral states. A neutral state may be satisfied with this responsibility, or it may recognize the belligerent character of the insurgents. If, however, it does not, the insurgent forces cannot exercise rights of war against neutral property without exposing themselves to treatment as outlaws and pirates. A case of such treatment occurred in September 1902 in connection with a then pending revolution in Hayti. A German cruiser, the "Panther," treated an insurgent gunboat, the "Crête-à-Pierrot," as a pirate vessel, and sank her for having stopped and confiscated arms and ammunition found among the cargo of the German steamer "Markomannia." In the North American Civil War, the right asserted by Great Britain to recognize the belligerency of the Confederate forces was based on the contention that British commercial interests were very largely affected by the blockade of the Southern ports.

It is also agreed that, as the existence of belligerency imposes burdens and liabilities upon neutral subjects, a state engaged in civil war has no right, in endeavouring to effect its warlike objects, to employ measures against foreign vessels, which, though sanctioned in time of peace, are not recognized in time of war. In other words, it cannot enjoy at one and the same moment the rights of both peace and war. Thus, in 1861, when the government of New Granada, during a civil war, announced that certain ports would be closed, subsequently the government of the United States proposed to adopt the same measure against the ports of the Southern States. In each case the United Kingdom protested and in neither case was the order carried out. When in 1885 the President of Colombia, during the existence of civil war, declared several ports to be closed without instituting a blockade, the Secretary of State of the United States, in a despatch of April 24th of that year, refused to acknowledge the closure.

The recognition of belligerency goes no farther than its immediate purpose. But this does not suffice to invest the belligerent with the attributes of independent sovereignty for such objects as negotiation of treaties, and the accrediting of diplomatic and consular agents. This was the attitude of Great Britain and France towards the Confederates in the American Civil War.

Regular Forces and Civilians.—Civilized warfare is confined, as far as possible, to disablement of the armed forces of the enemy; otherwise war would continue till one of the parties was exterminated. "The troops alone carry on war, while the rest of the nation remain in peace" (Vattel's *Law of Nations,* iii. 226). Modern notions of patriotism do not, however, view this total and unconditional abstention of the civilian population as any longer possible. They have found, to some extent, expression in the following Articles of the Hague War-Regulations of 1899 as amended in 1907:—

"Art. 1. The laws, rights and duties of war apply not only to an army, but also to militia and volunteer corps fulfilling the following conditions: (*a*) To be commanded by a person responsible for his subordinates; (*b*) to have a fixed distinctive emblem recognizable at a distance; (*c*) to carry arms openly; and (*d*) to conduct their operations in accordance with the laws and customs of war. In countries where militia or volunteer corps constitute the army, or form part of it, they are included under the denomination 'army.'

"Art 2. The population of a territory not under occupation, who, on the enemy's approach, spontaneously take up arms to resist the invading troops without having had time to organize themselves in accordance with Article 1, shall be regarded as belligerent if they *carry arms openly, and if they* respect the laws and customs of war." The preamble of the Convention refers specially to Articles 1 and 2 in the following terms *inter alia*:

"Until a more complete code of the laws of war is issued, the High Contracting Parties think it expedient to declare that in cases not included in the Regulations adopted by them, populations and belligerents remain under the protection and empire of the principles of international law, as they result from the usages established among civilized nations, from the laws of humanity, and the requirements of the public conscience."

By these provisions, irregular combatants whom both the government of the United States in the American Civil War and the German government in the Franco-German War refused to regard as legitimate belligerents, are now made legally so. It is noteworthy that both at the Brussels Conference of 1874 and the Hague Conference the British delegate ranged himself on the side of the smaller states in favour of the recognition of guerrilla bands. At the Hague Conference Sir John Ardagh gave notice of his intention to propose an additional Article, to the effect that nothing in the Regulations should "be considered as tending to diminish or suppress the right which belongs to the population of an invaded country patriotically to oppose the most energetic resistance by every legitimate means." The upshot of this notice was to cause the insertion of a proviso in the preamble of the Convention denying the right of military commanders to act according to their own arbitrary judgment (*Parliamentary Papers,* No. 1, 1899, c. 9534).

Before the practice of war became more refined, an invading army lived by foraging and pillage in the invaded country; pillage, in fact, being one of the inducements held out to the adventurers who formed part of the fighting forces and this continued down to comparatively recent times. Attenuations followed from the rise of standing and regular armies, and the consequent more marked distinction between soldier and civilian. They have now taken the form of systematic requisitions and contributions, the confining of the right of levying these to generals and commanders-in-chief, the institution of quittances or bills drawn by the belligerent invader on the invaded power and handed in payment to the private persons whose movable belongings have been appropriated or used. There is thus no immunity of private property in warfare on land, and the Hague War-Regulations ratified the right of appropriation of private property in the following Article:—

"Neither requisitions in kind nor services can be demanded from communes or inhabitants except for the necessities of the army of occupation. They must be in proportion to the resources of the country, and of such a nature as not to involve the population in the obligation of taking part in military operations against their country.

"These requisitions and services shall only be demanded on the authority of the Commander in the locality occupied.

"The contributions in kind shall, as far as possible, be paid for in ready money; if not, their receipt shall be acknowledged and the payment of the amounts due shall be made as soon as possible" (Article 52).

In another Article provision, moreover, is made for the utilization of property in kind belonging to private persons:—

"An army of occupation can only take possession of the cash, funds and property liable to requisition belonging strictly to the state, depots of arms, means of transport, stores and supplies, and, generally, all movable property of the state which may be used for military operations.

"All appliances, whether on land, at sea, or in the air adapted for the transmission of news, or for the transport of persons or things, exclusive of cases governed by naval law, depots of arms, and generally, all kinds of ammunition of war, may be seized, even if they belong to private individuals, but must be restored and compensation fixed when peace is made." (*See* the Ballot rules referred to *infra.*)

Enemy Property at Sea.—Enemy property at sea is subject to different rules from those which govern it on land. It is liable to capture and confiscation wherever found on the high seas or in enemy waters. The United States has made strenuous efforts to get this rule of maritime warfare altered, and immunity from capture accepted as the law of the sea. It has even made this a condition of its accession to the Declaration of Paris. (*See* NEUTRALITY.) At the Hague Conferences the United States raised the question again, but thus far all that has been done has been to ratify existing exemptions. Exemption from capture is now allowed by belligerents to enemy merchant ships which, at the outbreak of war, are on the way to one of their ports, and they also allow enemy merchantmen in their ports at its outbreak a certain time to leave them. This is confirmed by the Hague Convention of 1907 No. vi. A somewhat similar practice exists as regards pursuit of merchant ships which happen to be in a neutral port at the same time with an enemy cruiser. Under the Hague Convention of 1907 No. xiii. respecting the rights and duties of neutral powers in naval war (Art. 16), this, too, is confirmed. Lastly, there has grown up, on grounds similar to those which have led to the indulgence shown to private property on land, a now generally recognized immunity from capture of small vessels engaged in the coast fisheries, provided they are in no wise made to serve the purposes of war, which also has been duly confirmed in the Hague Conventions of 1907 by Art. 3 of the convention No. xi. Art. 4 of the same Convention also exempts from belligerent interference vessels employed on religious, scientific or philanthropic missions.

In the Great War, however, the property of non-resident enemy subjects was seized and realized and under the Treaties of Peace the proceeds were pro tanto applied to compensate for similar treatment of the property of subjects confiscated in enemy states.

The converse subject of the treatment of subjects of the one belligerent who remain in the country of the other belligerent also was not dealt with at the Hague. British practice in this matter was formerly indulgent, the protection to the persons and property of non-combatant enemies on British soil dating back to Magna Carta (s. 48). The practice on the continent of Europe varied according to circumstances.

Prisoners of War.—The Hague War-Regulations deal fully with the treatment of prisoners, and though they add nothing to existing practice, such treatment is no longer in the discretion of the signatory Powers, but is binding on them. They provide as follows:—

They must be humanely treated. All their personal belongings, except arms, horses and military papers, remain their property (Article 4). They can only be confined as an indispensable measure of safety, and only so long as circumstances necessitating this measure shall endure (Article 5). The state may utilize the labour of prisoners of war according to their rank and aptitude, with the exception of officers. Their tasks shall not be excessive, and shall have nothing to do with the military operations. Prisoners may be authorized to work for the public service, for private persons, or on their own account. Work done for the state shall be paid for according to the tariffs in force for soldiers of the national army employed on similar tasks, or if there are none in force, then according to a tariff suitable to the work executed. When the work is for other branches of the public service or for private persons, the conditions shall be settled in agreement with the military authorities. The wages of the prisoners shall go towards improving their position, and the balance shall be paid them at the time of their release, after deducting the cost of their maintenance (Article 6). The government into whose hands prisoners of war have fallen is bound to maintain them. Failing a special agreement between the belligerents, prisoners of war shall be treated, as regards food, quarters and clothing, on the same footing as the troops of the government which has captured them (Article 7). Prisoners of war shall be subject to the laws, regulations and orders in force in the army of the state into whose hands they have fallen. Any prisoner of war who is liberated on parole and recaptured, bearing arms against the government to whom he had pledged his honour or against the allies of that government, forfeits his right to be treated as a prisoner of war, and can be brought before the courts (Article 12).

These rules and others not mentioned in detail were not always properly observed by some of the belligerent powers in the Great War. An improved code of rules was drafted by the International Law Association and adopted at their 1921 Conference held at The Hague. It is understood that these rules have met with the approval of the authorities in the United Kingdom and elsewhere.

Journalists.—An interesting provision in original Hague Regulations assimilates individuals who, following an army without directly belonging to it, such as newspaper correspondents and reporters, sutlers, contractors, fall into the enemy's hands, to prisoners of war, provided they can produce a certificate from the military authorities of the army they were accompanying.

A new departure was made in 1907 by clauses providing for the institution of a bureau for information relative to prisoners of war. This institution was of great value during the World War. It is the duty of the bureau to receive and collect all objects of personal use, valuables, letters, etc., found on the battlefields or left by prisoners who have died in hospital or ambulance, and to transmit them to those interested. Letters, money orders and valuables, as well as postal parcels destined for the prisoners of war or despatched by them, are to be free of all postal duties both in the countries of origin and destination, as well as in those they pass through. Gifts and relief in kind for prisoners of war are to be admitted free of all duties of entry, as well as of payments for carriage by the government railways.

Relief Societies and Sick and Wounded.—Furthermore, relief societies for prisoners of war, regularly constituted with the object of charity, are to receive every facility, within the bounds of military requirements and administrative regulations, for the effective accomplishment of their task. Delegates of these societies are to be admitted to the places of internment for the distribution of relief, as also to the halting-places of repatriated prisoners, "if furnished with a personal permit by the military authorities, and on giving an engagement in writing to comply with all their regulations for order and police."

The obligations of belligerents with regard to sick and wounded in war on land are governed by the Geneva Convention of July 6, 1906. By this Convention ambulances and military hospitals, their medical and administrative staff and chaplains are "respected and protected under all circumstances," and the use of a uniform flag and arm-badge bearing a red cross are required as a distinguishing mark of their character. A Convention, accepted at the Peace Conferences of 1899 governs the treatment of hospital ships, making them inviolable as well as the religious, medical or hospital staff of any captured ship.

Injuring the Enemy.—The following prohibitions are also placed by the Hague Regulations on the means of injuring the enemy:—

To employ poison or poisoned arms.

To kill or wound treacherously individuals belonging to the hostile nation or army.

To kill or wound an enemy who, having laid down arms or hav-

ing no longer means of defence, has surrendered at discretion.

To declare that no quarter will be given.

To employ arms, projectiles or material of a nature to cause superfluous injury.

To make improper use of a flag of truce, the national flag or military ensigns and the enemy's uniform, as well as the distinctive badges of the Geneva Convention.

To destroy or seize the enemy's property, unless such destruction or seizure be imperatively demanded by the necessities of war; to attack or bombard towns, villages, habitations or buildings which are not defended.

To pillage a town or place, even when taken by assault.

Ruses of war and the employment of methods necessary to obtain information about the enemy and the country, on the contrary, are considered allowable.

A spy is one who, acting clandestinely, or on false pretences, obtains, or seeks to obtain, information in the zone of operations of a belligerent, with the intention of communicating it to the hostile party (the Hague War-Regulations, Art. 29). Thus, soldiers not in disguise who have penetrated into the zone of operations of a hostile army to obtain information are not considered spies. Similarly, the following are not considered spies: soldiers or civilians, carrying out their mission openly, charged with the delivery of despatches destined either for their own army or for that of the enemy. To this class belong likewise individuals sent in balloons to deliver despatches, and generally to maintain communication between the various parts of an army or a territory (*ib.*). A spy taken in the act cannot be punished without previous trial, and a spy who, after rejoining the army to which he belongs, is subsequently captured by the enemy, is a prisoner of war, and not punishable for his previous acts of espionage.

In sieges and bombardments all necessary steps are to be taken to spare as far as possible buildings devoted to religion, art, science and charity, hospitals and places where the sick and wounded are collected, provided they are not used at the same time for military purposes; but the besieged are to indicate these buildings or places by some particular and visible signs and notify them to the assailants.

A new Convention respecting bombardments by naval forces was adopted by the Hague Conference of 1907, forbidding the bombardment of undefended "ports, towns, villages, dwellings or buildings," unless after a formal summons the local authorities decline to comply with requisitions for provisions or supplies necessary for the immediate use of the naval force before the place in question. But they may not be bombarded on account of failure to pay money contributions. On the other hand, the prohibition does not apply to military works, depots of arms, etc., or ships of war in a harbour.

Another new Convention adopted at the Hague in 1907 dealt with the laying of automatic submarine contact mines. Its main provisions are as follows:—

It is forbidden:

1. To lay unanchored automatic contact mines, except when they are so constructed as to become harmless one hour at most after the person who laid them ceases to control them;

2. To lay anchored automatic contact mines which do not become harmless as soon as they have broken loose from their moorings;

3. To use torpedoes which do not become harmless when they have missed their mark (Art. 1).

It is forbidden to lay automatic contact mines off the coast and ports of the enemy, with the sole object of intercepting commercial shipping (Art. 2).

When anchored automatic contact mines are employed, every possible precaution must be taken for the security of peaceful shipping.

The belligerents undertake to do their utmost to render these mines harmless within a limited time, and, should they cease to be under surveillance, to notify the danger zones as soon as military exigencies permit, by a notice addressed to shipowners, which must also be communicated to the Governments through the diplomatic channel. (Art. 3.)

Neutral Powers which lay automatic contact mines off their coasts must observe the same rules and take the same precautions as are imposed on belligerents.

The neutral Power must inform shipowners, by a notice issued in advance, where automatic contact mines have been laid. This notice must be communicated at once to the Governments through the diplomatic channel. (Art. 4.)

At the close of the war the Contracting Powers undertake to do their utmost to remove the mines which they have laid, each Power removing its own mines.

As regards anchored automatic contact mines laid by one of the belligerents off the coast of the other, their position must be notified to the other party by the Power which laid them, and each Power must proceed with the least possible delay to remove the mines in its own waters. (Art. 5.)

Territory is considered as occupied when it is actually under the authority of the hostile army. The authority having passed into the hands of the occupant, the latter takes all possible steps to re-establish public order and safety. Compulsion of the population of occupied territory to take part in military operations against their own country, or even give information respecting the army of the other belligerent and pressure to take the oath to the hostile power are prohibited. Private property must be respected, save in case of military necessity (Arts. 46 and 52). The property of religious, charitable and educational institutions, and of art and science, even when state property, are assimilated to private property, and all seizure of, and destruction or intentional damage done to such institutions, to historical monuments, works of art or science is prohibited (Art. 56). As these rules were insufficient, new rules known as the Ballot rules, were adopted by the Warsaw conference of the International Law Association in 1928 and it is expected that they will form the basis of an interstate convention. A special Hague convention adopted at the Conference of 1907 now provides that hostilities "must not commence without previous and explicit warning in the form of a reasoned declaration of war or of an ultimatum with conditional declaration of war."

Limitation of Belligerent Rights.—Another fundamental principle which fully corresponds to the modern tendencies of the civilised world is that contained in article 22 of The Hague Convention No. IV., which expressly lays down that the "right of belligerents to adopt means of injuring the enemy is not unlimited." It must not be used for the purpose of inflicting unnecessary injuries or for the wanton devastation and spoliation of enemy property. More especially, the war must not be waged against the peaceful inhabitants of the enemy territory. This distinction between combatants and non-combatants on which international law has been based since the beginning of the nineteenth century, was repeatedly infringed by Germany and her Allies during the Great War of 1914–18. The sanctity of treaties, the rights of individual lives, family honour and private property were deliberately and persistently violated by the Central Powers. Even the lives and property of neutrals were not spared in this conflict which was throughout characterised by a complete disregard of the dictates of chivalry and humanity. New methods of warfare were also adopted which constituted a flagrant breach of the accepted laws and customs of war.

Use of Poisonous Gases.—Amongst such means was the employment of poisonous and asphyxiating gases and of liquid fire which were at first resorted to by Germany and subsequently adopted, by measure of self-defence, by her opponents. The progress of science has made this new weapon so barbarous and deadly that its use must be absolutely forbidden in all future wars. The Washington Conference of 1922 has reaffirmed the prohibition contained as regards "poison or poisoned arms" in The Hague Convention (*supra*) and has extended it to all asphyxiating gases and "all analogous liquids, materials or devices." The Geneva Protocol of July 17, 1925, which up to now has been agreed to by thirty-eight States, further extends the prohibition to all "bacteriological methods of warfare."

War Zones.—The declaration in the Great War of military or

war zones raises the question as to the legality of the exclusion of neutral vessels from vast parts of the high seas for the alleged self-protection of belligerents. The German declaration of February 4, 1915, proclaimed war zones round the north and west coasts of France and the waters surrounding the British Isles and enforced this closure both with mines and with submarines which torpedoed at sight all vessels entering therein. The area was extended by the German Order of January 31, 1917, to the whole of the waters round Great Britain, France, Italy, Greece, Asia Minor and North Africa and a considerable number of vessels, both belligerent and neutral, were sunk with their crews, passengers and cargo. The German attacks were countered by the Allies by the North Sea barrage which was maintained by mine-fields, but in every case free lanes were left for neutral shipping. But even in this modified form, the declaration of war zones is a violation of the principles of international law as it involves the destruction of neutral vessels and danger to innocent lives of non-combatant enemies and neutrals.

Submarines.—Submarines had for some years before the Great War been used for military offence and were included in the naval forces of the belligerents. During the War of 1914–18, Germany and her Allies employed this new arm for the indiscriminate sinking of belligerent and neutral ships. This action was a serious breach of the rules of naval warfare which prohibit the destruction of merchant vessels except in the case of military necessity and then only if the ships are enemy. As regards neutral vessels, their destruction is absolutely forbidden. Further, in the case of any merchant ship lawfully sunk, the law requires that the crew and passengers should first be removed to a place of safety. Owing to their inherent defect, submarines are unable to carry a prize crew or to provide for the protection of the persons removed from the ships they destroy. The Treaty signed at Washington on February 6, 1922, enacts that submarines are not, in any circumstances, exempt from the universal rules of international law and if a submarine cannot capture a merchant vessel in conformity with these rules, she must desist from attack and seizure By article 4 of the Treaty, the Signatory Powers "recognise the practical impossibility of using submarines as commerce destroyers without violating, as they were violated in the recent war of 1914–18, the requirements universally accepted by civilised nations for the protection of the lives of neutrals and non-combatants, and to the end that the prohibition of the use of submarines as commerce destroyers shall be universally accepted as a part of the law of nations, they now accept that prohibition as henceforth binding as between themselves and they invite all other nations to adhere thereto."

Reprisals in War.—During the Great War, resort was made on a considerable scale to the right of retaliation by both the Allies and the Central Powers. This doctrine of retaliation invoked by belligerents as a measure of redress for the violation of the rules of warfare by their adversaries, constitutes a grave interference with neutral trade and leaves neutral Powers practically without any remedy against unjustified and oppressive innovations or abuses of belligerent rights. It is inequitable that a neutral should be made to suffer, in the pursuit of his lawful trade, for the breach of the regulations of war when in fact he is not responsible for such a breach and has no control over it. Retaliation by the Allied Powers originated with the Order in Council of March 11, 1915, and the French Decree of March 13, 1915, ordering the seizure and detention of all goods of German origin, ownership or destination. By the Order in Council of February 16, 1917, all neutral vessels carrying goods of enemy origin or destination were made liable to capture and condemnation when encountered at sea on their way to or from a port in any neutral country affording means of access to the enemy territory unless they previously called at a British or Allied port. There can be no doubt that the retaliatory measures adopted by the Allies were fully justified by the violation of all rules of humanity and the serious menace to their rights and their very existence which the actions initiated by the Central Powers involved.

Aerial Warfare.—The first time that aircraft played an important part was in the Great War when it co-operated with the land and sea forces and gave valuable help in the campaign against submarines, in the bombardment of enemy military objectives and, generally, in its use as a scout. Although there was a lack of rules in 1914 on the subject of aerial warfare, all of these services may be legitimately included amongst belligerent rights since they were directed against the armed forces of the enemy. There was, however, a grave abuse by Germany and Austria of these rights in the bombing by aeroplanes of unfortified, unarmed and defenceless towns and villages with severe loss to non-combatant life and property. The Hague Convention of Jurists, appointed under the terms of the Washington Conference of 1922, prepared in the following year a set of rules which partially fill up the gap existing in the laws of aerial warfare. The rules prohibit aerial bombardment for the purpose of terrorising the civilian population, of destroying or damaging private property not of a military character or of injuring non-combatants or enforcing compliance with requisitions in kind or payment of contributions. They further enact that "aerial bombardment is legitimate only when directed at a military objective, that is to say, an object of which the destruction or injury would constitute a distinct military advantage to the belligerent. The bombardment of cities, towns, villages, dwellings or buildings not in the immediate neighbourhood of the operations of land forces is prohibited."

War Crimes.—The many violations of the rules of warfare led to the suppression in the Treaties of Peace which terminated the Great War of the usual "amnesty clause" and to its substitution by an entirely novel principle, that of the punishment of war criminals. Article 228 of the Treaty of Versailles, 1919, provides that the "German Government recognises the right of the Allied and Associated Powers to bring before military tribunals persons accused of having committed acts in violation of the laws and customs of war. The German Government shall hand over to the Allied and Associated Powers or to such of one of them as shall so request, all persons accused of having committed an act in violation of the laws and customs of war." The Allies acceded to the request of Germany that the accused persons should be tried by German Tribunals and accordingly sixteen cases were proceeded with and resulted in six convictions. These sentences were both insufficient and inadequate. The Advisory Committee of Jurists which sat at The Hague in 1920 to prepare the Statute for the Permanent Court of International Justice expressed a "voeu" for the creation of an International Court of Criminal Justice. A Statute for such a Court was elaborated at the Vienna Conference of the International Law Association, 1926, as a basis for an interstate Convention. Article 16 of the Covenant of the League of Nations provides for the application of sanctions against members of the League which resort to war in disregard of their obligations.

(C. J. C.)

LAWSON, CECIL GORDON (1851–1882), English landscape painter, was born near Shrewsbury on Dec. 3, 1851. Lawson's first works were studies of fruit and flowers in the manner of W. Hunt. These were followed by riverside Chelsea subjects. His first exhibit at the Royal Academy (1870) was "Cheyne Walk." His "Hop Gardens of England," exhibited at the Academy of 1876, and "The Minister's Garden," shown in 1878 at the Grosvenor gallery and now in the Manchester art gallery, are his finest works. He died at Haslemere on June 10, 1882.

See E. W. Gosse, *Cecil Lawson, a Memoir* (1883); Heseltine Owen, "In Memoriam: Cecil Gordon Lawson," *Magazine of Art* (1894).

LAWSON, SIR JOHN (d. 1665), British sailor, born at Scarborough, joined the parliamentary navy in 1642. In 1654–1655 he commanded in the North sea and the Channel. Appointed in Jan. 1656 as Blake's second-in-command, Lawson was a few weeks later summarily dismissed from his command, probably for political reasons. He was a Republican and Anabaptist, and therefore an enemy to Cromwell. In 1657, along with Harrison and others, he was arrested and, for a short time, imprisoned for conspiring against Cromwell. During the troubled months following the fall of Richard Cromwell, Lawson, flying his flag as admiral of the Channel fleet, played a marked political rôle. His ships escorted Charles to England, and he was soon afterwards

knighted. In 1661 he began a series of campaigns against the piratical states of the Algerian coast. Thence summoned to a command in the Dutch War, he was mortally wounded at Lowestoft. He died on June 29, 1665.

LAWSON, VICTOR FREMONT (1850–1925), American editor and philanthropist, was born in Chicago (Ill.), Sept. 9, 1850, the son of Iver H. Lawson, a Norwegian immigrant, and was educated at Phillips academy, Andover (Mass.). He took charge of his father's interest in the daily *Skandinaven,* and in July 1876, bought an interest in the Chicago *Daily News,* which had been organized six months before by Melville E. Stone as the first one-cent newspaper in the West. In 1881 Lawson and Stone started a morning edition called the Chicago *Record,* since discontinued. In 1888 Lawson bought Stone's interest, and he remained sole proprietor until his death, Aug. 19, 1925. His principal achievement was the development of the Chicago *Daily News.* His advocacy of a postal savings bank caused him to be called the father of the law establishing such a bank. Lawson supported Stone in his development of the Associated Press, and was its president from 1894 to 1900, and a director until his death. In 1923 the University of Michigan, and in 1924 Columbia university, gave him the degree of doctor of laws. (H. Ha.)

LAWSON, SIR WILFRID, 2ND BART. (1829–1906), English politician and temperance leader, son of the 1st baronet (d. 1867), was born on Sept. 4, 1829. In 1864 Lawson, who had entered parliament in 1859, first introduced his Permissive bill, giving to a two-thirds majority in any district a veto upon the granting of licences for the sale of intoxicating liquors; and though this principle failed to be embodied in any act, a resolution on its lines was accepted by a majority in the House of Commons in 1880, 1881 and 1883. He was the champion of the United Kingdom Alliance (founded 1853), of which he became president. An extreme Radical, he also supported disestablishment, abolition of the House of Lords, and disarmament. Lawson was popular for his own sake both in and out of the House of Commons; he was a famous wit. Examples of his witty verses may be found in *Customs in Line and Rhyme* (1905) in which he collaborated with F. C. Gould. He died on July 1, 1906.

LAWS RELATING TO REAL PROPERTY AND CONVEYANCING. Real property is distinguished from personal property by the fact that the conception of tenure is applicable only to the former. This conception, and the distinction founded upon it, can only be understood by an outline of the history of English land law.

History.—Such terms as "fee" or "homage" carry us back into feudal times. But the law of feudal times was itself based upon those primitive institutions, of which the modern rights of common and distress are the direct descendants. In its final form the common law in relation to land was the result of the evolution of the previously existing course of Teutonic custom under the stress of those feudal notions, which at and after the Conquest were introduced into England from the Continent, and which may themselves be traced to the partial assimilation of Roman notions of citizenship by the Gallic land-owner.

The characteristic features of the Teutonic system were enjoyment in common and the absence of private ownership except to a limited extent. The principal features of the old English land law before the Conquest were (1) liberty of alienation, either by will or *inter vivos,* of such land as could be alienated (chiefly, if not entirely, bocland), subject always to the limits fixed by the boc; (2) publicity of transfer by enrolment in the shire-book or church-book; (3) equal partition of the estate of a deceased among the sons, and failing sons among the daughters; (4) cultivation to a great extent by persons in various degrees of serfdom, owing money or labour rents; (5) variety of custom, tending to become uniform through the application of the same principles in the local courts; and (6) subjection of land to the *trinoda necessitas* (*i.e.,* the obligations of military service, repair of bridges and maintenance of fortifications). From the earliest times the ownership of land was the basis of political privilege and conferred some territorial jurisdiction upon the land-owner. In relation to folkland this jurisdiction, as well as the administration of the criminal law, became vested in the king as ultimate arbiter, and he in many cases delegated his powers to the great land-owners. Rudiments of the conception of tenure can thus be found in Anglo-Saxon times.

The effect of the Norman Conquest was not all at once to change allodial into feudal tenure, but to complete the association of territorial with personal dependence in a state of society already prepared for it. "Nulle terre sans seigneur" was one of the fundamental axioms of feudalism. The land forfeited to the Conqueror was regranted by him to be held by military service due to the king, not to the mesne lord as in Continental feudalism. In 1086 at the council of Salisbury all the landholders swore fealty to the Crown. There might be any number of infeudations and subinfeudations to mesne lords, but the chain of seigniory was complete, depending in the last resort upon the king as lord paramount. Land was not owned by free owners owing only necessary militia duties to the State, but was held of the king by military service of a more onerous nature. The folkland became the king's land; free owners tended to become tenants of the lord, the township to be lost in the manor; the common land became in law the waste of the manor, its enjoyment resting upon a presumed grant by the lord. On the other hand, the whole of England did not become manorial; the conflict between the township and the manor resulted in a compromise.

In the full vigour of feudalism the inhabitants of England were either free or not free. The free inhabitants held their lands either by free tenure (*liberum tenementum,* franktenement) or by a tenure which although originally that of a non-free inhabitant, remained attached to the land. Franktenement was either (1) military tenure, called also tenure in knight service or chivalry (including barony, the highest tenure known to the law, grand serjeanty and the special forms of escuage, castle-guard, cornage and others), or (2) socage (including burgage and petit serjeanty), or (3) frankalmoign (*libera eleemosyna,* divine service), by which ecclesiastical corporations generally held their land[1]. The non-free inhabitants were in Domesday Book *servi, cotarii* or *bordarii,* later *nativi* or *villani,* the last name being applied to both free men and serfs. All these were in a more or less dependent condition. The free tenures all existed until 1926, though, as will appear later, the military tenures had shrunk into the unimportant and exceptional tenure of grand serjeanty. The non-free tenures were until 1926 represented by copyhold (*q.v.*). The most important difference between the military and socage tenures was the mode of descent. Land held by military service descended as to the capital fief to the eldest son; but socage lands and lands other than the capital fief for some time followed the old pre-Conquest rule of descent, and if anciently partible (*antiquitus divisum*) were divided among all the sons equally. But by the time of Bracton (Henry III) the course of descent of lands held by military service had so far prevailed, that although it was a question of fact whether the land was partible or not, if there was no evidence either way descent to the eldest son was presumed. Relics of the old rule remained until 1926 in the custom of gavelkind. The military tenant was subject to the feudal incidents, from which the tenant in socage was exempt; and these incidents, especially wardship and marriage, were often oppressive. Alienation of lands by will, except in a few favoured districts, became impossible; alienation *inter vivos* was restrained in one direction in the interests of the heir, in another in the interests of the lord. At the time of Glanvill a tenant had a greater power of alienation over land which he had purchased (*terra acquietata*) than over land which he had inherited. But by the time of Bracton the heir had ceased to have any interest in either kind of land. It was enacted by Magna Carta that a free man should not give or sell so much of his land as to leave an amount insufficient to perform his services to his lord. In spite of this provision, the rights of the lords were continually

[1]Frankalmoign was not always regarded as a distinct tenure. Thus Littleton (s. 118) says that all that is not tenure in chivalry is tenure in socage.

diminished by sub-infeudation until the passing of the Statute of *Quia Emptores*. Alienation by a tenant in chief of the Crown without licence was a ground of forfeiture until 1. Edw. III. st. 2. c. 12, by which a fine was substituted. The modes of conveyance at this time were only two, feoffment with livery of seisin for corporeal hereditaments, grant for incorporeal hereditaments. Livery of seisin, though public, was not officially recorded like the old English transfer of property. The influence of local custom upon the land law must have become weakened after the circuits of the judges of the king's court were established by Henry II. Jurisdiction over litigation touching the freehold was taken away from the lord's courts by 15 Ric. II. c. 12.

The common law, so far as it dealt with real estate, had in the main assumed its present aspect by the reign of Henry III. The changes which have been made since that date have been chiefly due to the action of equity and legislation, the latter sometimes interpreted by the courts in a manner very different from the intention of parliament.

The most important influence of equity has been exercised in mortgages and trusts, in the doctrine of specific performance of contracts concerning real estate, and in relief from forfeiture for breach of covenant.

History of Real Estate Legislation.—The reign of Edward I. is notable for three leading statutes, all passed in the interests of the superior lords. The Statute of Mortmain (7 Edw. I. st. 2. c. 13) is the first of a long series directed against the acquisition of land by religious and charitable corporations. The statute *De Donis Conditionalibus* (13 Edw. I. c. 1) forbade the alienation of estates granted to a man and the heirs of his body, which before the statute became on the birth of an heir at once alienable (except in the case of gifts in frankmarriage), the lord thereby losing his escheat. The statute *Quia Emptores* (18 Edw. I. c. 1) preserved those rights of the lords which were up to that time subject to be defeated by subinfeudation, by enacting that in any alienation of lands the alienee should hold them of the same lord of the fee as the alienor[1]: the statute, however, does not bind the Crown. The practical effect of this statute was to make the transfer of land more of a commercial and less of a feudal transaction. The writ of *elegit* was introduced by the Statute of Westminster II. in 1285 as a creditor's remedy over real estate. It has, however, been considerably modified by subsequent legislation.

The reign of Henry VIII., like the reign of Edward I., is signalized by three important Acts. The one which had the most lasting influence in law was the Statute of Uses, 27 Hen. VIII. c. 10 (*see* TRUST), the object of which was to destroy altogether the system of uses and equitable estates. It enacted, in substance, that whoever should have a use or trust in any hereditaments should be deemed to have the legal seisin, estate and possession for the same interest that he had in the use; in other words, that he should become in effect the feudal tenant without actual delivery of possession to him by the actual feoffee to uses or trustee. In its result the statute was a fiasco. After a decent interval it was solemnly decided that the Act transferred the legal possession to the use once only, and that in the case of a conveyance to A to the use of B to the use of or upon trust for C, it gave the legal estate to B and left C with an interest in the position of the use before the statute. The statute thus formed the foundation of that complicated system of trusts fastened upon legal estates and protected by courts of equity, to simplify which was one of the objects of the Acts of 1922–25. The Statute of Uses was intended to provide against secrecy of sales of land, and as a necessary sequel to it the Statute of Enrolments (27 Henry VIII. c. 16) enacted that all bargains and sales of land should be publicly enrolled. Bargain and sale was a form of equitable transfer which had for some purposes superseded the common law feoffment. But the Statute of Enrolments was in terms limited to estates of freehold, and its unforeseen effect was to establish as the ordinary form of conveyance until 1845 the conveyance by lease and release[1]. It was allowed that a bargain and sale for a term, say, of one year, must transfer the seisin to the bargainee without enrolment. And since what remained in the bargainor was merely a reversion which "lay in grant," it was an easy matter to release this by deed the day after. By this ingenious device was the publicity of feoffment or enrolment avoided, and the lease and release, as the process was called, remained the usual mode of conveying a freehold in possession down to the 19th century. The third Act, 32 Hen. VIII. c. 1 (explained by 34 and 35 Hen. VIII. c. 5), was passed to remedy the inconvenience caused by the fact that uses having become legal estate by the Statute of Uses were no longer devisable (*see* WILL).

In the reign of Elizabeth the Acts of 13 Eliz. c. 5 and 27 Eliz. c. 4 avoided fraudulent conveyances as against all parties and voluntary conveyances as against subsequent purchasers for valuable consideration. Early in the reign of Charles II. the Act of 1661 (12 Car. II. c. 24) turned all the feudal tenures (with the exception of frankalmoign and grand serjeanty) into tenure by free and common socage and abolished the feudal incidents. The Statute of Frauds (29 Car. II. c. 3) contained provisions that certain leases and assignments, and that all agreements and trusts relating to land, should be in writing (*see* FRAUD). The land registries of Middlesex and Yorkshire date from the reign of Anne (*see* LAND REGISTRATION). Devises of land for charitable purposes were forbidden by the Mortmain Act (9 Geo. II. c. 36). In the next reign the first general Inclosure Act was passed, 41 Geo. III. c. 109 (*see* COMMONS). In the reign of William IV. were passed the Prescription, Limitation and Tithe Commutation Acts; fines and recoveries were abolished and simpler modes of conveyance substituted, and the laws of inheritance and dower were amended. Since the commencement of the reign of Victoria there has been a vast mass of legislation dealing with real estate in almost every conceivable aspect. At the immediate beginning of the reign stands the Wills Act. The transfer of real estate was simplified by the Real Property Act 1845 and by the Conveyancing Acts 1881 to 1911 (now the Law of Property Act 1925). The Act of 1845 finally established the modern system of transfer by a single deed by enacting that all corporeal hereditaments should, as regards the immediate freehold be deemed to lie in grant, as well as in livery. By the Acts of 1925 the ancient modes of conveyance, in practice already obsolete, were abolished. Additional powers of dealing with settled estates were given by the Settled Estates Act 1856, later by the Settled Estates Act 1877, and the Settled Land Acts 1882–90 (now the Settled Land Act 1925). Succession duty was levied for the first time on freeholds in 1853. The strictness of the Mortmain Act has been relaxed in favour of gifts and sales to public institutions of various kinds, such as schools, parks and museums. The period of limitation was shortened for most purposes from 20 to 12 years by the Real Property Limitation Act 1874. Several Acts were passed facilitating the enfranchisement and commutation of copyholds, until these were finally abolished by the Law of Property Act 1922. The Naturalization Act 1870 enabled aliens to hold and transfer land in England. The Felony Act 1870 abolished forfeiture of real estate on conviction for felony. The Agricultural Holdings Acts and other Acts gave the tenant of a tenancy within the Acts a general right to compensation for improvements, substituted a year's notice to quit for the six months' notice previously necessary, enlarged the tenant's right to fixtures, and limited the amount of distress. Somewhat similar provisions for the benefit of lessees are contained in the Landlord and Tenant Act 1927 (*see* LEASE). Among other subjects which have been dealt with by recent legislation may be mentioned land transfer, registration, mortgage, partition, excambion, fixtures, taking of land in execution, declaration of title and apportionment.

The Present Law.—The tendency of legislation since the abolition of fines and recoveries in 1833 has been to facilitate

[1]Tenants in chief of the Crown were liable to a fine on alienation until 12 Car. II. c. 24.

[1]From the reign of Edward IV. at latest up to the Fines and Recoveries Act of 1833 fines and recoveries were also recognized as a means of conveyance. They are so regarded in the Statute of Uses.

the sale of real estate. But until 1926 on the one hand land-purchase was discouraged by the variety of local custom and the liability, in the case of copyholds, to manorial incidents, in some cases a very real burden upon the tenant; and on the other hand the sale of land was in many cases for practical purposes impossible. For instance, under the old system the legal estate might be split up into a large number of undivided shares, such shares being vested in different persons, of whom some were unable to convey by reason of infancy or from some other cause, some had a mere term of years for securing a charge, and some had only a life or other limited interest. In such a case the equitable estate in the various undivided shares might also be tied up in a number of different ways. In order to sell the land it was sometimes necessary not only to obtain the concurrence of 20 or more persons but also to institute legal proceedings in order to obtain the sanction of the court; the expense involved might therefore be greater than the value of the land.

All land is now held in free and common socage. By the series of Acts[1] which came into force on Jan. 1, 1926, and which consolidate and profoundly modify the statutes relating to land from the time of Edward I., all copyholds were enfranchised, customary tenures[2] and local rules of descent were abolished, the splitting up of legal estates was made impossible, outstanding legal estates were got in, and infants were disabled from holding or acquiring land. At the same time all existing beneficial interests were preserved (though often in a different form), and it was made possible to create similar interests without thereby subjecting the land to the inconveniences formerly involved.

In brief, this object was attained (1) by abolishing forthwith certain manorial incidents (*e g.*, customary suits, fealty, escheat and certain forfeitures), and by making provision for the ultimate extinguishment of others (*e.g.*, manorial and customary rents, fines, heriots, etc.), either by agreement as to compensation or by notice to fix compensation or by automatic expiry; (2) by applying the general principle of the convertibility of land into money; (3) by enacting in effect that all land not held absolutely and beneficially by one person capable of conveying the same should be subject either to a trust for sale or a power of sale[3], the persons capable of exercising such trust[4] or power being never more than four, and (4) by reducing to two the number of legal estates in land. A few words of explanation must suffice.

The only estates in land capable of subsisting or of being conveyed or created at law are (a) an estate in fee simple absolute in possession and (b) a term of years absolute; examples of the latter being the estates taken by lessees and legal mortgagees (*see* LEASE, MORTGAGE). The only interests or charges in or over land are (1) an easement right or privilege for an interest equivalent to one of the two legal estates already mentioned; (2) a rentcharge in possession, either perpetual or for a term of years absolute; (3) a charge by way of legal mortgage; (4) land-tax, tithe-rentcharge and similar charges; and (5) rights of entry exercisable over or in respect of a legal term of years absolute or annexed to a legal rentcharge. All other estates, interests and charges in or over land take effect in equity and can be enforced by equitable remedies only. Certain mortgages and similar charges on land must be registered either at the land registry or, if the land is in Yorkshire, in the appropriate registry there in order to obtain the protection afforded by the Land Charges Act 1925; if not so registered they can be over-reached. (*See* LAND CHARGE, MORTGAGE.)

Land cannot now be held in undivided shares. The legal estate in fee simple in all land (other than settled land), which prior to 1926 was held in undivided shares, or which after 1926 is conveyed in a manner which under the old system would have created undivided shares, is now subjected to a trust for sale. Upon the appointment of new trustees of a conveyance of land on trust for sale, the same persons must be appointed as are trustees of the settlement of the proceeds of sale. A purchaser, however, is concerned neither to see that this is done nor yet with the manner in which the trustees deal with the purchase money; but as between the trustees for sale and the persons entitled to the undivided shares the purchase money and the income resulting from the investment thereof represent the land and are to be enjoyed in precisely the same manner as the land (*see* TRUST and TRUSTEES). A conveyance of land to persons some or all of whom are infants, either subjects the land to a trust for sale or else operates as a mere declaration of trust or agreement to execute a settlement of the land, according to the circumstances. In the case of settled land the legal estate must be vested in the tenant for life or statutory owner, who is invested with ample powers of selling, leasing, mortgaging and otherwise dealing with the settled land. If upon any such transaction any money arises which is in the nature of capital, such money must be paid to the trustees of the settlement for the purposes of the Settled Land Act. But before any such transaction can be validly effected a document called a vesting instrument must be executed; this document shows who has the legal estate, how the settlement arose, who are at the date of the vesting instrument the trustees of the settlement for the purposes of the Settled Land Act, and what powers (if any) the estate owner has in relation to the settled land over and above those conferred on him by the Act. If new Settled Land Act trustees are appointed, a deed of declaration to that effect must be executed and a memorandum endorsed on the vesting instrument. Upon the acquisition of land to be made subject to the settlement a subsidiary vesting deed is executed. When, upon a death or otherwise, someone other than the person named in the vesting instrument as the estate owner becomes entitled to have the legal estate vested in him, a fresh vesting instrument is executed, if the land remains settled land; but if under the "trust instrument" (*i.e*, the instrument or series of instruments or events which constitute the settlement of the beneficial interest in the settled property), the land ceases to be settled land, a deed of discharge is executed by the Settled Land Act trustees, and thenceforward a purchaser can safely pay capital money to the estate owner. Only in exceptional cases is a purchaser from the estate owner of settled land concerned to see that the vesting instrument was duly made. (*See* SETTLEMENT.)

Real estate is either corporeal or incorporeal, a division based upon the Roman law. Corporeal hereditaments, says Blackstone, "consist of such as affect the senses, such as may be seen and handled by the body; incorporeal are not the objects of sensation, can neither be seen nor handled, are creatures of the mind, and exist only in contemplation." Incorporeal hereditaments consist chiefly, if not wholly of rights *in alieno solo*. Examples are profits *à prendre* (such as rights of common), easements (such as rights of way[1]), seigniories, advowsons, rents, tithes, titles of honour, offices, franchises.

It remains to mention that a system of registration of title to land has been established; at present, however, the system is only compulsory in the County of London and in one or two outlying districts. (*See* LAND REGISTRATION.)

Title.—This is the name given to the mode of acquisition of rights over real estate. Title may arise either by alienation voluntary or involuntary, or by succession (*see* PROPERTY, DEVOLUTION OF). Voluntary alienation is either *inter vivos* or by will (*q.v.*). The former branch is practically synonymous with conveyance, whether by way of sale, settlement, mortgage or otherwise. As a general rule alienation of real estate *inter vivos* must

[1]Law of Property Act 1922, Law of Property Act 1925, Land Registration Act 1925, Settled Land Act 1925, Land Charges Act 1925, Administration of Estates Act 1925, Trustee Act 1925 and Universities and College Estates Act 1925.

[2]The services incident to grand and petty serjeanty are preserved, though the land has become socage land.

[3]The power of sale referred to is a power of sale created by the Acts, and can sometimes only be exercised with the concurrence of the court, *e.g.*, in the case of an equitable mortgagee where the mortgage is not by deed. So far as a deed other than a mortgage purports to give to any persons a power of sale it is, generally speaking, ineffective, except that it may make those persons trustees for the purposes of the Settled Land Act 1925.

[4]The vendors may need to obtain the consent of not more than two persons, but a purchaser is not concerned to see that such consent is obtained.

[1]It should be noticed that an easement in gross cannot exist.

be by deed. Involuntary alienation is by bankruptcy (*q.v.*), and by other means of enforcing the rights of creditors over land, such as distress or execution. It may also arise by the exercise by the State of its rights of eminent domain for public purposes, as under the Lands Clauses and other Acts[1], or by a vesting order made by a court of competent jurisdiction under statutory authority.

Conveyancing.—In the preparation of legal documents the practitioner is much assisted by the use of precedents. These are outlines or models of instruments, collections of which have been in use from early times, certainly since printing became common. The prolixity which formerly characterized most legal documents has largely disappeared, mainly through the operation of statutes which enable many clauses previously inserted at great length to be incorporated by the use of a few prescribed words or omitted altogether. The Solicitors' Remuneration Act 1881 has also assisted the process of curtailment, for there is now little or no connection between the length of a deed and the cost of its preparation. So long as the draftsman adheres to recognized legal phraseology and methods, there is no reason why modern instruments should not be concise.

It is not usual for land to be sold without a formal agreement in writing being entered into. This precaution is due, partly to the Statute of Frauds (*see* above), and partly to the fact that there are few titles which can with prudence be exposed to all the requisitions that a purchaser under an "open contract" is entitled by law to make. Under an open contract a vendor is presumed to be selling the fee simple, free from any incumbrance, liability or restriction as to user or otherwise; and if he cannot deduce a title of the statutory 30 years' length, or procure an incumbrance or restriction to be removed, the purchaser may repudiate the contract. The preparation of an agreement for sale involves accordingly an examination of the vendor's title. Upon a sale by auction the agreement is made up of (1) the particulars, which describe the property; (2) the conditions of sale, which state the terms upon which it is offered; and (3) the memorandum or formal contract at the foot of the conditions, which incorporates by reference the particulars and conditions, identifies the vendor, and is signed by the purchaser. The object of the agreement, whether the sale is by private contract or by auction, is to define accurately what is sold, to provide for the length of title and the evidence in support of or in connection with the title which is to be required, to fix the times at which the principal steps in the transaction are to be taken, and generally to regulate the rights of the parties except so far as it is intended that the general law shall operate. It is usual to require a deposit to be paid by way of security to the vendor against default on the part of the purchaser.

The signature of the agreement is followed by the delivery to the purchaser or his solicitor of the abstract of title, which is an epitome of the various instruments and events under and in consequence of which the vendor derives his title. A purchaser is entitled to an abstract at the vendor's expense unless otherwise stipulated. It begins with the instrument fixed by the contract for the commencement of the title, or, if there has been no agreement upon the subject, with an instrument of such character and date as is prescribed by the law in the absence of stipulation between the parties. From its commencement as so determined the abstract, if properly prepared, shows the history of the property down to the sale; every instrument, marriage, birth, death, or other fact or event constituting a link in the chain of title, being set forth in its proper order. The next step is the verification of the abstract on the purchaser's behalf by a comparison of it with the originals of the deeds, the probates of the wills, and office copies of the instruments of record through which the title is traced. The vendor is bound to produce the original documents, except such as are of record or have been lost or destroyed, but, unless otherwise stipulated, the expense of producing those which are not in his possession falls upon the purchaser. After being thus verified, the abstract is perused by the purchaser's advisers with the object of seeing whether a title to the property sold is deduced according to the contract, and what evidence, information or objection in respect of matters appearing or arising upon the abstract ought to be called for or taken. For this purpose it is necessary to consider the legal effect of the abstracted instruments, whether they have been properly executed and stamped, and whether incumbrances, adverse interests, defects, liabilities in respect of duties or any other burdens or restrictions disclosed by the abstract have been already got rid of or satisfied, or remain to be dealt with before the completion of the sale. The result of the consideration of these matters is embodied in "requisitions upon title" which are delivered to the vendor's solicitors within a time usually fixed for the purpose by the contract. In making or insisting upon requisitions regard is had, among other things, to any special conditions in the contract dealing with points as to which evidence or objection might otherwise have been required or taken, and to a variety of provisions contained in the Law of Property Act 1925. The possibility of the rescission clause now commonly found in contracts for the sale of real estate being exercised in order to avoid compliance with an onerous requisition, is also an important factor in the situation. The requisitions are in due course replied to, and further requisitions may arise out of the answers. A summary method of obtaining a judicial determination of questions connected with the contract, but not affecting its validity, is provided by the Law of Property Act 1925. Before completion it is usual for the purchaser to cause searches to be made in various official registers for matters required to be entered therein, such as judgments, land charges and pending actions, which may affect the vendor's title to sell, or amount to an incumbrance upon the property.

When the title has been approved, or so soon as it appears reasonably certain that it will be accepted, the draft conveyance is prepared and submitted to the vendor. This is commonly done by and at the expense of the purchaser, who is entitled to determine the form of the conveyance, provided that the vendor is not thereby prejudiced or put to additional expense. The common mode of conveying a freehold is now, as already mentioned, by ordinary deed. A deed derives its efficacy from its being signed, sealed and delivered: it is not necessary that its execution should be attested except in special circumstances; but in practice conveyances are attested by one or two witnesses. The framework of an ordinary purchase-deed consists of (1) the date and parties, (2) the recitals, (3) the testatum or witnessing part, containing the statement of the consideration for the sale, the words incorporating covenants for title and the operative words, (4) the parcels or description of the property, (5) the habendum, showing the estate or interest to be taken by the purchaser, and (6) any provisoes or covenants that may be required. A few words will illustrate the object and effect of these component parts.

(1) The parties are the persons from whom the property, or some estate or interest in or in relation to it, is to pass to the purchaser, or whose concurrence is rendered necessary by the state of the title in order to give the purchaser the full benefit of his contract and to complete it according to law. (2) The recitals explain the circumstances of the title, the interests of the parties in relation to the property, and the agreement or object intended to be carried into effect by the conveyance. (3) It is usual to mention the consideration. Where it consists of money the statement of its payment is followed by an acknowledgment in a parenthesis of its receipt, which, in deeds executed since the Conveyancing Act 1881 dispenses with any endorsed or further receipt. A vendor, who is the absolute beneficial owner, now conveys expressly "as beneficial owner," which words imply covenants by him with the purchaser that he has a right to convey, for quiet enjoyment, freedom from incumbrances and for further assurance, limited, however, to the acts and default of the covenantor and those through whom he derives his title otherwise than by purchase for value. A trustee or an incumbrancer joining in the deed conveys "as trustee" or "as mortgagee," by which words covenants are implied that the covenantor individually has not

[1] The right of the State to contribution from land for revenue purposes and to stamp duties on deeds perhaps falls under this head. These imposts are really involuntary alienation of part of the profit of the land.

done or suffered anything to incumber the property or to prevent him from conveying as expressed. As to the operative words, any expression showing an intention to pass the estate is effectual. Since the Conveyancing Act 1881 "convey" has become as common as "grant" which was formerly used. (4) The property may be described either in the body of the deed or in a schedule, or compendiously in the one and in detail in the other. In any case it is usual to annex a plan. (5) The habendum begins with the words "to hold" and defines or "limits" the estate to be taken by the grantee. Until 1882 upon a sale of the fee simple the property was expressed to be held "unto and to the use of 'the grantee' and his heirs" or "heirs and assigns." By the Conveyancing Act 1881 it was made possible to substitute "in fee simple" for the words "and his heirs" or "his heirs and assigns." Unless the appropriate words of limitation were added the purchaser got only an estate for his life. Now, however, the words "to the use of" and "and his heirs" are omitted, and the words "in fee simple" are no longer essential. If the property is to be held subject to a lease or incumbrance, or is released by the deed from an incumbrance previously existing, this is expressed after the words of limitation. (6) Where any special covenants or provisions have been stipulated for, or are required in the circumstances of the title, they are, as a rule, inserted at the end of the conveyance. In simple cases none are needed. Where however, a vendor retains documents of title, which he is entitled to do where he sells a part only of the estate to which they relate, it is the practice for him by the conveyance to acknowledge the right of the purchaser to production and delivery of copies of such of them as are not instruments of record, and (unless he is a trustee or mortgagee) to undertake for their safe custody. The foregoing outline of a conveyance will be illustrated by the following specimen of a simple purchase-deed of a house belonging to an absolute owner in fee:—

THIS CONVEYANCE made the . . . day of . . . BETWEEN A.B. of etc. of the one part and C.D. of etc. of the other part WHEREAS the said A.B. is the estate owner in respect of the fee simple in possession of the messuage hereinafter described and hereby conveyed free from incumbrances and has agreed to sell the same to the said C.D. for £1,000 NOW THIS DEED WITNESSETH that in pursuance of the said agreement and in consideration of the sum of £1,000 paid to the said A.B. by the said C.D. (the receipt whereof the said A B. doth hereby acknowledge) the said A.B. as beneficial owner doth hereby convey unto the said C.D. ALL THAT messuage or tenement situate etc. and known as etc. TO HOLD the same unto the said C.D. in fee simple. And the said A.B. hereby acknowledges the right of the said C.D. to production and delivery of copies of the following documents of title [mentioning them] and undertakes for the safe custody thereof IN WITNESS etc.

It will be observed that throughout the deed there are no stops, the commencement of the several parts being indicated by capital letters. The draft conveyance having been approved on behalf of the vendor, it is engrossed upon stout paper or parchment, and there remains only the completion of the sale, which usually takes place at the office of the vendor's solicitor. A purchaser is not entitled to require the vendor to attend personally and execute the conveyance in his presence or that of his solicitor. The practice is for the deed to be previously executed by the vendor and delivered to his solicitor, and for the solicitor to receive the purchase money on his client's behalf, since a purchaser is safe in paying the purchase money to a solicitor producing a deed so executed, when it contains the usual acknowledgment by the vendor of the receipt of the money. Upon the completion, the documents of title are handed over except in the case above referred to, and any claims between the parties in respect of interest upon the purchase money, apportioned outgoings, or otherwise are settled. The conveyance is, of course, delivered to the purchaser, upon whom rests the obligation of affixing the proper stamp—which he may do without penalty within 30 days after execution (Stamp Act 1891). It may be added that, subject to any special bargain, which is rarely made, the costs of the execution by the vendor and other parties whose concurrence is necessary, and of any act required to be done by the vendor to carry out his contract, are borne by the vendor.

Upon the sale and conveyance of a leasehold property substantially the same procedure is observed as above indicated in the case of a freehold. A few additional points, however, may be specially mentioned. Under an open contract the vendor cannot be called upon to show the title to the freehold reversion. Accordingly, the abstract of title begins with the lease, however old; but the subsequent title need not be carried back for more than 30 years before the sale. The purchaser, apart from stipulation, must assume, unless the contrary appears, that the lease was duly granted, and upon production of the receipt for the last payment due for rent before completion, that all the covenants and provisions of the lease have been duly performed and observed up to the date of actual completion. The vendor's covenants for title implied by his assigning "as beneficial owner" include, in addition to the covenants implied by those words in a conveyance of freehold, a covenant limited in manner above mentioned, that the lease is valid, and that the rent and the provisions of the lease have been paid and observed up to the time of conveyance. Where the vendor, as is the common case, remains liable after the assignment for the rent and the performance of the covenants, the purchaser must covenant to pay the rent, and perform and observe the covenants and provisions of the lease and keep the vendor indemnified in those respects. This covenant is implied unless a contrary intention appears. (As to leases *see* LEASE, LANDLORD AND TENANT.)

Procedure.—In some cases rights attaching to real estate are protected by peculiar remedies. At an early period it became more convenient to try the right to the possession of, rather than the right to the property in, real estate. Possessory tended to supersede proprietary remedies, from their great simplicity and elasticity. The general mode of trying the right to both property and possession was from the time of Henry II. the real action, the form called "writ of right" (after Magna Carta gradually confined to the Court of Common Pleas) being used to determine the property, that called "assise of novel disseisin" being the general means by which the possession was tried. About the reign of Elizabeth the action of ejectment became the ordinary form of possessory remedy. Real actions existed until the Real Property Limitation Act 1833, by which they were finally abolished, with unimportant exceptions. The assise of novel disseisin, the action of ejectment in both its original and its reformed stage, and finally the action for the recovery of land in use since the Judicature Acts are all historically connected as gradual developments of the possessory action. There are certain matters affecting real estate over which the Court of Chancery formerly had exclusive jurisdiction, in most cases because the principles on which the court acted had been the creation of equity. By the Judicature Act 1925 (re-enacting the Act of 1873) there are assigned to the Chancery Division of the High Court of Justice all causes and matters for (*inter alia*) the redemption or foreclosure of mortgages, the raising of portions or other charges on land, the sale and distribution of the proceeds of property subject to any lien or charge, the specific performance of contracts between vendors and purchasers of real estates, including contracts for leases, the partition or sale of real estates, and the wardship of infants and the care of infants' estates. In the case of rent a summary mode of remedy by act of the creditor still exists (*see* DISTRESS, RENT).

Conveyancing counsel to the court (*i.e.*, to the Chancery Division of the High Court) are certain counsel, in actual practice as conveyancers, of not less than ten years' standing, who are appointed by the lord chancellor, to the number of six, under s. 40 of the Master in Chancery Abolition Act 1852. They are appointed for the purpose of assisting the court in the investigation of the title to any estate, and upon their opinion the court or any judge thereof may act. Any party who objects to the opinion given by any conveyancing counsel may have the point in dispute disposed of by the judge at chambers or in court. Business to be referred to conveyancing counsel is distributed among them in rotation and their fees are regulated by the taxing officers.

International Law.—The law of the place where real estate

is situated (*lex loci rei sitae*) governs its tenure and transfer. The laws of England and of the United States are more strict on this point than the laws of most other countries. They require that the formalities of the *locus rei* must be observed, even if not necessary to be observed in the place where the contract was made. The *lex loci rei sitae* determines what is to be considered real estate. A foreign court cannot as a general rule pass title to land situated in another country. The English and United States courts of equity have to a certain extent avoided the inconvenience which this inability to deal with land out of the jurisdiction sometimes causes, by the theory that equity acts upon the conscience of the party and not upon the title to the foreign land. Thus in the leading case of *Penn* v. *Lord Baltimore* in 1750 (1 Vesey 444) the Court of Chancery on this ground decreed specific performance of articles for settling the boundaries of the provinces of Pennsylvania and Maryland. The difficulties always arise that, although the court professes to act upon the conscience, it must indirectly act upon the property, and that it cannot carry its decision into execution without the aid of the local tribunals.

See W. Stubbs, *Constitutional History of England* (1896); Williams, *Law of Real Property* (1926); Wolstenholme and Cherry, *Conveyancing Statutes* (1927); Key and Elphinstone, *Precedents in Conveyancing* (1927). (B)

IN THE UNITED STATES

The history of real property law as of other branches of law in the American Colonies remains to be written. Some of its more striking features, however, are apparent. There were no published reports and the number of professional lawyers was small. Colonial legislatures were active. Military tenure did not gain a foothold nor did copyhold tenure for whereas copyhold tenure survived in England until Lord Birkenhead's Act in 1922 (Law of Property Act, 1922), it was a tenure that harked back through the manor to the days of serfdom and of the village community and was not susceptible of transplanting. The universal tenure was socage, the least burdensome of the English forms of tenure and marked by small rents and payments on inheritance. So foreign did notions of feudal tenure appear that slight as these burdens were they gave rise or contributed to serious incidents, such as Bacon's Rebellion in Virginia in 1676. It was in the proprietary Colonies of Maryland and Pennsylvania that feudal tenure was most conspicuous. In both Maryland (*Matthews* v. *Ward* [1839], 10 Gill and J. 443) and Pennsylvania (*Wallace* v. *Harmstad* [1863], 44 Pa. 492, 499; but see *Ingersoll* v. *Sergeant* [1836], 1 Whart. 337), however, it has been declared by the courts that the Revolution did away with tenure. The Pennsylvania decision has been subject to criticism in that State (Sharswood, *Law Lectures*, p. 220 *et seq.*), but whether that criticism be justified or not, it is clear that since the Revolution tenure in the United States has been such a shadowy thing as to be practically non-existent.

The changes that were taking place in England were accelerated by the pioneer conditions in the Colonies. Conveyances were made by deed and while in New York and probably some other jurisdictions the cumbersome lease and release which prevailed in England for 200 years were used, in most jurisdictions probably a single document was all that was necessary. Sometimes this was a deed of bargain and sale, sometimes a statutory deed in which recording took the place of livery of seisin. Registration of deeds, a favourite scheme of the Commonwealth and one which was adopted for the counties of Middlesex and York in England in the first part of the 18th century, early became a part of the common practice in the Colonies and has remained a distinctive feature of real property law in the United States ever since. A single form of action for the recovery of and trial of title to land, usually the action of ejectment, was the common practice in the Colonies. The fictions of ejectment did not appeal to the New England Puritans, however, and in New England there was a revival of at least the names of Old English real actions, but this did not prevent the adoption in Connecticut and Massachusetts of a single statutory form of action at an early period. In South Carolina in 1791 the action of ejectment as the action to try title gave place to a special action of trespass. The common use of a single action for the trial of title and the prevalence of statutes of limitation modeled on that of 21 James I.c. 16, with a single period of limitation, usually of 20 years but sometimes as short as seven years, made it hard to think of the statute of limitation as merely cutting off a remedy. It became natural to think of it as affecting the right of property, to think of it as one element in a prescription by which the adverse possessor might become the owner of the land. Hence, while in England to-day the statute of limitation as to land is likely to be treated under the general head of limitation of actions, in the United States the statute of limitation as to land is almost certain to be treated under the head of adverse possession. In other words it is treated as one element in the acquisition of property rather than as primarily a matter of procedure.

Entails.—At the time of the settlement of the Colonies the entail was suffering a transformation in England from a means of holding land to a conveyancing device. From the time of the Statute De Donis (13 Edw. I., c. 1 [1285]) the large landed estates had been held by tenants in fee tail, but when the courts devised a way to destroy the entail, the latter ceased to be a sufficient means of keeping the estate in the family and the modern settlement was devised whereby the head of the family is a life tenant rather than a tenant in tail and the tenancy in tail is used for the sons and daughters of the life tenant but rarely comes into possession for on the oldest son reaching his majority a resettlement is made and he is given a life tenancy with remainders in tail in his children. The recent legislation in England which is associated with the name of Lord Birkenhead did away with the fee tail at law but retained it in equity and left the characteristic features of the family settlement unchanged. The strict family settlement never seems to have gained much, if any, of a foothold in the United States and it is not likely that it did in the Colonies, for it required conveyancing skill of a high order. Nor is it likely that the fee tail which had largely ceased to function as an estate in possession in England could have had much of a revival in the Colonies. There would not have been much sense in creating limited estates in possession which could instantly be turned into estates in fee simple by the tenants. That entails were not much favoured in the Colonies is shown by the legislation at the time of the Revolution which either facilitated their destruction or changed them into something else. It is doubtful whether the fee tail either in the United States or the Colonies has ever been anything but a very sporadic thing

Primogeniture.—Primogeniture originally became the general rule of law in New York and the Southern Colonies, but with the exception of Rhode Island not in the New England Colonies nor in Pennsylvania. In New England in general and in Pennsylvania, however, the oldest son had a double portion. With the Revolution this double portion was abolished as was also primogeniture in those States where it had been the general rule, although it may have had a shadowy continuance in connection with the fee tail.

Settled Land.—The most striking difference between real property in the United States and England has been that in England the great part of the land has been settled land, while in the United States settled land is the exception. Settled land means that the land is family land, that is land, which despite the long prevalence of individual rather than family ownership of land, is so tied up in the family that the beneficial interest of the one in possession is only a partial interest. In England, since the Commonwealth, the prevalent beneficial interest of the one in possession has been a life estate. In the United States most of the land is held either by the owner himself or by a tenant under a lease for years, but this lease is purely a commercial thing and not a family matter.

Abstracts of Titles.—Other striking differences between the law of real property in England and in the United States are that titles in the United States are traced back to the original patent or grant, that except in the older States grants are apt to be based on governmental surveys and thus many of the old troublesome boundary difficulties avoided and that registration of deeds is practically if not quite universal.

The registration of deeds makes conveyancing open instead of

secret and makes the abstract of title an abstract of the public record and not of the deeds themselves. This makes abstracting a different thing from what it is in England and has developed the abstractor who unlike his English brother, the solicitor, is not as such a member of the legal profession. The examination of the abstract, however, is the work of the lawyer and the delays incident to these examinations and the corrections of the record have tended to the spread of the title insurance policy and accordingly to the supercession of the formal abstract.

LAWS RELATING TO SEAMEN. For legislative purposes seamen may be divided into three classes—seamen in the royal navy, merchant seamen, and fishermen.

Seamen in the Royal Navy.—It is still lawful to impress men for the naval service (*see* IMPRESSMENT), subject to certain exemptions (13 Geo. II. c. 17, 1740). Among persons exempt are seamen in the merchant service. In cases of emergency officers and men of the coastguard and revenue cruisers, seamen riggers and pensioners may be required to serve in the navy (Naval Volunteers Act 1853). There appears to be no other instance (now that balloting for the militia is suspended) where a subject may be forced into the service of the Crown against his will. The navy is, however, at the present day wholly recruited by voluntary enlistment (*see* the Naval Enlistment Acts, 1835 to 1884). Special advantages are afforded by the Merchant Shipping Act 1894 to merchant seamen enlisting in the navy. They are enabled to leave their ship without punishment or forfeiture in order to join the naval service. The discipline of the navy is, unlike that of the army, for which an annual act is necessary, regulated by a permanent Statute, that now in force being the Naval Discipline Act 1866 amended by the Act of 1884. (*See* NAVY.)

Merchant Seamen.—Most of the acts dealing with this subject, commencing with 8 Eliz. c. 13, were repealed in 1854 and have since been consolidated and extended by the Merchant Shipping Acts 1894, 1906, 1921 and 1925. The act of 1894 defines a seaman as "every person (except masters, pilots, and apprentices duly indentured and registered) employed or engaged in any capacity on board any ship." The engagement and discharge of seamen must take place before a superintendent only when the employment is on a foreign-going ship. If the ship is a home-trade ship, the signing on and discharge take place before a superintendent only if the master so desire. But if the signing on does not take place before a superintendent, the master must cause the agreement to be read and explained to the seaman, and the seaman must sign it in the presence of a witness; copies of all such agreements must be transmitted to the Board of Trade. A copy of every agreement with the crew must be posted in some part of the ship accessible to the crew. Before a seaman can be discharged at any place abroad, the master must obtain the sanction, endorsed on the agreement with the crew, of the like officials or, in their absence, of merchants there resident. A seaman discharged in a foreign country is entitled to be provided with adequate employment on some other British ship bound to the port in His Majesty's dominions at which he was originally shipped, or to a port in Great Britain agreed to by the seaman, or to be furnished with the means of returning to such port or of a passage home. If his ship is wrecked or lost, the seaman is entitled by the Act of 1925 to two months' wages from the date of the termination of his services.

At common law there was no obligation of the owner to provide a seaworthy ship, but by the act of 1876, now superseded by the act of 1894, part v., every person who sends or attempts to send, or is party to sending or attempting to send, a British ship to sea in such unseaworthy state that the life of any person is likely to be thereby endangered is guilty of a misdemeanour, unless he proves that he used all reasonable means to ensure her being sent to sea in a seaworthy state, or that her going to sea in such unseaworthy state was under the circumstances reasonable and justifiable. By the Act of 1906 many of the provisions as to seaworthiness were applied to foreign ships, and they may be detained in a proper case. A return of certain particulars, such as lists of crews and of distressed seamen sent home from abroad, reports on discharge, births and deaths at sea, must be made to the registrar-general of shipping and seamen, an officer of the Board of Trade. The seaman is privileged in the matter of wills (*see* WILL), and is exempt from serving in the militia (42 Geo. III. c. 90, s. 43). There are special enactments in favour of Lascars and foreign seamen on British ships, *e.g.*, s. 125 of the Act of 1894.

Duties of Masters and Seamen.—The duties of the seamen are to obey the master in all lawful matters relating to the navigation of the ship and to resist enemies, to encourage him in which he may become entitled to prize money under 22 and 23 Car. II. c. 11 (*see* PRIZE). Any services beyond these would fall under the head of salvage service, and be recompensed accordingly. There are certain offences for which the seaman is liable to be summarily punished under the Act of 1894. They comprise desertion, neglect or refusal to join his ship or absence without leave, quitting the ship without leave before she is placed in security, wilful disobedience to a lawful command, either on one occasion or continued, assault upon a master or mate, combining to disobey lawful commands or to neglect duty, or to impede the navigation of the ship or the progress of the voyage, wilful damage to the ship, or embezzlement of or wilful damage to her stores or cargo and smuggling.

A seaman is punishable at common law for piracy and by statute for piracy and offences against the Slave Trade Acts. A riotous assembly of seamen to prevent the loading or unloading of any ship or to prevent others from working is an offence under 33 Geo. III. c. 67. By the Merchant Shipping Act 1894 a seaman is not entitled to the rating of "A B." unless he has served four years before the mast, or three years or more in a registered decked fishing vessel and one year at sea in a trading vessel.

Remedies for Wages.—The remedies of the seaman for wages are a plaint in a county court or an action *in rem* in the admiralty division of the high court (in Scotland in the court of session), a colonial court of admiralty, or a county court having admiralty jurisdiction. A seaman has also a right to take summary proceedings before justices, naval courts, or superintendents of mercantile marine offices. The master has now the same remedies as the seaman for his wages, under which are included disbursements made on account of the ship. At common law he had only a personal action against the owner. He has the additional advantage of being able to insure his wages, which a seaman cannot do. A county court having admiralty jurisdiction may entertain claims for wages where the amount claimed does not exceed £150 (County Courts [Admiralty Jurisdiction] Act 1868, s. 3). Wages cannot be attached. They may be forfeited or reduced by misconduct, such as desertion and smuggling. In actions in all courts of admiralty jurisdiction the seaman has a maritime lien on the ship and freight, ranking next after claims for salvage and damage. The amount recoverable summarily before justices is limited to £50. Orders may be enforced by distress of the ship and her tackle. Proceedings must be taken within six months.

Where a seaman is discharged before a superintendent in Great Britain his wages must be paid through or in the presence of the superintendent, and in the case of home-trade ships may be so paid if the master or owner so desire. The master must in every case deliver either to the superintendent or to the seaman a full account, in a form approved by the Board of Trade, of the wages and of all deductions therefrom; such deductions will only be allowed if they have been entered by the master during the voyage in a book kept for that purpose, together with a statement of the matters in respect of which they are made. Where a seaman is left abroad on the ground of his unfitness or inability to proceed on the voyage, the account of wages must be delivered to the superintendent, chief officer of customs, consular officer, or merchants, from whom the master obtains the certificate without

which he may not leave the seaman behind.

The scale of provisions must be entered in the agreement with the crew, and compensation made for short or bad provisions, and means are provided whereby the crew can raise complaints. In addition, in the case of ships trading or going from any British port through the Suez canal or round the Cape of Good Hope or Cape Horn, the provisions and water are put under inspection by the Board of Trade, and if they are deficient, the ship may be detained until the defects are remedied. By the act of 1906 a certificated cook must be provided for foreign-bound ships. If a seaman receives hurt or injury in the service of the ship, the expense of medical attendance and maintenance, together with the cost of bringing him home, is to be borne by the owner of the ship, and cannot be deducted from wages. By the Workmen's Compensation Act 1925 masters, seamen and apprentices are entitled to compensation in respect of personal injuries or their dependants in case of death.

Manning of British Ships.—The Merchant Shipping Act 1897 gave power to the Board of Trade to detain ships unseaworthy by reason of undermanning, but prescribed no rules for determining when a ship is to be deemed to be undermanned. Apart from that act the law does not interfere with the number of qualifications of the crew. Aliens serving on British ships may by a regulation of the home secretary (April 29, 1904) be naturalized without fee.

Certificates of competency as masters, mates and engineers are granted by the Board of Trade. Such certificates are for the following grades, *viz*, master or first mate, or second mate, or only mate of a foreign-going ship, master or mate of a home-trade passenger ship, first- or second-class engineer. By virtue of Orders in Council under s. 102 of the act of 1894, certificates granted in many of the British colonies have the same force as if granted by the Board of Trade. The following are the requirements of the act as to the officers to be carried by ships:—*Masters*: A properly certificated master must be carried by every foreign-going ship and every home-trade passenger ship, whatever their tonnage. *Mates:* A mate, with the certificate of the grade of first or only mate, or master, must, in addition to the certificated master, be carried by every foreign-going ship of 100 tons or upwards, unless more than one mate is carried, in which case the first and second mates must have valid certificates appropriate to their several stations on such ship or of a higher grade; and a mate, with a certificate of the grade of first or only mate or master, must, in addition to the certificated master, be carried by every home-trade passenger ship of 100 tons or upwards. *Engineers:* Every foreign-going steamship of 100 nominal horsepower or upwards must have two certificated engineers—the first possessing a first-class engineer's certificate, and the second possessing a second-class engineer's certificate, or a certificate of the higher grade. Every other foreign-going steamship, and every seagoing home-trade passenger steamship, is required to carry as the first or only engineer an engineer having a second-class certificate, or a certificate of the higher grade. Vessels in the home trade (*i.e.*, Great Britain and the continent of Europe between the Elbe and Brest) are not required to carry certificated masters or officers unless they are passenger ships of 100 tons or upwards; and vessels in the foreign trade of less than 100 tons are not required to carry any mate.

Provisions in regard to the apprenticing of boys to shipowners by parents or boards of guardians are contained in the Merchant Shipping Act 1894, ss. 105–109, and are substantially the same as those which govern an apprenticeship for service on land. Where a ship is a British ship, but not registered in Great Britain, the provisions of Part II. apply as follows:

The provisions relating to the shipping and discharge of seamen in Great Britain and to volunteering into the navy apply in every case. The provisions relating to lists of the crew and to the property of deceased seamen and apprentices apply where the crew are discharged or the final port of destination of the ship is in Great Britain. All the provisions apply where the ship is employed in trading or going between any port in Great Britain and any port not situate in the British possession or country in which the ship is registered. The provisions relating to the rights of seamen in respect of wages, to the shipping and discharge of seamen in ports abroad, to leaving seamen abroad, and the relief of seamen in distress in ports abroad, to the provisions, health, and accommodation of seamen, to the power of seamen to make complaints, to the protection of seamen from imposition, and to discipline, apply in every case except where the ship is within the jurisdiction of the Government of the British possession in which the ship is registered.

Fishermen.—The regulations respecting fishermen, which were contained in several acts from 1868, are now to be found in the Merchant Shipping Act 1894, part iv. This provides, *inter alia*, that indentures of apprenticeship are to be in a certain form and entered into before a superintendent of a mercantile marine office, that no boy under 13 is to be employed in sea-fishery, that agreements with seamen on a fishing-boat are to contain the same particulars as those with merchant seamen, that running agreements may be made in the case of short voyages, that reports of the names of the crew are to be sent to a superintendent of a mercantile marine office, and that accounts of wages and certificates of discharge are to be given to seamen. No fishing-boat is to go to sea without a duly certified skipper. Fishermen are exempt from Trinity House dues. The rights of British fishermen in foreign waters and foreign fishermen in British waters are in many cases regulated by treaty, generally confirmed in Great Britain by act of parliament. Special provisions as to fishermen in Scotland are contained in s. 389 of the Act of 1894 and in the Merchant Shipping (Scottish Fishing Boats) Act 1920.

In India and in most British colonies there are laws affecting merchant seamen. In some cases such legislation is identical with the imperial act, but in most there are differences of more or less importance, and the colonial statutes should be consulted. For the law of the United States in reference to seamen, which is in general accordance with that of England, see *The Navigation Laws of the United States* (Government Printing Office, Washington, 1927). For the continental European countries *see* the various commercial codes, which contain provisions of a more or less detailed character.

THE UNITED STATES

Naval Seamen.—The engagement of seamen in the navy is by voluntary enlistment. Although the officers are required to be American citizens, there is no such requirement with regard to the enlisted personnel However, both officers and enlisted men must take an oath of allegiance. Minors between the ages of 14 and 18 years may be enlisted with the consent of their parents. Persons who are insane or intoxicated or who have already deserted in time of war from the navy or army, may not be enlisted.

Enlistment may be for terms of two, three, four and six years. A seaman may terminate his service before the end of the enlistment period by purchasing his discharge or by being furloughed without pay for the balance of the term or, without any prejudice to any benefits which he otherwise would have received, may obtain his discharge at any time within three months of the completion of the enlistment period.

On retirement, after 30 years' service, an enlisted man is entitled to receive 75% of his pay and a further sum in lieu of rations and quarters. While on the retired list, he may be called to active duty in time of war. Furthermore, the secretary of the navy may require all enlisted men on discharge to serve four years in the Fleet Naval Reserve. On the death of any enlisted man, his estate is entitled to receive from the Government six months' pay. While under enlistment a seaman may not engage in any other employment which may bring him into competition with civilians.

The discipline of enlisted men is regulated by the articles for

the government of the navy. Among the offences punishable by death are mutiny, disobeying of orders, striking a superior officer, intercourse with the enemy, receiving messages from the enemy, desertion in time of war, deserting a trust, sleeping on watch, leaving a station, wilful stranding or injury of vessels, unlawful destruction of property and others.

For the relief of sick or injured seamen, the navy maintains hospitals at suitable places. For the support of such hospitals, the secretary of the navy is required to deduct from the pay of each seaman at the rate of 20¢ per month. Fines levied upon seamen for offences and forfeitures on account of desertion, are passed to the credit of the naval hospital fund. Seamen on naval vessels are also entitled to be treated in case of injury or illness at the marine hospitals maintained by the public health service.

Merchant Seamen.—The definition of the word "seamen" as used in the Revised Statutes is as follows: "Every person having command of any vessel belonging to any citizen of the United States shall be deemed to be the 'master' thereof; and every person (apprentices excepted) who shall be employed or engaged to serve in any capacity on board the same shall be deemed and taken to be a 'seaman'; and the term 'vessel' shall be understood to comprehend every description of vessel navigating on any sea or channel, lake or river, to which the provisions of this Title may be applicable" (Revised Statutes 4,612).

In addition to the regular crew, the following persons have been held to be seamen: A musician, a fisherman, a bar-tender, the wife of the cook serving as second cook. The provisions of U.S. statutes with regard to seamen apply to all seamen generally. Specific exceptions are made in the application of certain sections to seamen employed on fishing or whaling vessels and yachts, for which it is necessary to consult the statutes.

Engagement of Seamen.—Seamen employed on vessels bound from a port of the United States to a foreign port other than a port in British North American possessions, the West Indies, or the Republic of Mexico, or on any vessel of the burden of 75 tons or upward, bound from a port on the Atlantic to a port on the Pacific or vice versa, must be engaged in the presence of a shipping commissioner by an agreement in writing in a form prescribed by statute. The written agreement is commonly known as the "articles." It is signed in duplicate and one copy is retained by the shipping commissioner and the other by the master of the ship who is required to post a copy in such part of the vessel as to be accessible to the crew.

However, in the case of all vessels not classified as above, the owner, master or consignee may perform the duties of a shipping commissioner. Moreover, none of the above-mentioned provisions with respect to the engagement of a crew is applicable to the coastwise trade (except the coastwise trade between the Atlantic and Pacific coast) or in the lakegoing trade touching at foreign ports or otherwise, or in the trade between the United States and the British North American possessions, or in any case where the seamen by custom or agreement are entitled to participate in the profits or result of a cruise or voyage.

However, shipping commissioners may at the request of the master or owner engage or discharge crews of vessels engaged in the coastwise trade or the trade between the United States and the Dominion of Canada, Newfoundland, the West Indies or the Republic of Mexico, and, when so doing, are required to observe many of the requirements of the statutes applicable to those vessels which must compulsorily engage seamen with the supervision of a shipping commissioner. Furthermore, vessels of a burden of 50 tons or upward, bound from a port in one State to a port in any other than an adjoining State, except vessels of a burden of 75 tons or upward, bound from a port on the Atlantic coast to ports on the Pacific coast or vice versa, are required in the engagement of seamen to make an agreement in writing declaring the voyage or term of time for which the seamen shall be shipped.

Where the contents of the written agreement is regulated by statute, it is required to show the nature and duration of the intended voyage, the port of termination, the number and description of the crew, the time at which each seaman is to be on board, the capacity in which each seaman is to serve, the wages, a scale of provisions which are to be furnished to each seaman, the requirements as to conduct, the regulations as to fines or other lawful punishments, and stipulations as to allotment of wages.

Seamen may also be engaged in ports out of the United States in which there is a consular officer, provided the sanction of the consular officer be obtained and the seamen be engaged in his presence. In such cases the rules governing the employment of such seamen are the same as those governing the engagement of seamen in the United States before a shipping commissioner.

Discharge of Seamen.—The discharge of seamen in the United States from vessels engaged in foreign voyages, or, being of the burden of 75 tons or upward and engaged in voyages between the Atlantic and Pacific coasts of the United States, must take place before a shipping commissioner, except where some competent court otherwise directs. In foreign ports, either the master or the seaman may apply to the consul for a discharge of the seaman, and if it appears to the consul that the shipping agreement is completed or that the seaman is entitled to his discharge under an Act of Congress or the principles of the maritime law, the consul must discharge the seaman and require at the same time the payment of wages then due. If the discharge is not for neglect of duty, incompetency or injury incurred on the vessel, the master must provide the seaman with employment on another vessel agreed to by the seaman or provide him with one month's extra wages. If the discharge is by voluntary consent, the seaman is entitled only to wages up to the time of his discharge. If the discharge is on account of injury or illness the expenses of the seaman's maintenance and transportation to the United States are paid from the fund for the maintenance and transportation of destitute American seamen. If the discharge takes place by reason of the vessel being sold in a foreign country, the master must provide the seaman with adequate employment on board some other vessel bound to the port of original shipment or to some other port agreed upon or must provide him with passage home or leave with the consul a sum of money sufficient to pay for the maintenance or passage home of the seaman.

Whenever the discharge of a seaman in a foreign country takes place by reason of the consul's finding that the voyage is continued contrary to the original agreement or that the vessel is badly provisioned and unseaworthy or that the officers have cruelly treated the seaman, the master is required to pay the seaman one month's extra wages and to provide him with employment on board some other vessel or with passage either to the port of original shipment or the most convenient port of entry in the United States or a port agreed to by the seaman.

Wages of Seamen.—The written articles of agreement in cases where they are subject to statutory regulation are required to contain the rate of wages to which the seaman is entitled. At the termination of the service, the master is required to pay the seaman in the presence of the shipping commissioner, and both the master and seaman are required to sign a mutual release of all claims for wages. Wages are not dependent upon the earnings of freight.

In case the service of a seaman terminates before the end of the engagement by reason of the loss or wreck of the vessel, the seaman is entitled to wages only up to the termination of his service. However, under such circumstances he is entitled to transportation to the port of shipment as a destitute seaman. If a seaman has signed an agreement and he is discharged before the commencement of the voyage or before one month's wages are earned without fault on his part or without his consent, he is entitled only to a sum equal in amount to one month's wages as compensation and may recover that compensation as if it were wages earned.

Wages of seamen engaged in coastal voyages must be paid within two days after the termination of the agreement or at the time such seaman is discharged whichever happens first. In the case of vessels making foreign voyages or voyages between the Atlantic and Pacific coasts of the United States, wages must be paid within 24 hours after the cargo has been discharged or within four days after the seaman has been discharged, whichever happens first. The refusal or neglect on the part of the master to

make such payment without sufficient cause makes the master and owner liable to the seaman for a sum equal to two days' pay for each and every day for which payment is delayed beyond the period due, which sum is recoverable as wages. A seaman is entitled to receive on demand from the master one-half of the balance of the wages earned and remaining unpaid at the time when such demand is made at any port where such vessel, after the voyage has been commenced, shall load or deliver cargo before the voyage is ended. A demand may not be made oftener than once in five days or more than once in the same harbour on the same entry. This section is applicable alike to seamen on American vessels and seamen on foreign vessels while the foreign vessels are in a U.S. port.

For the recovery of his wages, a seaman may sue the owner *in personam* at common law or in admiralty, and may also sue the vessel *in rem* in admiralty. For this purpose he has a lien which takes precedence over nearly every other lien against the vessel. In case the wages are not paid within ten days after they are due or any dispute arises between the master or seaman touching wages, the seaman may obtain the intervention of a district judge of the judicial district where the vessel is present, who may summon the master of the vessel to appear before him and show cause why the vessel should not be attached. It is a misdemeanour to pay a seaman wages in advance of the time when he has actually earned them or to pay such wages or make any evidence of indebtedness to any other person or to pay any person for the shipment of the seaman when the payment is deducted or to be deducted from a seaman's wages. In the case of American vessels, such advances in wages or allotment of wages whether made within or without the United States are illegal. In the case of foreign vessels they are illegal only when made in the United States. Moreover, the seaman may recover his wages in full without any deductions on account of advances. However, the seaman may stipulate in the "articles" for the allotment of a portion of his wages to his dependent relatives provided the allotment has the approval of the shipping commissioner. The wages of a seaman are not subject to attachment.

Duties of Seaman and Ship-owner.—A seaman is required to obey the lawful commands of his superiors in the navigation of the ship and may be punished for the following offences: for desertion, for neglecting or refusing without reasonable cause to join his vessel, for absence without leave under certain conditions, for quitting the vessel without leave after the arrival at the port of delivery or before she is placed in security, for wilful disobedience to any command at sea, for continued wilful disobedience to lawful commands and continued neglect of duty at sea, for assaulting any master or mate, for wilfully damaging the vessel, for embezzlement or damage to any of the cargo and for smuggling.

The ship-owner is required to provide the seaman with food according to a scale enacted by statute. Provision is made whereby seamen may complain to an officer of the navy, a consul of the United States, a shipping commissioner or chief officer of the customs, in case the provisions for the use of the crew are of bad quality or deficient in quantity, and there is further provision for the correcting of any failure on the part of the master to observe the law with respect to provisions and water. Vessels on foreign voyages and on voyages between the Atlantic and Pacific coasts are required to carry a sufficient quantity of lime and lemon juice or other antiscorbutics, which are to be served to the seamen according to the provisions of the statute. Such vessels are also required to be provided with a slop chest containing a complement of clothing for each seaman employed, and also a full supply of tobacco and blankets. The contents of the slop chest are sold to seamen at a reasonable profit.

It is unlawful for the owner to send his vessel to sea in such unseaworthy condition that the life of any person is likely to be thereby endangered, unless he proves that he used all reasonable means to insure seaworthiness of the vessel, or that the sending of the vessel to sea in an unseaworthy condition was under the circumstances reasonable and justifiable. For the enforcement of these provisions there is further legislation by which inspection of the vessel may be obtained either at domestic ports or foreign ports, and for the discharge of the crew in case the vessel is unfit to go to sea.

The statutes also prescribe the number of cubic feet which must be allotted in the crew's quarters to each seaman, and regulate the lighting and ventilation. Merchant vessels which ordinarily make voyages of more than three days' duration between ports and which carry a crew of 12 or more seamen, are required to have a compartment for hospital purposes, having at least one bunk for every 12 men, and not more than six bunks in any case. All merchant vessels constructed since March 3, 1897, and having more than ten men on deck, must have a washing place provided with at least one washing outfit for every two men of the watch.

Manning of Merchant Vessels.—Merchant vessels of more than 100 tons gross are required to divide their sailors into two watches, and their engine room crew into three watches. While such a vessel is in a safe harbour seamen cannot be required to do unnecessary work on Sundays or on the following named days, New Year's Day, Fourth of July, Labour Day, Thanksgiving Day and Christmas Day. While in a safe harbour, nine hours, inclusive of the anchor watch, constitutes a day's work.

Of each department of the crew 75% must be able to understand any order made by the officers, and of the deck crew 65%, exclusive of licensed officers and apprentices, must be of a rating not less than able seamen. A person may be rated an able seaman and qualified for service as such on the seas who is 19 years of age, and who has had three years' service on deck. The requirements for able seamen on the Great Lakes are less.

In case of desertion or casualty resulting in the loss of one or more of the seamen, the master before proceeding to sea must ship others to take their places, if they are obtainable.

Officers on U.S. vessels must be citizens of the United States, and this applies to the chief engineer and assistant engineers of vessels propelled by steam who may be in charge of a watch. However, on foreign voyages vacancies may be filled by otherwise properly qualified persons who are not citizens, until the first return of the vessel to its home port. The president of the United States is authorized in his discretion to suspend the provisions of law as to the citizenship of officers of American vessels. All officers, including the master and the engineers, are required to obtain licences from the Board of Steamboat Inspectors, and such licences are issued only after an examination into the qualifications of the applicant.

Remedies of Seamen in Cases of Injury in Course of Employment.—For every injury and illness incurred while in the service of the vessel and not due to his own vice, a seaman is entitled to the reasonable expenses of his maintenance and cure. This includes medical attention and board and lodging for a reasonable period. In the construction of the reasonableness of the period, there is a tendency to allow a seaman maintenance and cure for that period during which physicians say that treatment can produce a cure. In addition thereto if the seaman's injury or illness is caused by the unseaworthiness of the vessel, or breach of the obligation to furnish good food and water, and prompt and proper medical attention, the seaman may recover damages. By virtue of the Merchant Marine Act of 1920, commonly known as the Jones Act, a seaman may recover against his employer if he is injured through the negligence of the employer or of anyone employed by him. Likewise the representatives of a deceased seaman may recover damages against the employer if the death is caused by the unseaworthiness of the vessel or there is a breach of the obligation to furnish good food and provisions, or prompt and proper medical attention or, under the Jones Act, if the death is caused by the negligence of the employer or anyone employed by him.

The seaman may enforce his right to obtain maintenance and cure, or damages, either *in personam* against the employer or *in rem* against the vessel, or he may sue at common law either in the Federal courts or the State courts. He may not, however, recover under the Jones Act by a proceeding *in rem* in the admiralty courts. The representative of a deceased seaman may

recover damages for the death of a seaman by an action *in personam* in admiralty or an action at common law. Where death statutes give no lien, and they generally do not, the representative may not sue *in rem* in admiralty to enforce a cause of action for death.

The Federal Government provides a number of marine hospitals at the more important ports of the United States, at which seamen may obtain free hospital and medical attention in case of injury or illness occurring while in the service of a merchant vessel. Formerly shipowners were required to contribute to the maintenance of this hospital service, but there is no longer any such requirement. In case a seaman is injured and unable to continue in the service of the ship while she is in a foreign port, the ship-owner has the primary duty of rendering the seaman proper medical attention and arranging for his transportation to a port in the United States. By Act of Congress, however, the U.S. consuls are also required, in case the seaman is discharged, to transport disabled seamen to a port in the United States at the expense of the Government. In case the consul refuses to discharge the seaman, the shipowner must bear the expense of returning the seaman to the United States

American seamen who are rendered destitute in a foreign country for any reason whatever, are entitled on application to the American consul to be furnished with subsistence and passage to some port in the United States. The consul is empowered to require the master of any American vessel to take such destitute seamen on board at the expense of the Government.

Formerly masters of vessels were permitted to flog seamen in order to enforce discipline. Such practice is now prohibited. Desertion was formerly an offence carrying the penalty of arrest and imprisonment. The seaman is now subject only to the loss of his clothing left on board and his wages. Moreover, there is no provision whereby deserters from either American or foreign vessels may be compelled to rejoin their vessels. The present situation is designed to approximate in the case of seamen to the freedom of obtaining and leaving employment which obtains in shore employments.

For the complete text of statutes relating to merchant seamen and their interpretation by the court, see *U.S. Code Annotated.*

(V. S. J.; R. Par.)

LAWTON, a city of southern Oklahoma, U.S.A., on Cache creek, near the Wichita mountains, 80 m. S W. of Oklahoma City; the county seat of Comanche county. It is served by the Frisco and the Rock Island railways. The population was 8,930 in 1920 (92% native white). It is in a grazing and farming region, where cotton is an important crop, and there is a productive oilfield just east of the city. A branch of the State Agricultural college is maintained here. The Fort Sill military reservation, now used for a field artillery school, is 3 m. N., and beyond it is the Wichita national forest.

LAWYER, in a broad sense one whose principal occupation is related to the making or administration of the law, and who has received an education sufficiently wide in its scope to distinguish him from minor administrative officials; more specifically one upon whom the State has conferred important special privileges in connection with the administration of justice, to the exclusion, however, of administrative officials, judges, legal scholars or law teachers, as such. Lawyers duly admitted to practice are "officers of the court." The essential distinction between these and "public officers," in a technical sense, is that lawyers are not restricted in number. Instead of being appointed to fill specific official vacancies, they constitute an indeterminate official class or order; they differ also from most public officers in that their official relationship continues during good behaviour, instead of for a specified term, and in that their compensation comes from their clients instead of from the State. These incidental characteristics help to obscure, but do not essentially affect, the peculiarly "public" nature of the legal profession.

A variety of influences—all grounded in this intimate connection between law and politics or government—have caused the lawyers of different countries to differ widely from one another. The Continent bases its jurisprudence upon the university-made civil law, in place of the judge-made common law of England and America. The practice, in a broad sense, of this civil law consists of several co-ordinate professions, each of which constitutes a career in itself. Such are, for instance, the profession of judge, of diplomat, of higher civil servant, of law teacher and scholar. The United States stands at the opposite extreme; the student, after his formal education is completed, is admitted by the State to the privilege of engaging in general practice of the law. There is little or no connection between his course of preparation—which may or may not be in a university—and the particular line of highly specialized legal activity in which he will find himself at first, and from which he will not infrequently pass in time to the bench, into politics or even business. In England the lawyer occupies a position somewhat resembling that of his colleague in the United States, but not to the extreme exemplified there. The principal difference is that English barristers, from whom alone the bench of judges is recruited, are sharply distinguished from the more numerous body of solicitors. Finally, England's self-governing dominions are in a sense intermediate between the mother country and the United States. The profession is usually technically divided at the outset, but outside of Quebec and South Africa, where the civil law prevails, there is no rule against a single individual's practising both as barrister and as solicitor.

Because of these differences in the meaning of the term, comparative figures as to the number of lawyers in different countries are likely to be somewhat misleading. Census figures are used, both because none other are available for the United States, and because in England and Canada the number carried on the lawyers' own official rolls is not always identical with that of active practitioners.

Number of Lawyers

	Date	Inhabitants	Lawyers	Lawyers to each million inhabitants
England and Wales	1921	37,885,242	17,946	474
Dominion of Canada	1921	8,788,483	7,548	859
United States	1920	105,710,620	122,519	1,159

In the United States the number of lawyers to each million inhabitants ranged, in 1920, from approximately 600 in Alabama, Mississippi and the two Carolinas to 1,800–2,000 in Oregon and California; nearly 3,000 in Nevada and over 5,500 in the Federal capital, Washington, D C. In Canada the range was from 500 or 600 in the Maritime Provinces to approximately 1,100 in Manitoba, 1,300 in British Columbia, and nearly 4,100 per million in Regina, the provincial capital of Saskatchewan.

The proportion of women to men lawyers is everywhere small. The following table shows that this source of variation counts for very little in explaining why the United States and Canada have so many more lawyers in proportion to their population than has England.

Number of Women Lawyers

	Men and women	Women	% Women
English and Welsh solicitors .	14,973	17	0·1
" " " barristers .	2,973	20	0·7
Canadian barristers, solicitors, judges and justices . .	7,548	66	0·9
United States lawyers, judges, justices and magistrates . .	122,519	1,738	1·4

The relation between the number of lawyers in different communities and such factors as density of population, wealth and industrial and political conditions, has still to be worked out on a scientific basis. One important explanation, however, of the wide differences that are revealed by these figures is to be found in the dominant political philosophies that underlie existing requirements for admission to legal practice. In older jurisdictions the tendency is to emphasize, to the exclusion of all other considerations, the need of a rigorous course of preparation, designed to promote competency and character among lawyers. Younger juris-

dictions are more alive to the evils that would flow from making access to a lawyer's special privileges unduly difficult for students of modest means. How these two principles—that of efficiency and that of democratic idealism—may be suitably combined, is a matter of current controversy.

LAY, a word of several meanings. (1) A song or, more accurately, a short poem, lyrical or narrative, which could be sung or accompanied by music; such were the romances sung by minstrels. (2) "Non-clerical" or "unlearned." The word is now specially applied to persons who are not in orders, and more widely to those who do not belong to other learned professions, particularly the law and medicine. In a cathedral of the Church of England "lay clerks" and "lay vicars" sing such portions of the service as might formerly be performed by clergy in minor orders. "Lay readers" are persons who are granted a commission by the bishop to perform certain religious duties in a particular parish. In a religious order a "lay brother" is freed from duties at religious services performed by the other members, and from their studies, but is bound by vows of obedience and chastity and serves the order by manual labour. For "lay impropriator" *see* APPROPRIATION, and for "lay rector" *see* RECTOR and TITHES; *see* further LAYMEN, HOUSES OF. (3) "Lay" as a verb means "to make to lie down." "to place upon the ground," etc. (4) "Lay-figure" is the name commonly given to articulated figures of human beings or animals, made of wood, papier-maché or other materials; draped and posed, such figures serve as models for artists.

LAYA, JEAN LOUIS (1761–1833), French dramatist, was born in Paris on Dec. 4, 1761 and died in Aug. 1833. He is remembered by his *Ami des lois* (1793) This play, with its scarcely veiled characterizations of Robespierre as Nomophage and of Marat as Duricrâne, was produced at the Théâtre Français (temporarily Théâtre de la Nation) only 19 days before the execution of Louis XVI. Ten days after its first production the piece was prohibited by the commune, but the public demanded its re-presentation; the mayor of Paris was compelled to appeal to the convention, and the piece was played while some 30,000 Parisians guarded the hall. Laya went into hiding, and several persons convicted of having a copy of the obnoxious play in their possession were guillotined At the end of the Terror, Laya returned to Paris. In 1813 he replaced Delille in the Paris chair of literary history and French poetry; he was admitted to the Academy in 1817. Laya produced in 1797 *Les Deux Stuarts*, and in 1799 *Falkland*, the title-rôle of which provided Talma with one of his finest opportunities. His *Oeuvres* were collected in 1836–37.

See H. Welschinger, *Théâtre de la révolution* (1880).

LAYAMON, early English poet, was the author of a chronicle of Britain entitled *Brut*, a paraphrase of the *Brut d' Angleterre* by Robert Wace (*q.v.*). All that is known of Layamon is derived from two extant mss., which present texts that often vary considerably, and it is necessary to understand their comparative value before any conclusions can be drawn. The older text (here called the A-text) lies very near the original text, which is unfortunately lost, though it now and then omits lines which are absolutely necessary to the sense. The later text (here called the B-text) represents a later recension of the original version by another writer who frequently omits couplets, and alters the language by the substitution of better-known words for such as seemed to be obsolescent; e.g., *harme* (harm) in place of *balewe* (bale), and *dead* in place of *feie* (fated to die, or dead). Hence little reliance can be placed on the B-text, its chief merit being that it sometimes preserves couplets which seem to have been accidentally omitted in A; besides which, it affords a valuable commentary on the original version.

We learn that Layamon was a priest, and the son of Leovenath (a late spelling of A.-S. Leofnoth); also, that he lived at Ernley, at a church on Severn bank, close by Radstone. This is certainly Areley Regis, or Areley Kings, 1 m. S. of Stourport in Worcestershire. The B-text turns Layamon into the later form Laweman, *i.e.*, Law-man, correctly answering to Chaucer's "Man of Lawe," though here apparently used as a mere name. It also turns Leovenath into Leuca, *i.e.*, Leofeca, a diminutive of Leofa, which is itself a petname for Leofnoth; so that there is no real contradiction. But it absurdly substitutes "with the good knight," which is practically meaningless, for "at a noble church."

We know no more about Layamon except that he was a great lover of books; and that he procured three books which he prized above others. These were: Baeda's *Ecclesiastical History* in the original Latin and in its English translation, and Wace's poem, *Brut d'Angleterre*, which Layamon proceeded to paraphrase in English. The A-text of Layamon's poem may be dated about 1205, and the B-text (practically by another writer) about 1275. Both texts are remarkably free from admixture with words of French origin; the lists that have been given hitherto are inexact, but it may be said that the number of French words in the A-text can hardly exceed 100, or in the B-text 160. Layamon's work is largely original; Wace's *Brut* contains 15,300 lines, and Layamon's 32,240 lines of a similar length; and many of Layamon's additions to Wace are notable, such as his story "regarding the fairy elves at Arthur's birth, and his transportation by them after death in a boat to Avalon, the abode of Argante, their queen"; *see* Sir F. Madden's pref. p. xv.

Wace's *Brut* is almost wholly a translation of the Latin chronicle of the early history of Britain by Geoffrey of Monmouth, who said that he obtained his materials from a manuscript written in Welsh. The name Brut is the French form of Brutus, who was the fabulous grandson of Ascanius, and great-grandson of Aeneas of Troy, the hero of Virgil's *Aeneid*. After many adventures, this Brutus arrived in England, founded Troynovant or New Troy (better known as London), and was the progenitor of a long line of British kings, among whom were Locrine, Bladud, Leir, Gorboduc, Ferrex and Porrex, Lud, Cymbeline, Constantine, Vortigern, Uther and Arthur; and from this mythical Brutus the name Brut was transferred so as to denote the entire chronicle of this British history.

Layamon gives the whole story, from the time of Brutus to that of Cadwalader, who may be identified with the Caedwalla of the *Anglo-Saxon Chronicle*, baptized by Pope Sergius in the year 688. Both texts of Layamon are in a south-western dialect; the A-text in particular shows the Wessex dialect of earlier times (commonly called Anglo-Saxon) in a much later form, and we can hardly doubt that the author, as he intimates, could read the old version of Beda intelligently. The metre of the poem has been sufficiently treated by J. Schipper. An abstract of the poem has been given by Henry Morley; and good general criticisms of it by B. ten Brink and others.

See *Layamon's Brut, or a Chronicle of Britain; a Poetical Semi-Saxon Paraphrase of the Brut of Wace; . . .* by Sir F. Madden (1847); B. ten Brink, *Early English Literature*, trans. by H. M. Kennedy (in Bohn's Standard Library, 1885); H. Morley, *English Writers*, vol. iii. (1888); J. Schipper, *Englische Metrik*, i. (Bonn, 1882), E. Guest, *A History of English Rhythms* (new ed. by W. W. Skeat, 1882). Article "Layamon," in the *Dict. Nat. Biog.*; *Six Old English Chronicles*, including Gildas, Nennius and Geoffrey of Monmouth (in Bohn's Antiquarian Library); *Le Roux de Lincy, Le Roman de Brut, par Wace, avec un commentaire et des notes* (Rouen, 1836–38). LAYARD, SIR AUSTEN HENRY (1817–1894), British author and diplomatist, the excavator of Nineveh, was born in Paris on March 5, 1817, son of Henry P. J. Layard, of the Ceylon civil service. Much of his boyhood was spent in Italy, where he received part of his schooling, and acquired a taste for the fine arts and a love of travel; but he was at school also in England, France and Switzerland. After spending nearly six years in a solicitor's office in London, he started in 1839 with the intention of making an overland journey across Asia to Ceylon, where he was to enter the civil service. But, after wandering for many months, chiefly in Persia, he returned in 1842 to Constantinople, where

Sir Stratford Canning employed him in various unofficial diplomatic missions in European Turkey. In 1845, encouraged and assisted by Canning, Layard left Constantinople to explore the ruins of Assyria. This expedition fulfilled a design which he had formed, when, during his earlier travels in the East, he had seen the ruins of Nimrud on the Tigris, and the great mound of Kuyunjik, near Mosul, already partly excavated by Botta.

Layard remained in the neighbourhood of Mosul, excavating at Kuyunjik and Nimrud, and investigating the condition of various tribes, until 1847. Returning to England in 1848, he published *Nineveh and its Remains: with an Account of a Visit to the Chaldaean Christians of Kurdistan, and the Yezidis, or Devil-worshippers; and an Inquiry into the Manners and Arts of the Ancient Assyrians* (2 vols., 1848–49), accompanied by *Illustrations of the Monuments of Nineveh* (1849). After a few months in England, Layard returned to Constantinople as attaché to the British embassy, and, in Aug. 1849, started on a second expedition, in the course of which he investigated the ruins of Babylon and the mounds of southern Mesopotamia. His record of this expedition, *Discoveries in the Ruins of Nineveh and Babylon* (1855), was accompanied by a volume of illustrations, *A Second Series of the Monuments of Nineveh*. During these expeditions Layard sent to England the splendid specimens which now form the greater part of the collection of Assyrian antiquities in the British Museum. Apart from the archaeological value of his work in identifying Kuyunjik as the site of Nineveh, these two books of Layard's are among the best-written books of travel in the language.

Layard entered parliament for Aylesbury in 1852. He was for a few weeks under-secretary for foreign affairs, but afterwards freely criticized the government, especially in connection with army administration. He was present in the Crimea during the war, and was a member of the committee appointed to inquire into the conduct of the expedition. In 1855 he refused from Lord Palmerston an office not connected with foreign affairs, was elected lord rector of Aberdeen university, and on June 15 moved a resolution in the House of Commons (defeated by a large majority) declaring that in public appointments merit had been sacrificed to private influence and an adherence to routine. Defeated at Aylesbury in 1857, he visited India to investigate the causes of the Mutiny. He unsuccessfully contested York in 1859, but was elected for Southwark in 1860, and from 1861 to 1866 was under-secretary for foreign affairs in the successive administrations of Lord Palmerston and Lord John Russell. In 1866 he was appointed a trustee of the British Museum, and in 1868 chief commissioner of works in W. E. Gladstone's government and a member of the Privy Council. He retired from parliament in 1869, on being sent as envoy extraordinary to Madrid. In 1877 he was appointed by Lord Beaconsfield ambassador at Constantinople, where he remained until Gladstone's return to power in 1880, when he finally retired from public life. In 1878 he received the G.C.B. Layard's manner was brusque, and his advocacy of the causes which he had at heart, though always perfectly sincere, was vehement to the point sometimes of recklessness. Layard retired to Venice, where he devoted much of his time to collecting pictures of the Venetian school, and to writing on Italian art. On this subject he was a disciple of his friend G. Morelli, whose views he embodied in his revision of F. Kugler's *Handbook of Painting, Italian Schools* (1887). In 1887 he published, from notes taken at the time, a record of his first journey to the East, entitled *Early Adventures in Persia, Susiana and Babylonia*. An abbreviation of this delightful book was published in 1894, shortly after the author's death, with a brief introductory notice by Lord Aberdare. Layard died in London on July 5, 1894.

(A. Gl.; X.)

LAYMEN, HOUSES OF: *see* Convocation; Canon Law: *In England and the Anglican Communion.*

LAYNEZ (or Lainez), **DIEGO** (1512–1565), the second general of the Society of Jesus, was born in Castile, and after studying at Alcala joined Ignatius of Loyola in Paris, being one of the six who with Loyola in Aug. 1534 took the vow of missionary work in Palestine in the Montmartre church. After the order had been definitely established (1540) Laynez was sent to Germany. He was one of the pope's theologians at the council of Trent (*q.v.*), where he played a weighty and decisive part. When Loyola died in 1556 Laynez acted as vicar of the society, and two years later became general. Before his death at Rome, on Jan. 19, 1565, he had strengthened the despotic constitution of the order and developed its educational activities. (*See* Jesuits.)

His *Disputationes Tridentinae* were published in 2 vols. in 1886. *See* H. Müller, *Les Origines de la Compagnie de Jésus: Ignace et Lainez* (1898).

LAZAR, a leper. The term is an adaptation of the name of Lazarus (Luke xvi. 20); in the middle ages it was also used of men suffering from other diseases. Lazaretto or Lazar-House is a hospital for the reception of poor persons suffering from the plague, leprosy, or other infectious or contagious diseases. "Lazaretto" is also an obsolete term for a place in the after-part of a merchant vessel for the storage of provisions, etc. *Lazzarone,* is an Italian term for beggars, particularly the poorest class of Neapolitans, who live chiefly by begging.

LAZAREV, PETR PETROVICH (1878–), Russian physicist, was born in Moscow, April 1, 1878. A doctor of medicine of Moscow university, he did research work in science at Strasbourg, and in 1907 was appointed *Privatdozent* in physics and assistant to Prof. P. N. Lebedev at the University of Moscow. In 1912 he became professor at the technical college in Moscow, and in 1917 member of the Russian academy of sciences and director of the research institute of physics and biophysics in Moscow. Lazarev's early investigations were in photochemistry; he showed by experiment that the velocity of photochemical reactions is proportional to the absorbed energy and does not depend on the wave length of light. Another series of his investigations is in molecular physics. His main work is on the fundamental problem of biophysics—the stimulation of living matter. His ionic theory of stimulation explains the process of senses and of muscular contraction and forms the basis of his theory for the functions of the central nervous system. In 1918 Lazarev became head of the geophysical survey of the Kursk Magnetic and Gravimetric Anomaly. Some of his papers have been published in French (*Comptes rendus de l'Académie,* 1923–24) and in English (*Science;* Lancaster, Pa.); *Journ. of General Physiology* (Baltimore, 1924).

LAZARITES (Lazarists or Lazarians), the popular names of the "Congregation of Priests of the Mission" in the Roman Catholic Church. It had its origin in the successful mission to the common people conducted by St. Vincent de Paul (*q.v.*) and five other priests on the estates of the Gondi family. Archiepiscopal recognition was obtained in 1626, by a papal bull of the 12th of January 1632, the society was constituted a congregation, with St. Vincent de Paul at its head. About the same time the canons regular of St. Victor handed over to the congregation the priory of St. Lazarus (formerly a lazar-house) in Paris, whence the name of Lazarites or Lazarists. Within a few years they had acquired another house in Paris and set up other establishments throughout France. A fresh bull of Alexander VII. in April 1655 further confirmed the society; this was followed by a brief in September of the same year, regulating its constitution. The rules then adopted, which were framed on the model of those of the Jesuits, were published at Paris in 1668 under the title *Regulae seu constitutiones communes congregationis missionis.* The special objects contemplated were the religious instruction of the lower classes, the training of the clergy and foreign missions. During the French Revolution the congregation was suppressed and St. Lazare plundered by the mob; it was restored by Napoleon in 1804 at the desire of Pius VII., abolished by him in 1809 in consequence of a quarrel with the pope, and again restored in 1816. Foreign missions are still maintained in various parts of the world.

Stork in Wetzer and Welte's *Kirchenlexikon* (Catholic), vii.; E. Bougaud, *History of St. Vincent de Paul* (1908); and art. "Congregation of the Mission" in the *Catholic Encyclopaedia*

LAZARUS, a contracted form of the Heb. name Eleazar ("God has helped," *cf.* 1 Macc. ii. 5; frequent in Josephus), is a name which occurs in the New Testament in two connections.

1. LAZARUS OF BETHANY, brother of Martha and Mary. John xi. relates the story of his being raised from the dead after four days. In the fourth century the house and tomb of Lazarus were shown to pilgrims, and the Gospel narrative, which defines the localities with care (John xi. 18, 30, 32, 38), may be based on the story told to first century visitors to Palestine.

2. LAZARUS is the name given by Luke (ch. xvi.) to the beggar in the parable of "Dives" and Lazarus. It is the only proper name attached to a character in the parables of Jesus.

LAZARUS, EMMA (1849–1887), American Jewish poetess, was born in New York, July 22, 1849. Her first book (1867) included poems and translations written in her teens. At the age of 21 she published *Admetus and Other Poems* (1871), inscribed to Emerson. Much of her next work appeared in *Lippincott's Magazine*. In 1874 she published a prose romance (*Alide*) based on Goethe's autobiography, which was praised by Turgeniev. Two years later she visited Concord and made the acquaintance of the Emerson circle, and while there read the proof-sheets of her tragedy *The Spagnoletto*. In 1881 she published her excellent *Translations from Heine*. Another vigorous drama, *The Dance to Death*, is based on the accusation brought against the Jews of poisoning the wells, and thus causing the Black Death. This was included with some translations of mediaeval Hebrew poems, and such shorter pieces as "The Crowing of the Red Cock" and "The Banner of the Jew" in *Songs of a Semite* (1882), dedicated to George Eliot. She devoted much of the short remainder of her life to the cause of Jewish nationalism, visiting Europe, however, in 1883 and 1885–86. In 1887 appeared *By the Waters of Babylon*, a series of "prose poems," full of prophetic fire. She died in New York on Nov. 19, 1887. A sonnet by Emma Lazarus is engraved on a memorial tablet on the Statue of Liberty in New York.

See article in the *Century Magazine*, new series, 14, p. 875 (portrait p. 803), afterwards prefixed as a "Memoir" to the collected edition of *The Poems of Emma Lazarus* (1889); *see* also E. C. Stedman's tribute in his *Genius and Other Essays* (1911). (I. A.)

LAZARUS, MORITZ (1824–1903), German philosopher, was born on Sept. 15, 1824, at Filehne, Posen. The son of a rabbinical scholar, he was educated in Hebrew literature and history, and subsequently in law and philosophy at Berlin. He was professor at Berne (1860–66), at the Kriegsakademie in Berlin (1868–73), and at Berlin university (1873). The fundamental principle of his philosophy was that truth must be sought not in metaphysical or *a priori* abstractions but in psychological investigation, and further that this investigation cannot confine itself successfully to the individual consciousness, but must be devoted primarily to society as a whole. The psychologist must study mankind from the historical or comparative standpoint, analysing the elements which constitute the fabric of society, with its customs, its conventions and the main tendencies of its evolution. In support of this *Völkerpsychologie* (folk- or comparative psychology) he founded, with H. Steinthal, the *Zeitschrift für Völkerpsychologie und Sprachwissenschaft* (1859). His chief work was *Das Leben der Seele* (1855–57; 3rd ed., 1883). Lazarus was pre-eminent among the Jews of the so-called Semitic domination in Germany. Like Heine, Auerbach and Steinthal, he took a leading place in German literature and thought. He protested against the violent anti-Semitism of the time in his *Treu und Frei, Reden und Vorträge über Juden und Judenthum* (1887). In 1869 and 1871 he was president of the first and second Jewish Synods at Leipzig and Augsburg.

LAZARUS, ST., ORDER OF, a religious and military order founded in Jerusalem about the middle of the 12th century. Its primary object was the tending of the sick, especially lepers, of whom Lazarus (*see* LAZAR) was regarded as the patron. From the 13th century, the order made its way into various countries of Europe—Sicily, Lower Italy and Germany (Thuringia); but its chief centre of activity was France, where Louis IX. (1253) gave the members the lands of Boigny near Orleans and a building at the gates of Paris, which they turned into a lazar-house for the use of the lepers of the city. The gradual disappearance of leprosy combined with other causes to secularize the order more and more. It was abolished at the Revolution, reintroduced during the Restoration, and formally abolished by a state decree of 1830.

Uhlhorn, *Die christliche Liebesthatigkeit im Mittelalter* (Stuttgart, 1884); articles in Herzog-Hauck's *Realencyklopädie für protestantische Theologie*, xi. (1902), Wetzer and Welte's (Catholic) *Kirchenlexikon*, vii. (1891), and the *Catholic Encyclopaedia*.

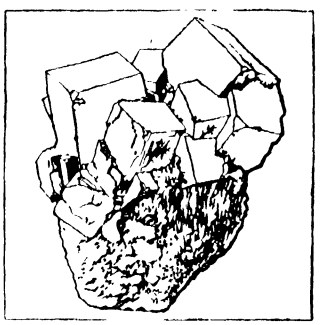
LEA, HENRY CHARLES (1825–1909), American historian of Quaker descent, was born at Philadelphia on Sept. 19, 1825, where he was educated by a tutor. He entered his father's publishing business in 1843 but retired in 1880. From early days he devoted himself to research, mainly on church history in the later middle ages, and his literary reputation rests on the important books he produced on this subject. These include *Superstition and Force* (1866); *A History of the Inquisition of the Middle Ages* (3 vol., 1888), several times translated; *History of Auricular Confession and Indulgences in the Latin Church* (3 vol., 1896); *The Moriscos of Spain* (1901); *A History of the Inquisition of Spain* (4 vol., 1906–7); and *The Inquisition in the Spanish Dependencies* (1908). He died at Philadelphia on Oct. 24, 1909.

As an example of the unfavourable criticism to which the nature of his work exposed him, *see* P. M. Baumgarten, *Henry Charles Lea's Historical Writings* (1909, translated from the German edition of 1908). For tributes see *Henry Charles Lea* (1910); also Amer. Phil. Soc., *Proceedings* (Philadelphia, Jan.–April, 1911).

LEACOCK, STEPHEN BUTLER (1869–), Canadian author and economist, was born at Swanmoor, Hants., on Dec. 30, 1869 and went to Canada at the age of six. He graduated at the University of Toronto, Upper Canada College (1891–99) and, after an interval of teaching, graduated Ph.D. at Chicago. In 1903 he was appointed to the staff of McGill University, Montreal, becoming professor of political economy in 1908, and subsequently head of his department. In 1907–8 he made a tour of the British Empire, lecturing on imperial organization under the auspices of the Cecil Rhodes Trust. His serious work includes biographies of R. Baldwin and La Fontaine in the "Makers of Canada" series; *Elements of Political Science* (1906); and *The Unsolved Riddle of Social Justice* (1920). It was as the author of a number of delightful short stories, parodies and skits, however, that Leacock became most widely known to the general public. His humorous works include: *Literary Lapses* (1910); *Nonsense Novels* (1911); *Sunshine Sketches of a Little Town* (1912); *Behind the Beyond* (1913); *Arcadian Adventures with the Idle Rich* (1914); *Moonbeams from the Larger Lunacy* (1915); *Further Foolishness* (1916); *Frenzied Fiction* (1918); *Winsome Winnie* (1920); *My Discovery of England* (1922); *The Garden of Folly* (1924); and *Winnowed Wisdom* (1926).

See Peter McArthur, *Stephen Leacock* (Toronto, 1923); C. K. Allen, *Oh, Mr. Leacock* (1925), and Patrick Baybrooke, *Peeps at the Mighty* (Phila., 1927).

LEAD (pronounced Leed), a city of Lawrence county, S.D., U.S.A., in the Black Hills, at an altitude of 5,300 ft., 15 m. from the western boundary of the State. It is on Federal highway 85, and is served by the Burlington and the Chicago and North Western railways. The population in 1925 (State census) was 6,810. Lead is the centre of the operations of the Homestake Mining company, which produces gold valued at about $6,000,000 annually. From the discovery of the ores in 1875 through 1925, the output was $200,544,759.34, and $48,826,924.29 was paid in dividends. There are vast quantities of low-grade ores (averaging about $4 a ton, mainly in gold), easily mined and easily worked. They are treated at Lead, Terraville, Blacktail and Deadwood, in amalgamating and cyaniding plants with a total capacity of 4,600 tons a day.



The first settlement here was made by prospectors in 1876. The city was chartered in 1890. The population reached 8,392 in 1910, fell to 5,013 in 1920, and then increased 36% in the next five years.

LEAD, a metallic chemical element known to the ancients, and mentioned in the Old Testament. (Symbol Pb, atomic number 82, atomic weight 207·2, chief isotopes 206, 207, 208.) The

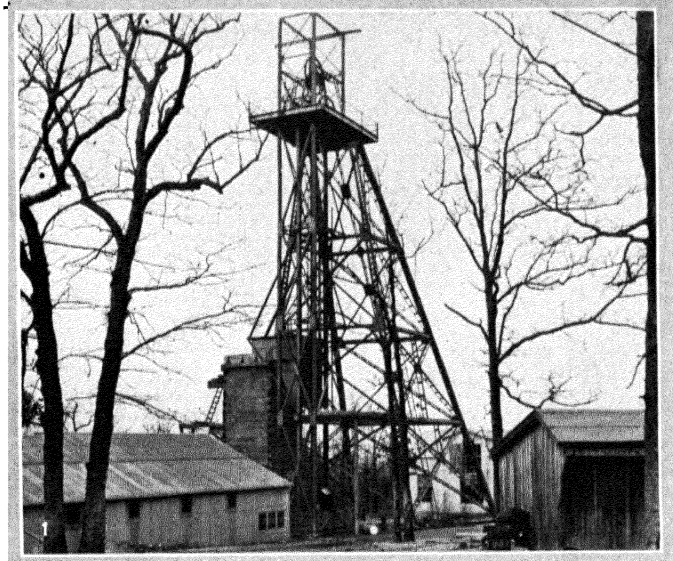
Romans used it largely, as it is still used, for the making of water pipes, and soldered these with an alloy of lead and tin. Pliny treats of these two metals as *plumbum nigrum* and *plumbum album* respectively, which seems to show that at his time they were looked upon as being only two varieties of the same species. In regard to the ancients' knowledge of lead compounds, we may state that the substance described by Dioscorides as μολυβδαίνα was undoubtedly litharge, that Pliny uses the word minium in its present sense of red lead, and that white lead was well known to Geber in the 8th century. The alchemists designated it by the sign of Saturn ♄.

Occurrence.—Metallic lead practically never occurs in nature. The chief lead ores are galena and cerussite; of minor importance are anglesite, pyromorphite, mimetite (*qq.v.*). Galena (*q.v.*), the principal lead ore, has a world-wide distribution, and is always contaminated with silver sulphide, the proportion of noble metal varying from about 0·01 or less to 0·3%, and in rare cases coming up to 0·5 or 1%. Galena occurs in veins in the Cambrian clay slate, accompanied by copper and iron pyrites, zinc-blende, quartz, calc-spar, iron-spar, etc.; also in beds or nests within sandstones and rudimentary limestones, and in a great many other geological formations. It is pretty widely diffused throughout the earth's crust. The principal English lead mines are in Derbyshire; but there are also mines at Allandale and other parts of western Northumberland, at Alston Moor and other parts of Cumberland, in the western parts of Durham, in Swaledale and Arkendale and other parts of Yorkshire, in Salop, in Cornwall, in the Mendip Hills in Somersetshire, and in the Isle of Man. The Welsh mines are chiefly in Flintshire, Cardigan and Montgomery; the Scottish in Dumfries, Lanark and Argyll; and the Irish in Wicklow, Waterford and Co. Down. Of continental mines we may mention those in Saxony and in the Harz, Germany; those of Carinthia, Austria; and especially those of the southern provinces of Spain Lead is widely distributed in the United States, and occurs in Mexico and Brazil; it is found in Tunisia and Algeria, in the Altai Mountains and India, and in New South Wales, Queensland and Tasmania.

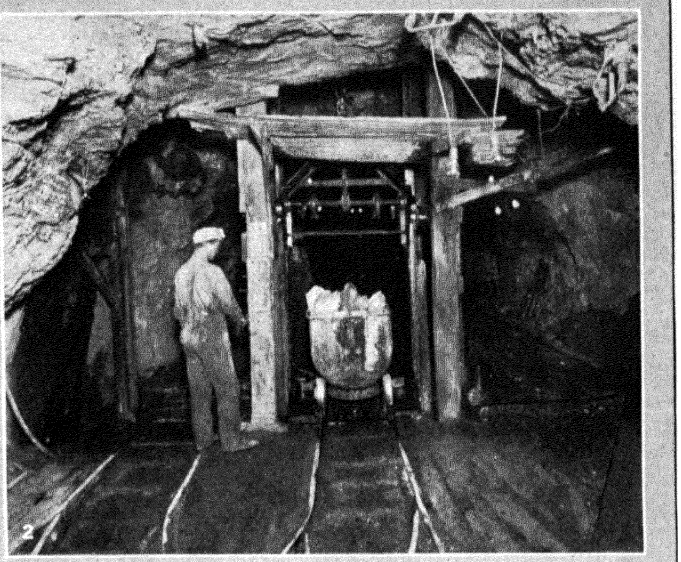
The native carbonate or cerussite (*q.v.*) occasionally occurs in the pure form, but more frequently in a state of intimate intermixture with clay ("lead earth," *Bleierde*), limestone, iron oxides, etc. (as in the ores of Nevada and Colorado), and sometimes also with coal ("black lead ore"). All native carbonate of lead seems to be derived from what was originally galena, which is always present in it as an admixture. This ore, metallurgically, was not reckoned of much value, until immense quantities of it were discovered in Nevada and in Colorado (U.S). The Nevada mines are mostly grouped around the city of Eureka, where the ore occurs in "pockets" disseminated at random through limestone. The crude ore contains about 30% lead and 0·2 to 0·3% silver. The Colorado lead district is in the Rocky Mountains, a few miles from the source of the Arkansas river. It forms gigantic deposits of almost constant thickness, embedded between a floor of limestone and a roof of porphyry. Stephens's discovery of the ore in 1877 was the making of the city of Leadville, which, in 1878, within a year of its foundation, had over 10,000 inhabitants. The Leadville ore contains from 24 to 42% lead and 0·1 to 2% silver. In Nevada and Colorado the ore is worked chiefly for the sake of the silver. Deposits are also worked at Broken Hill, New South Wales.

FROM HARN, "LEAD THE PRECIOUS METAL"
CRYSTALS OF GALENA, A CHIEF LEAD ORE

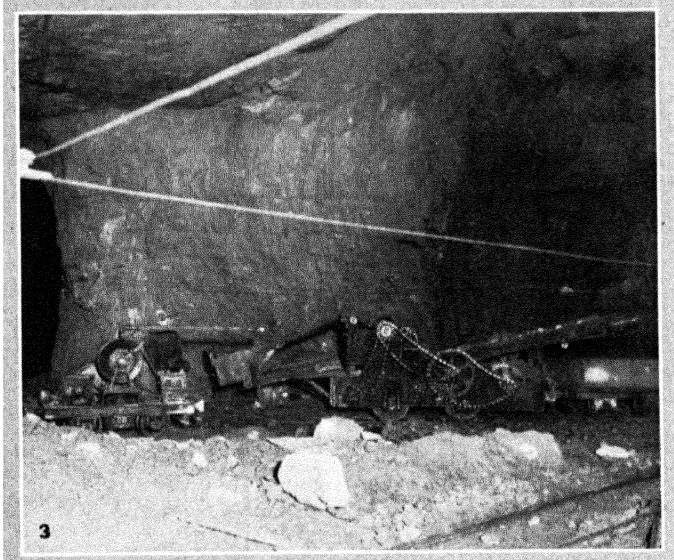
Anglesite, or lead sulphate, $PbSO_4$, is poor in silver, and is only exceptionally mined by itself; it occurs in quantity in France, Spain, Sardinia and Australia. Of other lead minerals we may mention the basic sulphates lanarkite, $PbO,PbSO_4$; leadhillite, $PbSO_4,3PbCO_3$; the basic chlorides matlockite, $PbO,PbCl_2$, and mendipite, $PbCl_2,2PbO$; the chloro-phosphate pyromorphite, $PbCl_2,3Pb_3(PO_4)_2$; the chloro-arsenate mimetesite or mimetite, $PbCl_2,3Pb_3(AsO_4)_2$; the molybdate wulfenite, $PbMoO_4$; the chromate crocoite or crocoisite, $PbCrO_4$; the tungstate stolzite, $PbWO_4$.



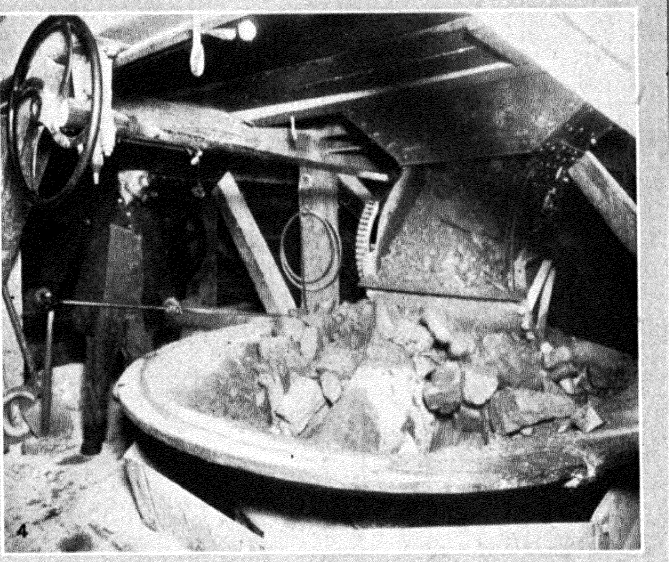
Production.—At the beginning of the 19th century the bulk of the world's supply of lead was obtained from England and Spain, the former contributing about 17,000 tons and the latter 10,000 tons annually. Germany, Austria, Hungary, France, Russia and the United States began to rank as producers during the second and third decades; Belgium entered in about 1840; Italy in the 'sixties; Mexico, Canada, Japan and Greece in the 'eighties; while Australia assumed importance in 1888 with a production of about 18,000 tons, although it had contributed small and varying amounts for many preceding decades. The present state and general trend of the lead industry may be seen from the following table, which gives the production of smelter (in metric tons) for the countries having the largest output, as well as the total for all countries.



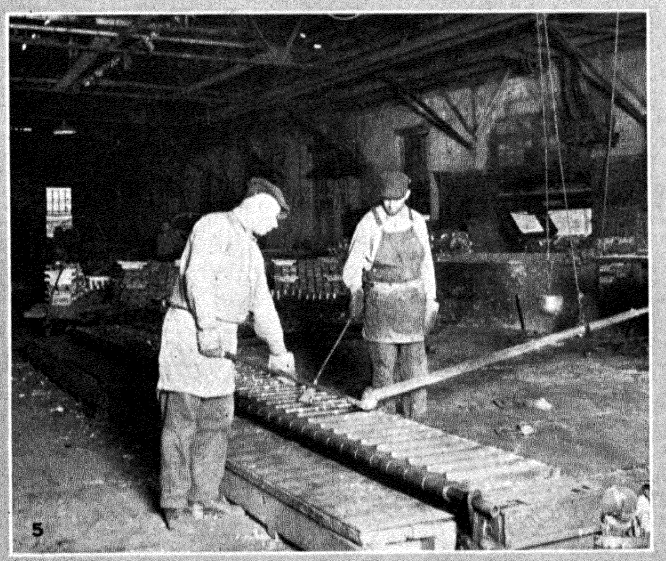
Year	1913	1922	1924	1926
Australia . .	110,444	109,046	135,501	151,886
Germany . .	181,100	73,564	66,405	98,187
Mexico . . .	62,000	120,821	161,207	200,381
Spain . . .	198,829	119,200	137,114	147,392
U.S.A. . .	396,034	432,562	532,691	637,937
Total (all countries) . .	1,162,874	1,077,640	1,330,841	1,602,773



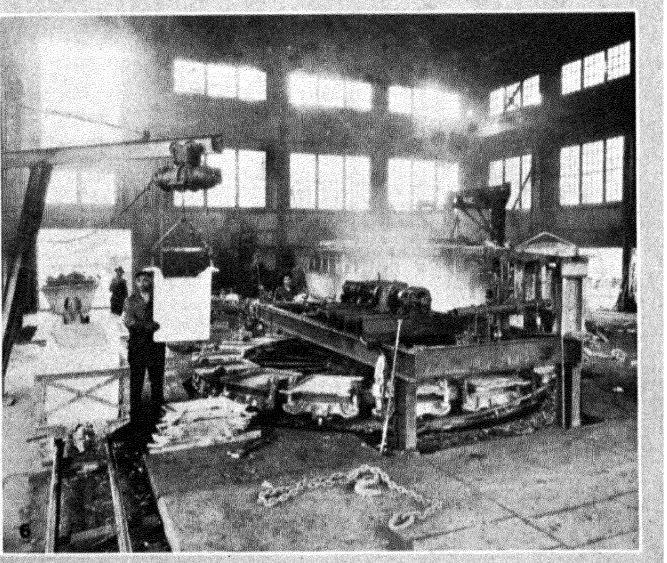
Properties of Lead.—Pure lead is a feebly lustrous bluish-white metal, endowed with a characteristically high degree of softness and plasticity, and almost entirely devoid of elasticity. Its breaking strain is very small: a wire $\frac{1}{10}$ in. thick is ruptured by a charge of about 30 lb. The specific gravity is 11·352 for ingot, and from 11·354 to 11·365 for sheet lead (water at 4° C=1). The expansion of unit-length from 0° C to 100° C is 0·002948 (Fizeau). The conductivity for heat (Wiedemann and Franz) or electricity is 8·5, that of silver being taken as 100. It melts at 327·7° C (H. L. Callendar); at a bright-red heat it perceptibly vapourizes, and boils at a temperature between 1,450° and 1,600°. Its vapour at 1,870° is monatomic. The specific heat is 0·0314 (Regnault). Lead exposed to ordinary air is rapidly tarnished, but the thin dark film formed is very slow in increasing. When kept fused in the presence of air lead readily takes up oxygen, with the formation at first of a dark-coloured scum, and then of monoxide PbO, the rate of oxidation increasing with the temperature



Water when absolutely pure has no action on lead, but in the presence of air the lead is quickly attacked, with formation first of the hydrate $Pb_2O,2H_2O$ and finally of $Pb(OH)_2$, which is appreciably soluble in water to give an alkaline liquid. When carbonic acid is present the dissolved oxide is soon precipitated as basic carbonate, so that the corrosion of the lead becomes continuous. Since all soluble lead compounds are strong cumulative poisons, danger is involved in using lead cisterns or pipes in the distribution of *pure* waters. The word "pure" is emphasized because experience shows that the presence in a water of even small proportions of calcium bicarbonate or sulphate prevents its action on lead. All impurities do not act in a similar way. Ammonium nitrate and nitrite, for instance, intensify the action of a water on lead. Even pure waters, however, such as that of Loch Katrine (which forms the Glasgow supply), act so slowly, at least on such lead pipes as have already been in use for some time, that there is no danger in using short lead service pipes even for them, if the taps are being constantly used. Lead cisterns must be unhesitatingly condemned.



Aqueous non-oxidizing acids generally have little or no action on lead in the absence of air. Dilute sulphuric acid (say an acid of 20% H_2SO_4 or less) has no action on lead even when air is present, nor on boiling. Strong acid does act, the more so the greater its concentration and the higher its temperature. Pure lead is far more readily corroded than a metal contaminated with



MACHINERY FOR MINING, SMELTING AND REFINING LEAD

1. Hoist house and hoist head frame over lead mine shaft
2. View of interior of lead mine, showing loaded ore car on hoist cage
3. Mechanical shoveling and car loading machine in lead mine. After lead ore has been broken in stopes by blasting, the machine gathers it from the floor of mine and loads it into the mine cars
4. Crushing operation showing mine-run lead ore being fed with gyratory crusher
5. Casting market pig lead in a refinery. Impurities are removed while lead is molten and the pure lead is then run into iron moulds
6. Lead refinery showing casting of anodes for electrolytic refining

1% or even less of antimony or copper. Boiling concentrated sulphuric acid converts lead into sulphate, with evolution of sulphur dioxide. Dilute nitric acid readily dissolves the metal, with formation of nitrate $Pb(NO_3)_2$. Lead has the peculiar property of making a lustrous black streak on paper.

Lead Alloys.—Lead unites readily with almost all other metals; hence, and on account of its being used for the extraction of (for instance) silver, its alchemistic name of *saturnus*. Alloys with the following metals may be named:—

Antimony.—An alloy of 83 parts of lead and 17 of antimony is used as type metal; other proportions are used, however, and other metals added besides antimony (*e.g.*, tin, bismuth) to give the alloy certain properties.

Arsenic renders lead harder. An alloy made by addition of about $\frac{1}{56}$ of arsenic has been used for making shot.

Bismuth and Antimony.—An alloy consisting of 9 parts of lead, 2 of antimony and 2 of bismuth is used for stereotype plates.

Bismuth and Tin.—These triple alloys are noted for their low fusing points. An alloy of 5 of lead, 8 of bismuth and 3 of tin fuses at 94·4° C, *i.e.*, below the boiling-point of water (Rose's metal). An alloy of 15 parts of bismuth, 8 of lead, 4 of tin and 3 of cadmium (Wood's alloy) melts below 70° C.

Tin unites with lead in any proportion with slight expansion, the alloy fusing at a lower temperature than either component. It is used largely for soldering.

"Pewter" (*q.v.*) may be said to be substantially an alloy of the same two metals, but small quantities of copper, antimony and zinc are frequently added.

Lead and Radioactivity.—Lead is the end product of several series of radioactive decay (*see* RADIOACTIVITY), and has been proved to be identical with radium-*D*. The atomic weight of lead therefore depends upon the series from which it is derived, and atomic weights as low as 206·0 have been found for lead derived from uranium, as in uraninite, and from several minerals in the Belgian Congo.

Compounds of Lead.—Lead generally functions as a bivalent element of distinctly metallic character, yielding a definite series of salts derived from the oxide PbO. At the same time, however, it forms a number of compounds in which it is most decidedly quadrivalent; and thus it shows relations to carbon, silicon, germanium and tin.

Hydrides.—In 1919, F. Paneth found that traces of a hydride were produced by dissolving a lead-magnesium alloy in acids or by electrolytic reduction of solutions of lead salts. In 1925, E. J. Weeks obtained a hydride, Pb_2H_2, as a grey deposit on aluminium foil placed in a solution of an alkali plumbite.

Oxides.—Lead combines with oxygen to form five oxides, viz. Pb_2O, PbO, PbO_2, Pb_2O_3 and Pb_3O_4. The *suboxide*, Pb_2O, is the first product of the oxidation of lead, and is also obtained as a black powder by heating lead oxalate to 300° out of contact with air. It ignites when heated in air with the formation of the monoxide; dilute acids convert it into metallic lead and lead monoxide, the latter dissolving in the acid. The *monoxide*, PbO, occurs in nature as the mineral *lead ochre*. This oxide is produced by heating lead in contact with air and removing the film of oxide as formed. It is manufactured in two forms, known as "massicot" and "litharge." The former is produced at temperatures below, the latter at temperatures above the fusing-point of the oxide. The liquid litharge when allowed to cool solidifies into a hard stone-like mass, which, however, when left to itself, soon crumbles up into a heap of resplendent dark yellow scales known as "flake litharge." "Buff" or "levigated litharge" is prepared by grinding the larger pieces under water. Litharge is much used for the preparation of lead salts, for the manufacture of oil varnishes, of certain cements, and of lead plaster, and for other purposes. Massicot is the raw material for the manufacture of "red lead" or "minium."

Lead monoxide is dimorphous, occurring as cubical dodecahedra and as rhombic octahedra. Its specific gravity is about 9; it is sparingly soluble in water, but readily dissolves in acids and molten alkalis; it is used in making flint glass and glazes. A yellow and a red modification have been described. The corresponding *hydrate*, $PbO,Pb(OH)_2$, is obtained as a white crystalline precipitate by adding ammonia to a solution of lead nitrate or acetate. It dissolves in an excess of alkali to form *plumbites* of the general formula $Pb(OM)_2$. It absorbs carbon dioxide from the air when moist.

Lead dioxide, PbO_2, also known as *puce oxide*, occurs in nature as the mineral plattnerite, and may be most conveniently prepared by heating mixed solutions of lead acetate and bleaching powder until the original precipitate blackens. The solution is filtered, the precipitate well washed, and, generally, is put up in the form of a paste in well-closed vessels. It is also obtained by passing chlorine into a suspension of lead oxide or carbonate, or of magnesia and lead sulphate, in water; or by treating the sesquioxide or red oxide with nitric acid. The formation of lead dioxide by the electrolysis of a lead solution, the anode being a lead plate coated with lead oxide or sulphate and the cathode a lead plate, is the fundamental principle of the storage cell (*see* ACCUMULATOR). Heating or exposure to sunlight reduces it to the red oxide; it fires when ground with sulphur, and oxidizes ammonia to nitric acid, with the simultaneous formation of ammonium nitrate. It oxidizes a manganese salt (free from chlorine) in the presence of nitric acid to a permanganate; this is a very delicate test for manganese. It forms crystallizable salts with potassium and calcium hydrates, and functions as a weak acid forming salts named plumbates. The Kassner process formerly used for the manufacture of oxygen depended upon the formation of calcium plumbate, Ca_2PbO_4, by heating a mixture of lime and litharge in a current of air, decomposing this substance into calcium carbonate and lead dioxide by heating in a current of carbon dioxide, and then decomposing these compounds with the evolution of carbon dioxide and oxygen by raising the temperature.

Quadrivalent Lead.—If a suspension of lead dichloride in hydrochloric acid be treated with chlorine gas, a solution of lead tetrachloride is obtained; by adding ammonium chloride ammonium plumbichloride, $(NH_4)_2PbCl_6$, is precipitated, which on treatment with strong sulphuric acid yields *lead tetrachloride*, $PbCl_4$, as a translucent, yellow, highly refractive liquid. It freezes at −15° to a yellowish crystalline mass; on heating it loses chlorine and forms lead dichloride. With water it forms a hydrate, and ultimately decomposes into lead dioxide and hydrochloric acid. It combines with alkaline chlorides—potassium, rubidium and caesium—to form crystalline *plumbichlorides*. By dissolving red lead, Pb_3O_4, in glacial acetic acid and crystallizing the filtrate, colourless monoclinic prisms of lead tetra-acetate, $Pb(C_2H_3O_2)_4$, are obtained. This salt gives the corresponding chloride, fluoride and phosphate by treatment with the appropriate acid.

These salts are like those of tin; and the resemblance to this metal is clearly enhanced by the study of the alkyl compounds. Here compounds of bivalent lead have not yet been obtained; by acting with magnesium ethyl bromide (*see* GRIGNARD REAGENTS) on lead chloride, *lead tetraethyl*, $Pb(C_2H_3)_4$, is obtained, with the separation of metallic lead. This compound is finding much use under the name "ethyl" as an "anti-knock" in internal-combustion engines. *See* ORGANO-METALLIC COMPOUNDS.

Lead sesquioxide, Pb_2O_3, is obtained as a reddish-yellow amorphous powder by carefully adding sodium hypochlorite to a cold potash solution of lead oxide, or by adding very dilute ammonia to a solution of red lead in acetic acid. It is decomposed by acids into a mixture of lead monoxide and dioxide, and may thus be regarded as lead metaplumbate, $PbPbO_3$. *Red lead, minium* or *triplumbic tetroxide*, Pb_3O_4, is a scarlet crystalline powder of specific gravity 8·6–9·1, obtained by heating very finely divided pure massicot or lead carbonate at 400° for 24 hours in a reverberatory furnace with free access of air; the brightness of the colour depends in a great measure on the roasting. Pliny mentions it under the name of *minium*, but it was confused with cinnabar and the red arsenic sulphide. On heating, it assumes a finer colour, but then turns violet and finally black, regaining, however, its original colour on cooling. On ignition, it loses oxygen and forms litharge. Commercial red lead is frequently contaminated

with this oxide, which may, however, be removed by repeated digestion with lead acetate. Acids decompose it into lead dioxide and monoxide, and the latter may or may not dissolve to form a salt; red lead may, therefore, be regarded as *lead orthoplumbate*, Pb_2PbO_4. It is chiefly used as a pigment and in the manufacture of flint glass.

Lead chloride, $PbCl_2$, occurs in nature as the mineral cotunnite, which crystallizes in the rhombic system, and is found in the neighbourhood of volcanic craters. It is artificially obtained by adding hydrochloric acid to a solution of lead salt, as a white precipitate, little soluble in cold water, less so in dilute hydrochloric acid, more so in the strong acid, and readily soluble in hot water, from which on cooling, the excess of dissolved salt separates out in silky rhombic needles. It melts at 485° and solidifies on cooling to a translucent, horn-like mass; an early name for it was *plumbum corneum*, horn lead. A basic chloride, Pb(OH)Cl, was introduced in 1849 by Pattinson as a substitute for white lead. An anhydrous basic chloride approximating to $PbCl_2{\cdot}7PbO$, but not a definite compound, is obtained by the fusion of the two components; it is used as a pigment under the name of "Cassel yellow." "Turner's yellow" or "patent yellow" is another artificially prepared oxychloride, used as a pigment (*see* PAINTS, CHEMISTRY OF). Mendipite and matlockite are mineral oxychlorides, $PbCl_2{,}2PbO$ and $PbCl_2{,}PbO$, respectively.

Lead fluoride, PbF_2 is a white powder obtained by precipitating a lead salt with a soluble fluoride; it is sparingly soluble in water but readily dissolves in hydrochloric and nitric acids. Lead bromide, $PbBr_2$, a white solid, and lead iodide, PbI_2, a yellow solid, are prepared by precipitating a lead salt with a soluble bromide or iodide; they resemble the chloride in solubility.

Lead carbonate, $PbCO_3$, occurs in nature as the mineral cerussite (*q.v.*). It is produced as an almost insoluble white precipitate by the addition of a solution of lead salt to an excess of ammonium carbonate. Of greater practical importance is a basic carbonate, substantially $2PbCO_3{,}Pb(OH)_2$, largely used as a white pigment under the name of "white lead." This pigment is of great antiquity; Theophrastus called it ψιμύθιον, and prepared it by acting on lead with vinegar, and Pliny, who called it *cerussa*, obtained it by dissolving lead in vinegar and evaporating to dryness. It thus appears that white lead and sugar of lead were undifferentiated. Geber gave the preparation in a correct form, and T. O. Bergman proved its composition. This pigment is manufactured by several methods. In the old Dutch method, pieces of sheet lead are suspended in stoneware pots so as to occupy the upper two-thirds of the vessels. A little vinegar is poured into each pot; they are then covered with plates of sheet lead, buried in horse-dung or spent tanner's bark, and left to themselves for a considerable time. By the action of the acetic acid and atmospheric oxygen, the lead is converted superficially into a basic acetate, which is at once decomposed by the carbon dioxide, with formation of white lead and acetic acid, which latter then acts *de novo*. After a month or so the plates are converted to a more or less considerable depth into crusts of white lead. These are knocked off, ground up with water, freed from metal particles by elutriation, and the paste of white lead is allowed to set and dry in small conical forms. The German method differs from the Dutch inasmuch as the lead is suspended in a large chamber heated by ordinary means, and there exposed to the simultaneous action of vapour of aqueous acetic acid and of carbon dioxide. Another process depends upon the formation of lead chloride by grinding together litharge with salt and water, and then treating the alkaline fluid with carbon dioxide until it is neutral. White lead is an earthy, amorphous powder. The inferior varieties of commercial "white lead" are produced by mixing the genuine article with more or less of finely powdered heavy spar or occasionally zinc white (ZnO). Venetian white, Hamburg white and Dutch white are mixtures of one part of white lead with one, two and three parts of barium sulphate respectively.

Although inexpensive, these methods are very slow, and are being replaced by electrolytic methods based on the oxidation of lead to hydroxide and conversion of this by means of carbon dioxide. The covering power of white lead increases with its density, and the material is more efficient the nearer its composition is to $2PbCo_3{,}Pb(OH)_2$, the pure normal carbonate being quite useless. Lead poisoning (plumbism) has been found to be greatly decreased when the wet rubbing down is used instead of the dry.

Lead sulphide, PbS, occurs in nature as the mineral galena (*q.v.*), and constitutes the most valuable ore of lead. It may be artificially prepared by leading sulphur vapour over lead, by fusing litharge with sulphur, or, as a black precipitate, by passing sulphuretted hydrogen into a solution of a lead salt. It dissolves in strong nitric acid with the formation of the nitrate and sulphate, and also in hot concentrated hydrochloric acid.

Lead sulphate, $PbSO_4$, occurs in nature as the mineral anglesite (*q.v.*), and may be prepared by the addition of sulphuric acid to solutions of lead salts, as a white precipitate almost insoluble in water (1 in 21,739), less soluble still in dilute sulphuric acid and insoluble in alcohol. Ammonium sulphide blackens it, and it is soluble in solution of ammonium acetate, which distinguishes it from barium sulphate. Strong sulphuric acid dissolves it, forming an acid salt, $Pb(HSO_4)_2$, which is hydrolysed by adding water, the normal sulphate being precipitated; hence the milkiness exhibited by samples of oil of vitriol on dilution.

Lead nitrate, $Pb(NO_3)_2$, is obtained by dissolving the metal or oxide in aqueous nitric acid; it forms white crystals, not easily soluble in cold water, readily in hot water and almost insoluble in strong nitric acid. It was mentioned by Libavius, who named it *calx plumb dulcis*. It is decomposed by heat into oxide, nitrogen peroxide and oxygen; and is used for the manufacture of fuses and other deflagrating compounds, and also for preparing mordants in the dyeing and calico-printing industries. Basic nitrates, *e.g.*, $Pb(NO_3)OH$, $Pb_3O(OH)_2(NO_3)_2$, $Pb_3O_2(OH)NO_3$, etc., have been described.

Lead Phosphates.—The normal ortho-phosphate, $Pb_3(PO_4)_2$, is a white precipitate obtained by adding sodium phosphate to lead acetate; the acid phosphate, $PbHPO_4$, is produced by precipitating a boiling solution of lead nitrate with phosphoric acid; the pyrophosphate and meta-phosphate are similar white precipitates.

Lead Borates.—By fusing litharge with boron trioxide, glasses of a composition varying with the proportions of the mixture are obtained, *e.g.*, $Pb_2B_6O_{11}{,}4H_2O$; $PbB_2O_4{,}H_2O$, $PbB_4O_7{,}4H_2O$; some of these are used in the manufacture of glass.

Lead silicates are obtained as glasses by fusing litharge with silica; they play a considerable part in the manufacture of the lead glasses (*see* GLASS).

Lead chromate, $PbCrO_4$, is prepared industrially as a yellow pigment, chrome yellow, by precipitating sugar of lead solution with potassium bichromate. The beautiful yellow precipitate is little soluble in dilute nitric acid, but soluble in caustic potash. The vermilion-like pigment which occurs in commerce as "chrome-red" is a basic chromate, Pb_2CrO_5, prepared by treating recently precipitated normal chromate with a properly adjusted proportion of caustic soda, or by boiling it with potassium chromate. Several other basic chromates of varying shades are known.

Lead acetate, $Pb(C_2H_3O_2)_2{\cdot}3H_2O$ (called "sugar" of lead, on account of its sweetish taste), is manufactured by dissolving massicot in aqueous acetic acid. It forms colourless transparent crystals, soluble in one and a half parts of cold water and in eight parts of alcohol. On exposure to ordinary air they become opaque through absorption of carbonic acid, and form a crust of basic carbonate. An aqueous solution readily dissolves lead oxide, with formation of a strongly alkaline solution containing basic acetates (*Acetum Plumbi* or *Saturni*). When carbon dioxide is passed into this solution the whole of the added oxide, and even part of the oxide of the normal salt, is precipitated as a basic carbonate chemically similar, but not quite equivalent as a pigment, to white lead.

Analysis.—When mixed with sodium carbonate and heated on charcoal in the reducing flame lead salts yield malleable globules of metal and a yellow oxide-ring. Solutions of lead salts (colourless in the absence of coloured acids) are characterized by their behaviour to hydrochloric acid, sulphuric acid and potassium chromate. But the most delicate precipitant for lead is sul-

phuretted hydrogen, which produces a black precipitate of lead sulphide, insoluble in cold dilute nitric acid, less so in cold hydrochloric, and easily decomposed by hot hydrochloric acid with formation of the characteristic chloride.

Pharmacology and Therapeutics.—The chief salts are: (1) *Plumbi oxidum* (lead oxide), litharge. It is not used internally, but from it is made *Emplastrum Plumbi* (diachylon plaster), which is an oleate of lead and is contained in emplastrum hydrargyri, emplastrum plumbi iodidi, emplastrum resinae, emplastrum saponis. (2) *Plumbi Acetas* (sugar of lead), dose 1 to 5 grains. From this salt are made the following preparations: (*a*) *Pilula Plumbi cum Opio,* the strength of the opium in it being 1 in 8, dose 2 to 4 grains; (*b*) *Suppositoria Plumbi composita,* containing lead acetate, opium and oil of theobroma, there being one grain of opium in each suppository; (*c*) *Unguentum Plumbi Acetatis;* (*d*) *Liquor Plumbi Subacetatis Fortior,* Goulard's extract, strength 24% of the subacetate; this again has a sub-preparation, the *Liquor Plumbi Subacetatis Dilutis,* called Goulard's water or Goulard's lotion, containing 1 part in 80 of the strong extract; (*e*) *Glycerinum Plumbi Subacetatis,* from which is made the *Unguentum Glycerini Plumbi Subacetatis.* (3) *Plumbi Carbonas,* white lead, a mixture of the carbonate and the hydrate, a heavy white powder insoluble in water; it is not used internally but from it is made *Unguentum Plumbi Carbonatis,* strength 1 in 10 parts of paraffin ointment. (4) *Plumbi Iodidium,* a heavy bright yellow powder not used internally. From it are made (*a*) *Emplastrum Plumbi Iodidi,* and (*b*) *Unguentum Plumbi Iodidi.* The strength of each is 1 in 10.

Applied externally lead salts have practically no action upon the unbroken skin, but applied to sores, ulcers or any exposed mucous membranes they coagulate the albumen in the tissues themselves and contract the small vessels. They are very astringent, haemostatic and sedative; the strong solution of the subacetate is powerfully caustic and is rarely used undiluted. Lead salts are applied as lotions in conditions where a sedative astringent effect is desired, as in weeping eczema; in many varieties of chronic ulceration; and as an injection for various inflammatory discharges from the vagina, ear and urethra, the Liquor Plumbi Subacetatis Dilutum being the one employed. The sedative effect of lead lotion in pruritus is well known. Internally lead has an astringent action on the mucous membranes, causing a sensation of dryness; the dilute solution of the subacetate forms an effective gargle in tonsilitis. The chief use of the preparations of lead, however, is as an astringent in acute diarrhoea, particularly if ulceration be present, when it is usefully given in combination with opium in the form of the Pilula Plumbi cum Opio. It is useful in haemorrhage from a gastric ulcer or in haemorrhage from the intestine. Lead salts usually produce constipation, and lead is an active ecbolic. Lead is said to enter the blood as an albuminate in which form it is deposited in the tissues. As a rule the soluble salts if taken in sufficient quantities produce acute poisoning, and the insoluble salts chronic plumbism. The symptoms of acute poisoning are pain and diarrhoea, owing to the setting up of an active gastro-enteritis; the faeces being black (due to the formation of a sulphide of lead), thirst, cramps in the legs and muscular twitchings, with torpor, collapse, convulsions and coma. The treatment is the prompt use of emetics, or the stomach should be washed out, and large doses of sodium or magnesium sulphate given in order to form an insoluble sulphate. Stimulants, warmth and opium may be required. For an account of chronic plumbism or saturnine poisoning, *see* LEAD POISONING.

METALLURGY AND EMPLOYMENT

Nearly all of the lead production of the world is obtained by smelting galena ore by a reduction process. Sometimes the ore is roasted to remove part of the sulphur before the reduction smelting treatment. But some ore, particularly the extremely high grade mill concentrates, is smelted directly without previous roasting. Three different types of smelting furnace are used to reduce the raw or roasted galena ore to metallic lead. The furnace selected depends to a large extent on the richness of the ore and the kind and amount of other metal impurities which, in the form of different minerals, are associated with the galena. The three types of smelting furnace are the ore hearth or Scotch hearth as it is sometimes called, the blast furnace and the reverberatory furnace.

The ore hearth is used principally for very high grade galena mill concentrates which have been ground rather fine in the milling operation and which are fairly free from other metals. The blast furnace is used principally to smelt lower grade crude ore containing a comparatively large amount of waste rock. The blast furnace is also used to smelt low grade mill concentrates, concentrates containing large amounts of other metal impurities and many by-products from the ore hearth and from the lead refineries. Much secondary lead material recovered in the form of waste products from many industries is also treated in the blast furnace. Reverberatory furnaces are used mostly to smelt secondary scrap and waste products and are not used to any great extent to smelt primary lead ores or concentrates.

The ore hearth is one of the simplest and oldest furnaces used for the smelting of lead and consists of a shallow hearth, filled with a bath of molten lead on which floats a coke fire maintained by blowing air through pipes or tuyères at the back of the hearth above the lead bath. The finely ground high grade lead ore is fed on the fire with continual stirring, which results in reduction of a large portion of the galena to metallic lead. The lead passes through to the lead bath underneath leaving a residue of waste materials in the form of slag which contains a considerable amount of lead and which is usually retreated in a blast furnace.

The blast furnace is a shaft furnace filled with a mixture of ore, fluxing materials and coke heated to a high temperature, which is continuously fed at the top and from which molten reduced metallic lead, slag and by-products are removed at the bottom. Combustion of the fuel is maintained by the introduction of compressed air through pipes or tuyères near the bottom. The reverberatory furnace consists of a long brick hearth with low arched roof and has a source of heat at one end and a flue at the opposite end. The material to be smelted is charged on the hearth where smelting with production of metallic lead, slag and by-products takes place.

When lead is reduced to metal in a smelting operation, small amounts of other metals are reduced with the lead. A refining operation is usually necessary to remove the other metal impurities and purify the lead for commercial use.

Use of Lead.—The world consumption of lead is about 1,500,000 tons of which about 750,000 tons or half of the entire consumption is used in the United States. A large proportion of the total lead consumed is used in the form of metallic lead and its alloys, but the largest and most important single use of lead is in the form of white lead for which purpose about 150,000 tons of metallic lead are consumed annually in the United States.

White lead is the hydrated basic carbonate of lead which, in the form of a finely ground white powder, is a very valuable paint pigment. White lead has been the most important white paint pigment for more than 2,000 years and the most durable exterior paints contain a large proportion of white lead. White lead is also used as one of the principal constituents of pottery glazes, for the making of certain chemical colours, and for many other purposes. White lead is made by a chemical process in which, by the aid of acetic acid, carbon dioxide and moisture, metallic lead is corroded into hydrated basic lead carbonate.

Next in importance to white lead is the use of lead in the form of lead oxides, litharge (PbO) and red lead (Pb_2O_4). Both litharge and red lead are used in very large amounts in the manufacture of lead storage battery plates. The plates consist of antimonial-lead grids filled with paste which is made by moistening litharge and red lead with sulphuric acid. Red lead is also an important paint pigment and red lead paint is the standard protective coat-

ing for iron and steel. Red lead and litharge are used in pottery glazes and litharge is extensively used in the refining of petroleum, in compounding rubber, in the manufacture of insecticides, in the making of certain colours, particularly chrome yellow and chrome green and for innumerable other purposes. Litharge and red lead are made by oxidizing metallic lead in a furnace at high temperature.

Large amounts of metallic lead in the form of sheet, pipe and plumbers' supplies are used in the construction of buildings, chemical apparatus and water mains and for many other purposes. Lead alloyed with tin in the form of solder is used in large tonnage and many industries could not be carried on in their present form without solder of this kind. Lead alloyed with antimony, tin and copper is used extensively in anti-friction metals for lining the bearings of moving machinery. There are many other uses for lead, such as in cable coverings for telephone wires, ammunition, caulking metal, foil, type metals, linings for X-ray apparatus and others too numerous to mention.

Lead was one of the first metals known to mankind. It has been a great aid in the development of civilization and to-day the value of lead is so great that this metal has become practically indispensable in our modern industrial fabric.

Production and Trade.—During the last few years the world's production of lead has been about 1,500,000 tons per annum. The United States, with an annual output of about 600,000 tons, has been the largest producer. Australia and Mexico have been next in importance, each with a production of about 150,000 tons per annum; Spain, with an annual production of about 130,000 tons, has been the fourth largest. The Mexican output has increased rapidly during the last few years, and prior to 1920 the Mexican production was much less than that from Australia and Spain. Lead is obtained from some of the other countries of the world but in much smaller amounts than from the four leading producers, which together furnish about two-thirds of the entire production of the world.

The largest lead producing district of the world is in the United States in the south-eastern part of the State of Missouri. The lead in this district is found in the form of galena disseminated through horizontal bedded limestone. The deposits vary from about 300 ft. to 800 ft. in thickness and are many hundreds of acres in extent. The second largest producing locality is the Broken Hill district in Australia, and the third in size is the large district in Central Spain in the vicinity of the towns of Penarroya and Linares. In both the Australian and Spanish districts, the lead occurs in the form of galena in true vein deposits.

Because of the nature of the ore deposits, nearly all lead mining is done with shafts, tunnels and adits which are required to reach the ore bodies at considerable depth. In some mines, the ore as recovered is sufficiently rich to be smelted directly into metallic lead, but the ore from most of the mines contains so much waste mineral that a preliminary milling treatment is required to mechanically remove the waste rock and concentrate the galena in fairly pure form. (R. L. Ht.)

LEAD AZIDE, a powerful detonator employed in military services instead of mercury fulminate, is a white, sparingly soluble, crystalline powder produced by adding a soluble lead salt to a solution of sodium azide. The methods of preparing alkali azides from organic materials are described under Azoimide. A purely inorganic process for preparing hydrazoic acid (Azoimide) and sodium azide is based on the interaction of hydrazine nitrate with nitrous acid or sodium nitrite,

$$N_2H_4{\cdot}HNO_3+NaNO_2=NaNO_3+N_3NH+2H_2O.$$

Another inorganic method employed for sodium azide is carried out as follows: sodamide, $NaNH_2$, produced by the action of ammonia on sodium, is heated in a stream of nitrous oxide, N_2O, whereby water and sodium azide are obtained.

$$NaNH_2+N_2O=NaN_3+H_2O.$$

The alkali and ammonium salts of hydrazoic acid are freely soluble in water, but neither the free acid nor these soluble salts are suitable for employment in explosives. The lead and silver salts are relatively insoluble in water, and the former only has so far been employed or is manageable. The cobalt and nickel salts are extremely violent explosives, but are deliquescent. When dry they and the silver salts are most sensitive to heat or friction.

Lead azide, PbN_6, as usually prepared should be in very fine crystals or almost amorphous. Large crystals are liable to explode on fracture. (W. R. Ho.)

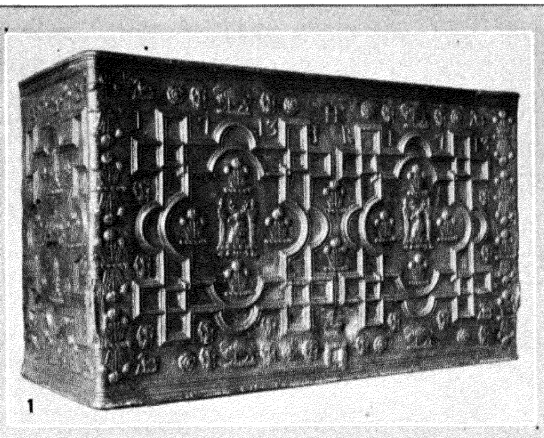
LEAD CHAMBER PROCESS: *see* Sulphuric Acid.

LEADER, BENJAMIN WILLIAMS (1831–1923), English painter, the son of E. Leader Williams, an engineer, received his art education first at the Worcester School of Design and later in the schools of the Royal Academy. He began to exhibit at the Academy in 1854, was elected A.R.A. in 1883 and R.A. in 1898, and became exceedingly popular as a painter of landscape. His subjects are attractive and skilfully composed. He was awarded a gold medal at the Paris Exhibition in 1889, and was made a knight of the Legion of Honour. One of his pictures, "The Valley of the Llugwy," is in the National Gallery of British Art. He died at Burrow's Cross near Guildford on March 22, 1923.

See L. Lusk, *The Life and Work of B. W. Leader, R.A.* (1901).

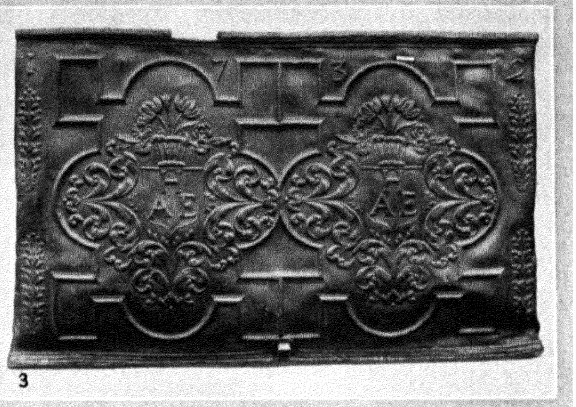
LEADHILLITE, a rare mineral consisting of basic lead sulphatocarbonate, $Pb_4SO_4(CO_3)_2(OH)_2$. Crystals usually have the form of six-sided plates with a perfect basal cleavage on which the lustre is strongly pearly; they are usually white and translucent. The hardness is 2·5 and the sp gr. 6·26–6·44. The optical characters point to the existence of three kinds of leadhillite, which are, however, identical in external appearance and may even occur intergrown together in the same crystal. The fact that the published analyses of leadhillite vary somewhat from the formula given above suggests that these three kinds may also be chemically distinct.

Leadhillite is a mineral of secondary origin, occurring with cerussite, anglesite, etc., in the oxidized portions of lead-bearing lodes, also in weathered lead slags left by the Romans. It has been found most abundantly in the Susanna mine at Leadhills in Scotland (hence the names leadhillite and susannite). Good crystals have been found at Red Gill, Cumberland and Granby, Missouri.

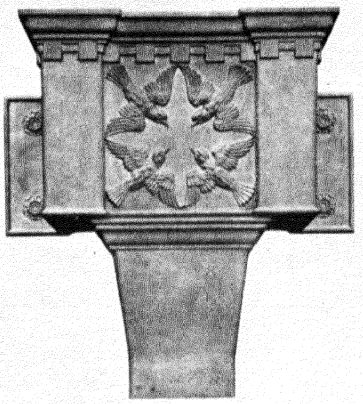


LEADHILLS, village, Lanarkshire, Scotland, 5¾ m. W.S.W. of Elvanfoot station on the L.M.S. Pop. (1921) 812. It lies 1,301 ft. above sea-level, near the source of Glengonner Water, an affluent of the Clyde. It is served by a light railway. Lead and silver have been mined here and at Wanlockhead, 1½ m. S.W., for many centuries—according to some authorities even in Roman days. Gold was discovered in the reign of James IV., but its mining has long ceased to be profitable.

LEAD-IN is that portion of a radio antenna system which completes the electrical connection between the elevated outdoor portion and the radio instruments or disconnecting switches inside the building.



LEAD IN ART. The uses to which lead has been put, wherein it achieves a definitely artistic value, in the working of which are needed the judgment and perception of the artist as well as the technique of the craftsman, cover a wide field, ranging from purely architectural application, where structural utility is the chief consideration, and the aesthetic value is achieved by the appreciation of the nature and quality of the material for the purpose, and the sympathetic use of appropriate ornament, to its use in a completely decorative sense, for statuary, garden ornaments, fountains, etc.



It is generally assumed that lead, for the latter purpose, is used from motives of economy, as a substitute for a richer and more costly metal, but this is quite erroneous, as a careful study of the leadworker's art will prove. Used as its limitations permit, it has a charm and dignified simplicity that is achieved with no other material. It is not suitable for the grander conception which needs bronze as its expression, and although capable of much refinement and delicacy of treatment, it is of a kind which would not be happily interpreted in stone.

Its durability and resistance to climatic conditions is such that Sir Christopher Wren wrote in 1708, at the age of 76, regarding roofing for spires, lanterns, etc.,—"Lead is certainly the best and lightest covering, and, being of our own growth and

BY COURTESY OF (1, 3, 5) THE DIRECTOR OF THE VICTORIA AND ALBERT MUSEUM, (2, 4, 6, 7, 8, 9) BROMSGROVE GUILD LTD

ENGLISH DECORATIVE LEAD WORK

1. Oblong cistern of cast lead from Trinity Convent, Bromley, Kent. Front and sides decorated with various heraldic and other devices in relief, including four frames of moulding in quatrefoil. Bears date, 1713, and initials HIR.; height 3 ft., length 5 ft., width 23 in.
2. Statuette in lead, "Love the Pedlar," designed as a garden ornament
3. Lead cistern, front view, showing two ornamental panels, each of which encloses shield of arms with letters HAE, surmounted by a basket of flowers and surrounded by floral design in a quatrefoil. Removed from Royal Agricultural House, Hanover Square, London. Dated 1732; height 3 ft. 11 in., depth 1 ft. 9 in.
4. Rain water head, bird and column design, modern work
5. Hanging cistern of cast lead with rounded front decorated in relief with dolphins, demi-lions and fluer-de-lys. Wing-top water tap of brass. English 17th century; height 12¾ in., width 13½ in.
6. Decorative lead mask, 14 in. wide, 12 in. high. Modern work
7. Modern ornamental lead garden cistern. Border in floral design, corner panels of riband pattern. Quatrefoil inner panel encloses wreath and shells, surmounted by two cornucopias, ram's head supports panel. Dated 1909
8. Lead cistern, dated 1924 on left end panel. Top border, grape and vine design; alternate squares decorated with fleur-de-lys, fruit basket, and conventionalized fruit and flower designs
9. Modern decorative lead spout and tank for garden wall. Spout and side ornaments of dolphin design; face of semi-cylindrical water tank ornamented with grape vine, nymphs and floral pattern

manufacture and lasting, if properly laid, for many hundreds of years, is without doubt the most preferable."

The use of lead has been apparent from the earliest times. As far back as the 6th century, we know that the Spartans used it for casting their votive figures. It has been used for practically all purposes for which it is suitable, since the earliest days of which we have record. The Romans made considerable use of it, as proved by the lead pigs, and the large amount of worked lead in various forms which has been found in every part of the country, where they had a permanent settlement. Many lead coffins of excellent craftsmanship have been found, those discovered at Colchester, England, being notable examples; and numbers of cast seals and tokens have been brought to light.

After the Roman occupation in England the use of lead was of an even more extensive nature. Apart from its structural uses, chiefly for roofing, and the supply and conveyance of water, such as tanks and cisterns, ornamental rainwater pipes and pipe heads, etc., we have fine examples of mediaeval fonts cast in lead, in various parts of the country, and pilgrims' signs and tokens were cast in great numbers in the 13th, 14th, and 15th centuries. In many places the custody of the casting moulds was vested in the sacristan; this was the case at Walsingham; other moulds have been found at Lynn, and at Dundrennan is a mould which casts six signs at once, which is an indication of their extensive use. Lead was also used for memorial tablets, but not to a great extent. An inscribed leaden tablet was found near Bath, which is an example of its use in this direction.

The sculptors of the 18th century did a great deal for the architectural side of garden craft, and much good lead-work originated at this period,—cisterns, pipes, pipeheads, and garden statuary, vases, and ornaments. Its delightful silvery grey colour, and peculiar appropriateness, rendered its use in the creation of the many beautiful formal gardens planned at this time, a particularly perfect inspiration; its soft delicate unobtrusive quality harmonizes with the gentle and restrained colouring of our countryside, and conveys a sense of complete fitness for an atmosphere essentially English. Among examples of its use in this direction are: Longford Castle, "Flora," by Sir Henry Cheere, in garden temple; Stoneleigh Abbey, vases on Gate Piers; Rousham, Bacchus; Canon's Ashby, Shepherd playing with flute; Nuns Moreton, statues; Wilton House, Amorini; Chiswick House, two vases; Enfield Old Park, vase; Penshurst, vase; Ilford Manor, vase, Victoria and Albert Museum and Enfield, cisterns, Drayton House, Northants, four vases.

A cast lead vase may be seen at Kew Gardens, which is a replica of a Greek vase of black marble in the Louvre There are many of these in existence; its form was so popular that it was worth while to make an iron casting pattern for it.

A beautiful Italian tank may be seen in the British Museum; the nature of the ornament suggests that it is of the late 15th century. The disfiguring inlet and outlet pipes have obviously been added at a later date, and by someone totally unappreciative of the charm of its decoration.

During the 19th century, unfortunately, the art was greatly neglected, and its position among the building arts was crowded out in favour of others of a more opulent and imposing nature. In all its decorative forms, it seemed to be almost eclipsed. Much of the history of leadwork in England is revealed by a study of that of the Worshipful Company of Plumbers, and the allied craft of the Pewterers, and their position among the City Guilds.

The modern tendency is towards a gradual revival of this simple and useful craft. There is a steady demand for leadwork of a high standard, both from the standpoint of artistic quality, as well as technical merit; but though it can be obtained, it is by no means general throughout the country. The craft has been neglected too long, and the few firms who specialize in good leadwork are practically the only sources of supply.

The fault seems to lie with the leadworkers themselves. The Worshipful Company of Plumbers have done very much to support and inspire the craft technically, but have not dealt with the artistic side at all. Architects are demanding good leadwork of sound design, and traditional methods of working, but although they can obtain work sound enough technically, from the aesthetic standpoint, it is unutterably bad. In order to imbue leadworkers with the right spirit, and feeling for their material, they need to receive their training from an artist, as well as a technical expert, as a perfect technical training, unleavened by any artistic perception, produces the most horrible results. Professor W. R. Lethaby has done a great deal to revive the forgotten spirit of old leadwork, and his book, published in 1893, was greatly needed to stimulate the gradually awakening interest in the ancient and homely craft. Valuable work has been done in the same direction by Mr. F. W. Troup, in his works on the subject.

Among modern examples of excellent leadwork, both from its technique, and admirable design and sense of material is that executed by the Bromsgrove Guild, Worcestershire, which express the traditional and completely English spirit of treatment.

There are many interesting examples of the modern treatment of lead, from a decorative standpoint by individual sculptors and artists, chiefly for the purpose of garden decoration, statuary, bird baths, fountains, rain water tanks, etc., but it could be much more extensively employed than it is.

LEADING NOTE, in music, the seventh degree of the diatonic scale, situated a semitone below the octave, and so called because the ear instinctively demands that it shall be followed by the octave, to which therefore it may be said to "lead" in a peculiarly irresistible manner. This characteristic of the note is indicated by the French name for it, *la note sensible;* other names by which it is sometimes known being the sub-tonic and the sub-semitone.

LEAD POISONING or **PLUMBISM,** a "disease of occupations," which is itself the cause of organic disease, particularly of the nervous and urinary systems. The workpeople affected are principally those engaged in potteries where lead-glaze is used; but other industries in which health is similarly affected are file-making, house-painting and glazing, glass-making, copper-working, coach-making, plumbing and gasfitting, printing, cutlery, and generally those occupations in which lead is concerned.

The poison affects the entire body but especially the nervous system and the blood-forming tissues. Its victims become pallid, digestion is deranged, appetite fails and painful colic with constipation supervenes. The loss of power is generally shown first in the fingers, hands and wrists, and the condition known as "wrist-drop" soon follows, rendering the victim useless for work. The palsy will extend to the shoulders, and shortly after to the legs also. Other organs frequently involved are the kidneys, which become fibrotic (granular kidney). Owing to optic atrophy the sight is weakened or even lost.

In England the Home Office authorities have from time to time made special rules for workshops, with the object of minimizing or preventing the occurrence of lead-poisoning; and in 1895 notification of cases was made compulsory. New special rules were imposed in 1899 and strengthened subsequently prohibiting the employment of persons under fifteen in the dangerous processes, ordering a monthly examination of all women and young persons working in lead by the certifying surgeon, with power to suspend those showing symptoms of poisoning, and providing for the more effectual removal of dust and the better enforcement of cleanliness. (*See* LABOUR LAW.)

LEADVILLE, a city of Colorado, U.S.A., 170 m. S.W. of Denver, at an elevation of 10,200 ft.; the county seat of Lake county, and one of the celebrated mining camps of the world. It is on Federal highway 40S, and is served by the Colorado and Southern and the Denver and Rio Grande Western railways. The population in 1920 was 4,959. It lies amid towering mountains on a terrace nearly 2 m. above sea-level, at the head of the valley of the Arkansas river. Great concentration and reduction works and smelters mark its location with a cloud of smoke by day and flames by night. In 1926 the mines of Lake county (nearly all in the Leadville district) produced zinc, lead, silver, gold and copper (named in the order of their importance) valued at $3,884,928.

Leadville's extraordinary history began with the discovery of placer gold in California gulch late in 1859. The lucky prospectors returned the next spring, and established a camp which they called Oro City. By the end of the year it had a population of 5,000, and in 1861 it was the largest town in Colorado territory. In a few years the placer deposits were exhausted, after yielding some $5,000,000, and Oro City dwindled to a small village The second spectacular period set in after 1874, when silver-lead ores were recognized by A. B. Wood, an experienced miner and metallurgist, in boulders that the gold-miners had regarded merely with annoyance as obstructions to their sluices. Active prospecting began in the spring of 1877 In Jan. 1878, the town was organized and re-named. In 1880 the Denver and Rio Grande railway reached the gulch, and it is estimated there were 35,000 persons in the district. The city now had a population of 15,000, 28 m of streets, 5 m. of water mains, 3 public hospitals, an opera-house and an ample supply of saloons; part of it was lighted by gas; the assessed valuation was $30,000,000. It had become the greatest silver camp in the world, with over 30 producing mines, ten large smelters, and an output (gold, silver and lead) valued at $15,000,000 in 1880. Silver mining was the chief interest until the slump in the price of silver in 1893. About 1900, zinc began to assume importance, and by 1915 it constituted 65% of the total output of the mines (in value). During the World War the dumps on Carbonate hill were worked over for zinc ore which had formerly been discarded, and in recent years a considerable amount of silver has been recovered from the slag dumps of old smelters. The veins are still far from exhausted; "unwatering" operations give renewed access to old workings; and new orebodies are still discovered from time to time.

In the early days Leadville was one of the most turbulent and picturesque of the mining camps of the West. There were serious strikes in 1879 and from June 19, 1896, to March 9, 1897. In the course of the latter, many mines were flooded, and the militia was on guard for months; the miners were finally starved out.

LEAF, WALTER (1852–1927), British banker and scholar, was born at Norwood, London on Nov. 26, 1852. Educated at Harrow and Trinity college, Cambridge, he graduated as senior classic in 1874, and in 1875 was made a fellow and in 1920 honorary fellow of his college. In 1877 he entered the firm of Leaf, Sons and Company, becoming in 1888 chairman of Leaf and Company Ltd. Later he became chairman of the Westminster Bank. Leaf was one of the founders of the International Chamber of Commerce, of which he was elected president in 1925. In 1918–19 he was chairman of the committee of the London clearing banks, and from 1919 to 1921, president of the Institute of Bankers. He was president of the Hellenic Society and the Classical Association. He died on March 28, 1927.

Among his classical works are *The Iliad* (1886–88, 1900–02), with English notes and introduction; *Companion to the Iliad* (1892); *Troy, a Study in Homeric Geography* (1912); *Homer and History* (1915); *Little Poems from the Greek* (1922); and *Strabo on the Troad* (1923). In 1882 he collaborated with Andrew Lang and E. Myers in a translation into English prose of Homer's *Iliad.*

LEAF, the name given in popular language to all the green expanded organs borne upon an axis, and so applied to similar objects. Investigation has shown that many other parts of a plant which externally appear very different from ordinary leaves are, in their essential particulars, very similar to them, and are in fact their morphological equivalents. Such are the scales of a bulb, and the various parts of the flower, and assuming that the structure ordinarily termed a leaf is the typical form, these other structures were designated changed or metamorphosed leaves, a somewhat misleading interpretation.

Leaves are produced as lateral outgrowths of the stem in definite succession below the apex. This character, common to all leaves, distinguishes them from other organs. In the higher plants we can easily recognize the distinction between stem and leaf. Amongst the lower plants, however, it is found that a demarcation into stem and leaf is impossible, but that there is a structure which partakes of the characters of both—*i.e.*, the *thallus.* The leaves always arise from the outer portion of the primary meristem of the plant, and the tissues of the leaf are continuous with those of the stem. Every leaf originates as a simple, cellular papilla, which consists of a development from the cortical layers covered by epidermis; and as growth proceeds, the fibro-vascular bundles of the stem are continued outwards, and finally expand and terminate in the leaf. The increase in length of the leaf by growth at the apex is usually of a limited nature. In some ferns, however, there seems to be a provision for indefinite terminal growth, while in others this growth is periodically interrupted. It not unfrequently happens, especially amongst Monocotyledons, that after growth at the apex has ceased, it is continued at the base of the leaf, and in this way the length may be much increased. Amongst Dicotyledons this is very rare In all cases the dimensions of the leaf are enlarged by interstitial growth of its parts.

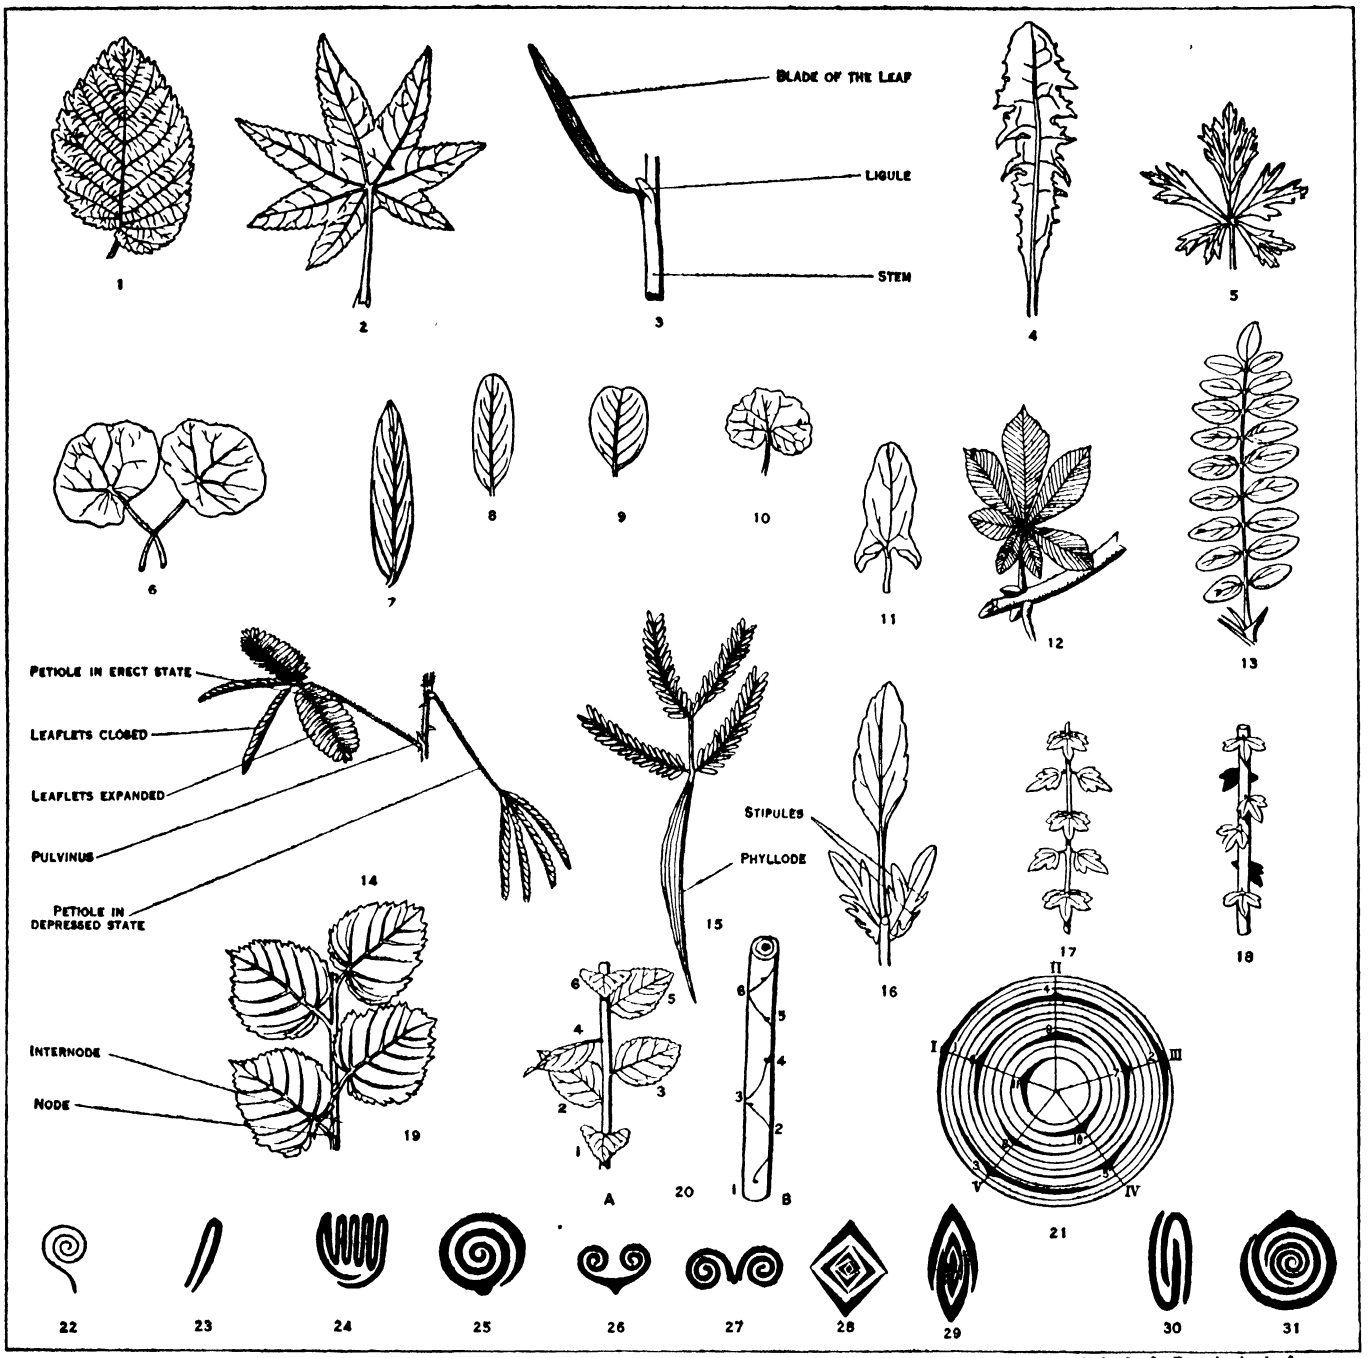
Structure of Leaves.—The simplest leaf is found in some mosses, where it consists of a single layer of cells. The typical foliage leaf consists of several layers, and amongst vascular plants is distinguishable into an outer layer (*epidermis*) and a central tissue (*mesophyll*) with fibro-vascular bundles distributed through it. (*See* PLANTS: *Anatomy*)

The form and arrangement of the parts of a typical foliage leaf are intimately associated with the part played by the leaf in the life of the plant. The flat surface is spread to allow the maximum amount of sunlight to fall upon it, as it is by the absorption of energy from the sun's rays by means of the chlorophyll contained in the cells of the leaf that the building up of plant food is rendered possible; this process is known as photosynthetic assimilation of carbon dioxide or simply photosynthesis. The first stage is the combination of carbon dioxide, absorbed from the air taken in through the stomata into the living cells of the leaf, with water which is brought into the leaf by the wood-vessels. The wood-vessels form part of the fibro-vascular bundles or veins of the leaf and are continuous throughout the leaf-stalk and stem with the root by which water is absorbed from the soil The palisade layers of the mesophyll contain the larger number of chlorophyll grains (or chloroplasts) while the absorption of carbon dioxide is carried on chiefly through the lower epidermis which is generally much richer in stomata. The water taken up by the root from the soil contains nitrogenous and mineral salts which combine with the first product of photosynthesis—a carbohydrate—to form more complicated nitrogen-containing food substances of a protein nature; these or their simpler products are then distributed by other elements of the vascular bundles (the phloem) through the leaf to the stem and so throughout the plant to wherever growth or development is going on. A large proportion of the water which ascends to the leaf passes out in the form of water vapour through the stomata—this process is known as transpiration. Hence the extended surface of the leaf exposing a large area to light and air is eminently adapted for the carrying out of the process of photosynthesis and transpiration. The arrangement of the leaves on the stem and branches (see *Phyllotaxis,* below) is such as to prevent the upper leaves' shading the lower, and the shape of the leaf serves towards the same end—the disposition of leaves on a branch or stem is often seen to form a "mosaic," each leaf fitting into the space between neighbouring leaves and the branch on which they are borne without overlapping.

Submerged leaves, or leaves which are developed under water, differ in structure from aerial leaves. They have usually no fibro-vascular system, but consist of a congeries of cells, which sometimes become elongated and compressed so as to resemble veins. They have a layer of compact cells on their surface, but no true epidermis, and no stomata. Their internal structure consists of cells, disposed irregularly, and sometimes having spaces which are filled with air for the purpose of floating the leaf. When exposed to the air these leaves easily part with their moisture, and become shrivelled and dry. In some cases there is only a network of filament-like cells, the spaces between which are not filled with parenchyma, giving a skeleton appearance to the leaf, as in *Ouvirandra fenestralis* (Lattice plant).

GROSS ANATOMY

A leaf, whether aerial or submerged, generally consists of a flat expanded portion, called the blade, or *lamina*, of a narrower portion called the *petiole* or stalk, and sometimes of a portion at the base of the petiole, which forms a sheath or *vagina*, or is developed in the form of outgrowths, called *stipules* All these portions are not always present. The sheathing or stipulary portion is frequently wanting. When a leaf has a distinct stalk it is *petiolate;* when it has none, it is *sessile*, and if in this case it embraces the stem it is said to be *amplexicaul*. The part of the leaf next the petiole or the axis is the *base*, while the opposite extremity is the *apex*. The leaf is usually flattened and expanded horizontally, *i.e.*, at right angles to the longitudinal axis of the shoot, so that the upper face is directed towards the heavens, or the lower towards the earth. In some cases leaves, as in Iris, or leaf-like petioles, as in Australian species of *Acacia* and *Eucalyptus*, have their plane of expansion parallel to the axis of the shoot, there is then no distinction into an upper and a lower face, but the two sides are developed alike; or the leaf may have a cylindrical or polyhedral form, as in mesembryanthemum. The upper angle formed between the leaf and the stem is called its *axil;* it is there that leaf-buds are normally developed. The leaf is sometimes articulated with the stem, and when it falls off a *scar* remains; at other times it is continuous with it, and then decays, while still attached to the axis. In their early state all leaves are continuous with the stem, and it is only in their after growth that articulations are formed. When leaves fall off annually they are called *deciduous;* when they remain for two or more years they are *persistent*, and the plant is *evergreen*. The laminar portion of a leaf is occasionally articulated with the petiole, as in the orange, and a joint at times exists between the vaginal or stipulary portion and the petiole.



Venation.—The arrangement of the fibro-vascular system in the lamina constitutes the *venation*. In an ordinary leaf, as that of the elm, there is observed a large central vein running from the base to the apex of the leaf, this is the *midrib* (fig. 1); it gives off veins laterally (*primary veins*). The venation is described as pinnate or feather-veined. In some cases, as sycamore or castor oil (fig. 2), in place of there being only a single midrib there are several large veins (*ribs*) of nearly equal size, which diverge from the point where the blade joins the petiole or stem, giving off lateral veins. The venation is then palmate. The primary veins give off secondary veins, and these in their turn give off tertiary veins, and so on until a complete network of vessels is produced, and those veins usually project on the under surface of the leaf. To a distribution of veins such as this the name of *reticulated* or *netted* venation has been applied. In the leaves of some plants there exists a midrib with large veins running nearly parallel to it from the base to the apex of the lamina, as in grasses (fig. 3); or with veins diverging from the base of the lamina in more or less parallel lines, as in fan palms (fig. 7), or with veins coming off from it throughout its whole course, and running parallel to each other in a straight or curved direction towards the margin of the leaf, as in plantain and banana. In these cases the veins are often united by cross veinlets, which do not, however, form an angular network. Such leaves are said to be *parallel-veined*. The leaves of Monocotyledons have generally this kind of venation, while reticulated venation most usually occurs amongst Dicotyledons. Some plants, which in most points of their structure are monocotyledonous, yet have reticulated venation; as in *Smilax* and *Dioscorea*. The distribution of the system of vessels in the leaf is usually easily traced, but in the case of succulent plants, as *Hoya*, agave, stonecrop and mesembryanthemum, the veins are obscure. The function of the veins, which consist of vessels and fibres, is to form a rigid framework for the leaf and to conduct liquids.

In nearly all plants, except Thallophyta, leaves are present at some period of their existence. In *Cuscuta* (Dodder) (*q.v.*), however, we have an exception. The forms assumed by leaves vary much, not only in different plants, but in the same plant. It is only amongst the lower classes of plants—Mosses, Characeae, etc. —that all the leaves on a plant are similar. As we pass up the scale of plant life we find them becoming more and more variable. The structures in ordinary language designated as leaves are considered so *par excellence*, and they are frequently spoken of as *foliage leaves*. In relation to their production on the stem we may observe that when they are small they are always produced in great number, and as they increase in size their number diminishes correspondingly. The cellular process from the axis which develops into a leaf is simple and undivided; it rarely remains so, but in progress of growth becomes segmented in various ways, either longitudinally or laterally, or in both ways. By longitudinal segmentation we have a leaf formed consisting of sheath, stalk and blade; or one or other of these may be absent, and thus stalked, sessile, sheathing, etc., leaves are produced. Lateral segmentation affects the lamina, producing indentations, lobings or fissuring of its margins. In this way two marked forms of leaf are produced—(1) *Simple* form, in which the segmentation, however deeply it extends into the lamina, does not separate portions of the lamina which become articulated with the midrib or petiole; and (2) *Compound* form, where portions of the lamina are separated as detached *leaflets*, which become articulated with the midrib or petiole. Of both simple and compound leaves, according to the amount of segmentation and the mode of development of the parenchyma and direction of the fibro-vascular bundles, many forms are produced.

Simple Leaves.—When the parenchyma is developed symmetrically on each side of the midrib or stalk, the leaf is *equal;* if otherwise, the leaf is *unequal* or *oblique* (fig. 1). If the margins are even and present no divisions, the leaf is *entire;* if there are slight projections which are more or less pointed, the leaf is *dentate* or toothed; when the projections lie regularly over each other, like the teeth of a saw, the leaf is *serrate* (fig. 1); when they are rounded the leaf is *crenate*. If the divisions extend more deeply into the lamina than the margin, the leaf receives different names according to the nature of the segments; thus, when the divisions extend about half-way down (fig. 4), it is *cleft;* when the divisions extend nearly to the base or to the midrib the leaf is *partite*.

If these divisions take place in a simple *feather-veined* leaf it becomes either *pinnatifid* (fig. 4), when the segments extend to about the middle, or *pinnatipartite*, when the divisions extend nearly to the midrib. These primary divisions may be again subdivided in a similar manner, and thus a feather-veined leaf will become *bipinnatifid* or *bipinnatipartite;* still further subdivisions give origin to *tripinnatifid* and *laciniated* leaves. The same kinds of division taking place in a simple leaf with palmate or *radiating* venation, give origin to *lobed, cleft* and *partite* forms. The name *palmate* or *palmatifid* (fig. 2) is the general term applied to leaves with radiating venation, in which there are several lobes united by a broad expansion of parenchyma, like the palm of the hand, as in the sycamore, castor-oil plant, etc. The divisions of leaves with radiating venation may extend to near the base of the leaf, and the names *bipartite, tripartite, quinquepartite*, etc., are given according as the partitions are two, three, five or more. The term *dissected* is applied to leaves with radiating venation, having numerous narrow divisions, as in *Geranium dissectum*.

When in a radiating leaf there are three primary partitions, and the two lateral lobes are again cleft, as in hellebore, the leaf is called *pedate* or *pedatifid*, from a fancied resemblance to the claw of a bird. In all the instances already alluded to the leaves have been considered as flat expansions, in which the ribs or veins

1. Leaf of elm (*Ulmus*). 2. Palmately cleft leaf of castor-oil plant (*Ricinus communis*). 3. Stem of a grass *Poa* with leaf. 4. Runcinate leaf of dandelion. 5. Five-partite leaf of aconite. 6. Peltate leaves of Indian cress (*Tropaeolum majus*). 7. Lanceolate leaf of species of senna. 8. Oblong leaf of species of senna. 9. Emarginate leaf of species of senna. 10. Reniform leaf (*Nepeta glechoma*), margin crenate. 11. Sagittate leaf of Convolvulus. 12. Palmately compound leaf of Horse-chestnut (*Aesculus hippocastanum*). 13. Imparipinnate (unequally pinnate) leaf of Robinia. 14. Branch and leaves of sensitive plant (*Mimosa pudica*). 15. Leaf of an acacia (*Acacia heterophylla*). 16. Leaf of pansy, showing stipules. 17. Stem with opposite leaves. 18. Stem with alternate leaves, arranged in pentastichous or quincuncial manner. 19. Portion of a branch of a lime tree (*Tilia*). 20. Part of branch cherry with six leaves. (A) branch, with leaves numbered in order; (B) magnified representation of branch, showing points of insertion of leaves and their spiral arrangement. 21. Diagram of a phyllotaxis represented by the fraction 2/5. 22. Circinate vernation. 23. Transverse section of conduplicate leaf. 24. Transverse section of plicate or plaited leaf. 25. Transverse section of convolute leaf. 26. Transverse section of involute leaf. 27. Transverse section of revolute leaf. 28 and 29. Transverse sections of buds in which leaves are respectively arranged in an accumbent and an equitant manner. 30. Transverse section of a bud, showing two leaves folded in an obvolute manner. 31. Transverse section of a bud, showing two leaves arranged in a supervolute manner

spread out on the same plane with the stalk. In some cases, however, the veins spread at right angles to the stalk, forming a *peltate* leaf as in Indian cress (fig. 6).

The form of the leaf shows a very great variety, ranging from the narrow *linear* form with parallel sides, as in grasses or the needle-like leaves of pines and firs, to more or less rounded or *orbicular*—descriptions of these will be found in works on descriptive botany—a few examples are illustrated here (figs. 8, 9, 10). The apex also varies considerably, being rounded, or *obtuse*, sharp or *acute*, notched (fig. 19), etc. Similarly the shape of the base may vary, when rounded lobes are formed, as in dog-violet, the leaf is *cordate* or heart-shaped; or kidney-shaped or *reniform* (fig. 10) when the apex is rounded as in ground ivy. When the lobes are prolonged downwards and are acute, the leaf is *sagittate* (fig. 11); when they proceed at right angles, as in *Rumex Acetosella*, the leaf is *hastate* or halbert-shaped. When a simple leaf is divided at the base into two leaf-like appendages, it is called *auriculate*. When the development of parenchyma is such that it more than fills up the spaces between the veins, the margins become *wavy, crisp* or *undulated*, as in *Rumex crispus* and *Rheum undulatum*. By cul-

tivation the cellular tissue is often much increased, giving rise to the *curled* leaves of greens, savoys, cresses, lettuce, etc.

Compound Leaves.—Compound leaves are those in which the divisions extend to the midrib or petiole, and the separated portions become each articulated with it, and receive the name of *leaflets*. The midrib, or petiole, has thus the appearance of a branch with separate leaves attached to it, but it is considered properly as one leaf, because in its earliest state it arises from the axis as a single piece, and its subsequent divisions in the form of leaflets are all in one plane. The leaflets are either sessile (fig. 12) or have stalks, called *petiolules* (fig. 13). Compound leaves are pinnate (fig. 13) or palmate (fig. 12) according to the arrangement of leaflets. When a pinnate leaf ends in a pair of pinnae it is *equally* or *abruptly pinnate* (paripinnate); when there is a single terminal leaflet (fig. 13), the leaf is *unequally pinnate* (imparipinnate); when the leaflets or pinnae are placed alternately on either side of the midrib, and not directly opposite to each other, the leaf is *alternately pinnate;* and when the pinnae are of different sizes, the leaf is *interruptedly pinnate*. When the division is carried into the second degree, and the pinnae of a compound leaf are themselves pinnately compound, a bipinnate leaf is formed.

Petiole.—The *petiole* or leaf-stalk is the part which unites the limb or blade of the leaf to the stem. It is absent in *sessile* leaves, and this is also frequently the case when a sheath is present, as in grasses (fig. 3). It consists of the fibro-vascular bundles with a varying amount of cellular tissue. When the vascular bundles reach the base of the lamina they separate and spread out in various ways, as already described under venation. The lower part of the petiole is often swollen (fig. 14), forming the *pulvinus,* formed of cellular tissue, the cells of which exhibit the phenomenon of irritability. In *Mimosa pudica* (fig. 14) and other species, a sensitiveness is located in the pulvinus which upon irritation induces a depression of the whole bipinnate leaf. A similar property exists in the pulvini at the base of the leaflets which fold upwards. The petiole varies in length, being usually shorter than the lamina, but sometimes much longer. In some palms it is 15 or 20 ft. long, and is so rigid as to be used for poles or walking-sticks. In general, the petiole is more or less rounded in its form, the upper surface being flattened or grooved. Sometimes it is compressed laterally, as in the aspen, and to this peculiarity the trembling of the leaves of this tree is due. At other times it is winged, as in lemon and *Dionaea,* or pitcher like, as in *Sarracenia.* In certain of the Australian acacias, and in some species of *Oxalis* and *Bupleurum,* the petiole is flattened in a vertical direction, the vascular bundles separating immediately after quitting the stem and running nearly parallel from base to apex. This kind of petiole (fig. 15) has been called a *phyllode.* In these plants the laminae or blades of the leaves are pinnate or bipinnate, and are produced at the extremities of the phyllodes in a horizontal direction; but in many instances they are not developed, and the phyllode serves the purpose of a leaf. Some petioles are long, slender and sensitive to contact, and function as tendrils by means of which the plant climbs; as in the garden nasturtiums (*Tropaeolum*), clematis and others; and in compound leaves the midrib and some of the leaflets may similarly be transformed into tendrils, as in the pea and vetch.

Leaf Base.—The leaf base is often developed as a *sheath* (*vagina*), which embraces the whole or part of the circumference of the stem (fig. 3). This sheath is comparatively rare in dicotyledons, but is seen in plants of the family Umbelliferae. It is much more common amongst monocotyledons. In sedges the sheath forms a complete investment of the stem, whilst in grasses it is split on one side. In the latter plants there is also a membranous outgrowth, the *ligule,* at right angles to the median plane of the leaf from the point where the sheath passes into the lamina, there being no petiole (fig. 3).

In leaves in which no sheath is produced we not infrequently find small foliar organs, *stipules,* at the base of the petiole (fig. 16). The stipules are generally two in number, and they are important as supplying characters in certain natural orders. Thus they occur in the pea and bean family, in rosaceous plants and the family Rubiaceae. They are not common in dicotyledons with opposite leaves. Plants having stipules are called *stipulate;* those having none are *exstipulate.* Stipules may be large or small, entire or divided, deciduous or persistent. They are not usually of the same form as the ordinary foliage leaves of the plant, from which they are distinguished by their lateral position at the base of the petiole. In the pansy (fig. 16) the true leaves are stalked and crenate, while the stipules are large, sessile and pinnatifid. In *Lathyrus Aphaca* and some other plants the true pinnate leaves are abortive, the petiole forms a tendril, and the stipules alone are developed, performing the office of leaves. In other instances the stipules unite together on the side of the stem opposite the leaf forming an *ochrea,* as in the dock family. The stipules are sometimes so minute as to be scarcely distinguishable without the aid of a lens, and so fugacious as to be visible only in the very young state of the leaf. They may assume a hard and spiny character, as in *Robinia Pseudacacia* (fig. 13), or, as in *Smilax,* each stipule may be represented by a tendril. At the base of the leaflets of a compound leaf, small stipules (*stipels*) are occasionally produced.

Modifications.—Variations in the structure and forms of leaves and leaf-stalks are produced by the increased development of cellular tissue, by the abortion or degeneration of parts, by the multiplication or repetition of parts and by adhesion. When cellular tissue is developed to a great extent, leaves become succulent and occasionally assume a crisp or curled appearance. Such changes take place naturally, but they are often increased by the art of the gardener, and the object of many horticultural operations is to increase the bulk and succulence of leaves. It is in this way that cabbages and savoys are rendered more delicate and nutritious. The leaves of barberry and of some species of *Astragalus,* and the stipules of the false acacia (*Robinia*) are spiny. To the same cause is due the spiny margin of the holly-leaf. When two lobes at the base of a leaf are prolonged beyond the stem and unite, the leaf is *perfoliate,* the stem appearing to pass through it, as in *Bupleurum perfoliatum* and *Chlora perfoliata;* when two leaves unite by their bases they become *connate,* as in *Lonicera Caprifolium;* and when leaves adhere to the stem, forming a sort of winged or leafy appendage, they are *decurrent,* as in thistles. The formation of peltate leaves has been traced to the union of the lobes of a cleft leaf. In the leaf of the *Victoria regia* the transformation may be traced during germination. The first leaves produced by the young plant are linear, the second are sagittate and hastate, the third are rounded-cordate and the next are orbicular. The cleft indicating the union of the lobes remains in the large leaves. The parts of the leaf are frequently transformed into *tendrils,* with the view of enabling the plants to twine round others for support. In Leguminous plants (the pea tribe) the pinnae are frequently modified to form tendrils, as in *Lathyrus Aphaca,* in which the stipules perform the function of true leaves. In *Flagellaria indica, Gloriosa superba* and others, the midrib of the leaf ends in a tendril. In *Smilax* there are two stipulary tendrils.

The pitchers of insectivorous plants are formed either by petioles or by laminae, and they are composed of one or more leaves. In *Sarracenia* and *Heliamphora* the pitcher is composed of the petiole of the leaf. In *Nepenthes* the pitcher is a modification of the lamina, the petiole often plays the part of a tendril, while the leaf base is flat and leaf-like.

In *Utricularia* bladder-like sacs are formed by a modification of leaflets on the submerged leaves.

In some cases the leaves are reduced to mere *scales—cataphyllary* leaves; they are produced abundantly upon underground shoots. In parasites (*Lathraea, Orobanche*) and in plants growing on decaying vegetable matter (*saprophytes*), in which no chlorophyll is formed, these scales are the only leaves produced. In *Pinus* the only leaves produced on the main stem and the lateral shoots are scales, the acicular leaves of the tree growing from axillary shoots. In *Cycas* whorls of scales alternate with large pinnate leaves. In many plants, as already noticed, phyllodes or stipules perform the function of leaves. The production of leaf-buds from leaves sometimes occurs as in *Bryophyllum,* and many plants of the order Gesneraceae. The leaf of Venus's fly-trap

(*Dionaea muscipula*) when cut off and placed in damp moss, with a pan of water underneath and a bell-glass for a cover, has produced buds from which young plants were obtained. Some species of saxifrage and of ferns also produce buds on their leaves and fronds. In *Nymphaea micrantha* buds appear at the upper part of the petiole.

Phyllotaxis.—Leaves occupy various positions on the stem and branches, and have received different names according to their situation. Thus leaves arising from the crown of the root, as in the primrose, are called *radical;* those on the stem are *cauline;* on flower-stalks, *floral* leaves (*see* FLOWER). The first leaves developed are known as seed leaves or *cotyledons.* The arrangement of the leaves on the axis and its appendages is called *phyllotaxis.*

In their arrangement leaves follow a definite order. The points on the stem at which leaves appear are called nodes; the part of the stem between two nodes is the *internode.* When two leaves are produced at the same node, one on each side of the stem or axis, and at the same level, they are *opposite* (fig. 18); when more than two are produced they are *verticillate,* and the circle of leaves is then called a *verticil* or *whorl.* When leaves are opposite, each successive pair may be placed at right angles to the pair immediately preceding. They are then said to *decussate,* following thus a law of alternation (fig. 17). The same occurs in the verticillate arrangement, the leaves of each whorl rarely being *superposed* on those of the whorl next it, but usually alternating so that each leaf in a whorl occupies the space between two leaves of the whorl next to it. There are considerable irregularities, however, in this respect, and the number of leaves in different whorls is not always uniform, as may be seen in *Lysimachia vulgaris.* When a single leaf is produced at a node, and the nodes are separated so that each leaf is placed at a different height on the stem, the leaves are *alternate* (fig. 18). A plane passing through the point of insertion of the leaf in the node, dividing the leaf into similar halves, is the median plane of the leaf; and when the leaves are arranged alternately on an axis so that their median planes coincide they form a straight row or *orthostichy.* On every axis there are usually two or more orthostichies. In fig. 19 the leaves arise from nodes and the nodes are separated from each other by internodes, the arrangement resulting in one leaf being placed above the other. In this case, then, there are two orthostichies, and the arrangement is said to be *distichous.* When the fourth leaf is directly above the first, the arrangement is *tristichous.* The same arrangement continues throughout the branch, so that in the latter case the 7th leaf is above the 4th, the 10th above the 7th; also the 5th above the 2nd, the 6th above the 3rd and so on. The size of the angle between the median planes of two consecutive leaves in an alternate arrangement is their *divergence;* and it is expressed in fractions of the circumference of the axis which is supposed to be a circle. In a regularly-formed straight branch covered with leaves, if a thread is passed from one to the other, turning always in the same direction, a spiral is described, and a certain number of leaves and of complete turns occur before reaching the leaf directly above that from which the enumeration commenced. If this arrangement is expressed by a fraction, the numerator of which indicates the number of turns, and the denominator the number of internodes in the spiral cycle, the fraction will be found to represent the angle of divergence of the consecutive leaves on the axis. Thus, in fig. 20 *A, B,* the leaf cycle consists of five leaves, the 6th leaf being placed vertically over the 1st, the 7th over the second and so on; while the number of turns between the 1st and 6th leaf is two; hence this arrangement is indicated by the fraction $\frac{2}{5}$. In other words, the distance or divergence between the first and second leaf, expressed in parts of a circle, is $\frac{2}{5}$ of a circle or $360° \times \frac{2}{5} = 144°$. In fig. 19 the spiral is $\frac{1}{2}$, *i.e.,* one turn and two leaves; the third leaf being placed vertically over the first and the divergence between the first and second leaf being one-half the circumference of a circle, $360° \times \frac{1}{2} = 180°$. Again, in a tristichous arrangement the number is $\frac{1}{3}$, or one turn and three leaves, the angular divergence being 120°.

By this means we have a convenient mode of expressing on paper the exact position of the leaves upon an axis. And in many cases such a mode of expression is of excellent service in enabling us readily to understand the relations of the leaves. The divergences may also be represented diagrammatically on a horizontal projection of the vertical axis, as in fig. 21. Here the outermost circle represents a section of that portion of the axis bearing the lowest leaf, the innermost represents the highest. The broad dark lines represent the leaves, and they are numbered according to their age and position. It will be seen at once that the leaves are arranged in orthostichies marked I–V, and that these divide the circumference into five equal portions. But the divergence between leaf 1 and leaf 2 is equal to $\frac{2}{5}$ of the circumference, and the same is the case between 2 and 3, 3 and 4, etc. The divergence, then, is $\frac{2}{5}$, and from this we learn that, starting from any leaf on the axis, we must pass twice round the stem in a spiral through five leaves before reaching one directly over that with which we started. The line which, winding round an axis either to the right or to the left, passes through the points of insertion of all the leaves on the axis is termed the *genetic spiral.* In cases where the internodes are very short and the leaves are closely applied to each other, as in the house-leek, it is difficult to trace the genetic spiral.

The spiral is not always constant throughout the whole length of an axis. The angle of divergence may alter either abruptly or gradually, and the phyllotaxis thus becomes very complicated. This change may be brought about by arrest of development, by increased development of parts or by a torsion of the axis.

In dicotyledonous plants the first leaves produced (the cotyledons) are opposite. This arrangement often continues during the life of the plant, but at other times it changes, passing into distichous and spiral forms. Some tribes of plants are distinguished by the opposite or verticillate, others by their alternate, leaves. Labiate plants have decussate leaves, while Boraginaceae have alternate leaves, and Tiliaceae usually have distichous leaves; Rubiaceae have opposite leaves. Such arrangements as $\frac{2}{5}$, $\frac{3}{8}$, $\frac{5}{13}$ and $\frac{8}{21}$ are common in Dicotyledons. In monocotyledonous plants there is only one seed-leaf or cotyledon, and hence the arrangement is at first alternate; and it generally continues so more or less, rarely being verticillate. Such arrangements as $\frac{1}{2}$, $\frac{1}{3}$ and $\frac{2}{3}$ are common in Monocotyledons, as in grasses, sedges and lilies. It has been found in general that, while the number 5 occurs in the phyllotaxis of Dicotyledons, 3 is common in that of Monocotyledons.

Axillary Buds.—In the axil of previously formed leaves leaf-buds arise. These leaf-buds contain the rudiments of a shoot, and consist of leaves covering a growing point. The buds of trees of temperate climates, which lie dormant during the winter, are protected by scale leaves. These scales or protective appendages of the bud consist either of the altered laminae or of the enlarged petiolary sheath, or of stipules, as in the fig and magnolia, or of one or two of these parts combined. These are often of a coarse nature, serving a temporary purpose, and then falling off when the leaf is expanded. They are frequently covered with a resinous matter, as in balsam-poplar and horse-chestnut, or by a thick downy covering as in the willow. In plants of warm climates the buds have often no protective apparatus, and are then said to be *naked.*

The arrangement of the leaves in the bud is termed *vernation* or *prefoliation.* In considering vernation we must take into account both the manner in which each individual leaf is folded and also the arrangement of the leaves in relation to each other. These vary in different plants, but in each species they follow a regular law. The leaves in the bud are either placed simply in apposition, or they are folded or rolled up longitudinally or laterally, giving rise to different kinds of vernation, as delineated in figs. 22 to 31, where the folded or curved lines represent the leaves, the thickened part being the midrib. The leaf taken individually is either folded longitudinally from apex to base, as in the tulip-tree, and called *reclinate* or *replicate;* or rolled up in a circular manner from apex to base, as in ferns (fig. 22), and called *circinate;* or folded laterally, *conduplicate* (fig. 23), as in oak; or it has several folds like a fan, *plicate* or *plaited* (fig. 24), as in vine and sycamore, and in leaves with radiating vernation, where the ribs mark the foldings; or it is rolled upon itself, *convolute* (fig. 25), as in banana and

apricot; or its edges are rolled inwards, *involute* (fig. 26), as in violet; or outwards, *revolute* (fig. 27), as in rosemary. The different divisions of a cut leaf may be folded or rolled up separately, as in ferns, while the entire leaf may have either the same or a different kind of vernation. The leaves have a definite relation to each other in the bud, being either opposite, alternate or verticillate; and thus different kinds of vernation are produced. Sometimes they are nearly in a circle at the same level, remaining flat or only slightly convex externally, and placed so as to touch each other by their edges, thus giving rise to *valvate* vernation. At other times they are at different levels, and are applied over each other, so as to be *imbricated,* as in lilac, and in the outer scales of sycamore; and occasionally the margin of one leaf overlaps that of another, while it in its turn is overlapped by a third, so as to be *twisted, spiral* or *contortive.* When leaves are applied to each other face to face, without being folded or rolled together, they are *appressed.* When the leaves are more completely folded they either touch at their extremities and are *accumbent* or *opposite* (fig. 28), or are folded inwards by their margin and become *induplicate;* or a conduplicate leaf covers another similarly folded, which in turn covers a third, and thus the vernation is *equitant* (fig. 29), as in privet; or conduplicate leaves are placed so that the half of the one covers the half of another, and thus they become *half-equitant* (fig. 30), as in sage. When in the case of convolute leaves one leaf is rolled up within the other, it is *supervolute* (fig 31). The scales of a bud sometimes exhibit one kind of vernation and the leaves another. The same modes of arrangement occur in the flower-buds.

Leaves, after performing their functions for a certain time, wither and die. In doing so they frequently change colour, and hence arise the beautiful and varied tints of the autumnal foliage Leaves which are articulated with the stem, as in the walnut and horse-chestnut, fall and leave a scar, while those which are continuous with it remain attached for some time after they have lost their vitality. Most of the trees of Great Britain have deciduous leaves, their duration not extending over more than a few months, while in trees of warm climates the leaves often remain for two or more years. In tropical countries, however, many trees lose their leaves in the dry season. The period of defoliation varies in different countries according to the nature of the climate. Trees which are called evergreen, as pines and evergreen-oak, are always deprived of a certain number of leaves at intervals, sufficient being left, however, to preserve their green appearance. The fall is directly caused by the formation of a layer of tissue across the base of the leaf-stalk; the cells of this layer separate from one another and the leaf remains attached only by the fibres of the veins until it becomes finally detached by the wind or frost. Before its fall the leaf has become dry owing to loss of water; certain of the materials of the leaf pass back into the stem and are available for further growth. The leaf scar is protected by a change of a corky nature (suberization) in the walls of the exposed cells. (A. B. R.; V. H. B.)

LEAF-CUTTER BEE, the name applied to solitary bees of the genus *Megachile,* which line their nests with portions of leaves or flower petals. These they cut out with their mandibles and fit together into thimble shaped cells one within the other, each one containing an egg and some pollen and honey paste The best known species, on both sides of the Atlantic, is *M. centuncutulus,* which utilizes rose leaves. (*See* BEE; HYMENOPTERA.)

LEAF-INSECT, the name given to orthopterous insects of the family Phasmidae, referred to the group *Phyllinae* and characterized by the presence of lateral laminae upon the legs and abdomen, which, in association with green colouring-matter, impart a leaf-like appearance to the whole insect. In the female this deceptive resemblance is enhanced by the large size and foliaceous form of the front wings which, when at rest, edge to edge on the abdomen, forcibly suggest in their veining the midrib and veins of an ordinary leaf. In this sex the posterior wings are reduced and functionless so far as flight is concerned; in the male they are ample, membranous and functional, while the anterior wings are small and not leaf-like. The freshly hatched young are reddish in colour; but turn green after feeding for a short time upon leaves. Since leaf-insects are purely vegetable feeders it is probable that their resemblance to leaves is for concealment from enemies. Their egg capsules are likewise protected by their similarity to various seeds. Leaf-insects range from India to the Seychelles on the one side, and to the Fiji Islands on the other.

LEAGUE OF NATIONS. The creation of the League of Nations by the incorporation of the Covenant in the Treaty of Versailles and the other Treaties of Peace in 1919, was perhaps the most remarkable of all the direct results of the World War. For the text of this document *see* p. 832. (*See* also EUROPE; SECURITY)

I. ORIGINS AND FOUNDATION

The League of Nations is not an abnormal achievement of human idealism—a great leap in advance beyond the achievements of the present age, outstripping the practical needs and requirements of the world. On the contrary, it is a practical method for achieving practical ends which are of importance to every citizen of every country. The demand for an international organization to prevent war has often been made in the last four centuries. Fundamentally, this demand is that the relations of States shall be subjected to something analogous to the system of law and order to which men have subjected themselves within the smaller units in which they live. It is one example of the truth of the maxim of the Roman lawyers—*ubi societas ibi lex.* But the purpose and the content of the rules for the conduct of their relations—the *lex*—necessarily depend on the nature of the units of the society and on the nature of their relations.

When Grotius wrote his famous work on the Law of Nations, he was writing of a Society of States whose intercourse was disturbed by the continual outbreak of war. Indeed, Europe had been convulsed by the Thirty Years' War for a whole generation prior to the publication of his work. Thus it was natural and indeed inevitable that the rules which Grotius produced for the guidance of the Society of States, as he knew it, amounted to little more than a code of laws for the better conduct of war. He did, indeed, sketch the outlines of a law for the pacific relations of States, and, in the following century and a half, his successors developed to some extent what he had begun. But only after the Napoleonic wars was the first serious attempt made to establish an organized system of conducting international affairs with a view to the avoidance of war.

To Alexander of Russia's scheme of a holy alliance we need only briefly allude. Though admirable in intention, it was rejected as "sublime nonsense and mysticism" by Castlereagh, and it eventually degenerated into a mere prop of despotism supported by the empires of Central Europe and France. But the work of Castlereagh himself is worthy of closer attention. He tried to substitute for the chaotic political methods of the past a system of diplomacy by conference, confining his efforts, however, to the Great Powers, though he desired to make their attitude to the smaller Powers one of "influence rather than authority." He provided his "Conference of Ambassadors" with an organized plan of work and with a secretariat, and he supplemented it by occasional conferences of the principal statesmen of the Concert. His conference of ambassadors continued to sit in one form or another for almost six years, and he held four or five of his conferences of principal statesmen.

The European Concert.—Later in the 19th century, Castlereagh's work bore fruit in the European Concert, which proved on many occasions to be an effective instrument for the joint settlement of Balkan problems and for the maintenance of European peace. But at the time, and for the purpose for which he had created it, Castlereagh's system of diplomacy by conference almost completely failed. It did so because it never had in it the seeds of life. Its members differed fundamentally on all the greater issues of international politics—while some of them were independent and autocratic sovereigns, subject to no control, and without the pressure behind them of a general democratic will for peace. It could truly be said that international society was not ready for such schemes.

Since the Napoleonic wars, however, forces have been at work

which have changed the economic condition of the world, knitting its many parts together, and making possible a permanent international political organization. The first of these forces is the revolution in communications in the course of the last century, which has brought the most remote parts of the world nearer to each other than neighbouring towns were 100 years ago. The second of the forces—a result of the first—is the remarkable raising of the standards of civilization through the co-operation of mankind in ever larger groups and in enterprises conceived and conducted on an ever greater scale. To-day, much of the world's commerce is international, and it has become evident that the interests of any one civilized country are indissolubly bound up with those of every other country, so much so that no sensible statesman will ever again base his policy on the principle that his country will gain by another country's loss.

Nor is this community of interests between peoples confined to their material well-being. It extends to every sort of scientific, political and moral activity in which men co-operate for the progress of their race. On the other hand, revolution in communications, rapidly destroying the factors of space and time, has rendered possible a development of warfare which has changed its whole character and rendered it universal and destructive in a sense never hitherto imagined. Indeed, it is not too much to assert that another World War would almost certainly throw mankind back into the dark ages. For these, among other reasons, some sort of international organization for the conduct of the relations of States was, in 1919, essential, if the human race was not to abandon the hopes and the ideals for which it had striven during centuries of progress.

ESSENTIAL PROVISIONS OF THE COVENANT

With the reasons for the failure of the earlier scheme of a century before, and with the nature of modern national States in our minds, we can perhaps now proceed to analyse the essential provisions of the Covenant.

It may be taken as commonly accepted that the purposes and objects of a league are the following: first, the maintenance of peace; second, and as a corollary to the first, the solution of international disputes by methods of law, if and when the necessary law exists; when it does not, their solution by political methods, by public debate, by impartial investigation and by conciliation on the basis of the accepted canons of right and justice; third, the promotion of international co-operation.

Membership.—Article 1 of the Covenant consists of the rules of membership of the League. These rules constitute a statement of the principles concerning membership that are essential if the members of the League are to have confidence that their mutual undertakings will be carried out.

Representation.—Articles 2, 3 and 4 of the Covenant stipulate for the creation of an Assembly consisting of three representatives of each member of the League, and for a smaller Council. The Covenant does not lay down the intervals at which these bodies shall meet; it merely stipulates that the Assembly shall meet at stated intervals and from time to time as occasion may require; and that the Council shall meet in the same way, and at least once a year.

Articles 6 and 7 provide for the necessary secretariat, and for the nomination of a secretary-general, who shall make all the appointments to the staff with the approval of the Council. These articles also provide that every position in the secretariat shall be open to women. So much for the institutional organisation of the League as it was established by the Covenant.

Disputes.—With regard to the agreements not to resort to war, the Covenant embodies almost everything that any responsible authority had in 1919 advocated as practicable. By Article 12 the members agree that if there should arise between them any dispute likely to lead to a rupture, they will submit the matter either to arbitration or to judicial settlement, or to inquiry by the Council, and they agree that they will in no case resort to arms until three months after award by the arbitrators or judicial decision, or a report has been made by the council. Article 12 thus not only embodies an agreement not to go to war without previous recourse to peaceful methods of settlement for disputes, but also lays down alternative procedures by which, through the agency of the League, settlement can be effected. These two articles, indeed, leave great elasticity, but their purpose was to secure the establishment of a permanent court of international law to which the parties should in the normal course take disputes of a legal nature.

There is, moreover, at the end of Article 14, a clause designed to increase the value of the Permanent Court. This clause provides that the court may give an advisory opinion upon any dispute or question referred to it by the Council or by the Assembly. Thus the Covenant included provisions which went far towards enabling all international disputes of a genuinely legal nature to be determined by legal methods.

With regard to the other alternative method provided for the settlement of disputes, which members agree to by Article 12, that is to say, inquiry by the Council, Article 15 lays down in considerable detail the procedure which is to be adopted. It provides that any party to a dispute can oblige the League to take cognizance of it by giving notice to the secretary-general. The parties undertake to communicate to the secretary-general as promptly as possible statements of their case, with all the relevant facts and papers. The Council is then given discretion to endeavour to effect a settlement of the dispute, and it is provided that if its efforts are successful, a statement shall be made public giving such an account of the dispute and of the settlement arrived at as the Council may deem proper. If the Council fails to settle the dispute, it is to make a report setting forth the merits of the dispute and the recommendations which the Council thinks would be suitable for a settlement, and this report is to be published. A report may be made either unanimously or by a majority vote, and any individual member of the League which is represented on the Council has a right to make its own public statement concerning the dispute.

There is a further provision in Article 15 to the effect that if such a report is agreed to by the Council unanimously, with the exception of the representatives of one or more of the parties to the dispute, the members of the League—including the parties—agree that they will not go to war with any party to the dispute who complies with the provisions of the report. This is a most important additional limitation of the right of members to resort to arms. Article 15 also allows an appeal from the Council to the Assembly, provided it is made within 14 days after the submission of the dispute to the Council. If a dispute is so referred to the Assembly, the Assembly is to deal with the matter in the same way as the Council, and if its report is agreed to by all the members of the League represented on the Council, and by a majority of the other members of the League, exclusive in each case of the representatives of the parties to the dispute, it has the same force as a unanimous report agreed to by the Council, *i.e.*, the members of the League must not go to war with any of the parties to the dispute which accept it.

These Articles, then, provide two, or rather three, methods by which disputes can be settled by peaceful means through the agency of the League. The first provides for legal verdicts by the Permanent Court, when such verdicts are possible and useful; the second for arbitration by some special tribunal agreed to by the parties to a dispute; and the third, for settlement by the political agency of the Council or the Assembly, in accordance with procedure based on the principles of full publicity and strict impartiality. The authors of the Covenant believed that publicity would of itself ensure impartiality; that it was not conceivable that a council, acting as the representative of the whole body of the League and in circumstances of utmost publicity, should conduct its inquiries into a dispute in any way not consistent with the strictest fairness to all the parties concerned.

Sanctions.—Articles 12 to 15 also make provision for the next essential of a league—united pressure by all the members against any of their number which disregards its undertakings. In providing for a public report by the Council on the merits of a dispute and for the publication of its recommendations as to a settlement, the Covenant lays down a method which, in prac-

tice, must exert the strongest moral pressure on any State which in defiance of Article 12 is disposed to go to war.

But the Covenant goes beyond this, and provides in Article 16 that, if any member of the League in contravention of its agreements resorts to arms, such a member is *ipso facto* "deemed to have committed an act of war against all other members of the League," and the other members are obliged to prevent all financial, commercial or personal intercourse between the nationals of the Covenant-breaking State and the nationals of any other State. It is difficult in the disturbed condition of the world after the World War to realise just what would be the effect of such a complete economic and financial boycott in times of normal peace. But it is not too much to say that no civilised State would, in 1914, have ventured to declare war had it been threatened by such a universal boycott as is stipulated by Article 16 of the Covenant.

It is sometimes held that in providing for such a universal boycott, the Covenant goes beyond the essentials of a league. It is sometimes even held that it goes beyond what is practicable and wise. But it must be remembered that Article 16 only comes into force if a State insists on going to war without waiting for any attempt at peaceful settlement, or where an agreed tribunal or a unanimous council have given a decision which has been accepted by the other party. In other cases ultimate resort to war is envisaged under the Covenant as legitimate, and the obligations of Article 16 would not come into force. Indeed against a genuinely recalcitrant member of the League, the Covenant goes even further. Article 16 lays down that in addition to the blockade which is an automatic obligation of all the members of the League, the council shall consider and shall *recommend* to the several Governments concerned, what military, naval or air forces members of the League shall severally contribute to the armed forces to be used to protect the Covenant. In other words, while leaving again the greatest possible elasticity, the Covenant foreshadows united military action, if it is necessary, against a Covenant-breaking State.

The provisions summarized above, relating to membership, machinery, arrangements for the peaceful settlement of disputes and sanctions, cover the essentials of any league designed to maintain peace.

FURTHER PROVISIONS OF THE COVENANT

How far, and in what respects, does the Covenant go beyond these essentials?

Guarantees.—First, there are the much-discussed provisions of Article 10. This Article has been very generally misunderstood. Its effect is to guarantee the members of the League *against external aggression* which would impair their territorial integrity or political independence; but this guarantee is only to be enforced as the Council acting unanimously shall agree. In practice the protection against sudden and unjust attacks provided by Articles 12–16 will probably be much more useful, and, if executed, all that is required. Article 10 is really only a rather clumsy assertion that territorial or political changes shall not be made by aggressive war. Such changes, if required, must be made under Article 19, which enables the Assembly to reconsider treaties which have become obsolete or dangerous to peace.

Armaments.—Secondly, it may perhaps be said that, by the provisions of Article 8 on the subject of armaments, the Covenant introduces something which is extraneous to an agreement to preserve the peace. But the history of the 20th century has demonstrated that if you prepare for war you will have war; that increase of armaments in one country provokes increase of armaments in other countries, and that if rivalry in preparation for war continues, within a certain time war will break out. The authors of the Covenant believed that unless rivalry in armaments could be prevented, any league of nations, however it be constituted, would fail. They therefore thought an agreement not to engage in unlimited competition in armaments absolutely necessary to the peace of the world. The Covenant deals with the matter in a way which is pre-eminently practical and sane. It recognises that the maintenance of peace requires the reduction of national armaments to the lowest point consistent with national safety, and directs the Council to formulate plans for such reduction for the consideration of the several members of the League. In other words, the members agree to co-operate in working out a general international plan embodying scales in accordance with which their armaments shall be limited or reduced. (*See* DISARMAMENT.)

Further, the members agree that they will, through the League, endeavour to take measures for abolishing the evil effects of the private manufacture of armaments and material of war, and they agree to exchange full information as to their armaments, their preparations for war and the condition of their industries which may be adapted to warlike purposes. Lastly, by Article 23 they agree that, subject to conventions to be arranged, the international traffic in arms, admittedly one of the minor contributing causes of war, shall be placed under the League's supervision.

These are only general principles. In themselves they would be of small value. But it was hoped by the authors of the Covenant that the action of the permanent machinery of the League would in time enable its members to give effect to the purpose of Article 8; and that thus great strides would be made towards the disarmament which everyone desires. In this respect, as in others, the authors of the Covenant were careful not to travel too fast; they laid foundations on which those who were to wield authority in the League could later build.

Secret Treaties.—By providing in Article 18 for the publication of all treaties, the Covenant may be regarded as again going beyond the essentials of a League of Nations. Yet no reasonable man can doubt that, under the diplomatic system which prevailed before 1914, secret treaties of alliance, directly by their mere existence and indirectly through the mistrust which they created, were one of the serious causes of international conflict.

Mandates.—Article 22 of the Covenant introduces a new principle into international affairs which is certainly extraneous to the central purpose of a league. The mandates system which it creates is a great experiment in the government by advanced peoples of backward territories and races. The main principles are simple. The Article is based on the proposition that backward peoples and territories are not for the future to be exploited for the exclusive benefit of those who govern them; that, on the contrary, their interests and well-being constitute a sacred trust of civilisation and that the way in which they are ruled is a matter of interest to the world at large. The Article therefore lays down that in the government of such territories the interests and progress of the inhabitants must be the guiding purpose of the administration. The methods by which their interests are to be protected and their development secured vary, of course, in every case with the nature of the territory and the character of the people concerned. But in every case the fundamental principles are the same; and to secure the observance of them the Covenant imposes on the mandatories a duty to make annual reports for submission to a permanent mandates commission; which is, in turn, to report to the Council. Here again the Covenant relies on publicity and public opinion as a guarantee that Article 22 will be faithfully carried into effect. (*See* MANDATES.)

International Co-operation.—With regard to international co-operation, the Covenant in Articles 23 and 24 goes a great deal further than might be considered essential. It provides in general terms for the establishment of a labour organisation (which in fact has been elaborated separately by another agreement; *see* INTERNATIONAL LABOUR ORGANIZATION); for the equitable treatment of commerce; for the development of freedom of transit; for League supervision of the traffic in arms; for League action in matters of public health and for the general supervision by the League of all official, and also, if necessary or useful, of unofficial, international offices established for international purposes of general interest. The general effect of these provisions is to make the League what it is clearly desirable that it should be—a central organism through which international activities of every sort can be co-ordinated and, when useful, assisted by the Council and the secretariat. There can be no doubt that the result of this must be to prevent waste of effort and promote efficiency in the conduct

of international business of every kind.

Amendments.—In the last place the Covenant, by Article 26, provides a method by which it can itself be amended; and this, it may be held, is not an essential of a league. It is true that the Covenant might have been regarded as an ordinary international treaty, valid, as most treaties are now made, for a certain fixed period, at the end of which it might have been renewed or changed by the ordinary methods. But it was precisely because the authors of the Covenant did not regard it as an ordinary international treaty that they provided a special means for amendment; and there can be no doubt that, morally, Article 26 is of great significance, and that practically it may prove to be of great constitutional value. It still leaves it difficult to secure amendment of the terms of the Covenant. It can only be done if all the members of the Council and the majority of the members of the Assembly are agreed. But the fact that amendment is definitely envisaged is in itself important.

General Observations.—Generally, it may be said that when the Covenant goes beyond the essential features which are necessary to any effective league to preserve peace, it does so with one of two objects in view. Either it is with the purpose of giving real life to the machinery which it establishes: of bringing the international forces actually at work into effective co-operation, in order that members of the League may be brought closer together, and the League itself be strengthened and have the vitality that comes from continuous and varied work; or else it is with the purpose of removing those deep-seated causes which public opinion has recognised as having led to war. It is not by chance that the Covenant contains more or less elaborate provisions concerning armaments, the traffic in arms, annexation by conquest, the avoidance of unfair economic competition, imperial rivalry in the exploitation of backward countries, secret treaties and alliances. It is because these things have led to war in the past that the Covenant seeks to deal with them in a practical and effective way, to the end that war may be rendered less probable in the future.

Elasticity is one of the chief "notes" of the whole machinery of the League. The Council and the Assembly are free to develop their own methods and systems as they choose, to appoint committees and commissions at their discretion, and to draw up codes of procedure which they can themselves change; they are thus able to give to the general principles of the Covenant the free development which experience may dictate.

PREPARATION AND ENFORCEMENT

The Covenant was prepared by a special commission of the Peace Conference of Paris, consisting of ten representatives of the Great Powers and nine representatives of the smaller Allied States. This commission, appointed on Jan. 20, 1919, was a body of remarkable authority. Presided over by President Wilson, its members included Colonel House, General Smuts (later Prime Minister of South Africa), Lord Robert (Viscount) Cecil, M. Léon Bourgeois (former Prime Minister of France), M. Venizelos (Prime Minister of Greece), M. Pessoa (later President of Brazil), M. Vesnitch (later Prime Minister of Yugoslavia), M. Scialoja (later Foreign Minister of Italy), M. Hymans (Foreign Minister of Belgium) and others.

The first draft prepared by the commission, based on proposals put forward jointly by the British and American delegations, was laid before the Peace Conference at a public meeting on Feb. 14; it was thereafter amended in the light of criticisms made by the Conference, by the press and by the neutral Powers at a special meeting held for the purpose of hearing their views; and the final draft was adopted by the Plenary Conference at another public meeting on April 28. It was, on the insistence of President Wilson, inserted as Part I. of the Peace Treaties made with Germany, Austria, Hungary and Bulgaria. By this device the Allied Powers were prevented from making peace with their enemies without being members of the League.

With the entry into force of the Treaty of Versailles on Jan. 10, 1920, the League of Nations came legally into existence. Prior to this date, preliminary organisation of its work had been carried on by the secretary-general under the authority of a committee of the Powers. When all the Allied Powers had ratified the Peace Treaties (except the U.S.A., Hejaz and Ecuador, who failed to do so) the members of the League numbered 29. To these were added during the course of 1920 the neutral Powers, 13 in all, who in accordance with Article I. of the Covenant acceded to it without reservation. By successive admissions of ex-enemy and other States, the number of members had by 1928 risen to 54.

II. TEXT OF THE COVENANT

(The following articles embody [in *italics*] amendments to Article 6 [in force from Aug. 13, 1924], Articles 12, 13 and 15 [in force from Sept. 26, 1924], and Article 4 [in force from July 29, 1926]. The numbering of the paragraphs is in accordance with the resolution adopted by the Assembly on Sept. 21, 1926.)

THE COVENANT OF THE LEAGUE OF NATIONS

THE HIGH CONTRACTING PARTIES,

In order to promote international co-operation and to achieve international peace and security

by the acceptance of obligations not to resort to war,

by the prescription of open, just and honourable relations between nations,

by the firm establishment of the understandings of international law as the actual rule of conduct among Governments,

and by the maintenance of justice and a scrupulous respect for all treaty obligations in the dealings of organised peoples with one another,

Agree to this Covenant of the League of Nations.

ARTICLE 1

1. The original Members of the League of Nations shall be those of the Signatories which are named in the Annex to this Covenant and also such of those other States named in the Annex as shall accede without reservation to this Covenant. Such accession shall be effected by a Declaration deposited with the Secretariat within two months of the coming into force of the Covenant. Notice thereof shall be sent to all other Members of the League

2. Any fully self-governing State, Dominion or Colony not named in the Annex may become a Member of the League if its admission is agreed to by two-thirds of the Assembly, provided that it shall give effective guarantees of its sincere intention to observe its international obligations, and shall accept such regulations as may be prescribed by the League in regard to its military, naval and air forces and armaments.

3. Any Member of the League may, after two years' notice of its intention so to do, withdraw from the League, provided that all its international obligations and all its obligations under this Covenant shall have been fulfilled at the time of its withdrawal.

ARTICLE 2

The action of the League under this Covenant shall be effected through the instrumentality of an Assembly and of a Council, with a permanent Secretariat.

ARTICLE 3

1. The Assembly shall consist of Representatives of the Members of the League.

2. The Assembly shall meet at stated intervals and from time to time as occasion may require at the Seat of the League or at such other place as may be decided upon.

3. The Assembly may deal at its meetings with any matter within the sphere of action of the League or affecting the peace of the world.

4. At meetings of the Assembly, each Member of the League shall have one vote, and may have not more than three Representatives.

ARTICLE 4

1. The Council shall consist of Representatives of the Principal Allied and Associated Powers,[1] together with Representatives of four other Members of the League. These four Members of the League shall be selected by the Assembly from time to time in its discretion. Until the appointment of the Representatives of the four Members of the League first selected by the Assembly, Representatives of Belgium, Brazil, Spain and Greece, shall be Members of the Council.

2. With the approval of the majority of the Assembly, the Council may name additional Members of the League whose Representatives shall always be Members of the Council[2]; the Council with like approval may increase the number of Members of the League to be selected by the Assembly for representation on the Council.[3]

2 *bis*.[4] *The Assembly shall fix by a two-thirds majority the rules dealing with the election of the non-permanent Members of the Council, and particularly such regulations as relate to their term of office and the conditions of re-eligibility.*

3. The Council shall meet from time to time as occasion may require, and at least once a year, at the Seat of the League, or at such other place as may be decided upon.

4. The Council may deal at its meetings with any matter within the sphere of action of the League or affecting the peace of the world.

5. Any Member of the League not represented on the Council shall be invited to send a Representative to sit as a member at any meeting of the Council during the consideration of matters specially affecting the interests of that Member of the League.

6. At meetings of the Council, each Member of the League represented on the Council shall have one vote, and may have not more than one Representative.

ARTICLE 5

1. Except where otherwise expressly provided in this Covenant or by the terms of the present Treaty, decisions at any meeting of the Assembly or of the Council shall require the agreement of all the Members of the League represented at the meeting.

2. All matters of procedure at meetings of the Assembly or of the Council, including the appointment of Committees to investigate particular matters, shall be regulated by the Assembly or by the Council and may be decided by a majority of the Members of the League represented at the meeting

3. The first meeting of the Assembly and the first meeting of the Council shall be summoned by the President of the United States of America.

ARTICLE 6

1. The permanent Secretariat shall be established at the Seat of the League. The Secretariat shall comprise a Secretary-General and such secretaries and staff as may be required.

2. The first Secretary-General shall be the person named in the Annex; thereafter the Secretary-General shall be appointed by the Council with the approval of the majority of the Assembly.

[1]The Principal Allied and Associated Powers are the following: The United States of America, the British Empire, France, Italy and Japan (*see* Preamble of the Treaty of Peace with Germany).

[2]In virtue of this paragraph of the Covenant, Germany was nominated as a permanent Member of the Council on September 8th, 1926.

[3]The number of Members of the Council selected by the Assembly was increased to six instead of four by virtue of a resolution adopted by the Third Assembly on Sept. 25, 1922. By a resolution of the Assembly on Sept. 8, 1926, the number of members of the Council selected by the Assembly was increased to nine.

[4]This Amendment came into force on July 29, 1926, in accordance with Article 26 of the Covenant.

3. The secretaries and staff of the Secretariat shall be appointed by the Secretary-General with the approval of the Council.

4. The Secretary-General shall act in that capacity at all meetings of the Assembly and of the Council.

5[1]. *The expenses of the League shall be borne by the Members of the League in the proportion decided by the Assembly.*

ARTICLE 7

1. The Seat of the League is established at Geneva.

2. The Council may at any time decide that the Seat of the League shall be established elsewhere

3. All positions under or in connection with the League, including the Secretariat, shall be open equally to men and women.

4. Representatives of the Members of the League and officials of the League when engaged on the business of the League shall enjoy diplomatic privileges and immunities

5. The buildings and other property occupied by the League or its officials or by Representatives attending its meetings shall be inviolable.

ARTICLE 8

1. The Members of the League recognise that the maintenance of peace requires the reduction of national armaments to the lowest point consistent with national safety and the enforcement by common action of international obligations.

2. The Council, taking account of the geographical situation and circumstances of each State, shall formulate plans for such reduction for the consideration and action of the several Governments.

3. Such plans shall be subject to reconsideration and revision at least every ten years.

4. After these plans shall have been adopted by the several Governments, the limits of armaments therein fixed shall not be exceeded without the concurrence of the Council.

5. The Members of the League agree that the manufacture by private enterprise of munitions and implements of war is open to grave objections. The Council shall advise how the evil effects attendant upon such manufacture can be prevented, due regard being had to the necessities of those Members of the League which are not able to manufacture the munitions and implements of war necessary for their safety.

6. The Members of the League undertake to interchange full and frank information as to the scale of their armaments, their military, naval and air programmes and the condition of such of their industries as are adaptable to warlike purposes.

ARTICLE 9

A permanent Commission shall be constituted to advise the Council on the execution of the provisions of Articles 1 and 8 and on military, naval and air questions generally.

ARTICLE 10

The Members of the League undertake to respect and preserve as against external aggression the territorial integrity and existing political independence of all Members of the League. In case of any such aggression or in case of any threat or danger of such aggression the Council shall advise upon the means by which this obligation shall be fulfilled.

ARTICLE 11

1. Any war or threat of war, whether immediately affecting any of the Members of the League or not, is hereby declared a matter of concern to the whole League, and the League shall take any action that may be deemed wise and effectual to safeguard the peace of nations. In case any such emergency should arise the Secretary-General shall on the request of any Member of the League forthwith summon a meeting of the Council.

[1]This Amendment came into force on August 13, 1924, in accordance with Article 26 of the Covenant and replaces the following paragraph: "5. The expenses of the Secretariat shall be borne by the Members of the League in accordance with the apportionment of the expenses of the International Bureau of the Universal Postal Union."

2. It is also declared to be the friendly right of each Member of the League to bring to the attention of the Assembly or of the Council any circumstance whatever affecting international relations which threatens to disturb international peace or the good understanding between nations upon which peace depends.

ARTICLE 12[1]

1. The Members of the League agree that if there should arise between them any dispute likely to lead to a rupture they will submit the matter either to arbitration *or judicial settlement* or to enquiry by the Council, and they agree in no case to resort to war until three months after the award by the arbitrators *or the judicial decision* or the report by the Council.

2. In any case under this Article the award of the arbitrators *or the judicial decision* shall be made within a reasonable time, and the report of the Council shall be made within six months after the submission of the dispute.

ARTICLE 13

1. The Members of the League agree that whenever any dispute shall arise between them which they recognize to be suitable for submission to arbitration or *judicial settlement,* and which cannot be satisfactorily settled by diplomacy, they will submit the whole subject-matter to arbitration *or judicial settlement.*

2. Disputes as to the interpretation of a treaty, as to any question of international law, as to the existence of any fact which, if established would constitute a breach of any international obligation, or as to the extent and nature of the reparation to be made for any such breach, are declared to be among those which are generally suitable for submission to arbitration *or judicial settlement.*

3. *For the consideration of any such dispute, the court to which the case is referred shall be the Permanent Court of International Justice, established in accordance with Article 14, or any tribunal agreed on by the parties to the dispute or stipulated in any convention existing between them.*

4. The Members of the League agree that they will carry out in full good faith any award *or decision* that may be rendered, and that they will not resort to war against a Member of the League which complies therewith. In the event of any failure to carry out such an award *or decision,* the Council shall propose what steps should be taken to give effect thereto.

ARTICLE 14

The Council shall formulate and submit to the Members of the League for adoption plans for the establishment of a Permanent Court of International Justice. The Court shall be competent to hear and determine any dispute of an international character which the parties thereto submit to it. The Court may also give an advisory opinion upon any dispute or question referred to it by the Council or by the Assembly.

ARTICLE 15

1. If there should arise between Members of the League any dispute likely to lead to a rupture, which is not submitted to arbitration *or judicial settlement* in accordance with Article 13, the Members of the League agree that they will submit the matter to the Council. Any party to the dispute may effect such submission by giving notice of the existence of the dispute to the Secretary-General, who will make all necessary arrangements for a full investigation and consideration thereof.

2. For this purpose the parties to the dispute will communicate to the Secretary-General, as promptly as possible, statements of their case with all the relevant facts and papers, and the Council may forthwith direct the publication thereof.

3. The Council shall endeavour to effect a settlement of the dispute, and if such efforts are successful, a statement shall be made public giving such facts and explanations regarding the dispute and the terms of settlement thereof as the Council may deem appropriate.

4. If the dispute is not thus settled, the Council either unanimously or by a majority vote shall make and publish a report containing a statement of the facts of the dispute and the recommendations which are deemed just and proper in regard thereto.

5. Any Member of the League represented on the Council may make public a statement of the facts of the dispute and of its conclusions regarding the same.

6. If a report by the Council is unanimously agreed to by the members thereof other than the Representatives of one or more of the parties to the dispute, the Members of the League agree that they will not go to war with any party to the dispute which complies with the recommendations of the report.

7. If the Council fails to reach a report which is unanimously agreed to by the members thereof, other than the Representatives of one or more of the parties to the dispute, the Members of the League reserve to themselves the right to take such action as they shall consider necessary for the maintenance of right and justice.

8. If the dispute between the parties is claimed by one of them, and is found by the Council, to arise out of a matter which by international law is solely within the domestic jurisdiction of that party, the Council shall so report, and shall make no recommendation as to its settlement.

9. The Council may in any case under this Article refer the dispute to the Assembly. The dispute shall be so referred at the request of either party to the dispute provided that such request be made within fourteen days after the submission of the dispute to the Council.

10. In any case referred to the Assembly, all the provisions of this Article and of Article 12 relating to the action and powers of the Council shall apply to the action and powers of the Assembly, provided that a report made by the Assembly, if concurred in by the Representatives of those Members of the League represented on the Council and of a majority of the other Members of the League, exclusive in each case of the Representatives of the parties to the dispute, shall have the same force as a report by the Council concurred in by all the members thereof other than the Representatives of one or more of the parties to the dispute.

ARTICLE 16

1.[1] Should any Member of the League resort to war in disregard of its covenants under Articles 12, 13 or 15, it shall *ipso facto* be deemed to have committed an act of war against all other Members of the League, which hereby undertake imme-

[1]The Amendments printed in italics in Articles 12, 13 (1) (2) (3) (4) 15 (1), came into force on September 26, 1924, in accordance with Article 26 of the Covenant. The original texts were identical with these now in force except for the absence of the words in italics.

[1]The Second Assembly, in October 1921, proposed that Article 16, paragraph I., be amended to read:

"Should any Member of the League resort to war in disregard of its Covenants under Articles 12, 13, or 15, it shall *ipso facto* be deemed to have committed an act of war against all other Members of the League, which hereby undertake immediately to subject it to the severance of all trade or financial relations, the prohibition of all intercourse between persons residing in their territory and persons residing in the territory of the Covenant-breaking State, and the prevention of all financial, commercial or personal intercourse between persons residing in the territory of the Covenant-breaking State and persons residing in the territory of any other State, whether a Member of the League or not."

On Sept. 27, 1924 the Fifth Assembly expressed the view that "it is no longer opportune for further Members of the League to ratify the said amendment" to Article 16, paragraph I., and recommended "in place thereof" the following:

"The latter part of the first paragraph of Article 16 of the Covenant shall read as follows: "Which hereby undertake immediately to subject it to the severance of all trade or financial relations and to prohibit all intercourse at least between persons resident within their territories and persons resident within the territory of the Covenant-breaking State, and if they deem it expedient, also between their nationals and the nationals of the Covenant-breaking State, and to prevent all financial, commercial or personal intercourse at least between persons resident within the territory of that State and persons resident within the territory of any other State, whether a Member of the League or not, and if they deem it expedient, also between the nationals of that State and the nationals of any other State, whether a member of the League or not."

diately to subject it to the severance of all trade or financial relations, the prohibition of all intercourse between their nationals and the nationals of the Covenant-breaking State, and the prevention of all financial, commercial or personal intercourse between the nationals of the covenant-breaking State and the nationals of any other State, whether a Member of the League or not.

2.[1] It shall be the duty of the Council in such case to recommend to the several Governments concerned what effective military, naval or air force the Members of the League shall severally contribute to the armed forces to be used to protect the covenants of the League.

3. The Members of the League agree, further, that they will mutually support one another in the financial and economic measures which are taken under this Article, in order to minimise the loss and inconvenience resulting from the above measures, and that they will mutually support one another in resisting any special measures aimed at one of their number by the Covenant-breaking State, and that they will take the necessary steps to afford passage through their territory to the forces of any of the Members of the League which are co-operating to protect the covenants of the League.

4. Any Member of the League which has violated any covenant of the League may be declared to be no longer a Member of the League by a vote of the Council concurred in by the Representatives of all the other Members of the League represented thereon.

ARTICLE 17

1. In the event of a dispute between a Member of the League and a State which is not a Member of the League, or between States not Members of the League, the State or States not Members of the League shall be invited to accept the obligations of membership in the League for the purposes of such dispute, upon such conditions as the Council may deem just. If such invitation is accepted, the provisions of Articles 12 to 16 inclusive shall be applied with such modifications as may be deemed necessary by the Council.

2. Upon such invitation being given the Council shall immediately institute an inquiry into the circumstances of the dispute and recommend such action as may seem best and most effectual in the circumstances.

3. If a State so invited shall refuse to accept the obligations of membership in the League for the purposes of such dispute, and shall resort to war against a Member of the League, the provisions of Article 16 shall be applicable as against the State taking such action.

4. If both parties to the dispute when so invited refuse to accept the obligations of membership in the League for the purposes of such dispute, the Council may take such measures and make such recommendations as will prevent hostilities and will result in the settlement of the dispute.

[1]The Second Assembly, Oct. 4, 1921, also proposed to insert the three following paragraphs between paragraphs 1 and 2 of the original text;

"It is for the Council to give an opinion whether or not a breach of the Covenant has taken place. In deliberations on this question in the Council the votes of Members of the League alleged to have resorted to war, and of Members against whom such action was directed, shall not be counted.

"The Council will notify to all Members of the League the date which it recommends for the application of the economic pressure under this Article.

"Nevertheless, the Council may, in the case of particular Members, postpone the coming into force of any of these measures for a specified period where it is satisfied that such a postponement will facilitate the attainment of the object of the measures referred to in the preceding paragraph, or that it is necessary in order to minimise the loss and inconvenience which will be caused to such Members."

The Sixth Assembly, Sept. 21, 1925, proposed that the following amendment should be made to paragraph 2 of the original text (which becomes paragraph 5 of the text as amended in 1921);

"The words 'in such case' in the second paragraph of the original text of Article 16 of the Covenant shall be deleted."

None of these proposed amendments had come into force by Nov. 1928.

ARTICLE 18

Every treaty or international engagement entered into hereafter by any Member of the League shall be forthwith registered with the Secretariat and shall as soon as possible be published by it. No such treaty or international engagement shall be binding until so registered.

ARTICLE 19

The Assembly may from time to time advise the reconsideration by Members of the League of treaties which have become inapplicable and the consideration of international conditions whose continuance might endanger the peace of the world.

ARTICLE 20

1. The Members of the League severally agree that this Covenant is accepted as abrogating all obligations or understandings *inter se* which are inconsistent with the terms thereof, and solemnly undertake that they will not hereafter enter into any engagements inconsistent with the terms thereof.

2. In case any Member of the League shall, before becoming a Member of the League, have undertaken any obligations inconsistent with the terms of this Covenant, it shall be the duty of such Member to take immediate steps to procure its release from such obligations.

ARTICLE 21

Nothing in this Covenant shall be deemed to affect the validity of international engagements, such as treaties of arbitration or regional understandings like the Monroe doctrine, for securing the maintenance of peace.

ARTICLE 22

1. To those colonies and territories which as a consequence of the late war have ceased to be under the sovereignty of the States which formerly governed them and which are inhabited by peoples not yet able to stand by themselves under the strenuous conditions of the modern world, there should be applied the principle that the well-being and development of such peoples form a sacred trust of civilization and that securities for the performance of this trust should be embodied in this Covenant.

2. The best method of giving practical effect to this principle is that the tutelage of such peoples should be entrusted to advanced nations who by reason of their resources, their experience or their geographical position can best undertake this responsibility, and who are willing to accept it, and that this tutelage should be exercised by them as Mandatories on behalf of the League.

3. The character of the mandate must differ according to the stage of the development of the people, the geographical situation of the territory, its economic conditions and other similar circumstances.

4. Certain communities formerly belonging to the Turkish Empire have reached a stage of development where their existence as independent nations can be provisionally recognised subject to the rendering of administrative advice and assistance by a Mandatory until such time as they are able to stand alone. The wishes of these communities must be a principal consideration in the selection of the Mandatory.

5. Other peoples, especially those of Central Africa, are at such a stage that the Mandatory must be responsible for the administration of the territory under conditions which will guarantee freedom of conscience and religion, subject only to the maintenance of public order and morals, the prohibition of abuses such as the slave trade, the arms traffic and the liquor traffic, and the prevention of the establishment of fortifications or military and naval bases and of military training of the natives for other than police purposes and the defence of territory, and will also secure equal opportunities for the trade and commerce of other Members of the League.

6. There are territories, such as South-West Africa and certain of the South Pacific Islands, which, owing to the sparseness of their population, or their small size, or their remoteness from the

centres of civilization, or their geographical contiguity to the territory of the Mandatory, and other circumstances, can be best administered under the laws of the Mandatory as integral portions of its territory, subject to the safeguards above mentioned in the interests of the indigenous population.

7. In every case of mandate, the Mandatory shall render to the Council an annual report in reference to the territory committed to its charge.

8. The degree of authority, control, or administration to be exercised by the Mandatory shall, if not previously agreed upon by the Members of the League, be explicitly defined in each case by the Council.

9. A permanent Commission shall be constituted to receive and examine the annual reports of the Mandatories and to advise the Council on all matters relating to the observance of the mandates.

ARTICLE 23

Subject to and in accordance with the provisions of international conventions existing or hereafter to be agreed upon, the Members of the League:

(*a*) will endeavour to secure and maintain fair and humane conditions of labour for men, women and children, both in their own countries and in all countries to which their commercial industrial relations extend, and for that purpose will establish and maintain the necessary international organizations;

(*b*) undertake to secure just treatment of the native inhabitants of territories under their control;

(*c*) will entrust the League with the general supervision over the execution of agreements with regard to the traffic in women and children, and the traffic in opium and other dangerous drugs;

(*d*) will entrust the League with the general supervision of the trade in arms and ammunition with the countries in which the control of this traffic is necessary in the common interest;

(*e*) will make provision to secure and maintain freedom of communications and of transit and equitable treatment for the commerce of all Members of the League. In this connection, the special necessities of the regions devastated during the war of 1914–1918 shall be borne in mind;

(*f*) will endeavour to take steps in matters of international concern for the prevention and control of disease.

ARTICLE 24

1. There shall be placed under the direction of the League all international bureaux already established by general treaties if the parties to such treaties consent All such international bureaux and all commissions for the regulation of matters of international interest hereafter constituted shall be placed under the direction of the League.

2. In all matters of international interest which are regulated by general conventions but which are not placed under the control of international bureaux or commissions, the Secretariat of the League shall, subject to the consent of the Council and if desired by the parties, collect and distribute all relevant information and shall render any other assistance which may be necessary or desirable.

3. The Council may include as part of the expenses of the Secretariat the expenses of any bureau or commission which is placed under the direction of the League.

ARTICLE 25

The Members of the League agree to encourage and promote the establishment and co-operation of duly authorized voluntary national Red Cross organizations having as purposes the improvement of health, the prevention of disease and the mitigation of suffering throughout the world.

ARTICLE 26

1. Amendments to this Covenant will take effect when ratified by the Members of the League whose Representatives compose the Council and by a majority of the Members of the League whose Representatives compose the Assembly.

2. No such amendments shall bind any Member of the League which signifies its dissent therefrom, but in that case it shall cease to be a Member of the League.[1]

III. THE WORK OF THE FIRST EIGHT YEARS

In order to understand what has determined the character, scope and varying efficacy of the League during the first eight years of its existence, it is necessary to bear in mind the general conditions under which it has been working. It is only by realising these that we shall understand why some of the main international problems have been dealt with by the League and some outside it; and why its success in those which it has undertaken has varied from case to case, according to the particular circumstance and nature of the questions under consideration.

The first of the determining political conditions is that the process of settling the terms of peace, of resolving the immediate problems left by the World War, was only begun and not ended by the treaties of peace signed in 1919. For years afterwards peace was still being negotiated in every capital in Europe. One of the treaties, indeed, the Treaty of Sèvres, was never ratified. Renewed war between Greece and Turkey, rather the continuation, after an interval, of one section of the World War than the outbreak of a new one, was to precede the new Treaty of Lausanne of 1923. But even those treaties which were duly ratified left unsettled questions of the first political importance, in the forefront "reparation" and in the second rank a host of secondary, but still difficult and important, problems, which will require prolonged consideration before a satisfactory settlement can be made.

In the second place, the scope of the League's work has been limited by the fact that, while in essence a world organisation, it has not in the first eight years of its existence received the adhesion of all countries.

These conditions derive additional importance from the fundamental character of the League as an organisation. The League is not a super-State with either the right or the authority to impose its will on the sovereign States which compose it. It is essentially an organ for securing agreement between them, and its power of action is at any time limited by the extent of possible agreement.

Except in special cases, of which the most important is that members undertake not to go to war to enforce a claim rejected by all the members on the Council except the disputants themselves, signature of the Covenant does not involve an obligation on any State to accept a decision of the League without its own consent.

For the great bulk of its work, therefore, the League requires unanimity. It can persuade, it can elicit a collective world opinion, both private and official, which it may use to aid its persuasion, but, except before the imminent threat of war, it cannot compel; and even in this case unanimity of the non-disputant members of the Council is required. It follows, therefore, that the power of the League varies with the policies and characters of the countries which compose it and of their relations between each other. How far this is from involving impotence, how great is the difference between the policy a country would pursue if left alone from that

[1]The Second Assembly, Oct. 3, 1921, proposed that Article 26 should be amended as follows:—

"Amendments to the present Covenant the text of which shall have been voted by the Assembly on a three-fourths majority, in which there shall be included the votes of all the Members of the Council represented at the meeting, will take effect when ratified by the Members of the League, whose Representatives composed the Council when the vote was taken and by the majority of those whose Representatives form the Assembly.

"If the required number of ratifications shall not have been obtained within twenty-two months after the vote of the Assembly, the proposed amendment shall remain without effect.

"The Secretary-General shall inform the Members of the taking effect of an amendment.

"Any Member of the League which has not at that time ratified the amendment is free to notify the Secretary-General within a year of its refusal to accept it, but in that case it shall cease to be a Member of the League."

This amendment had not come into force by July 1928.

which it can be induced to follow under the persuasion of collective opinion, the following account will show. But however wide the range within which such persuasion can be effective, there is at any given moment a limit beyond which a country cannot be moved. And beyond such limits the League is, for the great bulk of its work, impotent. In dealing with its various problems the League has to deal with exactly the same forces and differences of policy, and interest as if they were handled by other methods of negotiation; and the organs of the League, the Assembly and the Council comprise, indeed consist of, Representatives of interested Governments themselves.

It follows that any serious divergencies of policy between members of the League, and especially its more important members, will be likely to enfeeble the League for its general work. And it is obvious that the obstinate differences on reparation and other questions touching Germany and on Near Eastern affairs, affecting as they did for some years the general relations of some of the principal countries on the Council, necessarily limited the League's general power and progress.

These limiting factors have diminished in importance as the years have passed. Little by little, the specifically War problems have found a settlement, the transitional instruments of negotiation, supreme councils or allied conferences or the Conference of Ambassadors (*see* SAN REMO; SPA; PARIS; LONDON; CANNES; GENOA; LAUSANNE; and LOCARNO; also AMBASSADORS, CONFERENCE OF; SUPREME COUNCIL) have ended or retired to a secondary place; and the permanent organisation has come into the foreground The number of member States has risen from the 42 of the first Assembly to 54, in 1928, and the new members include Germany. Nevertheless, the continued absence of the United States of America and Russia; the notice of withdrawal, now happily cancelled, of Spain; the partial absence of the Argentine and the retirement of Brazil has meant that the League has been far from universal in its character For this and other reasons, some of the main problems of world interest, China, naval competition, recent troubles in Albania, have been the subject of negotiations in which it has taken no part. In the problems which it has handled, moreover, the League still shows notable fluctuations in its power of effective action, corresponding with changes in the relations between its principal members. On the whole, however, and on any reasonably long period of survey, the increase in its authority is incontestable.

ORGANISATION OF THE LEAGUE

The principal organs of the League are the Assembly, meeting usually once a year and representing all States; the Council meeting usually every third month and consisting of five permanent members (Great Britain, France, Germany, Italy and Japan) —and nine non-permanent members elected by the Assembly; the permanent secretariat; a whole series of special organisations and committees (for finance and economics, transit, health, armaments, mandates, intellectual co-operation, opium, traffic in women, etc.); and, working independently of the Council and Assembly, the Permanent Court of International Justice (*q.v.*) and the International Labour Organization (*q.v.*).

The respective spheres of competence of the Assembly and the Council are not exactly defined in the Covenant. Each may deal with any matter within the League's competence or affecting the peace of the world. In practice, the size, composition and times of meeting of the two bodies determine their functions. The Assembly affords an opportunity for an annual review, by the responsible representatives of the Governments of the world, of the international situation. It largely creates the atmosphere and determines the general lines of policy for the ensuing year, and it is a convenient instrument for the concluding stages in the negotiation of conventions and general agreements of world interest. The Council, on the other hand, has become the League's executive organ. It deals with the host of special questions that arise for settlement throughout the year, and directs the multifarious permanent tasks of the League and the special organisations through which they are carried on.

These special organisations are in some respects the most interesting feature of the League as an administrative machine. They consist for the most part of permanent committees, composed of specialists and experts drawn either from the departments of the national Governments or from private institutions. These experts live and work normally in their own countries, and have the special knowledge of national forces and conditions, and possess the national influence, which no purely international officials can retain. But they meet periodically as members of a regular organisation. By this system, which follows closely the principles of the inter-Allied central organisation built up in the later years of the World War, the League obtains an executive instrument more expert, more effective and more economical than could possibly be obtained by the unaided service of its own whole-time officers. It binds together the national administrations of the world and forms them into an instrument of international work. More than this, it permeates with its own spirit those who in their own countries are carrying on national work which reacts on the interests of other countries.

In these eight years thousands of such persons, no small proportion of those who throughout the world are forming and executing the policies which determine international relations, have learnt, in regular co-operation with those of corresponding position in other countries, the international point of view. It is thus a system which, apart from its direct utility, effects a peaceful penetration of the League point of view into national systems. In this elaborate and elastic system the permanent secretariat is the uniting element—the "coupling." Its importance results from the immense range and variety of the organs which it serves, and from the fact that these organs consist of councils, commissions or committees meeting periodically, not in permanent session, and consisting of persons whose main work is elsewhere, in their respective countries.

POLITICAL DISPUTES

It is the task of the League to prevent political disputes causing war. It is most successful where it has been able by patient work in improving international relations, to remove the causes of disputes before they arise. In this wider sense most of the work of the League has a political aspect In its mandates and minorities work, for example, the League is continually trying to establish conditions which will diminish the risks of future conflict; and in such a piece of international co-operation as the reconstruction of Hungary, the existence of political differences constituted one of the main obstacles to success, and their settlement one of its main rewards. The definite political disputes threatening to disturb international relations and, in some cases, the peace of the world, which have been submitted to the League of Nations are treated in this work under the individual headings, but something must be said here to illustrate the methods by which the League discharges its primary responsibility of preserving the peace.

The first of these disputes (1920–21) was between Sweden and Finland over the *Åland Islands* and resulted in a most notable success The second (1920–22) about *Vilna* (*q v*) was no less definitely a failure. The third issue, *Upper Silesia* in 1921 resulted from the incompleteness of the provision of the Treaty of Versailles. The settlement, of which details are given in the article SILESIA, has been considerably criticized both in Germany and Great Britain. It must be remembered, however, that the League had no authority to fix an ideal frontier line, but only to apply the treaty provisions. At least a decision was reached, a long-standing cause of dissension between the Allies was removed, work was resumed and rioting ceased. In a further case, an invasion of *Albania* (*q.v.*) in 1921 by Yugo-Slav troops was successfully arrested. The *Memel* (*q.v.*) case (1923) is another instance of a peace treaty question handed over to the League because the Allies, acting through their normal machineries, had been unable to settle it. The Council, after enquiry through an impartial Commission, secured the acceptance of a convention by both parties.

The Corfu Dispute.—A much more important dispute, affecting a principal Power, was brought before the League in the autumn of 1923. An Italian general and his staff, who were

engaged as representatives of the Conference of Ambassadors in fixing the frontier between Albania and Greece, were murdered on Greek soil, by persons unknown, on Aug. 27, 1923. The Italian Government demanded reparation and apologies of the Greek Government, who accepted some of the conditions and refused others. The Italian naval authorities thereupon occupied the island of Corfu, loss of life occurring in the operation (*see* CORFU). Greece appealed to the League, but also stated her willingness to accept any decision of the Conference of Ambassadors. The position of the Conference, as a body whose decision both parties agreed to accept and as itself directly interested, made the formal competence of the Council doubtful. The Council therefore confined itself to discussing detailed suggestions for a settlement and forwarding them to the Conference of Ambassadors. The Conference adopted most of these suggestions, but with an important modification on the question of reparation. With regard to this it dispatched an Allied committee of inquiry and, on receipt of its report, which it withheld from publication, it awarded Italy the full amount of reparation which she had demanded. Corfu was then evacuated. The immediate question thus settled, the Council referred to a committee of jurists the question of legal principle which the case had raised with regard to the competence of the Council, the right of coercive action and the responsibility of a State for political crimes committed on its territory. Unanimous replies were received to these questions and were transmitted by the Council to the Assembly; and the legal position was thus more clearly established as regards similar incidents in the future.

The case was an extremely intricate one, and there has been much difference of opinion as to the action of the League. The League facilitated a quick settlement, the early evacuation of Corfu and the avoidance of hostilities; and the actual proposals which it made as to the details of settlement are not open to adverse criticism. But it did not secure the adoption of all these proposals. The action of the Conference of Ambassadors, in giving its award while withholding the report on which it purported to base it, would have been impossible if the League had been in full control of the case. The factors which made effective League action difficult were partly the special and dual position of the Conference of Ambassadors in the question and partly, it must be recognised, the fact that one of the parties involved was a Great Power and that the general relations of the Powers were at the moment complicated by other questions of policy. The degree and limits of the League's action accurately reflect the extent to which it was possible to make a collective world opinion effective under the conditions created at the moment by the relations between the governments, and especially the Great Powers on the Council. That this collective opinion had an important influence on the settlement is indisputable, and the expression of this opinion, made possible by the meeting of the Assembly, was indeed a revelation to all who witnessed it of what is bound to be henceforth a new force of the first importance in the political life of the world.

Mosul.—The Conference of Lausanne in 1923 found that its most difficult question in the settlement of the terms of peace with Turkey was the frontier line between Turkey and the British "mandate" territory of 'Iraq. Agreement having failed, the treaty provided that Turkey and Great Britain should attempt to reach agreement by friendly negotiations, and that, if these did not succeed within nine months, the question should be referred to the Council of the League. The negotiations failed, and in Aug. 1924 the question was accordingly brought before the Council, which appointed a commission of three (a Swede, a Hungarian and a Belgian) to investigate on the spot. The commission worked for eight months and then presented a report in which, after reviewing exhaustively all the factors of the case, they recommended unanimously that the best solution would be for the disputed district, including the town of Mosul, to be included in 'Iraq if the British mandate could be continued for 25 years, but that, if this were impossible, it would be better to assign it to Turkey. When the Council had this report before them in Sept. 1925, they were faced with the contention of Turkey that the Council's task under the Treaty of Lausanne was one of mediation, not arbitration, and that no decision could be binding unless Turkey herself had assented to it. The Council asked an advisory opinion of the Permanent Court of International Justice, which replied that the Treaty had given arbitral powers and that the consent of the two parties was not required, though unanimity of the other members was necessary. With this opinion, the Council in Dec. decided, by a unanimous vote of all members other than the disputants, that the territory should be assigned to 'Iraq, subject to the prolongation of the British mandate and the assurance of full protection for the Kurdish population. The Turks refused to accept the Court's opinion that an arbitral decision was binding, and withdrew from the Council at which the above decision was taken. The British Government undertook to ask for authority to accept the prolongation of the mandate for 25 years or until such earlier date as 'Iraq could be accepted as a member of the League, and announced their intention to attempt the renewal of negotiations with Turkey.

During this difficult period the Council took various measures to assist in the maintenance of the *status quo* without hostilities and to investigate complaints as to Turkish deportations of Christians and violations of the frontier. The mission of Gen. Laidoner on behalf of the League for this latter purpose is of special interest as being the first of its kind. (For the general settlement *see* MOSUL.)

The Graeco-Bulgar Incident.—On Oct. 19, 1925 shots were exchanged between two Greek and Bulgarian sentries occupying frontier posts separated by 40 yards on the frontiers northeast of Salonika. On Oct. 22, Greek troops, under orders from Athens, entered Bulgarian territory through the Struma valley and penetrated about 8 km. on a front of about 32 kilometres. Bulgaria telegraphed an appeal to Geneva asking the secretary-general to convene a special meeting of the Council under the powers conferred on him by Article 11 of the Covenant. This appeal arrived on Friday morning, Oct. 23. The secretary-general at once decided to convene the Council, and after telephonic conversation with M. Briand, the president for the time being, fixed it at the most quickly accessible place, Paris, and at the earliest date physically possible for members requiring to come from Stockholm, London and Rome, namely, Monday, Oct. 26. At the same time it was arranged that a telegram should be sent to both Governments in M. Briand's name, as president, calling on both sides to abstain from all hostilities. This telegram was also dispatched the same Friday morning. Preparations had been made for a Greek attack on the Bulgarian town of Petrich with a force of 1,000 men and three batteries at 6 A.M. on Saturday, Oct. 24; and the Bulgarian Commander had orders to resist. Briand's telegram, arriving in the two capitals on Friday, was immediately effective. Orders arrived from Athens just in time to stop the Greek attack on Petrich.

On Monday, the 26th, the Council met in Paris. The situation of immediate danger, viz., the presence of Greek troops on Bulgarian territory, was at once dealt with. Evacuation was demanded within a time-limit of 60 hours, and an assurance that the necessary orders had been given was asked within a time-limit of 24 hours. The same day orders were telegraphed to British, French and Italian military attachés to proceed from Belgrade and Athens to supervise the evacuation. The attachés received their instructions on Tuesday, proceeded immediately by special trains, and arrived on the scene of action about 2 P.M. on Wednesday, Oct. 28. There followed one of the most dramatic and significant scenes in history. The attachés at once summoned the two commanders and gave them detailed instructions in the name of the League of Nations as to the evacuation, prescribing the time at which the evacuating troops should move and the interval which was to elapse before Bulgarian troops might enter the abandoned territory. Within about 11 hours of the officers' arrival, and eight hours before the expiration of the time limit, the last Greek soldier left Bulgarian soil.

The Council proceeded to deal with the question of reparation and of safeguards against the recurrence of similar incidents. They appointed a commission, under the chairmanship of Sir Horace Rumbold, and including French and Italian generals and Dutch and Swedish civilian members. The commission reported

to the Council at Geneva at its meeting in the first week in December. Its findings (*see* BULGARIA) were approved by the Council and accepted by the two Governments. The incident was closed and future security in the Balkans substantially increased.

The League in this case acted with promptitude and efficacy. The spirit expressed and developed at the recent Locarno conference, the relative weakness of the countries directly concerned and the fact that this was the kind of problem with which the League was designed to deal, and was not complicated by the difficulties of incompletely defined treaty provisions, all doubtless contributed to this result.

These cases have been chosen as best illustrating the character of the political problems with which the League was faced during the years 1920–5, and its method of working. Other disputes were brought before the League: between Hungary and Rumania, about the compensation of certain Hungarian nationals expropriated in Transylvania (an intricate question which has appeared on the Council's agenda for over two years without so far any settlement being reached); between Hungary and Austria about the Burgenland; between Hungary and Czechoslovakia about a frontier delimitation; between Finland and Russia about Eastern Karelia; a frontier dispute (Jaworzina) between Poland and Czechoslovakia, and a dispute between France and Great Britain with regard to the nationality of persons born of British parents but resident at Tunis.

Two Comments.—In reviewing the League's action in these political disputes as a whole, two comments at once suggest themselves:—

1. The extent of the League's power to act effectively necessarily varies with the general international relations of the governments in and outside the League. After Locarno the Council dealt promptly and decisively with the Graeco-Bulgar trouble. With the Vilna incident, which occurred when the relations between the principal Powers were difficult and complicated by many divergencies of policy on other questions, the action is slow, indecisive and unsuccessful.

2. The League, whose normal task is to preserve peace on the basis of treaties fully concluded, is placed in a difficult position when it is asked to complete the work of settling terms of peace. In the Upper Silesia, Memel, Vilna and 'Iraq cases this was a complicating factor. In such cases the treaties are either incomplete or ambiguous; they may be complicated by *obiter dicta* in the course of the negotiations; the League is held responsible by public opinion not only for a decision within the limits of its mandate but for the character of the mandate which it has had no power to vary; and by the very fact that it is continuing the work of making terms imposed by a victor its impartiality is compromised.

DISARMAMENT AND SECURITY

The reduction of armaments is the first of the specific tasks imposed by the Covenant. There is none on which the League has achieved so little direct and tangible result, for armaments remain, in the world as a whole, at a level not very substantially lower than in 1913, and no reduction is directly traceable to League action. But the indirect results have been of great importance. For it at once appeared that reduction of armaments required an increased sense of security; and the search for methods of obtaining this led to the growth of a belief in all-inclusive arbitration, the most notable and fruitful political development since the Covenant.

The first action of the League was to appoint a "temporary mixed commission" to prepare the way for armament reduction. This commission, consisting partly of politicians (though not representing their Governments), partly of military and other technical experts, and partly of persons representing special classes of public interest (*e.g.*, working-class opinion), finally elaborated a draft treaty of mutual assistance. The basic principle was a combination of a general and special guarantees. Within the cadre of a general treaty, groups of States would enter into detailed arrangements to support each other if attacked, and as a condition of being entitled to this support they would agree to proportional disarmament. The proposal was criticised on the ground that the detailed plans for reciprocal military support contemplated would be unlikely in fact to lead to reduced armaments and, above all, that the authorised grouping of friendly States against prospective enemies was in conflict with the essential spirit of the League. At the 1924 Assembly, when it was clear that these objections would be fatal to the draft Treaty, the whole problem was reviewed on another basis. In a month the "Geneva Protocol" was elaborated and unanimously agreed for recommendation to the Governments (*see* SECURITY). This second scheme also failed to win acceptance, the new Conservative Government of Great Britain taking the lead in its rejection as the previous Labour Government had led the opposition to the earlier treaty. Great Britain was not prepared to accept the unlimited obligation of arbitration in her own disputes, or the responsibility of assisting the enforcement of such arbitration over an unrestricted range of other countries who might accept the obligation.

When all is said, however, it is difficult to regret even the haste of the 1924 Assembly, for the demonstration which it gave of the genuine desire of a large part of Europe for all-inclusive arbitration, and the impetus it gave to the movement towards arbitration throughout the world, have been among the most important factors in political history since 1919.

Certainly the preparation of these two schemes was essential to the Locarno agreements of 1925. By "preparation" of course is not meant merely the technical elaboration of the proposals. In international agreements, that is always the least part of the work. It is the preparation of the public opinion of the world, of the minds of ministers and their advisers, which is the important thing. The preparation, in this wider sense, at Geneva was the indispensable basis of the Locarno treaties. These treaties provide for all-inclusive arbitration, on very much the Protocol principle, but over a restricted though wide range of countries; and for mutual guarantees and support somewhat similar to those of the original treaty of mutual assistance. It is, however, of their essence that the main vital guarantee is "bilateral" and not based upon a grouping of Powers presumed to be friendly against others presumed to be unfriendly.

Meantime the movement towards arbitration has found further expression in the conclusion of a large number of bilateral agreements. As a complement to these, less specific in its provisions but more universal in its scope, is the Treaty, signed in Aug. 1928, for the renunciation of war "as an instrument of national policy" (*see* OUTLAWRY OF WAR). By the side of this movement, developed outside but obviously aided by the political preparation of the League, the League itself (working through a "Preparatory Commission" for the Disarmament Conference), has proceeded with detailed work designed to increase the sense of security. It has prepared plans for assisting the Council to take effective action in case of a threat of war (under Art. 11 etc., . . .), these plans ranging from the improvement of material facilities of communication by telegram, wireless, telephone, etc., . . . to the drafting of an interesting plan of "financial assistance to the victim of aggression" (which is still under consideration). Effective measures of disarmament are still awaiting an increased sense of security; and while some advance has been made in the technical work of arranging the form in which reduction of armaments could most suitably be expressed, the date of an effective Disarmament Conference is still uncertain. The abortive Naval Conference of 1927, which though held at Geneva was conducted quite independently of the League, did not advance the general problem. Meantime, as might be expected, increasing emphasis is being placed by Germany on the assurance given to her at the signature of Peace that her disarmament was intended to be followed by reduction of armaments of other countries. Ultimate advance of course depends upon the public opinion of the different countries.

THE SAAR, DANZIG, MANDATES, MINORITIES

In certain areas of the world the League, normally an instrument through which sovereign States settle their differences or co-operate in matters of international concern, has itself direct and special responsibilities for government and administration.

In the Saar it has the full responsibility of a sovereign State, exercised through a Permanent Commission appointed by and responsible to the Council. The small free city of Danzig is under its special protection, and a resident High Commissioner of the League acts as arbitrator on disputes between the free city and Poland. Over the large area of the mandated territories separated from the German and Turkish Empires by the terms of peace, it is responsible for seeing that the mandatory powers govern and administer in accordance with the mandate and the provisions of the Covenant. And in a number of States it has duties with regard to the protection of minority populations.

The Saar Basin.—The Saar Basin is a large mining district, with a predominant German population of some 700,000, which the Treaty of Versailles transferred from Germany to the trusteeship of the League for 15 years, after which its future fate is to be decided by a plebiscite. The treaty prescribes the form of government, through a Governing Commission, subject to the Council of the League only, the inhabitants having no rights of representative government outside purely local administration, though the Commission is required to consider the views of elected representatives before changing the laws or imposing new taxes. The treaty also transferred the property in the mines to France in compensation for the destruction of the mines in Northern France.

The Saar Government is thus, by treaty provision, not by League decision, purely autocratic and unrepresentative. With an overhanging plebiscite and situated between France and Germany, it was inevitable that its inhabitants should have developed an extremely sensitive political consciousness and that the district should have been a mirror reflecting the controversies of its two great neighbours. There has in fact been considerable political friction and tension, varying directly with the changing political relations of France and Germany.

The main grievances, substantial though they had often been, have in reality been for the most part complaints against conditions which the provisions of the treaty made practically inevitable. Entrusted with the execution of terms imposed by the victor, the League is at once compelled by those terms to action which bears the mark of its origin, and at the same time is criticised by the standards properly applicable to an international authority which is not only impartial but unfettered. Since the entry of Germany into the League, and the general improvement of her relations with France which followed Locarno, difficulties about the Saar have become of much less importance.

Danzig.—The free city of Danzig, a small wedge between East Prussia and the Polish Corridor, is important as the chief outlet to the sea for Polish trade. To act as a kind of court of first instance for the disputes bound to arise out of the intricate and nicely balanced provisions of the Danzig constitution (*see* DANZIG), it was provided by the Treaty of Versailles that the League should appoint a resident High Commissioner, a further appeal lying to the Council. There was great tension and mutual suspicion throughout practically the whole of the first six years between Danzig and Poland, such as sometimes almost to make negotiations between the two impossible. Under these conditions the Council has had to devote much time at nearly every meeting to disputes of which the one about Poland's right to have post-boxes under her own control within Danzig is typical and the best known. The economic life of the city has on the whole been satisfactory, the vessels entering the port and the exports rising considerably above the pre-War level. The huge inflation of the German mark caused great difficulties, however, and capital was urgently needed to adjust Danzig's port and other facilities to the new conditions. The League gave an expression of its special interest in the city by assisting her to introduce successfully a stable currency of her own and later to raise first a municipal loan for development purposes, and later a financial stabilization loan for the Free City.

Mandates.—The German colonies and the Arab provinces of the Turkish Empire, ceded as a result of the World War, were not transferred to other States in full sovereignty. Their administration was entrusted to different mandatory powers under the general supervision of the League. For the terms on which the mandates were given and the general supervision exercised by the League through the permanent mandates commission, *see* MANDATES.

It is difficult to measure the extent to which this system of supervision does in fact modify colonial administration. No indication can of course be found by searching the League records for instances of censure and repentance. That is not the way in which the influence of a collective opinion operates, or can operate without disruptive results on the conduct of Great Powers. That does not mean, however, that this influence is not profoundly effective. Mandatory powers and their administrators are keenly sensitive to the candid and informed criticism which is always forthcoming in the Commission's meetings, even if it finds little reflection in the public resolutions; and the desire to avoid risk of exposure to it is a factor in daily colonial administration comparable with the influence exercised by Parliament on Whitehall by the right to ask questions of the responsible minister.

Minorities.—The work of the League in the protection of minorities (*q.v.*) is one of the most important, and perhaps the most delicate of all its current duties. Nine States are under treaty obligation, and five others have by declarations accepted a similar engagement, to observe in their administration certain principles designed to secure to racial and religious minorities within their territories protection of life and liberty, the free exercise of religious rights and the free use of their native tongue, with opportunities of education in it where it is the native tongue of a considerable proportion of the population. The minorities number in all some 30,000,000; many are so situated that no possible treaty provisions or frontiers could have given them rights of sovereign self-government without creating innumerable States or enclaves. They are free citizens of the States to which they belong, and the only ultimately satisfactory solution is that they should become indistinguishably incorporated in the general political life of the country. In the meantime the racial, religious and traditional feelings of enmity between them and those who form the majority of the population subject them to the dangers of differential majority government and administration.

The difficulties so caused constitute perhaps the greater part of the political troubles and political dangers of Europe. It is a problem of peculiar delicacy, for the minorities constitute a kind of State within the State, and interference with or even open criticism of the Government on which the daily conditions of their life depend may always do more harm than good. For this reason complaints are only considered officially by the Council if they are put on the agenda by a member of the Council, who satisfies himself that they are sufficiently serious and well founded to justify this action; and the council itself deals directly with these questions, not entrusting them beforehand to any technical committee. The League's influence is exercised for the most part in the form of private representations and conversations which gain their authority from the fact that the sanction of a public discussion at the Council always remains as a possibility in the background.

Economic and Financial Reconstruction.—The reconstruction work of the League shows, better than anything else, that the League is not confined to a limited range of special tasks, but is an instrument which the Governments of the world can use for any form of international co-operation they wish to undertake. The Covenant imposes scarcely any specific economic or financial duties. It implies the preparation of economic sanctions; it contains the obligation to secure and maintain freedom of communications and transit and (in a vague and ambiguous phrase) equitable treatment for the commerce of all member States; but there is nothing which directly contemplates such tasks as that of the financial restoration of a country.

The League's work in this sphere began with the Brussels financial conference held under its auspices in Sept. 1920. Experts from 39 countries, named by the Governments but not representing their policy, met to consider the methods by which stable finances and currencies could be restored. They drew up a series of unanimous resolutions which, elaborated as they were by the later Genoa Conference of 1922, have since served as a useful guide and support to countries attempting to restore their finances. More important, however, than the establishment of this general

body of doctrine was the League's practical work in itself restoring the finances of two countries, *Austria* and *Hungary*, whose problem was beyond their own unaided resources. (*See* AUSTRIA; HUNGARY.) This was pioneer work and the success achieved was a most valuable encouragement and example to financial restoration in other countries in Europe. If currency fluctuations have now ceased practically throughout the world, this result—or at least the date at which it has been achieved—owes much to the first experiments in Austria and Hungary.

Greek Refugee Settlement.—Reconstruction work of a somewhat different kind has been undertaken by the League in the settlement of Greek refugees (*see* REFUGEES) who to the number of nearly 1,500,000 or more than a fifth of the population of Greece, fled back to Greece as a result of the Graeco-Turkish War, a task evidently beyond the unaided resources of the country. With the aid of the League a loan of £10,000,000 was raised and employed to settle the refugees in productive employment, mainly upon the land. The work, directed by a refugee settlement commission, consisted of an American chairman and a British vice-chairman, selected by the League, and two Greek members, chosen with the Council's approval by the Greek Government. The bulk of the refugees were housed, allotted land, and started on their new careers with a small initial capital and the necessary equipment. (Subsequently a second loan of £6,000,000 has been raised under League auspices, partly to secure financial stabilisation in Greece, and partly to complete the work of refugee settlement.)

Bulgarian Refugees.—A similar problem, on a smaller scale, was in 1926 undertaken in Bulgaria. £2,250,000 was devoted to building houses and settlements under the control of a League Commissioner in conjunction with the Government. As in Greece it was found necessary to supplement this by a financial reconstruction scheme. A plan involving a loan of £5,000,000 has been approved, but the loan has not yet (July, 1928) been issued.

Among other work carried on under the direction of the financial committee have been the introduction of a new and stable currency, later followed by a municipal loan, for Danzig; financial advice to Estonia and Albania; and a study, which is still continuing, of the problem of double taxation.

Trade and Commerce.—Meantime there has been patient work at the task of securing more "equitable treatment" for commerce in the spirit of Article 23 of the Covenant, and in removing impediments to international trade. Up to 1927 the most important achievement in this sphere was the conclusion in Oct. 1923, of a convention for the simplification of customs formalities. In addition, a convention has been arranged which has removed some of the obstacles to commercial arbitration. Work has also been done upon the equitable treatment of foreigners (the recommendation of a code of principles to guide Governments in their treatment of foreign enterprises established in their territories) and the suppression of fraudulent trade marks.

World Economic Conference.—In May 1927, the World Economic Conference, perhaps the most authoritative body of experts which has ever met to discuss world economic problems, immensely widened the range and changed the scale of this work. The conference was preceded by nearly two years of preparation on a wide international basis. When it met it showed, with surprising force and unanimity, that now that currency fluctuations had practically come to an end the chief obstacle to economic progress was to be found in the weight, complexity and frequent changes of tariffs and trade barriers. It also advised that the development of "international industrial agreements" (the so-called cartels) should be watched and reported upon, and made some recommendations as to agricultural questions. The Conference left a great mass of detailed work, mostly designed to remove or reduce "trade barriers" in their multifarious forms, to be executed under the direction of the Council with the help of its economic committee (a body consisting mostly of the chief officials of the Boards of Trade of the principal countries and meeting four times a year). A new permanent committee, "the economic consultative committee," which meets annually and is in its range of qualification and nationality a kind of miniature world conference, has also been set up to follow the general progress of the work. An important convention has been signed for the abolition (with limited exceptions) of all prohibitions (as distinct from tariffs) on exports and imports. It is too early to estimate the general results, but the review of the first year (ending May, 1928) showed that the rapid upward movement of tariffs had apparently been at least arrested. Much depends, both for world prosperity and for the establishment of the conditions favourable for peace, upon the future success of the policy so authoritatively recommended by the Conference.

Communications and Transit.—A communications and transit committee, with numerous subcommittees, includes experts in land, sea and air transport, and is responsible to a periodical conference. The first important conference was held at Barcelona in 1921, when two conventions were approved laying down the general principles that transport originating in one State and crossing a second into a third, or transport making use of through international waterways (*see* INLAND WATER TRANSPORT), should enjoy complete liberty of transit with equal treatment for all flags and freedom from customs duties and vexatious dues. A second conference held at Geneva in Nov. 1923 dealt with international railway traffic, equality for shipping in maritime ports, the transmission of electric power across a third State and the development of hydraulic basins situated between two or more States. The maritime ports convention, drawn up at this conference, provides for equal treatment of all States in port dues and regulations, while the railway convention codifies existing railway practice as regards international traffic and aims at simplifying frontier formalities for passenger and goods traffic. All the conventions concluded at these conferences provide for machinery of compulsory arbitration similar to those contained in the clauses of the Peace Treaties of 1919 relating to communications and transport. In such cases the transit committee of the League acts as a mediatory body before a case goes for compulsory settlement to the international court of justice. The transit organisation has been instrumental in effecting considerable improvements in the passport system (particularly in the abolition of visas in many cases).

Among other questions studied are the reform of the calendar, commercial aerial law, wireless regulations, international motor drivers' licences, etc.

MISCELLANEOUS QUESTIONS

The League is also an instrument of positive co-operation in work of general benefit to the world. The short space here allotted to this must not be taken as an adequate measure of its relative importance in the general achievements of the League.

Health Work.—The League has the assistance of a technical health committee, composed, like the financial, economic and transit committees, of experts. This health organisation has the active co-operation of the United States and Russia, as well as the member States, and its activities have extended throughout Europe and the Eastern Mediterranean, tropical Africa and the Far East.

In Poland an Epidemic Commission with western experience helped to prevent the spread of typhus through Poland to Europe. For this purpose it was necessary to attack the problem in Russia itself, and the Commission went to Russia, established effective co-operation and opened offices in Moscow and Kharkov. This was followed by a European conference at Warsaw in May 1922, attended by Soviet Russia, the Ukraine, Turkey, Germany and 24 other States. A draft convention was drawn up and has since become the basis of bi-lateral agreements between the nations adjoining Poland and Russia. Public health courses were arranged for health officers at Moscow, Kharkov and Warsaw. The Epidemic Commission next gave assistance to the Greek health authorities in dealing with the dangers of epidemic resulting from the sudden immigration of masses of Greek refugees in and after the Graeco-Turkish war.

Apart from such emergency assistance, much has been done to secure an interchange of knowledge and experience between the public health organisations of the world, to promote their co-operation and to study the characteristics of special epidemic or endemic diseases and the methods of combating them. Various

missions have visited the Eastern Mediterranean, the Far East, Greece and Albania, the Balkan States, Russia and Italy, Palestine and Syria and Persia. Scientific work is also being done with a view to the standardisation of sera and of certain drugs for the treatment of diphtheria, tetanus and dysentery.

An interesting experiment, which has been made possible on a large scale by the generosity of the Rockefeller foundation, is the interchange of selected officers of health administrations. Officers of one country visit those of another, study their methods, participate for some weeks or months in practical work and then meet at Geneva to compare results. Lastly, the health organisation maintains an epidemiological intelligence service, publishing at regular intervals detailed information of the movement of epidemic disease throughout the world.

Drug Traffic.—Of what may be called the social questions handled by the League the control of noxious drugs, and particularly opium, has been the most difficult and important. The League took as its starting point the Opium Convention of 1912, which had been signed by most countries in the world. An advisory committee was appointed to prepare a plan to make the application of this convention, more effective in practice. They took as their aim the restriction of the traffic to medicinal and scientific requirements, and started an investigation to discover the extent of these requirements. The U S. Government sent a delegation to participate in the work of this committee, and in any conference which might follow, and to attend the 1924 Assembly which reviewed the progress of the previous year and a half. Plenipotentiary conferences followed in the winter of 1924-5. The first of these dealt with the question of the gradual suppression of opium smoking in the Far East with a view to its ultimate abolition. At this an agreement was reached under which the signatory States undertook (*a*) to strengthen the measures already provided for in the convention of 1912 and (*b*) to suppress entirely the consumption of prepared opium in their respective territories within 15 years from the date at which the poppy-growing countries should succeed in preventing the clandestine exportation of raw opium from constituting a serious obstacle to the restriction of consumption in the former territories. The second conference drew up a convention for the more effective restriction of the production or manufacture of narcotics and of the international trade in them. The latter is to be controlled in particular by a system of export authorisations and import certificates. A permanent central board is to be established which is to receive periodical estimates from the contracting parties of the quantities of narcotics they need and ask for explanations if they are such as to suggest a danger of illicit traffic A further protocol engages the signatory States to take measures which shall completely prevent, within five years, the smuggling of opium out of their territories from constituting a serious obstacle to the suppression of the use of prepared opium in other countries.

White Slave Traffic.—Certain work has also been done by the League in connection with the traffic in women and the protection of children. A convention was drawn up by the 1921 Assembly strengthening in certain respects the provisions of two pre-War conventions dealing with traffic and has been signed by 33 States. More important perhaps has been the effect on public opinion of an investigation conducted on a wide scale as to the conduct of the traffic in many countries. The attention attracted by the report of this investigation seems likely to have a considerable effect upon policy. The problem is also being studied by one of the two committees of the Commission for the protection and welfare of children and young people, which includes representatives of voluntary organisations and makes annual recommendations to the Assembly. The study of child welfare is undertaken by the child welfare committee of this commission.

Apart from this general work the League took direct practical measures in 1921 to rescue, and where possible restore to their own people, women captured and removed from their homes during the military operations in the Near East, houses of refuge being established at Constantinople and Aleppo. Lastly, in 1923, the League arranged a conference at which a convention was drawn up to assist in the suppression of the international traffic in obscene publications.

Humanitarian Work.—Two important pieces of humanitarian work have been undertaken by the League through Dr. Nansen. In 1920 large numbers of war prisoners were still in Russia and adjacent countries awaiting the means of repatriation. With the aid of certain charitable societies Dr. Nansen organised a fleet of steamers under League charter in the Baltic and Black seas and 427,386 prisoners of 26 different nationalities were repatriated at the astonishingly low cost of less than £1 a head. Dr. Nansen also undertook somewhat similar work for the settlement of large numbers of Russian refugees. Their movements were assisted by the invention of a special system of identity certificates, as a substitute for passports, and considerable progress has been made in finding them employment. (*See* REFUGEES.)

Two other pieces of humanitarian work may be mentioned in conclusion, a convention drawn up at the 1925 Assembly for the suppression of slavery (*q.v.*) and restriction of forced labour, and the scheme prepared by Senator Ciraolo and now being worked out in collaboration with Red Cross organisations, for the provision of insurance against national calamities such as earthquakes. Among other tasks, the most novel departure has perhaps been the work of the committee on Intellectual Co-operation (*q.v.*), presided over successively by M. Bergson, Dr. Lorentz and Prof. Gilbert Murray and including among its other members Prof. Einstein and Madame Curie.

Under Article 24 of the Covenant some international bureaux established by convention must be, and others may be, brought under the League. Four such organisations have now been affiliated, viz.: a relief bureau (for the repatriation of distressed persons), a hydrographic bureau (to secure co-ordination in hydrographic work), an office for the control of liquor traffic in Africa and a committee for air navigation. The question of closer relations with the Institute of Agriculture at Rome is now under discussion. The League issues a handbook giving information about some 360 international organisations and a quarterly bulletin giving some account of their work. Limits of space have forbidden an account of much of the work of the League, among which may be mentioned the convention on the traffic in arms, a Press Conference, and the work now in progress on the codification of international law.

CHANGES IN THE COUNCIL, MACHINERY AND METHODS OF WORK

The decision of Germany to enter the League, after the Locarno agreement, marked a stage of the first importance in the development of the League. Hitherto the Council had included no belligerent in the World War except those on the Allied side, and the League itself only those of secondary power. It was of course understood that Germany's entry would and should be simultaneous with her election as a permanent member of the Council. The whole balance of forces and interests which finds its expression in Council decisions would necessarily, and rightly, be changed. The distinction between permanent and non-permanent members on the Council, however, had aroused some jealousy, and the election of Germany was taken as the occasion for putting forward claims to a permanent seat for Spain, Poland and Brazil (and later China). These claims were not accepted, but they led to considerable constitutional changes. The Council was enlarged to 14, Germany being added to the permanent members, and the non-permanents being raised from 6 to 9. It was arranged that the non-permanent members should normally have a tenure of 3 years, three retiring each year on a rotation system; but it was provided that three members may, by a two-thirds majority of the Assembly, be accorded a longer tenure. This provision did not satisfy Spain and Brazil, who gave notice of withdrawal from the League. The former cancelled the notice before the expiration of the statutory two years and therefore remains a member, but Brazil's withdrawal took effect in June 1928.

Meantime the enlargement of the Council, the inclusion of Germany, the gradual disappearance from it of most of the personalities who had been most prominently associated with the early days of the League made it in character, and in some respect in its

outlook and method of working, a different body from the earlier and smaller body. This development accompanied an important change in the attitude to the League of the principal Governments. In the first years most of the more immediately practical questions had fallen outside the League; the League itself was at once comparatively unfettered in discussion but weak in action. Gradually the League has become recognized as a definite and permanent institution through which, and not outside which, the Foreign Offices work and conduct their negotiations. The Foreign Ministers of the great Powers, and of some others, attend regularly; each main Foreign Office has a special branch for following League questions; and the League has become for each of them an important organ, though not the only one, through which they press their respective policies. It is natural therefore that, for both good and ill, the League has become less idealistic and more realistic. The greater interest of the Foreign Offices in the League is perhaps reflected in the increased proportion of *diplomats de carrière* now in the higher posts in the Secretariat, a change which has been welcomed by some as assisting a closer *liaison* with the national administrations and criticized by others as possibly endangering, if it passes certain limits, the spirit of the Secretariat as an international civil service. Lastly it is a characteristic of the new stage of the League's development that the smaller countries sometimes complain that they have a less influential voice in Council decisions. This does not mean that a small country used to have, or claimed to have, as powerful an influence as the great Powers. But a country like Sweden had an influence of a special kind, and many think of a very valuable kind, because she was often more interested in the principles upon which a given dispute was settled, and their permanent effect in moulding League policy, than in the substance of the particular settlement. Few political settlements are based solely upon a principle of general application; most contain also elements of a bargaining compromise. But the proportions in which the two elements are found varies greatly and some have feared that the latter may tend to increase. Such are the main features of the League's recent development. They are all signs of the League being more deeply rooted in the actual life and real forces of the world, a development which means greater strength and at the same time possibly new dangers. The once delicate infant is now strong and sturdy; it will live, and act; interest turns from anxiety as to its life to questions as to its probable character.

SUMMARY OF WORK

In these nine years (1919–28), therefore, the League has averted hostilities in some half-dozen cases and probably prevented at least minor wars in several of them. It has made a substantial contribution to Europe's recovery by the guidance and influence of the Brussels Financial Conference; by the direct reconstruction of Austria and Hungary; by the model so afforded for the solution of the German problem, and the self-restoration achieved in other countries; and by a series of transit and customs formalities, Conventions and other measures designed to remove the impediments to international trade. It has repatriated some hundreds of thousands of refugees and established nearly 1,000,000 in productive employment in Greece and Bulgaria. It has exercised a varying but increasing influence over the Government of some 30,000,000 of minority populations entrusted to its guidance. It has supervised the mandatory administration of the former colonial Empire of Germany and Turkey. It has directly governed the district of the Saar and has assisted in the government of Danzig. It has worked at a number of social problems, the regulation of opium and other drugs, and the protection of women and children.

Apart from these tangible and visible results, it has penetrated and modified the policies of national governments through the regular contact, and co-operation in international work, of Foreign Ministers, quarterly and annually at meetings of the Council and Assembly, and of their advisers and technical assistants both at these meetings and at a series of technical conferences and discussions. Beginning with disarmament but extending to security, it has prepared the way for the great extension of comprehensive arbitration embodied in the Locarno agreements and doubtless destined to extend beyond them.

On the other hand, the League remained long impotent before the protracted conflicts which reflected the incompleteness of the conclusion of peace in 1919 both in diplomacy, as in the reparation question, and in actual hostilities, as between Greece and Turkey. In some of the disputes which it has handled, it has been indecisive or ineffective; in others, the nature of its action has apparently been determined as much by the relative strength of the disputants as by considerations of ideal justice. It has made no material progress in securing disarmament. Its work in removing the fundamental causes of war, and in particular those which spring from economic policy, has only begun.

Whether these results will be regarded as disappointing or as satisfactory will doubtless depend mainly on the standard by which they are judged. By comparison with the pre-War position and methods of negotiation there can be no doubt that they represent a very great achievement. No better illustration can perhaps be found than in two references to Lord Grey's book, *Twenty-five Years* (1926). Of the London Conference of Ambassadors of 1913, for example, he says in effect that it lasted eight months, discussed minor questions and settled nothing, but was well worth while because it gave the world a sense of confidence to think that there was some method of international contact during a period of tension.

In contrast with this, the Assembly of 1928, one of the least spectacular of recent years, in three weeks dealt with a mass of useful work, of real if secondary importance, and the assurance of a regular method of international contact is now not temporary but permanent. Still more significant is the account which Viscount Grey gives of the conference of the Balkan Powers when they met, as it happened in London, after the first Balkan conflict of 1912. He believed that the policy they were discussing would mean both the resumption of war and a disastrous result, as indeed it did. But neither Great Britain nor any other Great Power was directly concerned. If his opinion were asked in unofficial conversations he gave it, informally, tentatively—and in fact without effect. Neither he nor anyone else felt able to intervene in a matter directly affecting only the negotiating States. The second disastrous war followed. In contrast with this the settlement of the recent Graeco-Bulgar dispute of 1925 illustrates the recognition of the new principle that a war is the concern of the whole world.

If, however, our standard of judgment for the results of the eight years is not the pre-War position but the ultimate ideals of the League, it is no less clear that the League's work is only in its infancy. The League is not yet universal in its composition. Its ability to deal with a first-class dispute between first-class Powers has fortunately not yet been tested. There is as yet no complete assurance that such a dispute would find the League united and effective. Nor has more than a beginning been made in removing the causes from which such disputes may arise. This, the ultimate object of the League, must in the nature of the case be a progressive, and indeed a permanent task. It means a complete, if gradual, revolution in the traditional and historic attitude of the nations of the world to each other and a transformation of many of their policies. In this work the League may lead, but it can never advance far beyond, the public opinion of the world. The scope is illimitable and the task unending.

BIBLIOGRAPHY.—The main authorities are the League's own publications, which give complete information as to all its activities. In the first place the *Official Journal* contains the minutes of the Council with the documents presented to it; while the records of Assembly meetings are issued in special supplements. All Treaties registered under Article 18 of the Covenant are published in the *Treaty Series*. All reports of specially appointed League Commissions are at once published, as are also the periodical reports of permanent officers and authorities carrying on League work (such as the Commissioners General in Austria and Hungary, the Greek Refugee Settlement Commission, the Saar Governing Commission, etc.). As these official records are very voluminous the League also publishes (*a*) an abbreviated *Monthly Summary*, giving a regular account of League activities and (*b*) a series of special pamphlets as to special tasks (health work; reconstruction of Austria; mandates,

etc.) and a general summary "A Survey." In addition, the League issues technical publications on various subjects of world interest. Of these the most important are the *Economic Publications* (including a *Monthly Bulletin of Statistics*, which gives a synopsis of all main statistics indicative of economic development throughout the world, and annual publications on *Currency, Public Finance, Trade and Commerce*), a *Military Year Book* and a *Monthly Epidemiological Report*. These publications are issued in English and French through League agents (in England Messrs. Constable).

Books on the League work are numerous, especially with regard to special subjects (the Saar, Opium, etc.) and the general principles and conception of the league. Of those which summarise the general work of the League the following may be mentioned: Publications by the League of Nations Union (1920, etc.); Organisers of the League of Nations. *The League of Nations Starts* (1920); W. Schucking and H. Wehberg, *Die Satzung des Volkerbundes. Kommentiert* (1921); L. V. A. Bourgeois, *L'Oeuvre de la Société des Nations 1920–1923* (1923); P. Munch, *Les Origines et l'Oeuvre de la Société des Nations* (1923); R. Williams, *The League of Nations To-day* (1923); H. G. Alexander, *The Revival of Europe* (1924); M. Fanshawe, *Reconstruction*, a full summary to 1925, well documented (1925). League of Nations Information Section, *Pamphlets on the League of Nations*, its Covenant and its various activities; P. J. N. Baker, *The Geneva Protocol for the Pacific Settlement of International Disputes* (1925); Sir G. G. Butler, *A Handbook to the League of Nations, brought down to the end of the 5th Assembly, with an explanation of the* Protocol . . . with an introduction by the Right Hon. Viscount Cecil of Chelwood, 2nd ed. (1925). The publications of the World Peace Foundation include a number on the work of the League. Among these are *Handbook on the League of Nations, 1920–24*, and the *Yearbook of the League of Nations* (1925). (A. SA.)

LEAGUE OF NATIONS AND EDUCATION. The question of interesting the younger generation in the ideals and aims of the League was first raised in the Assembly of the League in 1923. The 1924 Assembly instructed the secretariat to make it a subject of special investigation.

Proposals.—A report was presented to the Assembly in 1925, who decided to request the international committee on intellectual co-operation "to consider the possibility of summoning a sub-committee of experts to consider and co-ordinate the means for making the League of Nations known to young people, and for familiarizing them with the idea of international co-operation."

The committee on intellectual co-operation accepted this proposal. A sub-committee was appointed and its report was submitted to the Assembly of 1927. It recommended: (1) Instruction in the League in international co-operation as part of the formal education of every child; (2) such instruction, where possible, to be correlated with the geography, history, civics or moral instruction; (3) special attention to the subject in training colleges; (4) similar instruction in all special schools, agricultural, technical, military, etc.; (5) provision of special literature, including reference books by experts; (6) facilities for special courses for teachers at Geneva, etc.; (7) special lectures in universities as to international law compulsory for all law students.

As regards administrative machinery, the report recommended: (*a*) A national conference in each country "to ensure co-operation between the administrative authorities, teachers and voluntary associations;" (*b*) an official centre for information concerning the progress of the work; (*c*) the maintenance of the sub-committee of experts to review progress and consider further action. Meanwhile the Assembly of 1926 had passed a further resolution asking the Governments and other competent authorities to provide scholarships to enable students to visit Geneva before and during the Assembly, so as to obtain a first-hand knowledge of the League.

Results Attained.—Up to Aug. 1928, 25 Governments had sent in reports to the secretary-general recording progress: South Africa, Argentine, Australia, Belgium, Bulgaria, Canada, Cuba, Denmark, Estonia, Finland, Greece, Guatemala, Hungary, the Irish Free State, Liberia, Lithuania, Holland and the Dutch Indies, New Zealand, Nicaragua, Rumania, Salvador, Siam, Venezuela and Yugoslavia. One Government, that of Great Britain, had held a national conference of local education authorities. Eight Governments (Czechoslovakia, Denmark, Hungary, Italy, Poland, Rumania, Sweden and the Saar Territory) had awarded scholarships to enable students to visit Geneva and gain a first-hand knowledge of the League through attendance at the Geneva School of International Studies, which had been organized to serve this purpose. The fifth session of the school was held in the summer of 1928. It was attended by 311 university students and teachers from 29 nationalities, of whom 167 stayed for a month and over. Among these were parties of secondary school teachers from Great Britain, the United States and the Saar Territory; 46 in all.

See *How to Make the League of Nations Known and to Develop the Spirit of International Co-operation:* Recommendations by the sub-committee of experts (1927); Alfred Zimmern, *Learning and Leadership* (1928). (A. Z.)

LEAKE, WILLIAM MARTIN (1777–1860), British antiquarian and topographer, was born in London on Jan. 14, 1777. He entered the marine artillery and was lent by the British Government to the Turks as an artillery instructor. In 1801, after travelling across the desert with the Turkish army to Egypt, he was, on the expulsion of the French, employed in surveying the valley of the Nile as far as the cataracts; unfortunately he sailed for England on the ship chartered to bring to London the Elgin marbles, and he lost all his maps and observations when the vessel foundered off Cerigo. He was then sent out to survey the coast of Albania and the Morea, with the view of assisting the Turks against attacks of the French from Italy. There he made a valuable collection of coins and inscriptions. In 1807, war having broken out between Turkey and England, he was a prisoner at Salonica for a short time. He then went on a diplomatic mission to Ali Pasha of Iannina, with whom he remained for more than a year as British representative. In 1815 he retired from the army, in which he held the rank of colonel. Leake died at Brighton on Jan. 6, 1860. The marbles collected by him in Greece were presented to the British Museum; his bronzes, vases, gems and coins were purchased by the University of Cambridge after his death, and are now in the Fitzwilliam museum.

LEAMINGTON (lĕm'ĭng-ton), municipal borough in the Warwick and Leamington parliamentary division, Warwickshire, England, on the Leam, 98 m. N.W. from London, served by the G.W.R. and L.M.S.R. Pop. (1921) 28,941. The centres of the towns of Leamington and Warwick are 2 m. apart, Warwick lying to the west, but they are united by the intermediate parish of New Milverton. There are saline springs, pump-rooms, baths and pleasant gardens on the right bank of the river The parish church of All Saints is modernized, and the other churches are modern. Industries include iron foundries and brickworks. The town lies in a well-wooded and picturesque country, within a few miles of such interesting towns as Warwick, Kenilworth, Coventry and Stratford-on-Avon. It is a favourite health resort and residential centre.

Leamington was a village of no importance until about 1786, when baths were first erected. The town was incorporated in 1875. By royal licence granted in 1838 it was called Royal Leamington Spa.

LEAP YEAR (otherwise *bissextile*), the name given to the year containing 366 days. The astronomers of Julius Caesar, 46 B.C., settled the solar year at 365 days 6 hours. These hours at the end of four years made a day which was added to the fourth year. The English name for the bissextile year is an allusion to a result of this interposition; for after Feb. 29 a date "leaps over" a day of the week. Of the custom for women to woo during leap year no satisfactory explanation has ever been offered. In 1288 a law was enacted in Scotland that "it is statut and ordaint that during the rein of hir maist blissit Megeste, for ilk yeare knowne as lepe yeare, ilk mayden ladye of bothe highe and lowe estait shall hae liberte to bespeke ye man she likes, albeit he refuses to taik hir to be his lawful wyfe, he shall be mulcted in ye sum ane pundis or less, as his estait may be; except and awis gif he can make it appeare that he is betrothit ane ither woman he then shall be free." A few years later a like law was passed in France, and in the 15th century the custom was legalized in Genoa and Florence.

LEAR, EDWARD (1812–1888), English artist and humorist, was born in London on May 12, 1812. His earliest drawings were ornithological. When he was 20 years old he published a brilliantly coloured selection of the rarer Psittacidae. Its power attracted the attention of the 13th earl of Derby, who employed Lear to draw his Knowsley menagerie. He became a permanent favourite with the Stanley family, and Edward, 15th earl, was the child for whose amusement the first *Book of Nonsense* was composed. From birds Lear turned to landscape, his earlier efforts in which recall the manner of J. D. Harding; but he quickly acquired a more individual style. About 1837 he set up a studio at Rome, where he lived for ten years, with summer tours in Italy and Sicily, and occasional visits to England. During this period he began to publish his *Illustrated Journals of a Landscape Painter:* charmingly written reminiscences of wandering, which ultimately embraced Calabria, the Abruzzi, Albania, Corsica, etc. From 1848–1849 he explored Greece, Constantinople, the Ionian Islands, Lower Egypt, the wildest recesses of Albania, and the desert of Sinai. He returned to London, but the climate did not suit him. In 1854–1855 he wintered on the Nile, and migrated successively to Corfu, Malta and Rome, finally building himself a villa at San Remo. From Corfu Lear visited Mount Athos, Syria, Palestine and Petra; and when over 60, by the assistance of Lord Northbrook, then Governor-General, he saw a large area of India.

The last task he set himself was to prepare for popular circulation a set of some 200 drawings, illustrating from his travels the scenic touches of Tennyson's poetry; but this he did not live to complete. He died at San Remo on Jan. 30, 1888. Until sobered by age, his conversation was brimful of humorous fun. The paradoxical originality and ostentatiously uneducated draughtsmanship of his numerous nonsense books won him a more universal fame than his serious work. Ruskin placed the *Book of Nonsense* first in the list of a hundred delectable volumes of contemporary literature.

See *Letters of Edward Lear to Chichester Fortesque, Lord Carlingford, and Frances, Countess Waldegrave* (1907), edited by Lady Strachey, with an introduction by Henry Strachey; and a *Memoir* by Franklin Lushington, prefixed to Lear's *Illustrations to Tennyson, Nonsense Songs and Stories* (6th ed., 1888).

LEAST SQUARES: *see* PROBABILITY AND ERROR.

LEATHER is manufactured from the hides and skins of various animals, the principal of which are cattle, calves, sheep, goats and pigs. The skins of many rarer animals such as the walrus, seal, antelope, deer; the reptiles (snake, lizard and alligator); and the ostrich, camel and elephant are also converted into leather for special purposes. The object of tanning (or the manufacture of leather) is the conversion of the putrescible skin into a material which under ordinary conditions of use does not putrefy, and which can be wetted and subsequently dried without becoming hard or horny. A characteristic difference between dried skin and leather is that the former becomes soluble in water at a temperature of 140° F whilst leather is unaffected by such immersion.

Treatment of Hides and Skins.—Hides and skins must be treated to prevent putrefaction; *i.e.*, must be cured in some suitable way. The chief methods are drying and salting. Ordinary domestic stock is simply treated with a small quantity of salt which acts as a temporary preservative during the period of transit from the slaughter house to the tanner. Imported hides and skins are received in one or other of the following conditions—(a) Sun Dried, (b) Dry Salted, (c) Wet Salted. *Sun dried skins* are prepared for shipment by laying them on the ground in the shade, or by hanging them on poles, until they have become thoroughly dry. Such skins are sometimes treated with a weak arsenical solution before drying in order to lessen the risk of putrefaction and of insect damage. *Dry salted skins* are lightly sprinkled with salt prior to drying. In countries where salt is subject to taxation and where salt is scarce, the "salting" process consists in the application of some native saline earth, which may be composed of a large number of salts. *Wet salted skins* are prepared by either applying salt to the flesh side or by first completely immersing the hide or skins in a strong brine and then subsequently re-salting with fresh salt applied to the flesh side. The moisture is so reduced by the de-hydrating action of the salt that the goods are no longer liable to drip, but have been converted into a semi-dry condition. The methods of sun drying and of salting depend for their efficacy upon the removal of the natural moisture from the hide or skin or the replacement of it by brine, since bacterial action, which results in putrefactive damage, cannot occur in the absence of moisture or in strong salt solutions.

Sources of Supply.—The following figures give the estimated average slaughterings in various countries—

	Cattle hides	Calf skins	Goat and kid skins	Sheep and lamb skins
Australia	2,000,000	800,000		12,000,000
Austria	1,250,000		87,000	175,000
Argentine	7,500,000		2,000,000	5,000,000
China	7,000,000		13,000,000	6,500,000
Denmark	250,000	260,000	.	..
France	1,750,000	1,350,000	400,000	..
Germany	7,500,000	5,000,000	480,000	1,500,000
Great Britain	2,000,000		.	8,000,000
India (estimated)	20,000,000		6,000,000	..
Italy	1,750,000	2,300,000	1,000,000	3,500,000
New Zealand	500,000	150,000		3,800,000
Spain	700,000	350,000	1,110,000	6,250,000
Switzerland	550,000	.	140,000	120,000
United States	14,500,000		110,000	15,000,000
Union of South Africa	650,000	40,000	2,500,000	8,000,000

Histology of Skin.—A knowledge of the histology and complex chemical constituents of animal skin is essential to a proper understanding of the intricate reactions taking place in manufacturing commercial leather. (*See* SKIN.) The skin may be said to consist of living cells and the products of cell activity, *e.g.*, fibres, dead cells, etc. Skin consists of 3 well defined layers, distinct both in structure and origin There are (1) a thin outer layer of epithelial cells, the *epidermis*, (2) a thick layer called the *derma* and (3) a subcutaneous layer or adipose tissue known commercially as "flesh." The epidermal tissue is completely removed during the preparation for tanning. The derma is the layer converted into leather. The hair is embedded in a pocket or follicle of epidermis, the hair follicle and hair being penetrated by a projection coming from the derma and known as the hair papilla.

Variation of Fibre Structure —The variation of fibre structure determines the resulting tensile strength and pliability of the leather produced from it and the satisfactory preparation of skins for tanning depends upon the separation of these white fibres without damage. The derma consists of connective tissues and fat cells in varied proportions in different skins, determining the general character of the finished product; where large groups of fat cells are present interspersed between the collagen fibres the result will be the production of soft, spongy leather because of the empty spaces left when the fat cells have been removed, by the preparatory processes to which the skin is subjected In considering fibre structure from the tanner's standpoint the presence of connective fibres, which consist of yellow fibres as distinct from the white fibres of the collagen, and which are of different chemical composition and are composed of the protein elastin, is of great importance. The presence or absence of these in the finished leather has an important influence on its physical character, particularly as to the grain the leather possesses, and also influences stretch and elasticity. These elastins are removed to a pre-determined degree in order to effect desired variations of character.

Chemical Composition of Skin.—The following occur naturally in skin—Water, proteins, fatty matter, carbohydrates and mineral matter. The proportions vary according to the kind of animal, and, in a given species, according to the age, sex, mode of feeding, climatic conditions, etc ; further in a given kind of skin they vary from place to place. The composition of the skin as received by the tanner differs from that in the natural state because foreign matter is picked up by the animal while it is alive, and is introduced during curing and also because soluble matter may be washed out during the curing process The composition is further modified by bacterial and other changes occurring in the interval

between flaying and receipt by the tanner. The skin also contains enzymes and bacteria.

Collagen forms about 95% of the protein matter in the derma of calf, steer and cow hides, *i.e.*, the layer which is converted into leather. The fatty matter consists of numerous other substances besides glycerides. The amount in hides is usually small and during the tanning process it is for the most part converted to lime soaps which are removed during scudding. If not properly eliminated it may give rise to greasy leather. The naturally present mineral matter consists of sodium chloride; in addition there are chlorides, sulphates, phosphates, silicates of sodium, potassium, calcium and magnesium. The mineral matter introduced is removed in the wet work. The chief carbohydrate is glycogen.

PROCESSES PRELIMINARY TO TANNING

The first operation preliminary to tanning consists in washing and soaking the hides or skins.

Washing and Soaking.—The method ordinarily practised in the case of freshly butchered hides or skins which have only been very lightly salted and which have not subsequently been dried, is to carry out the soaking in a pit. This vessel which is also commonly employed in liming consists of a brick or cement chamber sunk to ground floor level and of a capacity of usually 1,000 gallons. The skins are immersed in water in this vessel for varying periods dependent upon their condition, to remove the small amount of salt, and to effect the removal of blood, the extraction of albumens and other nitrogenous matters soluble in water, and the softening of adhering dung so that the latter can be removed by mechanical means. The soaking of dried skins is very much more difficult. In this case the proteins have been coagulated by the temperature to which the skins have been subjected in the drying and some liquefaction of the collagen has taken place with the result that the fibres have become attached to each other by a hard film of gelatinous matter; and in addition, even when dried at moderate temperatures, the natural greases of the skin have formed a water-resisting film on the surface.

When the soaking is done in water only as in the case of comparatively fresh goods, they should be immersed for as short a time as possible and preferably in two or more successive changes of clean water. In the case of highly dried goods the use of some chemical agent to effect the swelling of the fibres in as short a time as possible without detrimental influence is now almost universal. The chemical agents so employed may be divided into two classes (a) alkaline (b) acids. Probably the most commonly employed alkaline agents are sodium sulphide and sodium hydroxide; the goods being soaked in a comparatively weak solution of one or other of these until a sufficient amount of swelling and water absorption has been effected to bring the skins back into a condition of pliability. The soaking operation is usually supplemented by working the goods over an inclined beam by hand with a dull unhairing knife to stretch the skin in every direction and thereby facilitate the separation of the fibres; this latter operation is termed "breaking" and is commonly applied to sheepskins. Hides and goatskins are subjected, instead, to a "dry drumming" process. This consists in placing the skins when moderately soft in a large wooden circular drum, which is mechanically rotated and which is provided with shelves or pegs in the interior for the purpose of lifting the skins up during rotation and allowing them to fall from a point midway between the top and the bottom of the vessel, whilst the drum is rotated some 8 or 10 revolutions per minute. The weight of skins falling upon each other assists in the separation of the fibres by the constant kneading action so produced. After this mechanical treatment the goods are then usually subjected to a further immersion either in water or in a weak solution of the soaking agent, the operations being repeated until the skins have acquired the desired degree of flaccidity and flexibility comparable with that of a freshly flayed skin. Weak solutions of acetic, formic, sulphurous and boric acids are also used. For sheepskins, the wool of which is detrimentally affected by strong alkaline solutions, sodium bisulphide or sulphurous acid are commonly employed. The quality and yield of the finished leather is materially affected by this soaking process. Loss of skin material should be avoided.

Unhairing.—The next process is a suitable treatment that will loosen the hair covering so that it can be removed by mechanical means. One of the oldest methods is the one known as sweating. This consists in hanging the goods in a closed chamber or sweat pit, usually constructed below ground floor level in order to provide regularity of temperature. The skins or hides are hung in the chamber previously heated to warm summer temperature and left until putrefactive organisms have effected the requisite loosening of the hair or wool. This process is now usually used only upon fine woolled sheepskins, as it has less deleterious influence upon the wool than the alkaline treatment.

The modern sweat chamber is usually lined internally with white glazed tiles or bricks with a floor which can be kept scrupulously clean, and is provided with means of regulating the heat and humidity. Temperature, atmospheric humidity and ventilation must be very carefully controlled. The time required for this operation is usually three or four days. During this time watchfulness is necessary to guard against the destruction of the grain surface of the skin. On account of the difficulty of control this method is confined to skins carrying high grade wool.

The Liming Process.—The object of liming is to solubilise the epidermis layer, thereby loosening the hair sheath and making easy the removal of the hair by mechanical means, and to swell the hide fibres to the degree requisite for the production of leather possessing the desired properties, either of plumpness, solidity or stretch. The method ordinarily practised consists in immersing the goods in a mixture of lime and water for varying periods. During the process of immersion the goods are periodically withdrawn from the liquor, piled up, and allowed to drain.

The methods of liming can be classified as follows:—(1) Pit method, (2) Paddle method, (3) Painting methods. The first mentioned is the oldest and is carried out in a series of rectangular brick pits, varying in size, according to the class of goods to be processed, from a capacity of 300 to 1,200 gallons. It is customary to use an amount of lime greatly in excess of that which is soluble, and consequently the major portion of the lime is in suspension in the liquor. The goods are thrown into the well mixed liquor singly, and a thin film of undissolved lime deposits itself on the uppermost side of each skin as it is submerged. The greater the amount of lime in direct proximity to the goods, the more rapidly will the lime solution be maintained saturated.

The modern method consists usually of "sharpening" the lime by the addition of sodium sulphide, which dissolves keratin with very great rapidity and consequently effects quickly the loosening of the hair. Liming has also been speeded up by mechanical aid. Sheepskins and goatskins are commonly limed in a paddle wheel, where they can be kept in motion by the operation of a paddle fixed to a semi-circular vessel and slightly dipping in the liquor. In the case of sheepskins where it is undesirable that the wool covering should come in contact with lime, the method of fellmongering these goods consists in the application to the flesh side of a paste of lime to which sodium sulphide sufficient in quantity to loosen the wool in a maximum period of 12 hours has been added.

When the skins have been limed to a condition in which the epidermis has become sufficiently loosened they are removed from the liming pit or vat and are then unhaired. Unhairing is more commonly done in the case of calf and goat skins by machine.

Fleshing.—The next operation is the mechanical one of fleshing. This is also effected either by hand over the fleshers' beam or by machine, and has for its object the removal of fat and fleshy matters from the underside of the skin.

Washing and Deliming.—Next in order is the washing operation preliminary to the chemical removal of lime and other alkali, and to convert the pelt from an alkaline to a mildly acid condition, as it is not possible to tan pelt by the usual processes when in an alkaline condition. The goods are first washed in water. The operation is preferably done in running soft water and is prolonged until the goods are freed from surface lime. The more complete removal of the lime content is commonly effected by the use of a suitable acid. The degree of deliming is

BY COURTESY OF THE RADEL LEATHER MANUFACTURING COMPANY

PROCESSES IN THE TANNING AND FINISHING OF AUTOMOBILE UPHOLSTERY LEATHER

1. The beam house, where tanning process begins. Hides are first soaked to soften and cleanse them of extraneous matter and preservatives. After this immersion they are lifted from the vats and further cleaned by machine (left centre) having a steel-bladed cylinder adjusted to remove stringy pieces of fat without biting into true hide substance. Another soaking and cleansing follows in tanks (background). Hides on floor (left) are being trimmed before placing them in the vats (right) for treatment with milk of lime solution to dissolve the hair roots and plump the hide substance
2. Dehairing machine, similar to that described in fig. 1, a revolving slate-bladed cylinder passes over the hair or grain side of hides with a rubbing rather than a cutting action, removing the hair, which is used as a by-product for carpet cushioning, insulation and felt
3. Following the first tanning the hides are split in a band or belt-knife machine. Vats in background contain another tanning liquor in which the hides are immersed; paddle wheels speed this final tanning operation. Afterward the hides are given a coat of cod-liver oil and "Degras" worked into the fibres of the leather. Oiling operation shown at left, workmen using stones to rub in oil
4. After tanning process the hides are cleared, bleached and softened in a bath of warm sumac solution and thoroughly stretched on large wooden frames shown in the tacking loft. Fans (above) dry the wet leather overnight with warm air
5. When dried the hides are put through the shaving machine (right), which has two rollers, one of steel with 16 blades, the other of hard rubber protected by a leather apron. Softening is effected by rolling the hides between rollers of cork and rubber. Buffing machine (left); shaving and softening machine (background)
6. Finishing the leather Hides are shown spread out on tables for coats of pyroxylin or other surface-coating compounds. At the first table the hides are receiving their first finish, applied with hand brushes. Subsequent coats are applied (second table) with a round brush of Chinese hog bristles with peg in centre, a type of brush which allows more material to be carried and which has a good spread—an essential detail in the production of a good finish. At the right are hides hung on racks to dry between applications of the finish. Fans (overhead) and large suction blower in wall (background) carry off the fumes generated while applying the finishing coats

determined by the condition required in the resulting leather; for example, when the leather is to be firm and lacking in stretch, *e.g.*, sole leather, the deliming is usually carried to a stage in which the lime is only removed from the outer surfaces. If the leather is required to be soft and pliable deliming is carried on until all of the lime has been neutralised. In the case of lighter leathers, *e.g.*, sheepskins, the deliming is always carried out thoroughly.

Bating.—Bating, practised almost exclusively upon skins, has for its objects the further removal of lime; an emulsification of the natural grease and some hydrolysis of the collagen fibres to obtain the degree of stretch demanded in such leathers as glove leathers, etc., or a smoother, more elastic and cleaner grain surface in the case of calfskins, and to make the finished leather softer and more pliable. There is still some uncertainty as to the way the skin is modified by bating but there is a removal or breaking down of elastin fibres, a further degree of deliming and a certain degree of hydrolysis of the collagen.

Pickling.—A further preparatory process commonly employed upon sheep, goat and calf skins is that known as pickling. This consists in processing the goods, most commonly by drumming or paddling, in a solution containing a mixture of sulphuric acid and common salt. Pickling brings the skins to a uniform degree of acidity before tanning; thoroughly cleanses the goods; and effects a further separation of the fibres to enhance softness.

TANNING

Tannin or tannic acid is abundantly distributed in many different forms of plant life. Whereas the older type of tanner processed his skins exclusively with oak bark, the modern tanner uses tannin-containing materials from various sources and of different types. Tannins were originally classified as belonging to the pyrogallol or catechol class, but this classification has been superseded by more scientific grouping either according to Freudenberg by the chemical groups of (A) hydrolyzable tannins and (B) condensed tannins; or to Perkin in 3 groups (1) gallo-tannins, (2) ellagi-tannins and (3) phloba-tannins or catechol-tannins. For the practical tanner the latter grouping is of most interest.

The following is a brief table of the most common tannins showing the classification of Perkin; and classified according to their behaviour in the tanning process, as to whether they deposit "bloom"—a crystalline deposition of ellagic acid—which conduces to firmness in the finished leather but is objectionable when goods are to be subsequently dyed.

Gallo-Tannins	*Ellagi-Tannins*	*Catechol-Tannins*
Do not produce bloom	Produce bloom	Do not produce bloom
Per cent tannin	Per cent tannin	Per cent tannin
Galls (*Quercus Infectoria*) . 50/60	Myrobalans (*Terminalia Chebula*) . . 33/36	Canaigre (*Rumex Hymenosepalum*) . 25/30
Sumach (*Rhus Coriaria*) . 26/30	Divi-divi (*Caesalpinia Coriaria*) . 39/42	Gambier (*Nauclea Gambir*) . . 35/45
	Valonia (*Quercus Aegilops*) . . 30/40	Hemlock (*Abies Canadensis*) . . 8/20
	Oak Bark (*Quercus Robur*) . . 10/12	Larch (*Larix Europaea*) . 9/10

		Quebracho Extract (*Quebracho Colorado*) . . 62/68
		Mimosa Extract (*Acacia Family*) . . 62/64

Synthetic Tannins.—There are a number of synthesised products manufactured from phenols and hydrocarbons, such as naphthalene, which are converted into leather forming materials by sulphonation with sulphuric acid and subsequent condensation with formaldehyde. These products are being used to a considerable extent as re-tanning agents and for bleaching dark coloured leather. These products are not synthetic tannins in the strictly chemical sense for their chemical constitutions are entirely different from those of the natural tannins.

Vegetable Tanning.—Vegetable tanning may be conveniently dealt with in two distinct groups, (a) the tannage of heavy leather —sole, belting, harness etc. and (b) the tannage of light leather —shoe upper leather, fancy, bookbinding, etc.

Tannage of Sole Leather.—The world's production of sole leather is estimated to aggregate half a million tons per annum, of which the United States produces 200 million pounds, Great Britain 175 million pounds, and Germany 130 million pounds. In Great Britain, preliminary to the tannage for sole leather, the hides in the limed condition are subjected to "rounding"; this consists in cutting the hide into several portions—butt or bends, shoulder and bellies. In the United States, Australia and elsewhere, the tannage is very often done in sides, the hide being divided into two portions by cutting down the line of the backbone.

The tannage of sole leather usually consists of three group operations:—1. Colouring, by suspending the goods in a series of weak liquors of gradually increasing strength. 2. Laying the goods in strong liquors and transferring them to stronger liquors as the tannage proceeds; the operation being called handling and the series of pits being described as the "handlers." 3. Placing the goods for comparatively long periods in a strong liquor after they have been dusted (in layer pits, called "dusters") with a small quantity of solid tanning material between each piece of leather. The suspender tannage is accomplished in a series of pits containing weak liquors that have been used upon previous goods.

The goods are usually moved daily into gradually increasing strength solutions and their position is also changed in the same pit once or twice daily. The length of time and the number of pits used varies in different tanneries.

The goods are moved from the strongest suspender pits to the "handlers" or "floaters," being handled daily by being drawn up on the side of the pit, allowed to drain and then re-transferred to the pit in a horizontal position, moving the goods to pits of gradually increasing strength of tannin. "Handling" becomes less necessary as the tannage proceeds In the latest stages of the handler round it is customary in Great Britain to sprinkle the goods with a little solid material; Mimosa bark, ground myrobalans or valonia, as a preliminary to the "layers," or "dusters." At the end of the "handler" round the goods are usually almost completely tanned and are then transferred to the "layers" which contain very strong liquor obtained from the leaches, of previously unused tannin; or by the addition of chestnut or oak wood extract.

In the "layers" the goods may be allowed to remain for long periods without change, being lifted and re-transferred into increasing strength solutions at the end of each one or two weeks. This treatment permits the deposition of bloom and conduces to the production of firmer, harder, heavier and better wearing leather. To complete the process, the goods are removed and drained and then scoured to remove the deposited bloom from the grain.

Tannage of Calfskins.—One of the essential differences in the manufacture of this leather by the vegetable process is in the preparation before tanning. After liming, unhairing, fleshing and scudding the goods are either most commonly bated, or very thoroughly delimed. The goods after bating are sometimes pickled; sometimes, however, this operation is omitted.

Usually the tannage is begun by suspending the skins in non-astringent liquors consisting of used liquors originally prepared from a mixture of two or more of the following materials—

Mimosa bark, myrobalans, gambier, quebracho, chestnut and oak wood extract. After the goods have been suspended for a period varying from two to seven days the tannage may be completed in a "handler" round, the goods being finally given a re-tannage with a view to lightening the colour by drumming, paddling or suspending in a warm sumach infusion. Alternatively, the tannage is sometimes done entirely in paddles using gambier in the earlier stages and gradually strengthening up the tannin content of the solution by adding quebracho-myrobalan extract, chestnut extract, etc. As calfskins are required in the majority of cases to be dyed it is the usual custom to avoid "bloom-giving" tanning materials, the irregular deposition of bloom on the surface of the leather detracting from the production of a level dyed result.

Tannage of Skivers.—Skivers are the grain portions of sheepskins, which have been split in the limed condition. The universal tannage used in their manufacture is sumach (*Rhus coriaria*), this material being chosen because it readily produces a white leather capable of being dyed in any pale or brilliant colour.

The goods, as removed from the splitting machine in their limed condition, require to be washed, delimed and very thoroughly bated, after which they are most commonly pickled and then tanned in a paddle wheel. The goods are placed in the paddle wheel with the sumach in the ground leaf form and preferably after having been infused with water for a few minutes at a temperature of 140° F; the tannage being usually commenced at a temperature of about 90° F. The goods are usually completely tanned within 12 hours, when they may be removed, drained, rinsed in water and hung up to dry into the "crust" condition.

Bottle Tannage.—A number of goatskins and also some few calfskins and sheepskins are tanned by a primitive method commonly termed bag or bottle tanning. The goods after being bated are individually sewn into a bag by doubling the skin down the ridge or backbone and then sewing round by means of a power driven sewing machine. The skin bag is then filled by means of a funnel to about ⅓ of its capacity with a sumach infusion through an aperture left for the purpose. A quantity of air is blown into the bag and the aperture is closed by tying round with a cord. The skin bags are immersed in a shallow tank previously filled with a warm sumach infusion in which they float, the position of the bags being changed by keeping the goods in motion and turning them over with a wooden pole. The goods are withdrawn after 2–3 hours and are then placed upon a draining rack and left for several hours until the liquor has drained from them, when they are again re-filled with a stronger infusion of sumach liquor and immersed in a still stronger and warmer infusion. After two or three immersions the goods become thoroughly tanned, when the bags are cut open and then either rinsed and dried, or given a further re-tannage by paddling in a stronger infusion of sumach. The distending of the skins produces a thin leather devoid of contracted grain, and not liable subsequently to stretch.

Mineral Tannages.—The oldest process of tanning by mineral salts is the *alum process.* This is still very largely practised in the manufacture of glove leather. The proportions of the materials used vary, but the following may be taken as an example:—alum, 8 lbs.; salt, 8 lbs.; flour, 3–5 lbs.; egg yolk, 2–4 lbs., for 100 lbs. weight of prepared skins. It is customary to add all of the ingredients at the commencement of the tanning and prolong the drumming for about two hours until the leathering process is completed when the goods are removed, drained, and dried.

Chrome Tanning by the "Double-bath" Method.—This method is commercially applied chiefly in the tanning of goatskins for the manufacture of glacé kid; it is also used in the tannage of calfskins for willow calf; and for mechanical leathers.

The prepared pelt is first treated with a comparatively weak solution of potassium or sodium bichromate acidified with hydrochloric or sulphuric acid. After this solution has been absorbed by the skins, they are transferred to a solution of sodium thiosulphate ("hypo"), to which hydrochloric or sulphuric acid is added as the reduction process proceeds. The free sulphurous acid produced reduces the chromic acid resulting from the action of the acid on the bichromate solution, into a basic chromium chloride or a basic chromium sulphate salt; the thiosulphate during the reduction process undergoing oxidation to sodium tetrathionate and sodium sulphate. At the same time, sulphur is liberated and deposited in the interstices between the fibres as well as in and on the fibres of the skins. The sulphur deposit is one of the principal features which distinguish leather tanned by the "two-bath" process from that produced by the "one-bath" method.

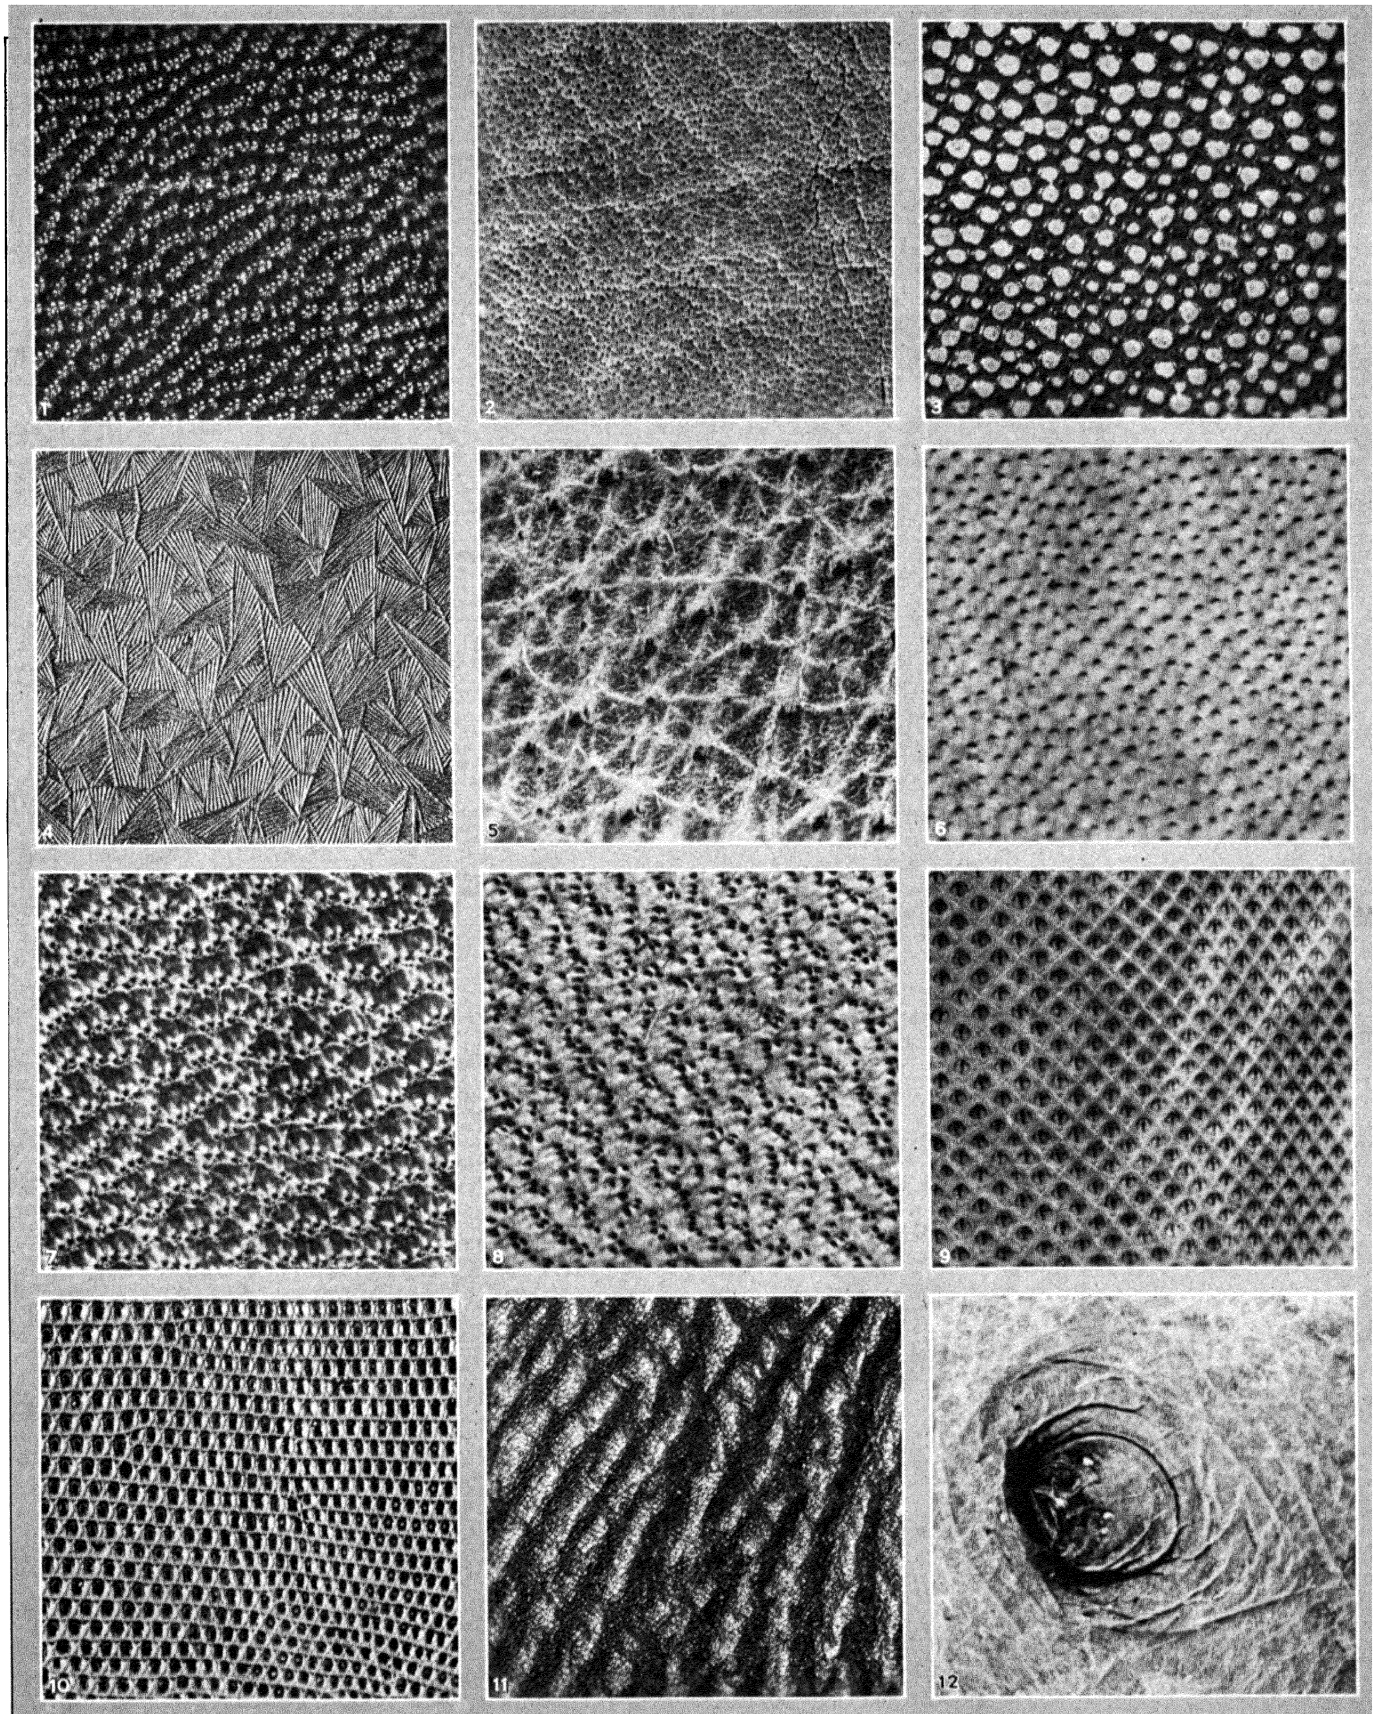
The method now commercially practised is first to pickle the skins with sulphuric acid and common salt, and then drum in a solution of sodium bichromate and acid. The more complete the absorption of chromic acid resulting from the chemical action the better, as this has an important influence on the finished leather.

After the goods have been thoroughly impregnated, they should be of a bright orange yellow colour. They are then removed from the solution, and carefully drained for a minimum period of 24 hours, when they are passed through a striking-out machine for the purpose of laying the grain of the skin perfectly flat and removing any wrinkles that may have appeared.

The reducing operation is done in the drum or paddle-wheel, but in the case of heavy goods it may be done in pits. The following is probably the best procedure:—The necessary quantity of sodium thiosulphate is dissolved and placed in the paddle. About one-third of the acid required, after dilution, is added to the solution of sodium thiosulphate. The mixture should be well stirred either by paddling or by hand, with a wooden stirrer, when after a few minutes the solution will become slightly cloudy, as a result of precipitation of finely divided sulphur which shows that the reaction has begun. A further ⅓ of the diluted acid is added, and after about 1 hour the remainder.

Generally, the reduction takes place in fairly well defined stages indicated by the colour of the goods. In the early stages there is a change from the original yellowish orange to a darker shade of yellow and to a lightly brownish yellow. Later the colour becomes a greenish olive, and finally a pale bluish green.

The following are suggested quantities for the two solutions:—



1st Bath	*2nd Bath*
6 % bichromate of soda	15 % sodium thiosulphate
4½ hydrochloric acid	7½ hydrochloric acid
or	*or*
1¾% sulphuric acid	3 % sulphuric acid

Chrome Tanning by the "Single-bath" Method.—The "single-bath" method is more largely practised than is the "two-bath" process, particularly in the case of calfskins intended for "box" and "willow," or suede finish; hides for side leathers; and sheep for gloving, upper leather, linings, and fancy purposes. The "single-bath" process is simpler, and less liable to produce irregular results. The essential difference is that, whereas in the "double-bath" process the basic salt of chromium is formed on the fibres, in the "single-bath" method the basic chromium salt is applied direct to the skins in solutions of gradually increasing strength.

One of the simplest methods of preparation of a "single-bath" chrome liquor consists of neutralising the acid of chromium sulphate or chrome alum by adding sodium carbonate. The following proportions of sodium carbonate and chrome alum should be used to produce the salt, $Cr(OH)SO_4$, which is most generally suitable. For each 1,000 lbs. pelt to be tanned, dissolve:—150 lbs. chrome alum in 50 gallons water, at a temperature of about 85 to 95 deg. C. When the whole of the chrome alum has gone into solution, cautiously add a solution, prepared by dissolving 16 lbs. soda ash or 60 lbs. washing soda crystals in 25 gallons hot water. When all of the sodium carbonate has been added, the solution should be thoroughly stirred.

The usual procedure is to mix together carefully in a suitable lead-lined tank equal parts of sodium bichromate and concentrated sulphuric acid after dissolving the bichromate in a small quantity of water. The reducing agent is then very cautiously added until the colour of the solution is changed from the original orange yellow colour to a bright bottle-green shade.

The following quantities produce a liquor which is considered of a satisfactory chemical composition:—200 lbs. Bichromate; 200 lbs. Sulphuric acid (95%); 50 lbs. Glucose; 100 gal. Water. The tannage is carried out on lines more or less identical with those of vegetable leathers; the processing being done either

1. Kid. 2. Calf. 3. Galluchat shark grain on calf. 4. Grained calf. 5. Pigskin. 6. Kangaroo. 7. Goat. 8. Cowhide. 9. Watersnake. 10. Calcutta Lizard. 11. Shark. 12. Ostrich

in the drum or paddle-wheel for the lighter classes of leather, and by suspension in vats for chrome sole leather, hydraulic and similar leathers. Starting with a weak solution, the strength is increased until complete penetration has been effected.

Chrome tanned leather possesses properties not associated with leather produced by vegetable tanning. For example, properly tanned chrome leather will stand high temperature without any detrimental effect. Chrome leather is also more resistant to atmospheric influences, and to chemical fumes and moisture.

On account of the comparative quickness of the tanning process, and the good wearing properties of the leather, this process is largely replacing the vegetable tanning process in the case of boot and shoe uppers, and for special purposes where the above mentioned properties are advantageous; also where extreme tensile strength is demanded. The disadvantage of this leather in comparison with vegetable leather for sole leather is that unless impregnated with waxes it tends to slip in wear and it is not practicable to obtain the desired thickness.

Oil Tannage.—One of the very earliest processes for converting pelt into leather was the application of oil and fatty substances. The modern method of manufacturing chamois leather (made from the flesh split of a sheepskin), deer, antelope, and similar skins, consists in the impregnation with an oxidisable fish oil of the goods when in a weakly alkaline condition, and subsequently processing to effect further oxidation of the oil on the fibres.

The goods as they leave the splitting machine are re-limed to effect a further swelling of the fibres and decomposition of the fat cells with a view to subsequent removal of the natural grease. The goods having been re-limed sufficiently are then frized on the split side. This operation is somewhat similar to that of hand fleshing but consists of the removal of the coarse fibred surface or "ground" from the split side nearest to the grain, by cutting this away with a sharp two handled knife on a frizing beam.

The goods are now delimed either by employing a fermented infusion of bran or other flour offal, or by the use of a suitable acid. The object to be attained by oil tanning is the substitution for the moisture in the fibres of a suitable fish oil The goods are first drained and then pressed in some hydraulic or other press to express from them as much moisture as possible. They are then hung up to become partially dry. This requires very careful supervision to prevent the goods becoming too dry, and the fibres in consequence becoming repellant to the subsequent absorption of the oil and becoming stuck to each other. After as much moisture has been eliminated as practicable without causing the fibres to adhere to one another, the goods are then placed in a machine called the "stocks." This consists of two heavy hammers working in a semi-cylindrical vessel in which the goods are placed and subjected to a hammering or beating action; at the same time the goods are continuously turned over by reason of the shape of the vessel. They are sprinkled with a fish oil, usually cod liver oil, during the process of stocking or kneading and are processed until they become sufficiently saturated. They are then further dried and re-sprinkled with oil and re-stocked.

These operations are repeated until the goods are fully saturated and practically all moisture has been replaced by fish oil. The oil is then decomposed on the fibres by the application of heat.

PROCESSES FOLLOWING TANNING

Drying.—The old method is to hang the goods up in a loft which is ventilated as required by louvres, the goods usually hung up from tenterhooks in rails placed parallel to the current of air.

A light coating of oil is usually applied to the wet leather before drying in order to act as a protective film against the drying of the grain surface and to ensure that the evaporation of the moisture is chiefly from the flesh side. The regularity of the colour of the leather when dry is in the main dependent upon the rate of evaporation of the moisture. Thick sole leather requires to be dried more slowly than thin goods (calf or sheep leather); and vegetable tanned leather much more slowly than mineral tanned leather, which is dried in a few hours at a comparatively high temperature and with little ventilation.

During the past few years considerable improvements have been effected with a view to accelerating the process. The method now employed for all of the lighter classes of leather and also for some of the heavy classes is to dry the goods by machine. There are various machines, which differ mechanically, but are similar in general principle and are modelled more or less on the continuous type of baker's oven.

Currying.—The old time currier was a skilled craftsman who was capable of undertaking the whole of the processes from the crust tanned condition to the finished commercial product, when the leather was required to be of a greasy type. The term currying is applied to-day to the impregnating of leather with grease. The goods after tanning and drying are split or shaved, and then scoured either by hand or machine until the grain surface is thoroughly cleansed from "bloom" and excess tannins. The leather is then usually re-tanned with sumach to obtain a better colour, after which it is ready for grease impregnation.

Grease impregnation may be done in three different ways (1) hand stuffing, (2) drum stuffing and (3) dipping. Hand stuffing consists in applying to the previously moistened leather a thick layer of dubbin prepared by mixing together about equal parts of beef tallow and cod liver oil. The application is made, usually to the flesh side of the leather, with a brush and the leather is afterwards slowly dried. As drying proceeds by evaporation the more oily portions of the dubbin are absorbed by capillarity, and become thoroughly distributed and absorbed by the fibres. This method is now only practised upon a few high grade leathers and has been replaced by drum stuffing and dipping. Drum stuffing consists in drumming the leather, which has been previously got into an equable condition of moisture by damping, in a drum which has been heated either by live steam or by hot air circulating through the vessel.

Dipping is chiefly practised upon heavy leathers, for example, harness backs, strapping, etc., and consists in immersing the leather, which has been previously well dried, in a tank filled with molten grease (usually paraffin wax). The dried leather offers little resistance to the penetration of the molten wax and complete permeation is effected in a few minutes. This impregnation is not so satisfactory as drum or hand stuffing because of the non-oxidisable and little lubricating properties of the wax.

Dyeing.—The dyeing process is accomplished by the following methods: (1) brush dyeing or "staining", (2) dipping, (3) dyeing in paddle or drum, (4) spraying. The first mentioned is used in the colouring of the heavy types of leathers, such as hides for upholstery, bag and portmanteau work, etc., which on account of their size and weight are inconvenient to handle by dipping or other immersion processes. This method consists of brushing a weak solution of the dye on the surface of the prepared leather, usually two or three applications being given to obtain regularity of colour. The dyes employed are the usual coal tar colouring materials of the acid or basic class.

Dyeing by immersion in rectangular wooden trays or by dipping pairs of skins at a time in a shallow wooden or porcelain vessel either by machine or by hand is practised when small quantities of leather are to be processed.

The spray method in which the dyestuff is applied to the leather in an atomised state through a spray pistol is used upon leather for the application of dyestuffs and also of insoluble paint-like compositions. The application of mineral pigments, such as the ochres and umbers in suspension in a water medium in which has been dissolved some binding agent such as casein or shellac, has effected a considerable improvement in the regularity of shade of colour. The modern practise is to dye with coal tar dyestuffs with a top coating of a suitable pigment mixture.

The Finishing of Leather.—The finishing of leather in order to make it suitable for the purpose for which it is required in commercial usage necessitates considerable mechanical treatment according to the kind of finish required. The following may be considered amongst the most important:—

Sole Leather.—In order to obtain the requisite degree of firmness and solidity to ensure satisfactory wearing qualities sole leather must be compressed as compactly as possible. This is done by either rolling or hammering. The system in Great

Britain and America is to roll the leather, commencing first in a slightly damp condition and afterwards in the dry state, on a girder type of heavy rolling machine under heavy pressure.

Upper Leather.—The finishing of upper leather, box calf, willow calf, etc., consists of staking which is performed by a machine which forcibly drags the skin over the edge of blunted knife blades, to impart the necessary softness. After staking, the skins are fluffed or buffed on the flesh side by a buffing machine, a rapidly rotating emery-covered cylinder imparting a suede or pile finish to the flesh side. The necessary polish is imparted by first applying a "seasoning" mixture consisting usually of a weak solution of albumen or casein mixed with milk for the purpose of limiting the liability of damage by friction, and a little dissolved dyestuff for the purpose of enhancing the colour. The leather is then friction-glazed by a machine, a glass cylinder being rapidly rubbed over the surface under heavy pressure, thus imparting a high polish.

The box or willow grain is produced either by hand or machine. The skin is doubled, grain side inside, and then pressure is applied to the doubled portion in the required directions either by hand with a cork covered board or by rotating cork covered rollers, so as to make the natural grain take a defined form Skins of this type are often finally smoothed by placing the grain surface of the skins in pressure contact with a polished plate.

Moroccos.—Goatskins for moroccos are usually grained by hand after glazing on a special type of glazing machine For the best leather this is done, whilst the skin is wet, by hand with a cork covered hand graining tool, working the skin in five or more directions until the natural grain has been raised in a rounded or "birds-eye" form. The grain is fixed by drying the goods at a high temperature. The goods are re-glazed and re-grained if a high polish is required. Sheepskins required for linings and leathers demanding a smooth finish are given a light rolling on a pendulum rolling machine.

Suede Leathers.—The suede or pile required is attained by "wheeling." This consists in applying the flesh side of the skin to the surface of a rapidly rotating emery or carborundum covered cylinder, which grinds the flesh fibres to a fine pile.

Embossed Leathers.—A very large quantity of leather is embossed with an artificial grain in simulation of more expensive skins. The embossing is done by passing skins through machines possessing an engraved roller or electrotype plate, on which has been reproduced an intaglio of the kind of grain required

(M. C. L.)

LEATHER, ARTIFICIAL, or leather substitute, has been made in various ways for over seventy-five years, the earliest patents having been granted in England about 1850. The most popular material used at present consists essentially of a suitable cotton base fabric to which has been applied a waterproof coating composition. The material so prepared is smooth and in order to simulate genuine leather must be given a suitable pattern or design. The design may be either a reproduction of genuine leather or merely a conventional pattern. The material may be made in either solid colours or in multitone effects by applying additional coatings of contrasting colours after embossing. In this way Spanish or Morocco leather finishes as well as many other pleasing effects can be produced. The fabrics used as a base for the material may be either sheetings which are of the plain weave type, or drills, sateens, moleskins and broken twills which are of the twill weave type. The weight per square yard of the fabrics varies from 2 ounces to 13½ ounces depending on the type of material to be manufactured. Before coating the fabrics are usually dyed a colour similar to that of the coating composition to be applied. The heavier fabrics are often napped on the uncoated side to make the finished product softer and more pliable. The coating compositions applied to the fabric are of two general types,—Cellulose Nitrate compositions or drying oil compositions, the former being the most commonly used. The Cellulose Nitrate compositions consist of dry Cellulose Nitrate dispersed in a mixture of suitable organic solvents, such as denatured Ethyl Alcohol or Methyl Alcohol, Methyl, Ethyl or Butyl Acetate, Acetone and hydrocarbons of the Methane or Benzene series, to which is added pigment previously dispersed in a suitable softener or plasticizer. The finished composition thus consists of Cellulose Nitrate dispersed in an organic medium, pigment and softener or plasticizer. The most common softener used is pure castor oil, Oxidized castor, rapeseed, cottonseed, fish or linseed oil are also used. Among common plasticizers used are Dibutyl Phthalate, Dibutyl Tartrate, Triphenyl and Tricresyl Phosphate. The pigments used are usually of mineral origin, although many lakes are used to produce the more brilliant colors. The drying oil compositions consist essentially of suitably bodied drying or semi-drying oils, pigment and fillers, such as clay, talc or barytes The coating composition is applied by passing the fabric under a "doctor" knife attached to a suitable framework. The coated fabric is then passed through a drying chamber where the solvent is volatilized, to be recovered by some manufacturers. The drying oil compositions must be "baked" or dried for a period of several hours Rubber compound coated fabrics are sometimes embossed in leather grains and the material sold as Artificial Leather This material, however, cannot be produced in the variety of colours and grains that is possible with the Cellulose Nitrate type

Artificial leather finds a variety of uses, in many places taking the place of leather and in some instances being preferred to genuine leather. Among innumerable uses are upholstery of furniture and automobile seats, automobile tops, both of open and closed type, bookbinding, notebook covers, luggage of various kinds, various parts of shoes, protective coverings where waterproofness is essential, decorative purposes as wall coverings, table covers, etc.

The manufacture of Artificial Leather in the United States occupies an important position in the industries of the country. The material is also manufactured in Europe and finds extensive uses there. In the United States between 45 and 50 million yards are manufactured yearly and the industry is steadily growing

(E. H N.)

LEATHER, CARE OF. All leather goods must have careful attention to ensure adaptability under varying conditions and to lengthen the life of the leather. Important factors to be considered are the effects of dirt, water, oil, grease, chemicals, polishing, drying, on the leather article under conditions of ordinary use.

Shoes.—Shoes should be kept clean, pliable and water resistant. Those for heavy outdoor wear in winter and wet weather need thorough greasing Those for street wear need occasional light oiling with castor oil and polishing only. Neutral flexible polishes keep the leather soft and pliable and give it a finish that helps to turn water and prevent the collection of dirt. Light oiling with castor oil once or twice a month helps to keep patent leather uppers from cracking Butter, milk, lard and oil in quantity produce ugly stains on light-coloured leather, which may be removed by covering the stain with a rubber solution and peeling it off when dry. The appearance of shoes upon which polish has accumulated can often be decidedly improved by cleaning with benzene or gasolene and then polishing. The nap of uppers often can be satisfactorily raised with a small wire brush made for the purpose. (*See* BOOT AND SHOE INDUSTRY.)

Drying.—To dry shoes properly, wash off all mud with tepid water and while still damp, oil or grease work or rough shoes with one of the preparations described below. Oil street shoes lightly with castor oil, otherwise polishing will be difficult. Then straighten all parts carefully and stuff the shoes with crumpled paper to keep

the shape and hasten drying. Finally set them aside in a warm place to dry slowly. If in drying the leather becomes hotter than the hand can bear it is almost sure to be ruined.

Oiling and Greasing.—Among the best materials for greasing shoes are neat's-foot, cod and castor oils, tallow and wool grease, or mixtures of them. Apply warm oil or grease to the cleaned shoe with a swab of wool or flannel, and rub it well into the leather, especially where the sole is fastened to the upper, as water soaks through there readily. Dry the greased shoes in a warm place.

Waterproofing.—Leather footwear can not be expected to keep the feet dry if worn long in water, slushy snow or soft mud. Nevertheless, waterproofed, properly made, heavy soled, leather shoes ordinarily keep the feet dry. Grease for waterproofing shoes in summer should be harder than that used in winter. In winter a mixture of grease and oil that is not hard when cold is required, and more of it may be used than the leather will absorb, if maximum water resistance is desired. Nothing better than one of the following simple formulae is known. *Formula 1:* Neutral wool grease, 8 oz.; dark petrolatum, 4 oz.; paraffin wax, 4 ounces. *Formula 2:* petrolatum, 1 lb.; bees-wax, 2 ounces. Melt together the ingredients by warming them carefully and stirring thoroughly. Grease thoroughly the edge of the sole and the welt, as this is where shoes leak most. Saturate the sole with the grease by standing the shoes for about 15 min. in a shallow pan containing enough melted waterproofing material to cover the entire sole. Rubber heels should not be put in the grease.

Polishing.—Most shoe polishes are pasty mixtures of waxes, dyes and turpentine. Turpentine in the proportion used in paste polishes is apparently not injurious to leather. Polishes should be neutral in reaction. Those containing sulphuric or oxalic acid, especially some emulsions containing alkalies are very injurious. Since nitrobenzene (*q.v.*) is poisonous, polishes containing it should never be applied to shoes while on the feet. Castor oil applied lightly is practically the only oil to use if shoes are to be polished afterward. Shoes are made fairly water resistant by oiling and polishing the uppers and greasing the welt and soles.

Harness.—Harness should be kept clean, and be washed and oiled from two to four times a year. The useful life of a harness can be thus quadrupled. Clean with tepid water and neutral castile or white toilet soap, using a sponge or fairly stiff brush. Scrape off hardened grease or foreign matter. Rinse in clean, tepid water, and hang in a warm room until but slightly damp Oil or grease while still damp. For driving harness use neat's-foot or castor oil, or a mixture of these with wool grease to make a paste of about the consistency of butter. Apply lightly to driving harness and liberally to work harness. Rub the warm oil or grease thoroughly into the damp leather. After the harness has hung in a warm place over night, remove any excess oil. Harness should not look or feel greasy.

Driving Belts.—A belt in service gradually loses a portion of its grease, becomes dry and harsh, loses strength and elasticity and finally fails. Once a belt loses its good properties no amount of dressing can fully restore them. Belts should be frequently cleaned of dust and dirt. Mixtures of soft dirt and oil can be removed with gasolene or naphtha, taking precautions against explosion and fire. Oil soaked belts should be sent to a manufacturer to be de-greased. Belts can often be cleaned with warm water and a neutral castile or white toilet soap. Washing must be cautiously and rapidly done. Under no circumstances should the belt become wet, as it will then stretch and slip and laps may become loose. Remove caked dressings or other material—they injure the belt and cause uneven running. When clean apply a dressing of a mixture of neat's-foot, cod oil, tallow and wool grease free from acid and of about the consistency of soft butter, to the outside of the belt at rest and let soak in over night. Apply dressing evenly and rub in with cotton waste or felt. If necessary go over the pulley side with waste or felt lightly greased with the dressing Even distribution and penetration should be secured. Dressed belts should feel mellow and pliant, not greasy or soggy.

Inspect joints periodically and fix at the first signs of weakening. Repair laps as soon as they begin to separate and replace breaking fasteners at once. If a belt is running crooked the cause should be found and removed. Belts should be protected as much as possible from exposure to abnormal conditions that are injurious to leather. Store belts not in use on open shelves in a well ventilated room of even temperature and humidity. (*See* BELTING FOR POWER TRANSMISSION.)

Bookbinding Leathers.—Bookbinding leathers must contain little if any mineral or oxalic acid; less than 1% will hasten their decay. In addition to the use of unsuitable tanning materials, leather bindings are subjected to a number of deteriorating factors, the most important being direct sunlight, air and acids contained therein, and low atmospheric relative humidity in winter. Rooms where books are kept should be lighted with diffused light, relative humidity kept between 45% and 65% and with the air free from even traces of mineral acids. Even with these precautions, leather bindings need care. They tend to become harsh, dry, dirty and to deteriorate. This tendency can be greatly retarded by annually oiling the leather. Castor and neat's-foot oils are the best oils that can be now recommended for the purpose. Rub the leather with cheese cloth lightly moistened with the oil, allow bindings to dry over night in a well-ventilated room and finally rub dry with a clean cloth. (*See* BOOKBINDING.)

Bags, Cases, Upholstery.—Leather goods of this type should not be allowed to get wet, except that they may be washed very carefully with saddle soap occasionally, and oiled very lightly with castor or neat's-foot oil as directed under bookbinding leathers, and finally rubbed dry. The leather may then be given a light coat of neutral colourless wax polish if desired, and rubbed until it does not stain a white cloth. Oils should never be used on glazed enamel or coated leather. They make the coating soft and sticky. Use special top or seat dressing for this purpose.

Mildew.—Leather goods kept in a warm, damp and dark place, mildew. Mildew probably will not seriously harm the leather unless it is allowed to remain for several weeks or longer, but it may change its colour. The simplest way to prevent mildewing is to keep the articles in a well-ventilated, dry, well-lighted place. When first detected, mildew should be wiped off with a damp cloth, the leather well dried, and put in a drier place. The application of poisons to prevent mildew is not to be recommended.

LEATHERHEAD, an urban district in Surrey, England, 18 m. S.S.W. of London, on the S.R. Pop. (1921) 5,817. It lies at the foot of the North Downs in the valley of the river Mole. The church of St. Mary and St. Nicholas dates from the 14th century. Leatherhead has brewing, metal working and food producing industries, and the district is largely residential.

LEATHER-JACKET, the popular name for the destructive larva of the crane-fly or daddy-long-legs (*Tipula oleracea*), which feeds on the roots of grass and crops. It is, however, readily kept in check by poisons. *See* DIPTERA and ENTOMOLOGY, ECONOMIC.

LEATHES, STANLEY (1830–1900), English biblical scholar, was born at Ellesborough, Bucks, on March 21, 1830, and was educated at Jesus college, Cambridge. He held various church preferments, was a prebendary of St. Paul's, and at the time of his death was rector of Much Hadham (Herts). Leathes was professor of Hebrew at King's college, London, and a member of the Old Testament revision committee from 1870 to 1885.

His son, SIR STANLEY MORDAUNT LEATHES (b. 1861), was a fellow of Trinity college, Cambridge, and one of the editors of the *Cambridge Modern History*. He was a civil service commissioner from 1907 to 1927.

LEAVEN, a substance which produces fermentation, particularly in the making of bread (Latin, *levamen*, a means of raising, in the sense of alleviation, comfort); a portion of already fermented dough added to other dough for this purpose. (*See* BREAD.) Figuratively, any element or influence which effects a

subtle change. The Hebrew association of the idea of fermentation with that of corruption may have been one source of the prohibition of the use of leavened bread in sacrificial offerings. For the use of unleavened bread at the feasts of the Passover and of Massôth *see* PASSOVER.

LEAVENWORTH, oldest city of Kansas, U.S.A., in the north-eastern part of the State, on bluffs overlooking the Missouri river; the county seat of Leavenworth county and the seat of important national institutions. It is on Federal highway 73E, and is served by the Burlington, the Chicago Great Western, the Leavenworth and Topeka, the Missouri Pacific, the Rock Island, the Santa Fe and the Union Pacific railways. The area is 6·5 sq. miles. The population in 1925 (State census) was 20,889 (12% negroes).

Leavenworth has many fine public buildings, a Roman Catholic cathedral and several charitable institutions under religious auspices. It is a commercial and manufacturing city of importance. The output of the factories in the city was valued at $7,065,141 in 1925. The products include furniture, stoves and ranges, wagons, trailers, truck bodies, mill and mine, and road machinery, steam engines, ice machines, washing machines, farming implements, hay presses, bridge and structural iron and steel, brooms, boxes, sash and doors, flour, mattresses, gloves, overalls, and amusement devices. Valuable coal mines are in and near the city.

At Ft. Leavenworth, one of the oldest military posts west of the Mississippi, on a reservation of 8,000 ac. N. of the city, are the army service schools, enrolling 400 officers of high rank; the U.S. Federal prison, with nearly 4,000 inmates; and the U.S. disciplinary barracks, with 1,000 military prisoners, where every Friday morning a famous "silent drill" is given by the men who are about to be restored to the army. There is an aviation field on the reservation, and a citizen's military training camp draws an attendance of 3,000 every summer. Just south of the city is the western branch of the National Home for Disabled Volunteer Soldiers, occupying 1,000 ac., where 3,000 veterans of the Civil, Spanish and World Wars are cared for. At Lansing, 3 m. S., is the State penitentiary, with 2,000 prisoners employed in coal mining and other occupations, and the State industrial farm for women, completed in 1922.

Ft. Leavenworth was built in 1827 by Col. Henry Leavenworth (1783–1834), for the protection of the traffic between the Missouri river and Santa Fe. The city was founded in 1854, by settlers from Missouri, and its early sympathies were pro-slavery. A free-state convention, meeting here on April 3, 1858, adopted a radically anti-slavery constitution, which was nominally approved by popular vote, and was submitted to Congress, but never came into effect. Leavenworth was headquarters of the transportation company which promoted much of the western travel by wagon. During the Civil War it was an important mobilization and supply centre, and until 1880 was the largest city of the State. It was incorporated in 1855, secured a new charter in 1881, and in 1908 adopted a commission form of government.

LEBANON (Semitic *laban,* "to be white," or "whitish"), in its widest sense, is the central mountain mass of the State of Great Lebanon (proclaimed in 1920 in the French mandated territory in Syria), extending for about 100 m. from north-north-east to south-south-west. It is bounded west by the Mediterranean, north by the Nahr el-Kebir, beyond which rise the mountains of the Ansariye, and east by the inland plateau of Syria. To the south the Lebanon mountains end where the River Litany bends westward. A structural depression followed in its southern section by the Litany and in its northern by the ancient Orontes, divides the mountainous mass into two great parts. That lying to the west is still called Jebel Libnan; the greater part of the eastern mass is now called the Eastern Mountain (Jebel-esh-Sharki). In Greek the western range was called Libanos, the eastern Antilibanos. The southern extension of the latter, Mount Hermon, may in many respects be treated as a separate mountain. The eastern boundary of the State of Great Lebanon passes over Mount Hermon, makes a detour around Zebdani and then follows the crest of Anti-Lebanon.

The district west of Lebanon, averaging about 20 m. in breadth, and composed in the main of Upper Jurassic and Upper Cretaceous rocks, slopes in an intricate series of plateaux and terraces to the Mediterranean. The coast is mainly abrupt and rocky, often leaving room for only a narrow path along the shore. Most of the mountain spurs run from east to west, but in northern Lebanon the prevailing direction of the valleys is north-westerly, and in the south some ridges run parallel with the principal chain. Most of the valleys have been deeply excavated by mountain streams as is typical of a limestone region; the heights are crowned by lesser villages, castles or cloisters. The chief perennial streams include the Nahr Akkar, N. Arka, N. el-Barid, N. Kadisha, "the holy river" Wadi el-Joz (falling into the sea at Batrun), Wadi Fidar, Nahr Ibrahim, Nahr el-Kelb (the ancient Lycus), Nahr Beirut (the ancient Magoras, entering the sea at Beirut), Nahr Damur (ancient Tamyras), Nahr el-'Auwali (the ancient Bostrenus). The 'Auwali and the Nahr el-Zaherani, the only other considerable streams before the Litany, flow north-east to south-west, in consequence of the interposition of a ridge subordinate and parallel to the central chain. On the north, where the mountain bears the special name of Jebel Akkar, the main ridge of Lebanon rises gradually from the plain. Valleys run to the north and north-east, among them that of the Nahr el-Kebir (anc. Eleutherus). The Berdani rises in Jebel Sunnin, and enters the Buka'a plain by a gorge at Zahleh.

The highest summits occur in the north. The "Cedar block" consists of a double line of four and three summits respectively, ranged from north to south with a general elevation just under 10,000 ft. (Zahr el-Kazib, 10,018 ft.). South from them is the pass (8,351 ft.) which leads from Baalbek to Tripoli. S. Farther south is a second group of summits—the snow-capped Sunnin visible from Beirut (8,554 ft.). Between this group and the more southerly Jebel Kuneiyiseh (6,825 ft.) lies the pass (4,700 ft.) traversed by the road between Beirut and Damascus. Among the summits farther south are the ridge of Jebel el-Baruk (about 7,000 ft.), the Jebel Niha, with the Tamât Niha (6,070 ft.), near which is a pass to Sidon, and the Jebel Rihan (5,389 ft.).

The Buka'a, the valley which separates Lebanon from Anti-Lebanon, is composed mainly of recent deposits flanked by the limestones on the west and Eocene rock followed by the Upper Cretaceous of Anti-Lebanon on the east. It is watered by two rivers having their watershed near Baalbek, at an elevation of about 3,600 ft. That flowing northwards, El-'Asi, is the ancient Orontes (*q.v.*); the other is the Litany. In the lower part of its course the latter has scooped out a deep and narrow bed in typical limestone country. It bends suddenly westwards over the Cretaceous rocks. Near the bend are the ruins of the old castle of Kal'at esh-Shakif. In its lower part the Litany bears the name of Nahr el-Kasimiyeh.

The Buka'a used to be known as Coelesyria (Strabo, xvi. 2, 21); but that word as employed by the ancients had a much more extensive application.

Anti-Lebanon rises from the plain of Hasya-Homs, and in its northern portion is arid. It has not so many offshoots as occur on the west of Lebanon; under its precipitous slopes stretch broad steppe plateaux. It is composed in the main of Upper Cretaceous material surrounded by the Eocene rocks. Patches of basalt show through the Cretaceous. Along the western side of northern Anti-Lebanon stretches the Khasha'a, a succession of hard limestone ridges, cut by a succession of grassy ravines. The eastern slopes show typical Karst features. One of the best watered valleys of Anti-Lebanon is that of Helbun, the ancient Chalybon, the Helbon of Ezek. xxvii. 18. The highest points of the range are Halimat el-Kabu (8,257 ft.), Tal'at Musa (8,721 ft.) and the adjoining Jebel Nebi Baruh (7,900 ft.); and a third group near Bludan, in which the most prominent names are Shakif, Akhyar and Abu'l-Hin. The Wadi Yafufa descends westward. A little farther south, running north and south, is the rich upland valley of Zebedani, where the Abana (Barada) has its highest sources. The latter flows eastward to the plain of Damascus, and the portion of Anti-Lebanon traversed by it was called Abana (Canticles iv. 8). From the point where the southerly continuation of Anti-Lebanon begins to take a more westerly direction, a low ridge shoots out towards the south-west. Eastward from the

Hasbany branch of the Jordan lies the meadow-land Merj 'Iyun, the ancient Ijon (1 Kings xv. 20). In both Lebanon and Anti-Lebanon the southern portion is less arid and barren than the northern, and the western valleys (open to Mediterranean influences) better wooded and more fertile than the eastern.

Vegetation.—The western slope of Lebanon has the common characteristics of the flora of the Mediterranean coast, but the Anti-Lebanon belongs to the poorer region of the steppes, and the Mediterranean species are met with only sporadically along the water-courses. There is much low brushwood and the higher ridges maintain alpine plants only so long as patches of snow continue to lie. On the western slope, to a height of 1,600 ft., is the coast region, with the locust tree and the stone pine; in *Melia Azedarach* and *Ficus Sycomorus* (Beirut) is an admixture of foreign and partially subtropical elements. The great mass of the vegetation, however, is of the *maquis* type. The mountain region (1,600–6,500 ft.) exhibits sparse woods and isolated trees wherever shelter and moisture permit their growth. From 1,600 to 3,200 ft. is a zone of dwarf hard-leaved oaks, amongst which occur the Oriental forms *Fontanesia phillyraeoides, Acer syriacum* and the red-stemmed *Arbutus Andrachne*. Between 3,700 and 4,200 ft., a tall pine, *Pinus Brutia,* is characteristic. Between 4,200 and 6,200 ft. is the region of the two most interesting forest trees of Lebanon, the cypress and the cedar. The former still grows thickly, especially in the valley of the Kadisha; the horizontal is the prevailing variety. The cypress and cedar zone exhibits a variety of other leaf-bearing and coniferous trees mainly oaks and the rare Cilician silver fir (*Abies cilicica*). Rhododendrons are plentiful. Into the alpine region (6,200 to 10,400 ft) penetrate a few very stunted oaks (*Quercus subalpina*), junipers and a barberry (*Berberis cretica*). Then follow dense dwarf bushes, thorny and grey, *Astragalus* and the peculiar *Acantholimon,* found to within 300 ft. of the highest summits.

The spring vegetation, which lasts until July, is rich. The alpine flora of Lebanon is more closely associated with the Oriental flora of lower altitudes than it is with the glacial flora of Europe and northern Asia.

The population of the State of Great Lebanon was, in 1922, 628,863. The culture of the mulberry and silk, of tobacco, of the olive and vine, of many kinds of fruits and cereals as well as of cotton, has expanded enormously. Beirut exports silk, fruit and carpets and imports machinery, tin plates, etc. Lebanon has thick deposits of lignite coal of inferior quality. Iron has been worked from ancient times. Manufactures are of small account, the raw material going mostly to the coast, where the silk industry is important in Beirut. Olive-oil is made, together with various wines, of which the most famous is the *vino d'oro.*

(X)

HISTORY

Though the inhabitants of Lebanon have played a minor part in history, commercial, religious and strategical causes have frequently linked their fortunes with those of more powerful Near Eastern and Mediterranean communities. Almost at the beginning of history Lebanon appears in the character, which it preserves until the days of the Byzantine empire, of the well-wooded background of the Phoenician coast-towns which exploit its forests. Whether or not certain Egyptian cults (*see* EGYPT, *Religion*) originated in or near Lebanon, the value of its pines and cedars to timberless Egypt sufficiently explains the close connection, commercial and religious, between that country and Phoenicia which is now known to have been established as early as 3,000 B.C. (*see* ARCHAEOLOGY and JEBEIL). Under the Thothmosid and earlier Ramessid Pharaohs Lebanon with Phoenicia was an Egyptian protectorate. During the Egyptian decadence under the XXIst Dynasty Hiram of Tyre formed an alliance with Solomon of Israel which was based upon the exchange of Lebanese timber for Palestinian grain and olive-oil (1 Kings, ch. v.). The Phoenician rulers seem to have been able to control their valuable mountain hinterland and the comparative rarity of Phoenician remains in Lebanon is probably due to the fact that it was mainly inhabited by woodcutters and shepherds, and though Lebanon was included in Joshua's programme of conquest (Joshua, ch. xiii.) there is no evidence that it ever tempted Hebrew invasion. Under Persians and Seleucids there is no change; archaeological evidence suggests closer settlement in the Roman period, but it is not till the 6th and 7th centuries of the Christian era that Lebanon begins to have any political importance apart from the towns of the coast.

In the 6th century Monothelite sectaries flying from orthodox Byzantine persecution in North Syria colonized the Mountain and apparently Christianized it after their fashion. In the next century they appear first as the allies of Justinian II. against the caliph and then as rebels, hence called "Mardaites" against his authority. The next four centuries were marked by the infiltration into southern Lebanon of the heretics of Islam, who finally coalesced into the Druse community, but the early history of the Druses and of their Christian Maronite rivals is most obscure. The latter are certainly the descendants of the Monothelites, with whom they were ranked by Abulfaragius at the end of the 13th century; their reconciliation with Rome was not effectual till the 18th century and the status of their church as a body affiliated to the Church of Rome was not definitely fixed until 1736. Their history has been much darkened by propaganda designed to remove the reproach of past heresy, and to represent them as the potent allies rather than the unimportant auxiliaries of the crusading French. Latin ecclesiastical and crusading political influence certainly entered the northern Lebanon in the 12th century, but after the collapse of the Frankish adventure the "Mountain" was left to itself and its subsequent history until the massacres of 1860 will be found under DRUSES and MARONITES. By giving informal protection to the latter community in the early 18th century France sowed the seeds of the feud between Maronite and Druse. The reviving Turkish sultanate encouraged the Druses in the 19th century against an infidel community which looked to the West for countenance; the feudal organization of both communities broke down between 1840 and 1860. The Druses disclaimed their Shehab amirs and the Maronites in 1858 revolted from the Khazin family. Civil war led to European intervention which brought the constitution of the Lebanon as an autonomous province in 1864. Its natural ports, Beirut, Saida (Sidon) and Tarablus (Tripoli-in-Syria) remained, however, under the direct rule of the Turk.

The Lebanon Sanjak was governed from 1864 until 1914 by a Christian military governor (*mushir*) assisted by a council (mejlis) of 12 elected representatives of the three religions of the Mountain and their sects. Sub-governors (Qaimaqams) administered the seven districts of the Sanjak. Order was preserved by a local militia and Turkish troops were not quartered in the province. The system worked well for 50 years (1864–1914). Lebanon enjoyed peace and a relative prosperity tempered by the exiguity of its budget. The railway from Beirut to Damascus was constructed through mid-Lebanon; numerous roads were built; many villages became summer resorts for Syrians and foreigners; many missionary stations and schools were founded. A number of Druses emigrated, but the Christian population increased out of proportion to the resources of the province and from about 1890 an increasing number emigrated to the United States, Egypt and South America, to return in many cases and settle down as comfortable *petits bourgeois*. The World War put an end to the prosperity of the Sanjak. Remittances from abroad ceased; the tourists and summer visitors vanished; Turkish troops occupied the Sanjak and famine, fostered by Turkish official connivance, thinned the Maronites. At the end of the war the province became the kernel of "O E T A N." (Occupied Enemy Territory Administration North). Its subsequent fortunes under the French Mandate are described under SYRIA.

Comte R. de Gontaut-Biron's, *Comment la France s'est installée en Syrie* (1923) gives a good account of conditions at the end of the World War. *See* also under DRUSES; MARONITES. (P. GR.)

LEBANON, a town of New London county, Connecticut, U.S.A., about 27 m. E.S.E. of Hartford, served by the Central Vermont railroad. Pop. (1920) 1,343. Though it is known to

have been settled as early as 1695, the first record of a town meeting is 1698. It was formally organized in 1700. As the home of Jonathan Trumbull, governor of Connecticut 1769–84, Lebanon occupied a prominent place in revolutionary history. Then on the direct road to Boston, it ranked 14th among the 76 towns enumerated in 1774, with a population of 3,960, and was 11th in taxable property. When word of the Lexington alarm was received there, Governor Trumbull's store, adjoining his home, became the centre from which the military and naval activities of Connecticut were directed and has ever since been known as the "War Office" In May 1775, the General Assembly of the Colony appointed a committee of nine to assist the governor. This committee became known as the Council of Safety, or War Council of the Colony, and was convened at the "War Office." The first meeting, on June 7, 1775, authorized the shipment of 50 bbl. of powder of 108 lb. each, in response to the call from Massachusetts, and it is estimated that more than one-half of the entire amount of ammunition used by the Americans at Bunker Hill was forwarded from this point. In 1891, the "War Office" was presented to the Connecticut Sons of the American Revolution, by whom it was restored and re-dedicated to public purposes.

LEBANON, a city of Saint Clair county, Ill., U.S.A., 22m. E of Saint Louis, on the Baltimore and Ohio railroad. The population in 1920 was 1,883. It is the seat of McKendree college, one of the oldest colleges in the Mississippi valley, founded by the Methodists in 1828.

LEBANON, a city of central Indiana, U.S.A., on Federal highway 52, 28m N.W. of Indianapolis; the county seat of Boone county. It is served by the Big Four and the Pennsylvania railways, and by inter-urban electric lines. The population was 6,257 in 1920 (98% native white) and was estimated locally at 7,000 in 1928 It is the trade centre of a farming and dairying region, and has grain elevators, canneries, a cream-separating and milk-condensing plant and other manufacturing industries. The first log house was built in 1832; a brick court-house in 1840. The city was incorporated in 1853, the year after the railroad reached it.

LEBANON, town, Grafton county, New Hampshire, U.S.A., on the Connecticut river at the mouth of the Mascoma; served by the Boston and Maine railroad. The population was 6,162 in 1920 (85% native white). It has a beautiful common, and a town hall of characteristic New England architecture The river provides power for factories and public utilities. The village is a touring centre and has a variety of manufacturing industries, including woollen, shoddy and knitting mills, garment factories, machine shops, lumber mills and brick yards. Lebanon was chartered as a town on July 4, 1761.

LEBANON, a city of south-eastern Pennsylvania, U.S.A., in the beautiful and fertile Lebanon valley, 86m. N.W. of Philadelphia; county seat of Lebanon county It is on Federal highway 22 and the Cornwall, the Pennsylvania and the Reading railways. Pop. (1920) 24,643 (93% native white) About 5m. S. of the city are the Cornwall iron mines, one of the most productive magnetite deposits in the world. Limestone, brownstone and brick-clay also abound in the vicinity. The city has extensive iron and steel works, and numerous industries making use of these products The output of its 97 factories in 1926 was valued at $27,724,500. Bank clearings in 1927 amounted to $95,939,160. The city has a commission form of government. The first settlement in this locality was made about 1730, and 20 years later a town was laid out by one of the landowners, George Steitz, and named Steitztown. About 1760 it became known as Lebanon. It was incorporated as a borough in 1821, and chartered as a city in 1885 The iron deposits at Cornwall have been worked since 1740. An early settler, Peter Grubb, leased the use of the red dirt from the Conewago Indians "as long as grass grows and water flows." During the Revolution, Baron Steigel used this ore in his primitive furnaces to make cannon for the Continental army.

LEBANON, a town of central Tennessee, U.S.A., 30m. E. by N. of Nashville; on Federal highway 70, and served by the Nashville, Chattanooga and St. Louis and the Tennessee Central railways; the county seat of Wilson county. The population was 4,084 in 1920 (29% negroes). It ships cotton, grain, tobacco and live stock; has various manufacturing industries; and is the seat of Cumberland university (Cumberland Presbyterian; established 1842). The town was founded in 1802.

LE BARGY, CHARLES GUSTAVE AUGUSTE (1858–), French actor, was born at La Chapelle (Seine). He became a member of the Comédie Française, and made a great reputation in *Le Duel, L'Énigme, Le Marquis de Priola, Le Dédale* and other plays. His wife, Simone le Bargy *née* Benda, an accomplished actress, made her début at the Gymnase in 1902, and in later years had a great success in *La Rafale* and other plays. In 1910 he had differences with the authorities of the Comédie Française and ceased to be a *sociétaire*.

LEBEDEV, PETR NIKOLAJEVICH (1866–1912), Russian physicist, was born on Feb 24 (old style) 1866 in Moscow. In 1887 he went to study physics under Kundt in Strassburg. He took his doctor's degree in 1891 and published his first research on the Mossotti-Clausius theory of dielectrics. In the same year he was appointed assistant in physics at the University of Moscow and in 1892 professor. He succeeded, among other achievements, in proving, experimentally (1899), the existence of the extremely small pressure which light exercises on bodies (*see* RADIATION; and LIGHT) In 1901 appeared his classical work: *Experimental Research on Light Pressure.* Finally in 1910 (*Annalen der Physik*) he succeeded in measuring this pressure, theoretically determined by Maxwell In 1911 Lebedev left the university and started a private laboratory. His further work was mainly on the origin of the earth's magnetism, but death from heart failure on March 1, 1912 stopped his ingenious experiments He founded in Moscow the Lebedev Physical Society. In 1913 his *Collected Researches* were published in Russian under the auspices of this society.

LEBEL, JEAN (d. 1370), Belgian chronicler, was born near the end of the 13th century. His father, Gilles le Beal des Changes, was an alderman of Liége. Jean entered the church and became a canon of the cathedral church, but he and his brother Henri followed Jean de Beaumont to England in 1327, and took part in the border warfare against the Scots. His will is dated 1369, and his epitaph gives the date of his death as 1370. Jacques de Hemricourt, author of the *Miroir des nobles de Hesbaye,* has left a eulogy of his character, and a description of the magnificence of his attire, his retinue and his hospitality. Hemricourt asserts that he was eighty years old or more when he died. For a long time Jean Lebel (or le Bel) was only known as a chronicler through a reference by Froissart, who quotes him in the prologue of his first book as one of his authorities. A fragment of his work, in the ms. of Jean d'Outremeuse's *Mireur des istores,* was discovered in 1847; and the whole of his chronicle, preserved in the library of Châlons-sur-Marne, was edited in 1863 by L. Polain. Jean Lebel gives as his reason for writing a desire to replace a certain misleading rhymed chronicle of the wars of Edward III by a true relation of his enterprises down to the beginning of the Hundred Years' War. Lebel's chief merit is his refusal to narrate events unless either he himself or his informant had witnessed them. Writing for the public of chivalry, he preserves no general notion of a campaign, which resolves itself in his narrative into a series of exploits on the part of his heroes Froissart was considerably indebted to him, and seems to have borrowed from him some of his best-known episodes, such as the death of Robert the Bruce, Edward III. and the countess of Salisbury, and the devotion of the burghers of Calais.

See L. Polain, *Les Vraies Chroniques de messire Jehan le Bel* (1863); Kervyn de Lettenhove, *Bulletin de la société d'émulation de Bruges,* series ii vols. vii. and ix.; and H. Pirenne in *Biographie nationale de Belgique.*

LE BEL, JOSEPH ACHILLE (1847–), French chemist, was born at Pechelbronn on Jan. 21, 1847; he studied at the Polytechnic school in Paris and then became préparateur at Strasbourg and later at Paris, under Balard and Wurtz. Shortly afterwards he retired from academic work. Le Bel has made a number of investigations in organic chemistry but he is best known for the theory of the asymmetric carbon atom in optically active compounds (*see* STEREOCHEMISTRY), which he put forward almost

simultaneously with J. van't Hoff (*q.v.*) in 1874. He claimed to have obtained experimental evidence for the existence of optically active nitrogen compounds (1891) but the results were shown to be erroneous.

LEBLANC, NICOLAS (1742–1806), French chemist, was born at Issoudun, Indre, in 1742. He made medicine his profession and in 1780 became surgeon to the duke of Orleans, but he also paid much attention to chemistry. Leblanc will be particularly remembered for his invention of a process for the manufacture of soda from common salt. This process is now obsolescent but it played an important part in the development of chemical industry in the 19th century. The first step had been taken in 1789 by J. C. de la Métherie (1743–1817), editor of the *Journal de physique,* but the important discovery which made the method possible was due to Leblanc. Salt was heated with vitriol (sulphuric acid) and the resulting sodium sulphate was calcined with charcoal; the product was mainly sodium sulphide. Leblanc, however, added chalk (calcium carbonate) to the mixture of sulphate and charcoal, and after heating, soda (sodium carbonate) could be extracted from the resulting "black ash" by means of water. In 1792 he was granted a patent for the process, and a factory, financed by the duke of Orleans, was started at St. Denis, near Paris. As a result of the Revolution the factory was confiscated soon after its opening, and although it was returned to Leblanc in 1800, he was unable to obtain the financial support necessary for its successful maintenance. Worn out with disappointment, he committed suicide at St. Denis on Jan. 10, 1806.

(For the Leblanc soda process *see* ALKALI MANUFACTURE: *Manufacture of Salt Cake;* and HYDROCHLORIC ACID.)

LE BLANC, a town of central France, capital of an arrondissement, in the department of Indre, 44 m. W.S.W. of Châteauroux on the Orléans railway between Argenton and Poitiers. Pop. (1926) 4,159. Le Blanc, which is identified with the Roman *Oblincum,* was in the middle ages a lordship belonging to the house of Naillac and a frontier fortress of the province of Berry. The Creuse divides it into a lower and an upper town. The church of St. Génitour dates from the 12th, 13th and 15th centuries, and there is an old castle restored in modern times. It is the seat of a subprefect, and has a tribunal of first instance. Wool-spinning, and the manufacture of linen goods and edge-tools are among the industries. There is trade in horses and in the agricultural and other products of the surrounding region.

LEBOEUF, EDMOND (1809–1888), marshal of France, was born at Paris on Nov. 5, 1809, passed through the École Polytechnique and the school of Metz. He served in Algeria, in the Crimean War, and in the Italian war of 1859, when his action at Solferino materially assisted in achieving the victory. In September 1866, having in the meantime become aide-de-camp to Napoleon III., he was despatched to Venetia to hand over that province to Victor Emmanuel. In 1869 Leboeuf became minister of war, and reorganized the War Office and the civil departments of the service. In the spring of 1870 he received the marshal's baton. On the declaration of war with Germany Leboeuf delivered himself in the Corps Législatif of the historic saying, "So ready are we, that if the war lasts two years, not a gaiter button would be found wanting." Leboeuf took part in the Lorraine campaign, at first as chief of staff (major-general) of the Army of the Rhine, and afterwards, when Bazaine became commander-in-chief, as chief of the III. corps, which he led in the battles around Metz. Shut up with Bazaine in Metz, on its fall he was a prisoner in Germany. On the conclusion of peace he returned to France and gave evidence before the commission of inquiry into the surrender of Metz, when he strongly denounced Bazaine. He died at the Château du Moncel near Argentan on June 7, 1888.

LE BON, JOSEPH (1765–1795), French politician, born at Arras on Sept. 29, 1765, was curé of a constitutional church in the Pas-de-Calais, and was elected to the Convention on July 2, 1793. His severities against counter-revolutionaries during his missions (1793–94) to the departments of Somme and Pas-de-Calais led to his arrest on July 10, 1795, on a charge of abuse of power. He was tried before the Somme tribunal, and executed at Amiens on Oct. 10, 1795. Whatever his offences may have been, he saved Cambrai from falling into the hands of the Austrians, and his condemnation was probably mainly due to political enmities.

His son, Emile le Bon, published a *Histoire de Joseph le Bon et des tribunaux révolutionnaires d'Arras et de Cambrai* (2nd ed., 2 vols., Arras, 1864).

LE BOURGET AIRPORT, owned and operated by the French Government, is situated approximately 7 m. from the centre of Paris. Regular aeroplane passenger service is carried on between Le Bourget and the principal cities of Europe. Le Bourget is about 325 ac. in area and is divided into civil and military sections. The airport is provided with an administration building containing a waiting room for passengers, ticket offices, restaurant and the executive offices. Another building houses the baggage, express and mail offices, as well as the customs officials. There is also a fully equipped emergency service. Adjoining the main building there is a structure where complete meteorological information is collected and shown on a display board.

The field is equipped with 12 metal and 5 cement hangars, all of which are provided with fire-extinguishing apparatus. There is a main anchorage platform to which aeroplanes "taxi" for loading and unloading the passengers and express; Le Bourget is fully illuminated with modern airport-lighting and signalling equipment. There is no mooring mast or hangar for lighter-than-air craft at Le Bourget, but the airport of Villeneuve-Orly, which is 25 km. from Le Bourget, has accommodations for two dirigibles.

(J. C. McG.)

LE BRAZ, ANATOLE (1859–1926), Breton scholar, was born on April 2, 1859 at Duault, Côtes-du-Nord, and educated at the Lycée St. Louis, and at the Faculté des Lettres at Paris. He held posts as professor of philosophy at the college of Etampes (1884–86) and the Lycée of Quimper (1886–1900); and as lecturer at the university of Harvard (1906). He made lecturing tours in Canada and the United States in 1907, 1912 and 1915.

His publications include *Soniou Breiz-Izel* (1892); *La Chanson de la Bretagne* (1892); *Pâques d'Islande* (1897); *La Terre du Passé* (1901); *Au Pays des Pardons* (1894); *La Légende de la mort chez les Bretons-armoricains* (1902, later ed., 1922); *Vieilles Histoires du pays Breton* (1897); *Au Pays d'exil de Chateaubriand* (1909); *Ames d'Occident* (1911).

LEBRIJA or LEBRIXA, a town of southern Spain, in the province of Seville, near the left bank of the Guadalquivir. Pop. (1920) 12,012. Lebrija is 44 m. S. by W. of Seville, on the Seville-Cadiz railway. Lebrija is the *Nabrissa* or *Nebrissa,* surnamed *Veneria,* of the Romans; by Silius Italicus (iii. 393), who connects it with the worship of Dionysus, the name is derived from the Greek *νέβρις* (a "fawn-skin," associated with Dionysiac ritual). *Nebrishah* was a strong and populous place during the period of Moorish domination (from 711); it was finally recovered in 1264. It was the birthplace of Nebrissensis, a Renaissance scholar, the tutor of Queen Isabella, and a collaborator with Cardinal Jimenes in the preparation of the Complutensian Polyglot (*see* ALCALA DE HENARES). Its chief buildings are a ruined Moorish castle and the parish church, containing some early specimens of the carving of Alonso Cano (*q.v.*).

LE BRUN, CHARLES (1619–1690), French painter, was born at Paris on Feb. 24, 1619, and attracted the notice of Chancellor Séguier, who placed him at the age of 11 in the studio of Vouet. At 15 he received commissions from Cardinal Richelieu, in the execution of which he displayed an ability which obtained the generous commendations of Poussin, in whose company Le Brun started for Rome in 1642. In Rome he remained four years in the receipt of a pension due to the liberality of the chancellor. On his return to Paris Le Brun found numerous patrons, of whom Superintendent Fouquet was the most important. Employed at Vaux le Vicomte, Le Brun ingratiated himself with Mazarin.

Colbert also promptly recognized Le Brun's powers of organization, and attached him to his interests. Together they founded the Academy of Painting and Sculpture (1648), and the Academy of France at Rome (1666), and gave a new development to the industrial arts. In 1660 they established the Gobelins, which at first was a great school for the manufacture, not of tapestries only, but of every class of furniture required in the royal pal-

aces. Commanding the industrial arts through the Gobelins—of which he was director—and the whole artist world through the Academy—in which he successively held every post—Le Brun imprinted his own character on all that was produced in France during his lifetime, and gave a direction to the national tendencies which endured after his death.

The nature of his emphatic and pompous talent was in harmony with the taste of the king, who, full of admiration at the decorations designed by Le Brun for his triumphal entry into Paris (1660), commissioned him to execute a series of subjects from the history of Alexander. The first of these, "Alexander and the Family of Darius," so delighted Louis XIV. that he knighted Le Brun (Dec. 1662), who was also created first painter to his majesty with a pension of 12,000 livres, the same amount as he had yearly received in the service of the magnificent Fouquet. From this date all that was done in the royal palaces was directed by Le Brun. The works of the gallery of Apollo in the Louvre were interrupted in 1677 when he accompanied the king to Flanders (on his return from Lille he painted several compositions in the Château of St. Germain), and finally he reserved for himself at Versailles the Halls of War and Peace, the Ambassadors' Staircase, and the Grande Galerie des Glaces, other artists being forced to accept the position of his assistants. At the death of Colbert, Louvois, who succeeded him in the department of public works, showed no favour to Le Brun, and in spite of the king's continued support he felt the change in his position. He died on Feb. 22, 1690.

See H. Jouin, *Charles Le Brun et les Arts sous Louis XIV.* (1889); P. Marcel, *Charles Le Brun* (1909).

LEBRUN, CHARLES FRANÇOIS, duc de Plaisance (1739–1824), French statesman, was born at St-Sauveur-Lendelin (Manche) on March 19, 1739. He was an adviser of the chancellor Maupeou and shared in his downfall in 1774. After the revolution he professed liberal views, in the Constituent Assembly, and proposed various financial laws. After the *coup d'état* of the 18th Brumaire in the year VIII. (Nov. 9, 1799), Lebrun was made third consul and he took an active part in the reorganization of finance and of the administration of the departments of France. In 1804 he was appointed arch-treasurer of the empire, and in 1805–1806 as governor-general of Liguria effected its annexation to France. In 1808 he reluctantly accepted the title of duc de Plaisance (Piacenza). He was governor-general of the departments formed in Holland from 1811 to 1813. He accepted the *fait accompli* of the Restoration in April 1814, and Louis XVIII. made him a peer of France; but during the Hundred Days he accepted from Napoleon the post of grand master of the university. On the return of the Bourbons in 1815 he was suspended from the House of Peers, but was recalled in 1819. He died at St. Mesmes (Seine-et-Oise) on June 16, 1824.

See M. de Caumont la Force, *L'Architrésorier Lebrun* (1907); M. Marie du Mesnil, *Mémoire sur le prince Le Brun, duc de Plaisance* (1828); *Opinions, rapports et choix d'écrits politiques de C. F. Lebrun* (1829), ed. with a biographical notice, by his son Anne-Charles Lebrun.

LECAN, an independent linguistic stock of South American Indians, so called from the Lecas, its most important tribe. The Lecas lived in north-western Bolivia, just east of Lake Titicaca, on the eastern slope of the Andes. Their original home is said to have been on the Tipuani river and its tributaries, but they later moved east and north-east to the Mapiri and Beni rivers in the provinces of Larecaja and Caupolican, where, in the vicinity of Aten, their modern descendants live.

See A. F. Chamberlain, "Sur quelques familles linguistiques . . . de l'Amérique du Sud," *J. Soc. Americanistes de Paris* (n.s.), vol. vii., pp. 179–202.

LE CARON, HENRI (whose real name was THOMAS MILLER BEACH) (1841–1894), British secret service agent, was born at Colchester, on Sept. 26, 1841. At nineteen he went to Paris, where he found employment in business connected with America. He crossed the Atlantic in 1861 and enlisted in the Northern army, taking the name of Henri Le Caron. In 1864 he married a young lady who had helped him to escape from some Confederate marauders; and by the end of the war he rose to be major. In 1865, through a companion in arms named O'Neill, he was brought into contact with Fenianism, and having learnt of the Fenian plot against Canada, he mentioned the designs when writing home to his father. Le Caron, from that time till 1889, acted for the British government as a paid military spy. He remained for years on intimate terms with the most extreme men in the Fenian organization. His services enabled the British government to take measures which led to the fiasco of the Canadian invasion of 1870 and Riel's surrender in 1871, and he supplied full details concerning the various Irish-American associations, in which he himself was a prominent member. He was in the secrets of the "new departure" in 1879–1881, and in 1882 had an interview with Parnell at the House of Commons, when the Irish leader spoke sympathetically of an armed revolution in Ireland. For 25 years he lived at Detroit and other places in America, paying occasional visits to Europe, and all the time carrying his life in his hand. The Parnell commission of 1889 put an end to this. Le Caron was subpoenaed by *The Times*, and in the witness-box the whole story came out. He published the story of his life, *Twenty-five Years in the Secret Service*. He died on April 1, 1894. The report of the Parnell commission is his monument.

See references under PARNELL.

LE CATEAU, a town of northern France, in the department of Nord, on the Selle, 15 m. E S E of Cambrai by road. Pop. (1926) 8,494. Formed by the union of the two villages of Péronne and Vendelgies, Le Cateau became the seat of an abbey in the 11th century. In the 15th it was frequently taken and retaken, and in 1556 it was burned by the French. It was finally ceded to France by the peace of Nijmwegen in 1678. Le Cateau suffered much damage during the World War. It was the scene of the battle of Le Cateau in Aug. 1914 and in Oct. 1918 was bombarded after the British entered it. It has a board of trade arbitration. It manufactures cloths, etc.

LE CATEAU, BATTLE OF, 1914. This was the battle which Gen. Smith-Dorrien's II. Corps, the left wing of the British Expeditionary Force, as also of the Franco-British line of armies, fought during the retreat from Mons (*q.v.*). It thus formed a pendant to the Battles of the Frontier. (*See* FRONTIER, BATTLES OF THE.) Too closely pressed by the advancing German I. Army (Kluck) to continue its retreat safely, the II. Corps paused to fight, on the initiative of its commander, and against the intentions of the British commander-in-chief. By its resolute resistance, at serious cost to itself, it averted a disaster to the British Expeditionary Force and contributed to the secure retreat of the Allied armies.

LECCE, town and archiepiscopal see of Apulia, Italy (anc. *Lupiae*), capital of the province of Lecce, 24 m. S E. of Brindisi by rail. Pop. (1921), 34,138 (town); 39,290 (commune). The town is rich in buildings of the 17th century, in rococo style. They are built in the light yellow stone of the district, which closely resembles that of Malta. Among them are the cathedral of S. Oronzo, the churches of S. Croce, S. Angelo, S. Irene, S. Matteo, etc., and the Prefettura (containing a museum). There are remains of a Roman amphitheatre, and the church of SS. Nicola e Cataldo, built by Tancred in 1180, may be noted, as well as the massive castle of 1539 and the walls and bastions of the same period. Lecce is the centre of a fertile agricultural district and is a very clean and prosperous town. It makes statues of papier-mâché. The small harbour of S. Cataldo is 7½ m. E. and is reached by electric tramway. Lecce occupies the site of a Messapian city of unknown name. Hardly a mile west was Rudiae, the birthplace of the poet Ennius. The name Lycea, or Lycia, begins to appear in the 6th century. The city was for some time held by counts of Norman blood, including Bohemund, son of Robert Guiscard. Its remoteness from the larger centres has given it a life of its own, and it has produced so many men of letters that it has been called the Athens or the Florence of Apulia.

See M. S. Briggs, *In the Heel of Italy* (London, 1910); G. Gigli, *Il Tallone d'Italia I. Lecce e Dintorni* (Bergamo, 1911); both well illustrated.

LECCO, town of Lombardy, province of Como, 32 m. by rail N. by E. of Milan, 673 ft. above sea-level. Pop. (1921) 28,739. It is near the south end of the eastern branch of the Lake of

Como, which is frequently distinguished as the Lake of Lecco. From Lecco the line to Colico was one of the earliest in Europe to be run by electricity (overhead wires). Branches run to Chiavenna and Sondrio; and another line runs to Bergamo. To the south the Adda is crossed by a fine bridge originally constructed in 1336–38 by Azzone Visconti and rebuilt in 1609 by Fuentes. Almost the only old building is the castle, of which a part remains. Besides iron-works, there are copper-works, brass-foundries, olive-oil mills and a manufacture of wax candles; and silk-spinning, cotton-spinning and wood-carving.

In the 11th century Lecco, previously seat of a marquisate, was presented to the bishops of Como by Otto II.; but in the 12th century it passed to the archbishops of Milan. During the 13th century it was struggling with the metropolitan city. In 1283 the Visconti drove its inhabitants across the lake to Valmadrera But in a few years the people returned and Azzone Visconti made Lecco a strong fortress. During the 15th and 16th centuries the citadel of Lecco was an object of endless contention. In 1647 the town with its territory was made a countship. Morone, Charles V.'s Italian chancellor, was born in Lecco.

LECH (*Licus*), a river of Bavaria, 177 m. long, with a drainage basin of 2,550 sq miles. It rises in the Vorarlberg Alps, winds out of the gloomy limestone mountains, flows north-north-east and enters the plains at Füssen (2,580 ft). Here it forms rapids, and a fall, then pursues a northerly course past Augsburg, where it receives the Wertach, and joins the Danube from the right just below Donauwörth (1,330 ft). It is not navigable. (*See* DANUBE)

LE CHAMBON, a town of France in the department of Loire, 7½ m. S.W. of St. Étienne by rail, on the Ondaine. Pop. (1926) 9,549. Coal is mined in the neighbourhood, and there are forges, steel works, manufactures of tools and other iron goods. Between Le Chambon and St. Étienne is La Ricamarie (pop. 8,037 [1926]), also of importance for its coal-mines. Many of the galleries of these mines have been burning from the 15th century, probably from spontaneous combustion.

LE CHAPELIER, ISAAC RENÉ GUY (1754–1794), French politician, was born at Rennes on June 12, 1754. He studied law and in 1789 was elected to the States General. He adopted advanced opinions, and was one of the founders of the Breton club. He was elected president of the Constituent Assembly and presided during the important period following Aug. 3, 1789. He was a leading member of the committee which drew up the new constitution; he further presented a report on the liberty of theatres and on literary copyright. He also opposed Robespierre's proposal to exclude members of the Constituent Assembly from the new Assembly. After the flight of the king to Varennes (June 20, 1792), his opinions became more moderate, and on Sept. 29 he brought forward a motion to restrict the action of the clubs. This, together with a visit which he paid to England in 1792 made him suspect, and he was denounced on his return. He was executed at Paris on April 22, 1794.

See A. Aulard, *Les Orateurs de la constituante* (2nd ed., 1905); R. Kerviler, *Recherches et notices sur les députés de la Bretagne aux états généraux* (2 vols., Rennes, 1888–89); P. J. Levot, *Biographie bretonne* (2 vols., 1853–57).

LECHLER, GOTTHARD VICTOR (1811–1888), German Lutheran theologian, was born on April 18, 1811 at Kloster Reichenbach, Württemberg. He studied at Tübingen under F. C. Baur, and became in 1858 pastor of the church of St. Thomas, professor of historical theology and superintendent of the Lutheran church of Leipzig. He died on Dec. 26, 1888. A disciple of Neander, he belonged to the extreme right of the school of mediating theologians.

He is chiefly remembered for his *Johann von Wiclif und die Vorgeschichte der Reformation* (2 vols., 1873; Eng. trans. 1878, new ed., 1884).

LECKY, WILLIAM EDWARD HARTPOLE (1838–1903), Irish historian and essayist, was born at Newtown Park, near Dublin, on March 26, 1838, being the son of John Hartpole Lecky and his first wife, Mary Anne Tallents. Lecky was educated at Kingstown, Armagh, Cheltenham and Trinity college, Dublin, from which he graduated B.A. in 1859 and M.A. in 1863. An early interest in theology led to the publication of *Religious Tendencies of the Age,* in 1860; but this, together with a book of poems and *Leaders of Public Opinion in Ireland* (1861), met with little success. In 1863, he made his fourth venture as an author with the *Declining Sense of the Miraculous,* subsequently incorporated in the *History of Rationalism* (1865). In spite of its length and discursiveness, the book, which is indicative throughout of wide knowledge, clear thought and sound judgment, achieved an instantaneous success. His reputation was enhanced by the appearance of the *History of European Morals* (1869). Both books are, in a sense, an attempt to explain the same set of facts from a different standpoint; or, in his own words, both "are an attempt to examine the merits of certain theological opinions according to the historical method. . . . The 'Morals' is a history of the imposition of those opinions upon the world and attempts to show how far their success may be accounted for by natural causes. . . . The 'Rationalism' is a history of the decay of those opinions."

Lecky's marriage in 1871 with Elizabeth van Deden involved him in a multiplicity of social duties, but he did not allow these to interrupt his work. In the same year he brought out a revised edition of *Leaders of Public Opinion,* but it still failed to please, and Lecky returned to his magnum opus, *The History of England in the 18th Century.* This work, which occupied him for 19 years, was published in 12 volumes, each of which was received with acclamation. The book is distinguished by its lucidity, reliability and scrupulous impartiality, qualities which are most conspicuous in the section dealing with Ireland, a subject in which Lecky was intensely interested.

In 1895, he was elected member of parliament for Dublin university as a Liberal Unionist and on taking his seat in the House he became a keen advocate of reform in Ireland. He supported the extension of educational facilities for Roman Catholics, and upheld Plunkett's agricultural policy, but he continued to oppose the granting of Home Rule. Lecky was the recipient of many honours. In 1897 he was made a privy councillor, in 1902 he became one of the first members of the British Academy founded in that year, and soon after he received the Order of Merit. He died on Oct. 22, 1903, in London.

Apart from the works mentioned, Lecky wrote: *Democracy and Liberty* (1896, revised ed., 1899); *The Map of Life* (1899); and in 1903 he published a third and finally revised edition of *Leaders of Public Opinion.* He contributed to several periodicals and two of his lectures, *The Political Value of History* and *The Empire, its Value and its Growth,* were published in 1892 and 1893 respectively. A collection of essays and biographical sketches was published posthumously in 1908 by Mrs. Lecky, under the title of *Historical and Political Essays.*

LECLANCHÉ CELL, an electrolytic cell commonly used for purposes such as ringing electric bells, where only an intermittent current is required. (*See* BATTERY: *Depolarization by Oxidation.*)

LE CLERC [CLERICUS], **JEAN** (1657–1736), French Protestant theologian, was born on March 19, 1657 at Geneva, where his father was professor of Greek. In 1679 were published *Liberii de Sancto Amore Epistolae Theologicae* (Irenopoli: Typis Philalethianis), usually attributed to Le Clerc; they deal with the doctrine of the Trinity, the hypostatic union of the two natures in Christ, original sin, and the like. At Amsterdam he met John Locke and Philip v. Limborch, professor at the Remonstrant college; the acquaintance with Limborch soon ripened into a close friendship, which strengthened his preference for the Remonstrant theology. In 1684 he finally settled at Amsterdam, first as a moderately successful preacher, and afterwards as professor of philosophy, belles-lettres and Hebrew in the Remonstrant seminary. He died on Jan. 8, 1736.

His publications are listed with biographical material, in E. and E. Haag's *France Protestante* and in J. G. de Chauffepié's *Dictionnaire* His series of Biblical commentaries appeared between 1693 and 1731; the portion relating to the New Testament included the paraphrase and notes of Henry Hammond (1605–60). Le Clerc's commentary had a great influence in showing the necessity for a more scientific inquiry into the origin and meaning of the biblical books, but it was on all sides hotly attacked. His *Ars Critica* appeared in 1696, and, in continuation, *Epistolae Criticae et Ecclesiasticae* in 1700. Le Clerc's new edition

of the *Apostolic Fathers* of Johann Cotelerius (d. 1686), published in 1698, marked an advance in the critical study of these documents. But the greatest influence of Le Clerc was exercised by means of the journals which he edited. These were the *Bibliothèque universelle et historique* (Amsterdam, 25 vols. 1686–93), begun with J. C. de la Croze; the *Bibliothèque choisie* (Amsterdam, 28 vols. 1703–13); and the *Bibliothèque ancienne et moderne* (29 vols., 1714–26).

See Le Clerc's *Parrhasiana ou pensées sur des matières de critique, d'histoire, de morale, et de politique: avec la défense de divers ouvrages de M. L. C. par Théodore Parrhase* (Amsterdam, 1699); and *Vita et opera ad annum MDCCXI., amici ejus opusculum, philosophicis Clerici operibus subjiciendum,* also attributed to himself. The supplement to Hammond's notes was translated into English in 1699, *Parrhasiana, or Thoughts on Several Subjects,* in 1700, the *Harmony of the Gospels* in 1701, and *Twelve Dissertations out of M. Le Clerc's Genesis* in 1696.

LECOCQ, ALEXANDRE CHARLES (1832–1918), French musical composer, was born in Paris, on the 3rd of June 1832, and studied at the Conservatoire. His chief success was made with *La Fille de Madame Angot* (Paris, 1873; London, 1873), which was performed for 400 nights consecutively, and has retained enormous popularity. After 1873 Lecocq produced a large number of comic operas, though he never repeated the triumph of *La Fille de Madame Angot.* He died in Paris on Oct. 24, 1918

LE CONTE, JOSEPH (1823–1901), American geologist, of Huguenot descent, was born in Liberty county (Ga.), on Feb. 26, 1823. He was educated at Franklin college (Ga.), where he graduated (1841) and received a degree in medicine at the New York college of Physicians and Surgeons in 1845. After practising for three or four years at Macon (Ga.), he entered Harvard, and studied natural history under L. Agassiz. At this time he developed a keen interest in geology After graduating at Harvard, Le Conte in 1851 accompanied Agassiz on an expedition to study the Florida reefs. On his return he became professor of natural science in Oglethorpe university (Ga); and from 1852 to 1856 was professor of natural history and geology in Franklin college. From 1857 to 1869 he was professor of chemistry and geology in South Carolina college, and he was then appointed professor of geology and natural history at the University of California, a post which he held until his death. He published papers on monocular and binocular vision, and also on psychology. His chief contributions, however, related to geology, and in all he wrote he was lucid and philosophical. He described the fissure-eruptions in western America, discoursed on earth-crust movements and their causes and on the great features of the earth's surface. As separate works he published *Elements of Geology* (1878, 5th ed., 1889); *Religion and Science* (1874); and *Evolution: its History, its Evidences, and its Relation to Religious Thought* (1888). He died in the Yosemite Valley (Calif), on June 6, 1901.

A bibliography of his work is given in *Bulletin* of the Geol. Soc of America, vol. 26, p. 54.

See Obituary by J. J Stevenson, *Annals of New York Acad of Sciences,* vol. xiv. (1902), p. 150.

LECONTE DE LISLE, CHARLES MARIE RENÉ (1818–1894), French poet, was born in the island of Réunion on Oct. 22, 1818. His father, an army surgeon, who brought him up with great severity, sent him to travel in the East Indies with a view to preparing him for a commercial life. After this voyage he went to Rennes to complete his education, studying especially Greek, Italian and history. He returned once or twice to Réunion, but in 1846 settled definitely in Paris. His first volume, *La Vénus de Milo,* attracted to him a number of friends many of whom were passionately devoted to classical literature. In 1873 he was made assistant librarian at the Luxembourg; in 1886 he was elected to the Academy in succession to Victor Hugo. His *Poèmes antiques* appeared in 1852; *Poèmes et poésies* in 1854; *Le Chemin de la croix* in 1859; the *Poèmes barbares,* in their first form, in 1862; *Les Erinnyes,* a tragedy after the Greek model, in 1872; for which occasional music was provided by Jules Massenet; the *Poèmes tragiques* in 1884; *L'Apollonide,* another classical tragedy, in 1888; and two posthumous volumes, *Derniers poèmes* in 1899, and *Premières poésies et lettres intimes* in 1902. In addition to his original work in verse, he published a series of admirable prose translations of Theocritus, Homer, Hesiod, Aeschylus, Sophocles, Euripides, Horace. He died at Voisins, near Louveciennes (Seine-et-Oise) on July 18, 1894.

In Leconte de Lisle the Parnassian movement seems to crystallize. His verse is clear, sonorous, dignified, deliberate in movement, classically correct in rhythm, full of exotic local colour, of savage names, of realistic rhetoric. It has its own kind of romance, in its "legend of the ages," so different from Hugo's, so much fuller of scholarship and the historic sense, yet with far less of human pity. Coldness cultivated as a kind of artistic distinction seems to turn all his poetry to marble, in spite of the fire at its heart. Most of Leconte de Lisle's poems are little chill epics, in which legend is fossilized. They have the lofty monotony of a single conception of life and of the universe. He sees the world as what Byron called it, "a glorious blunder," and desires only to stand a little apart from the throng, meditating scornfully. Hope, with him, becomes no more than this desperate certainty:—

"Tu te tairas, ô voix sinistre des vivants!"

His only prayer is to Death, "divine Death," that it may gather its children to its breast:—

"Affranchis-nous du temps, du nombre et de l'espace,
Et rends-nous le repos que la vie a troublé!"

(A. Sy.)

Brunetière, *L'Evolution de la poésie lyrique en France au XIXe siècle* (1894), and *Nouveaux essais sur la litt contemp.* (1895); J. Dornis, *Leconte de Lisle intime* (1895); F. Calmette, *Un Demi-siècle littéraire, Leconte de Lisle et ses amis* (1902); M. A. Leblond, *Leconte de Lisle d'après des documents nouveaux* (1906); E. Estève, *Leconte de Lisle* (1922).

LE CORBUSIER, M. (whose family name is *Jeanneret*) (1887–), Swiss architect, was born at La Chaux de Fonds, near Neuchatel, in 1887. He built his first house at the age of 17, and shortly afterwards studied for a time under Auguste Perret, who, with his brother was a pioneer of reinforced-concrete construction. Le Corbusier settled in Paris in 1916 and for some years worked at industrial research and as a painter of the modern school. Both in theory and practice he is one of the most notable of contemporary architects Associated with him is his cousin, Pierre Jeanneret, a native of Geneva. Le Corbusier explicitly proclaims "engineer-building" as the only form corresponding spiritually no less than economically to the age:—"Styles are a lie"; "the house is a habitable machine"; "beauty will always come when the intention towards it exists, and the means, *which are proportion.*" The stripped economy and exact functional fitness of the steamship, the automobile and the aeroplane are held up by him as models to builders who have eyes to see. It follows from these indications that he is working for the industrialization of building, since "engineer-building" means reinforced-concrete constructions, and the expense of the moulds for these demands their use in a series of houses. The details of the series, *e.g.,* window-frames, and even built-in furniture are then naturally produced also in mass. Type-houses are the "Citrohan" and the "Monol," while another form has been erected at Pessac, near Bordeaux.

Endless ingenious methods of construction appear to be at Le Corbusier's disposal. The flat roof with roof-garden, which he advocates, is not merely a tribute from architecture to health; but the thick concrete flags laid on sand, with open, grass-sown joints, insulate the house beneath and lessen the considerable reaction of a concrete structure to varying weather conditions. His best known non-series buildings include the Maison Laroche, Auteuil, a private house at Garches; a contribution to the Werkbund exhibition at Stuttgart in 1927; the Pavillon de l'Esprit Nouveau at the Paris exhibition of 1925, and the design for the Palace of the Nations at Geneva (one of the two chosen for final selection from 377 entries), a magnificent conception which is perhaps most simply described as fulfilling all that is best in the 20th century. Le Corbusier has also devoted considerable time to town-planning. A complete scheme was elaborated in 1922 for a city of three million inhabitants, on a basis of decentralization, communal services and fresh air for everybody.

His publications include: *Vers Une Architecture* (Paris, 1922), *L'Art Décoratif d'Aujourd'hui* (1922), *Urbanisme* (1925).

See *Baubücher II.*, "Internationale Neue Baukunst" (Stuttgart).

LECOUVREUR, ADRIENNE (1692–1730), French actress, was born on April 5, 1692, at Damery, Marne, the daughter of a hatter, Robert Couvreur. She showed a natural talent for declamation and was instructed by La Grand, *sociétaire* of the Comédie Française. After a long apprenticeship, she made her Paris début in 1717, as Électre, in Crébillon's tragedy of that name; and Angélique in Molière's *Georges Dandin*. She was immediately received into the Comédie Française, and for 13 years she was the queen of tragedy there, attaining a popularity never before accorded an actress. She is said to have played no fewer than 1,184 times in a hundred rôles, of which she created 22. Adrienne Lecouvreur abandoned the stilted style of elocution of her predecessors for a naturalness of delivery and a touching simplicity of pathos that delighted and moved her public. In Baron, who returned to the stage at the age of 67, she had an able and powerful coadjutor in changing the stage traditions of generations. The jealousy she aroused was partly due to her social success; she was on visiting and dining terms with half the court, and her *salon* was frequented by Voltaire and all the other notables and men of letters. She was the mistress of Maurice de Saxe from 1721, and sold her plate and jewels to supply him with funds for his ill-starred adventures as duke of Courland. By him she had a daughter, her third, who was grandmother of the father of George Sand. Adrienne Lecouvreur died on March 30, 1730. She was denied the last rites of the Church, and her remains were refused burial in consecrated ground. Voltaire, in a fine poem on her death, expressed his indignation at the barbarous treatment accorded to the woman whose "friend, admirer, lover" he was.

Her life formed the subject of the tragedy (1849), by Eugène Scribe and Ernest Legouvé See *Lettres d'Adrienne Lecouvreur* (ed. G. Monval, 1892); A. Bourgeois, *Adrienne Lecouvreur* (1895); G. Rivollet, *Adrienne Le Couvreur* (1925).

LE CREUSOT, a town of France in the department of Saône-et-Loire, 55 m. S.W. of Dijon on the Paris-Lyon railway. Pop. (1926) 24,247. Le Creusot is situated in a district rich in coal and iron and it has the most extensive iron works in France. The coal bed of Le Creusot was discovered in the 13th century; but it was not till 1774 that the first workshops were founded there. The royal crystal works were transferred from Sèvres to Le Creusot in 1787, but this industry came to an end in 1831. Meanwhile several enterprises for the manufacture of metal had ended in failure. It was only in 1836 that the foundation of iron works by Adolphe and Eugène Schneider definitely inaugurated the industrial prosperity of the place. They supplied war material at first, but later they enlarged their size and manufactured steel, armourplate, guns, locomotives, electrical machinery, etc. A network of railways about 37 m. in length connects the works and the Canal du Centre. Special attention is paid to the welfare of the workers, and good schools have been established. In 1897 the ordnance-manufacture of the Société des Forges et Chantiers de la Méditerranée at Havre was acquired by the Company, which also has important branches at Chalon-sur-Saône, where shipbuilding and bridge-construction is carried on, and at Cette.

LECTERN, a reading desk, usually restricted to ecclesiastical use. In the early church the ambo (*q.v.*) served as a reading desk, but by the 15th century the use of special stands for the large books then in vogue became common. On the Continent, especially in Italy, there are many beautiful examples of the Renaissance period in carved wood, usually with heavily scrolled, spreading, triangular base, and a support of generally baluster type. In the Anglican church, where the lectern is usually reserved for the reading of the lessons, a type has become traditional in which the book-rest is supported on the wings of an eagle or a pelican. In many cases these are of metal.

LECTION, LECTIONARY. A lection, or lesson, is a reading from Scripture, patristic homilies or lives of saints in the Roman Catholic Church. The custom of reading extracts from the Pentateuch and prophetic books (*cf.* Luke iv. 16–20, xvi. 29) in Synagogues on the Sabbath was taken over with others into the Christian divine service, additions being made from the writings of the apostles and evangelists. We find traces of such additions within the New Testament itself in such passages as Col. iv. 16; 1 Thess. v. 27.

There are traces of fixed lessons coming into existence in the 3rd century: Origen refers to the book of Job being read in Holy Week (*Commentaries on Job*, lib. i.). Allusions of a similar kind in the 4th century are frequent. John Cassian (*c.* 380) tells us that throughout Egypt the Psalms were divided into groups of twelve, and that after each group there followed two lessons, one from the Old, one from the New Testament (*De caenob. inst.* ii. 4), implying but not absolutely stating that there was a fixed order of such lessons just as there was of the Psalms. St. Basil the Great mentions fixed lessons on certain occasions taken from Isaiah, Proverbs, St. Matthew and Acts (Hom. xiii. *De bapt.*). From Chrysostom (Hom. lxiii. *in Act*, etc.), and Augustine (Tract. vi. *in Joann.*, etc.) we learn that Genesis was read in Lent, Job and Jonah in Passion Week, the Acts of the Apostles in Eastertide, lessons on the Passion on Good Friday and on the Resurrection on Easter Day. Nothing in the shape of a lectionary is extant older than the 8th century, though there is evidence that Claudianus Mamertus made one for the church at Vienne about 450. The council of Carthage in 397 forbade anything but Holy Scripture to be read in church; this rule has been adhered to so far as the liturgical epistle and gospel, and occasional additional lessons in the Roman missal are concerned, but in the divine office, on feasts when nine lessons are read at matins, only the first three lessons are taken from Holy Scripture, the next three being taken from the sermons of ecclesiastical writers, and the last three from expositions of the day's gospel; but sometimes the lives or *Passions* of the saints, or of some particular saints, were substituted for any or all of these breviary lessons.

LECTISTERNIUM (from Lat. *lectum sternere*, "to spread a couch"), a rite of Greek origin, but common in Rome from 399 B.C. (*see* Livy, v., 130) onward. It consisted of a meal offered to gods and goddesses, represented by their busts or statues, perhaps originally by aniconic symbols (*see* Festus, p. 56, 12 Lindsay). These symbols were laid upon a couch (*lectus*) or *pulvinar* (from *pulvinus*, a cushion) in the attitude of reclining. In front of the couch, which was placed in the open street, a meal was set out on a table.

On the first occasion couches were prepared for three pairs of gods—Apollo and Latona, Hercules and Diana, Mercury and Neptune. The feast, which on that occasion lasted for eight (or seven) days, was also celebrated by private individuals; the citizens kept open house, quarrels were forgotten, debtors and prisoners were released, and everything done to banish sorrow. Similar honours were paid to other divinities in subsequent times, always after consultation of the Sibylline books and as a propitiatory ceremony. The gods being grouped in Greek fashion and being frequently of Greek origin, it is plain that the rite is Greek, presumably Cumaean, since the Sibylline books came from Cumae; but in this form it does not seem to be found in Greece. In addition, *lectisternia* were held annually, or oftener (for the greater part of the year in some shrines, Livy xxxvi., 1, 2; xlii., 30, 8) at temples of gods originally Greek, as Ceres. This largely replaced the old Roman *epulum* or *daps*, in which a table was spread for the god, who was not visibly represented. A sort of compromise is the *sellisternium*, in which a goddess is provided with a chair (*sella*), not a couch, according to the Roman custom by which women did not recline but sat at meals (*e.g.* Valerius Max., ii. 1, 2). In Christian times the word was used for a feast in memory of the dead (Sidonius Apollinaris *Epistulae*, iv. 15).

See G. Wissowa, *Religion u. Kultus d. Römer*, p. 421 (bibl.).

LECTOR or **READER**, a minor office-bearer in the Christian Church. From an early period men have been set apart, under the title of *anagnostae, lectores* or readers, for the purpose of reading Holy Scripture in church. We do not know what the custom of the Church was in the first two centuries, the earliest reference to readers, as an order, occurring in the writings of Tertullian (*De praescript. haeret.* cap. 41); there are frequent allusions to them in the writings of St. Cyprian and afterwards. Cornelius, bishop of Rome in A.D. 251–252, in a well-known letter mentions readers among the various church orders then existing

at Rome. The custom has not fallen out of use, but the precise duties and method of appointment vary greatly.

LECTOURE, a town of France in the department of Gers, 21 m. N. of Auch. Pop. (1926) 2,359. Lectoure, capital of the Iberian tribe of the *Lactorates* and for a short time of Novempopulania was the seat of a bishopric in the fourth century. In the 11th century the counts of Lomagne made it their capital, and on the union of Lomagne with Armagnac, in 1325, it became the capital of the counts of Armagnac. In 1473 Cardinal Jean de Jouffroy besieged the town on behalf of Louis XI. and after its fall put the population to the sword. In 1562 it again suffered severely at the hands of the Catholics under Blaise de Montluc. The church of St. Gervais and St. Protais was once a cathedral. The massive tower which flanks it belongs to the 15th century. Its industries include distilling, the manufacture of wooden shoes, furniture and biscuits, and market gardening; it has trade in grain, flour, cattle, wine and brandy.

LEDA (parentage variously given), in Greek legend, was wife of Tyndareus and *either* was loved by Zeus in the form of a swan, and laid an egg, or eggs, from which came Helen and one or both of the Dioscuri (*cf.* CASTOR AND POLLUX), *or* hatched out a similar egg laid by Nemesis. Clytaemnestra was her daughter by Tyndareus.

See Roscher's *Lexikon der Inythologie,* art. "Leda."

LE DAIM (or LE DAIN), **OLIVER** (d 1484), favourite of Louis XI. of France, was born at Thielt, Flanders. He became court barber and valet to Louis XI., and in 1474 he was ennobled under the title Le Daim, and in 1477 made comte de Meulant. In 1477 he was sent to Burgundy to influence the young heiress of Charles the Bold, but he was ridiculed and compelled to leave Ghent. He thereupon seized and held Tournai for the French. Le Daim amassed a fortune, and was named gentleman-in-waiting, captain of Loches, and governor of Saint-Quentin. After the death of Louis XI., he was arrested, tried before the parlement of Paris, and on May 21, 1484 hanged at Montfaucon without the knowledge of Charles VIII. Le Daim's property was given to the duke of Orleans.

See the memoirs of the time, especially those of Ph. de Commines (ed. Mandrot, 1901–03, Eng. trans in Bohn Library); Robt. Gaguin, *Compendium de origine et gestis Francorum* (Paris, 1586)—it was Gaguin who made the celebrated epigram concerning Le Daim "Eras judex, lector, et exitium"; De Reiffenberg, *Olivier le Dain* (Brussels, 1829); Delanone, *Le Barbier de Louis XI.* (Paris, 1832); G Picot, "Procès d'Olivier le Dain," in the *Comptes rendus de l'Académie des sciences morales et politiques,* viii. (1877), 485–537. The memoirs of the time are uniformly hostile to Le Daim.

LEDBURY, market town in Hereford parliamentary division, Herefordshire, England, 14½ m. E of Hereford by the G W., on the south-western slope of the Malvern hills. Pop. (1921) 3,154. Cider and agricultural produce are the chief articles of trade, and there are limestone quarries in the neighbouring hills. The town contains many timbered houses, the principal being the Market House (1633) raised on pillars of oak The church of St. Michael exhibits all the Gothic styles, the noteworthy features being the Norman chancel and west door, and a series of ornate Decorated windows. Among several charities is the hospital of St. Catherine, founded by Foliot, bishop of Hereford, in 1232.

Wall Hills Camp is the earliest evidence of a settlement near Ledbury (Liedeburge, Lidebury). The manor was given to the see of Hereford in the 11th century; but in 1561–62 became crown property. As early as 1170–71 an episcopal castle existed in Ledbury. The town was early called a borough; and in 1295 and 1304–05 returned two members to parliament.

LEDGER, properly a book remaining regularly in one place, and so used of the copies of the Scriptures and service books kept in a church. The *New English Dictionary* quotes from Charles Wriothesley's *Chronicle,* 1538 (ed. *Camden Soc.,* 1875, by W. D. Hamilton), "the curates should provide a booke of the bible in Englishe, of the largest volume, to be a lidger in the same church for the parishioners to read on." It is an application of this original meaning that is found in the commercial usage of the term for the principal book of account in a business house. (*See* BOOK-KEEPING.) Apart from these applications to various forms of books, the word is used of the horizontal timbers in a scaffold (*q.v.*) lying parallel to the face of a building, which support the "put logs"; of a flat stone to cover a grave; and of a stationary form of tackle and bait in angling.

LEDOCHOWSKI, MIECISLAUS JOHANN, COUNT (1822–1902), Polish cardinal, was born on Oct. 29, 1822 in Gorki (Russian Poland). When archbishop of Gnesen (Posen) he issued (1873) a protest against the demand of the government that religious teaching should be given only in German, and was asked to resign. On his refusal he was arrested on Feb. 3, 1874, and taken to the military prison at Ostrowo.

The pope made him a cardinal on March 13, but it was not till Feb. 3, 1876 that he was released from prison. Having been expelled from the eastern provinces of Prussia, he went to Cracow, where his presence was made the pretext for anti-Prussian demonstrations. He was thereupon expelled from Austria, and went to Rome, whence, in spite of his removal from office, which was decreed on April 15, 1874, he continued to direct the affairs of his diocese, for which he was on several occasions from 1877 to 1879 condemned *in absentia* by the Prussian government. It was not till 1885 that Ledochowski resolved to resign his archbishopric, in which he was succeeded by Dinder. He died in Rome on July 13, 1902.

LEDRU-ROLLIN, ALEXANDRE AUGUSTE (1807–1874), French lawyer politician, was the grandson of Nicolas Philippe Ledru, the celebrated quack doctor known as "Comus" under Louis XIV., and was born in a house that was once Scarron's, at Fontenay-aux-Roses (Seine), on Feb 2, 1807. He was called to the bar, and was retained for the Republican defence in most of the great political trials of the years 1830–40. He was elected deputy for Le Mans in 1841 with hardly a dissentient voice; but for the violence of his electoral speeches he was tried at Angers and sentenced to four months' imprisonment and a fine, against which he appealed successfully on a technical point. He made a rich and romantic marriage in 1843, and in 1846 disposed of his charge at the Court of Cassation to give his time entirely to politics. He was now the recognized leader of the workingmen of France. He had more authority in the country than in the Chamber, where the violence of his oratory diminished its effect. He asserted that the fortifications of Paris were directed against liberty, not against foreign invasion, and he stigmatized the law of regency (1842) as an audacious usurpation. He founded *La Réforme* in which to advance his propaganda. Between Ledru-Rollin and Odilon Barrot with the other chiefs of the "dynastic Left" there were acute differences, hardly dissimulated even during the temporary alliance which produced the campaign of the banquets in 1848. Ledru-Rollin and Lamartine then held the tribune in the Chamber of Deputies until the Parisian populace stopped serious discussion by invading the Chamber. He was minister of the interior in the provisional government, and was also a member of the executive committee appointed by the Constituent Assembly, from which Louis Blanc and the extremists were excluded. At the crisis of May 15 he definitely sided with Lamartine and the party of order against the proletariat.

After this he never regained his influence with the working classes, who considered they had been betrayed. At the presidential election in December he secured only 370,000 votes. His opposition to the policy of Louis Napoleon, especially his Roman policy, led to his moving the impeachment of the president and his ministers. The motion was defeated, and next day (June 13, 1849) he headed what he called a peaceful demonstration, and his enemies armed insurrection. He himself escaped to London where he joined the executive of the revolutionary committee of Europe, with Kossuth and Mazzini among his colleagues. He was accused of complicity in an obscure attempt (1857) against the life of Napoleon III., and condemned in his absence to deportation. Émile Ollivier removed the exceptions from the general amnesty in 1870, and Ledru-Rollin returned to France after twenty years of exile. Though elected in 1871 in three departments he refused to sit in the National Assembly, and took no serious part in politics until 1874, when he was returned to the Assembly as member for Vaucluse. He died on

Dec. 31, 1874.

Under Louis Philippe he made large contributions to French jurisprudence, editing the *Journal du palais, 1791–1837* (27 vols., 1837), and *1837–1847* (17 vols.), with a commentary *Répertoire général de la jurisprudence française* (8 vols., 1843–48), the introduction to which was written by himself. His later writings were political in character. See *Ledru-Rollin, ses discours et ses écrits politiques* (2 vols., Paris, 1879), edited by his widow; A. R. Calman, *Ledru-Rollin and the Second French Republic* (New York, 1922); A. R. Calman, *Ledru-Rollin après 1848 et les proscrits français en Angleterre* (1921).

LEE, ANN (1736–1784), English religious visionary, was born in Manchester, where she was first a factory hand and afterwards a cook. She is remembered by her connection with the sect known as Shakers (*q.v.*). She died at Watervliet, near Albany, New York.

LEE, ARTHUR (1740–1792), American diplomat, brother of Richard Henry Lee, was born at Stratford, Westmoreland county, Virginia, on Dec. 20, 1740. He was educated at Eton, and studied and practised medicine and law in Virginia and in England. In 1770–75 he served as London agent for Massachusetts. At that time he had shown great ability as a pamphleteer, having published in London *The Monitor* (1768), seven essays previously printed in Virginia, as well as various political tracts. In Dec. 1775 the committee of secret correspondence chose him as its European agent for the purpose of ascertaining the views of European countries regarding the war between the colonies and Great Britain. In Oct. 1776 he was appointed on the commission with Franklin and Silas Deane to negotiate a treaty of alliance, amity and commerce with France, and to negotiate with other European governments. His letters to Congress resulted in Deane's recall; and other letters impaired the confidence of Congress in Franklin, of whom Lee was especially jealous. Early in 1777 he went to Spain as American commissioner, but receiving no official recognition, accomplished nothing; until the appointment of Jay, however, he continued to act as commissioner to Spain, held conferences with the Spanish minister in Paris, and in Jan. 1778 secured a promise of a loan of 3,000,000 livres, only a small part of which (some 170,000 livres) was paid In June 1777 he went to Berlin, but was not officially recognized. With Franklin and Deane in Feb. 1778 he signed the treaties between the United States and France. Lee was recalled in 1779, and returned to the United States in Sept. 1780. He was a member of the Virginia house of delegates in 1781 and a delegate to the Continental Congress in 1782–85. With Oliver Wolcott and Richard Butler he negotiated a treaty with the Six Nations, Oct. 22, 1784, and with George Clark and Richard Butler a treaty with the Wyandot, Delaware, Chippewa and Ottawa Indians, Jan. 21, 1785. He was a member of the treasury board in 1784–89. After the adoption of the constitution which he opposed, he retired to his estate at Urbana, Va, where he died on Dec. 12, 1792.

Bibliography.—*See* R. H. Lee, *Life of Arthur Lee* (1829), and C. H. Lee, *A Vindication of Arthur Lee* (1894); both partisan. Eight vols. of Lee's mss. in the Harvard university library are described and listed in *Library of Harvard University, Bibliographical Contributions* No. 8 (1882). Much of Lee's correspondence is to be found in Wharton's *Revolutionary Diplomatic Correspondence* (1889); *American Historical Review*, xxx. *p.* 280, and xxxi., pp. 33–39.

LEE, EDWARD (*c.* 1482–1544), archbishop of York, famous for his attack on Erasmus, who replied to him in his *Epistolae aliquot eruditorum virorum*. Lee was sent by the king on embassies to the emperor Charles V. and to Pope Clement VII. In 1531 he became archbishop of York. At Pontefract in 1536, during the Pilgrimage of Grace, the archbishop was compelled to join the rebels. He was the last archbishop of York to coin money. Lee died on Sept. 13, 1544.

LEE, FITZHUGH (1835–1905), American cavalry general, was born at Clermont, in Fairfax county, Virginia, on Nov. 19, 1835. He was the grandson of "Light Horse Harry" Lee, and the nephew of Robert E. Lee (*q.v.*). Graduating from West Point in 1856, he became a cavalry subaltern. On the secession of Virginia he joined the Confederate army and served with distinction through the Civil War. He was made brigadier-general in 1862, and major-general in 1863, commanding cavalry divisions under Stuart, Hampton and Lee. On April 9, 1865, at Farmville, Va., he led the last charge of the Confederates.

After the war he was conspicuous in his efforts to reconcile the Southern people to the issue of the war. From 1886 to 1890 he was governor of Virginia. In 1896 he was appointed by President Cleveland consul general at Havana. In this post (in which he was retained by President McKinley) he was from the first called upon to deal with a situation of great difficulty, which culminated with the destruction of the "Maine" (*see* Spanish-American War). Upon the declaration of war with Spain he re-entered the army. He was one of the three ex-Confederate general officers who were made major generals of U.S. Volunteers. He was military governor of Havana and Pinar del Rio in 1899, and retired as a brigadier-general U.S. Army in 1901. He died in Washington April 28, 1905. He wrote *General Lee* (1894) in the "Great Commanders" series, and *Cuba's Struggle Against Spain* (1899).

LEE, HENRY (1756–1818), American general, called "Light Horse Harry," was born near Dumfries (Va.), on Jan. 29, 1756. His father was first cousin to Richard Henry Lee. He graduated (1773) at Princeton, and on the outbreak of the War of Independence, became an officer in the patriot forces. He served with distinction under Washington, and in 1778 was promoted major and given the command of a small irregular corps, with which he won a great reputation as a leader of light troops, and the soubriquet of "Light Horse Harry"

His greatest exploit was the brilliant surprise of Paulus Hook (N.J.), on Aug. 19, 1779. He was promoted lieutenant-colonel 1780, and sent with a picked corps of dragoons to the southern theatre of war. Here he rendered valuable services, notably at Guildford Court House, Camden and Eutaw Springs. From 1786–88 he was a delegate to the Confederation Congress, and in the Virginia Convention of 1788 he favoured the adoption of the Federal Constitution.

From 1789–91 he served in the general assembly, and from 1791–94 was governor of Virginia. In 1794 Washington sent him to help in the suppression of the "Whisky Insurrection" in western Pennsylvania. He was a major-general in 1798–1800. From 1799–1801 he served in Congress. He delivered the address on the death of Washington which contained the famous phrase, "first in war, first in peace, and first in the hearts of his countrymen." Soon after the outbreak of the War of 1812, Lee, while helping to resist an attack on his friend, A. C. Hanson, editor of the Baltimore *Federal Republican,* received injuries, from which he never recovered. He was the father of Gen Robert E. Lee. He died on Cumberland Island, on March 25, 1818.

Lee wrote valuable *Memoirs of the War in the Southern Department* (1812; 3rd ed. with memoir by Robert E. Lee, 1869).

LEE, NATHANIEL (*c.* 1653–1692), English dramatist, son of Dr. Richard Lee, a Presbyterian divine, was born probably in 1653. Lee was educated at Westminster school, and at Trinity college, Cambridge, taking his B.A. degree in 1668. Coming to London under the patronage, it is said, of the duke of Buckingham, he tried to earn his living as an actor, but his acute stage fright made acting impossible. His earliest play, *Nero, Emperor of Rome,* was acted in 1675 at Drury Lane. Lee made his reputation in 1677 with a blank verse tragedy, *The Rival Queens, or the Death of Alexander the Great,* which remained a favourite on the English stage down to the days of Edmund Kean. *Mithridates, King of Pontus* (acted 1678), *Theodosius, or the Force of Love* (acted 1680), *Caesar Borgia* (acted 1680)—an imitation of the worst blood and thunder Elizabethan tragedies—*Lucius Junius Brutus, Father of His Country* (acted 1681), and *Constantine the Great* (acted 1684) followed. *The Princess of Cleve* (1681) is a gross adaptation of Madame de La Fayette's exquisite novel of that name. *The Massacre of Paris* (published 1690) was written about this time. Lee had given offence at court by his *Lucius Junius Brutus;* he sought rehabilitation by collaborating with Dryden in *The Duke of Guise* (1683), a play which directly advocated the Tory point of view. In it part of the *Massacre of Paris* was incorporated. In 1684 his mind became completely unhinged. He recovered his health but died in a drunken fit in 1692, and was buried in St. Clement Danes, Strand, on May 6.

Lee's *Dramatic Works* were published in 1784. In spite of their

extravagance, they contain many passages of great beauty.

LEE, RICHARD HENRY (1732–1794), American statesman and orator, was born at Stratford, Westmoreland county (Va.), on Jan. 20, 1732, one of the six distinguished sons of Thomas Lee (d. 1750), a descendant of an old Cavalier family. Richard Henry Lee received an academic education in England, travelled, and returned to Virginia in 1752, having inherited a fine property from his father, and applied himself to varied studies. When 25 he was appointed justice of the peace of Westmoreland county, and in the same year was chosen a member of the Virginia house of burgesses, in which he served from 1758 to 1775. His first speech was in strong opposition to slavery, which he proposed eventually to abolish by imposing a heavy tax on all further importations. He early allied himself with the Whig element in Virginia, and in the years immediately preceding the War of Independence was a conspicuous opponent of the arbitrary measures of the British ministry. In 1768, in a letter to John Dickinson of Pennsylvania, he suggested a private correspondence among the friends of liberty in the different colonies, and in 1773 he became a member of the Virginia committee of correspondence.

Lee was a delegate to the First Continental Congress in Philadelphia in 1774, and prepared the address to the people of British America, and the second address to the people of Great Britain. He introduced in Congress on June 7, 1776, the famous resolutions: (1) "that these united Colonies are, and of right ought to be, free and independent States, that they are absolved from all allegiance to the British Crown, and that all political connection between them and the State of Great Britain is, and ought to be, totally dissolved"; (2) "that it is expedient to take the most effectual measures for forming foreign alliances"; and (3) "that a plan of confederation be prepared and transmitted to the respective Colonies for their consideration and approbation." His first resolution was adopted on July 2, and the Declaration of Independence was adopted two days later. Lee was in Congress from 1774 to 1780; a member of the Virginia house of delegates in 1777, 1780–84 and 1786–87; was in Congress again from 1784–87, having been president in 1784–86; and was one of the first U.S. senators chosen from Virginia. Though opposed to the Constitution because of what he regarded as its infringements upon the independent power of the States, he accepted the place of senator in hope of bringing about amendments, and proposed the Tenth Amendment in substantially the form in which it was adopted. He retired from public life in 1792, and died at Chantilly, in Westmoreland county, on June 19, 1794

See the *Life* (1825), by his grandson, R. H. Lee; and *Letters* (1910), edited by J. C. Ballagh.

His brother, WILLIAM LEE (1739–1795), accompanied another brother, Arthur Lee (*q.v.*), to England in 1766 to engage in mercantile pursuits, joined the Wilkes faction, and in 1775 was elected an alderman of London. In April 1777, however, he received notice of his appointment by the committee of secret correspondence in America to act as a commercial agent at Nantes. He went to Paris and became involved in his brother's opposition to Franklin and Deane. In May 1777 Congress chose him commissioner to the courts of Vienna and Berlin, but he gained recognition at neither. In Sept. 1778, at Aix-la-Chapelle, he negotiated a plan of a treaty with Jan de Neufville, who represented Van Berckel, pensionary of Amsterdam. A copy of this proposed treaty, falling into the hands of the British on the capture of Henry Laurens (*q.v.*), led to Great Britain's declaration of war against the Netherlands in Dec. 1780. Lee was recalled from his mission to Vienna and Berlin in June 1779. He resigned his post as an alderman of London in Jan. 1780, and returned to Virginia about 1784.

See *Letters of William Lee,* edited by W. C. Ford (1891).

LEE, ROBERT EDWARD (1807–1870), American general, was born at Stratford, Va., on Jan. 19, 1807. He came of a family with a great record of public service. His father, Henry Lee, was governor of Virginia and in the Revolutionary War made himself famous as a leader of Washington's cavalry, earning the sobriquet of "Light Horse Harry." Two Lees (Richard and Francis) signed the Declaration of Independence. A forbear, Thomas Lee, became president and commander-in-chief of Virginia, while the founder of the American branch of the family, Richard Lee, who migrated to Virginia in the reign of Charles I., became secretary of State and a member of the privy council of Virginia, and helped to hold the colony for Charles II.

Robert, the fourth son in Henry's second family, entered the United States military academy at West Point, where he graduated with great distinction, and was in 1829 commissioned as 2nd lieutenant in the Corps of Engineers. Two years later he married Mary Custis, great granddaughter of Martha Washington, heiress to the Arlington estate in the Virginian hills which overlook Washington, and of the White House on the Pamunkey. Thus by birth and marriage Robert was connected with the leading families of Virginia. In 1846, when war broke out between the United States and Mexico, Lee, then a captain, was already distinguished in the service for his ability, and was chosen by Gen. Scott to join the headquarters staff. He returned from this war with a reputation established at the age of 42, and was chosen successively to be superintendent of West Point, and to be colonel of cavalry, in which capacity he was employed for some years in the country of the Comanche Indians. In 1859 he was at his wife's home, Arlington, when John Brown's raid on Harper's Ferry took place, and he was employed in the unpleasant task of capturing the raiders. From this duty he returned to the Texas border to be summoned to Washington in February, 1861, to meet the crisis of his life.

Lee was no politician, but he had followed with an intelligent interest the development of the crisis which culminated in the Civil War. He regarded slavery as an evil, and in common with many of the landowners of Virginia, had liberated his slaves, but he considered that it would be a greater evil to attempt to eradicate slavery by force He believed firmly in the advantages of the Union, but still more firmly that the authority of the Federal Government was conferred on it freely by the several States, which had the right to secede if they wished. His political creed may be summed up in the words which he wrote on the eve of the crisis.—"I can anticipate no greater calamity for the country than the dissolution of the Union. . . . Still a union that can only be maintained by swords and bayonets, and in which strife and civil war are to take the place of brotherly love and kindness, has no charms for me. If the Union is dissolved and the Government dispersed I shall return to my native State and share the miseries of my people and, save in defence, will draw my sword no more."

At the time when war became certain Lee's military reputation was so high that Scott advised Abraham Lincoln to offer him the command of the Federal forces in the field. That brilliant offer Lee declined with a heavy heart. He resigned his commission in the United States army and went to Richmond to place his services at the disposal of Virginia.

AS MILITARY ADVISER

In the first months of the war Lee was engaged in organizing the troops of his State. He was then for a time military adviser to the Confederate president, Jefferson Davis, and in that capacity watched the defeat of the first Federal invasion of Virginia at Bull Run. During part of that year, 1861, he was sent to command in western Virginia, where the Federals under the leadership of McClellan had won conspicuous successes. With untrained troops and inexperienced officers, in difficult mountainous country, his campaign there was a failure, and he returned to Richmond with his reputation under a cloud to be sent by Davis to organize the coast defences of the Carolinas. He was engaged on this work when he was again summoned, in March 1862, to Richmond to be military adviser to the President.

The Federals had then assembled armies for the invasion of Virginia numbering 180,000 men, to which the Confederates could immediately oppose 80,000, a number which might eventually be brought up to 100,000. McClellan, with the main Federal army, was preparing to disembark on the Yorktown peninsula and to advance on Richmond from the coast, while other Federal forces converged on Richmond from the north and west. How

in these circumstances was Richmond to be defended? J. E. Johnston, who commanded the Confederate main army in Virginia, proposed to concentrate all available troops about Richmond and to fight it out there. Lee saw that this was a counsel of despair, and that the one chance for the Confederates was to utilize their central position and to compensate by skilful manoeuvre for inferior numbers. He therefore persuaded the President to send Johnston, against the latter's wish, to oppose McClellan in the Yorktown peninsula, so that time might be gained. He turned to "Stonewall Jackson" (*see* JACKSON, THOMAS JONATHAN), whom he asked to unite some of the remaining detachments of the Confederates in Virginia, in order to attack the Federals in the Shenandoah valley, and so create alarm for the safety of Washington. This task Jackson brilliantly accomplished in his famous Valley campaign. The Federal forces intended to aid McClellan in his attack on Richmond were diverted or dispersed. In the meantime Johnston had fallen back on lines prepared around Richmond, and in the battle of Seven Pines attacked McClellan. The result was indecisive and Johnston fell wounded, Lee succeeding to the command of the army of northern Virginia.

Lee now proceeded to consummate his plan. McClellan, expecting reinforcements to his right flank, had advanced on Richmond with his forces divided by the Chickahominy. Jackson had prevented the arrival of these reinforcements and kept them in expectation of attack. Lee thereupon brought Jackson by rail and road towards Richmond, and on his arrival had 87,000 men opposed to McClellan's 109,000. Further he skilfully utilized the defences of Richmond to outbalance McClellan's superior numbers, leaving in them 28,000 men to hold 75,000 of McClellan's army south of the Chickahominy, while with 59,000 he attacked at the beginning of the battles of the "Seven Days" the 34,000 Federals on the north of the river. With his right overwhelmed McClellan was forced to retreat and fell back to the James river, eventually embarking his troops and returning to the Potomac. Generalship had neutralized superior numbers and the danger to Richmond was removed

When McClellan's retreat was ended, Lee sent Jackson to the Rapidan to check the Federal force which, recovering from the latter's blows, was uniting under the command of Pope. As soon as McClellan's intention to evacuate the Yorktown peninsula was clear Lee joined Jackson with the main body of the army of northern Virginia. Before them Pope fell back behind the Rappahannock, and Lee, whose intention was to manoeuvre Pope out of Virginia, divided his forces, sending Jackson with half his force by a flank march to come down on Pope's rear, while he himself followed with the remainder under Longstreet. Jackson reached Manassas Junction and destroyed Pope's depots, and then fell back a short distance so as to cover the passes of the Blue Ridge and be in a position to unite with Longstreet. While so placed a Federal column, ignorant of his presence, marched across his front. Jackson, unable to resist the temptation, attacked and so brought on the second battle of Bull Run (Aug. 29–30), in which, Longstreet arriving in the nick of time on the field, Pope was completely defeated. Lee then decided to cross the Potomac and invade Maryland, not with the object of conquering any portion of Northern territory, but to keep the Federal forces out of Virginia by forcing them to defend Washington, and to strengthen the peace party in the North.

After crossing the Potomac Lee detached Jackson with half his force to reduce Harper's Ferry, which, held by a garrison of 11,000 Federals, interrupted his communications with Virginia. Jackson speedily accomplished his task, but while he was engaged in it, an order by Lee which disclosed the division of his forces fell into the hands of McClellan, who advanced and attacked the Confederates in position behind the Antietam (Sept. 17). Jackson arrived on the field in time to enable Lee to repulse McClellan's attacks, but this done the Confederates were compelled to retire into Virginia. It is more than doubtful whether Lee was justified in accepting this battle. He could have avoided it and returned to Virginia with the defeat of Pope and the surrender of Harper's Ferry to his credit and have avoided the heavy losses which the Confederates could ill afford. It would appear that at this time he was disposed to underrate unduly the fighting power of the Northern troops.

A long pause followed the battle of the Antietam, and it was not until Dec. 1862 that Burnside, who had displaced McClellan in command of the Army of the Potomac, attempted to meet Lee in the field. Lee's army was then disposed along the Rappahannock, and his service of information being admirable, he was able to concentrate in time to meet Burnside's attack upon his position at Fredericksburg. This attack, which was purely frontal against a strong position, was repulsed with great ease on Dec. 13. Lee had been criticized for not undertaking an immediate pursuit, but his justification is that he expected the Federals to renew the attack, and did not wish to expose his infantry to the fire of the superior Federal artillery on the opposite heights.

The experiences of a winter campaign in Virginia caused the Federals to await the spring to renew their efforts, and the two armies watched each other on the Rappahannock until towards the end of April 1863. Hooker, who had taken Burnside's place, then had 120,000 men opposed to Lee's 60,000, and he planned, while leaving part of his army on the river, to occupy Lee's front, to march the remainder round the Confederate left and come down on their rear through the woods of Chancellorsville. Lee was once more well informed of his opponents' movements. Leaving a detachment on the river he marched with the bulk of his troops, including Jackson's corps, towards Chancellorsville. On the outskirts of the wilderness of Chancellorsville Lee and Jackson made their plans on the night of May 1–2. Lee, with an understanding of the delaying power of entrenchments which no other soldier of his day possessed, proposed to repeat the manoeuvre which had opened the battles of the "Seven Days." Keeping only 10,000 men with himself entrenched opposite Hooker's front, he sent Jackson, under cover of the woods, round Hooker's right, which on the evening of May 2 was surprised and routed. Jackson fell mortally wounded, but Hooker was driven back over the Rappahannock.

Lee followed this victory by another invasion of Northern territory. He had been joined by Longstreet's corps, which brought his strength to 73,000 men, and early in June he began a brilliant series of manoeuvres across Hooker's front, which brought his army in the third week of that month into the northern end of the Shenandoah valley. There he detached Stuart with his cavalry to delay Hooker's crossing of the Potomac. It was Lee's intention that Stuart should return to cover his right flank, but by an unfortunate misunderstanding Stuart, who had made himself famous by a number of raids round the Federal army, crossed the Potomac to the east of Washington and was separated from Lee for several days. Thus the Confederates entered Pennsylvania by way of the Cumberland valley deprived of their eyes, and in ignorance of the Federal movements. Hooker had crossed the Potomac to cover Washington, but Lincoln, realizing that he had been outmanoeuvred by Lee, replaced him by Meade.

It was not until June 29 that Lee learned that the Federal army was across the Potomac, and he at once began to concentrate his forces. The next day his flank guard came into collision with Federal cavalry near Gettysburg, and on July 1 both armies were converging on that place. That evening and on the morning of the 2nd the advantage was with the Confederates, for the Federal forces were arriving piecemeal, and there is little doubt but that if Longstreet had attacked on the morning of the 2nd, as Lee wished him to do, the Confederates would have been victorious. But Longstreet, though a fine tactician, was an obstinate subordinate, and found excuses for delay. By noon on July 2 the opportunity had passed, and Lee's attacks both on that day and on the 3rd were heavily repulsed. Lee thereupon skilfully retreated, and on July 14 was back in Virginia.

After Gettysburg both armies needed rest, and when Meade was once more ready to advance Lee had prepared strong defences along the Rapidan, which the Federals found too formidable for attack. So the winter passed with the two armies waiting for better weather to resume manoeuvre.

The result of Gettysburg was to change Lee's military policy.

Up to that battle he had hoped to force the North to make peace by winning a resounding victory in Northern territory. After Gettysburg he understood that the South's resources would no longer justify that policy, and his plan became to exhaust by delay the patience of the North. In March 1864 Lincoln took the decisive step of appointing Grant, the hero of Vicksburg, to the supreme command of the Federal armies. Grant, realizing that Lee and his army were the chief obstacle to the fulfilment of Federal aims and the superiority of the resources of the North, proposed to fasten on to Lee and compel him to fight on every possible occasion. By the beginning of May Grant had an army of 130,000 ready in northern Virginia, and on the night of May 3–4 he began to cross the Rappahannock near Fredericksburg, hoping to force Lee to leave his lines on the Rapidan in order to cover Richmond. Lee waited until Grant was across the river, and then attacked, with 60,000 men, Grant's flank as he was moving through the forest of the Wilderness. The forest country neutralized the effect of the superior Federal artillery, the Southerners were better acquainted with the intricate country and the advantage was with the Confederates. But Grant would not acknowledge defeat, and knowing that his army was much stronger than that of Lee, he, instead of retreating as Hooker had done, broke off the battle and continued to advance towards Richmond.

Lee at once divined Grant's intention, and when the Federal advanced guard reached Spottsylvania court house on May 9 it found its way barred by entrenchments. There followed a nine days' battle of trench warfare, in which the Federal assaults were heavily repulsed. Grant then abandoned his efforts to force Lee's front, and once more marched past his flank, only to find, on May 23, Lee once more barring his way behind the North Anna. Again Grant marched past Lee's flank, and again on June 1 found Lee in position at Cold Harbor. Grant, apparently losing patience, on June 3 made a frontal attack on Lee's lines which failed with heavy loss.

Despite this rebuff Grant's determination was not shaken. He continued his previous manoeuvre and crossing the James river compelled Lee to follow him towards Richmond, and began on June 16 the long siege of Petersburg. During his advance from the Rappahannock to Petersburg Grant had under him 180,000 men, including reinforcements. Lee commanded 80,000. It had taken the Federals a month of strenuous fighting to advance 70 miles, and their casualties had numbered close to 55,000. Confidence in the North was shaken, but both Lincoln and Grant remained firm, and as long as that was so the end was sure Grant by confining Lee to the immediate defence of Richmond had deprived him of the one weapon which could compensate for his inferior numbers, his skill in manoeuvre.

The siege of Petersburg dragged on through the winter of 1864 and into the spring of the following year, Grant continually extending his lines and compelling Lee to stretch his exiguous resources until the breaking point was reached. On April 2, he abandoned his lines around Richmond in the hope of being able to unite with Johnston in North Carolina This Grant prevented by a prompt and masterly pursuit, and Lee surrendered with his army at Appomattox court house on April 9, in an interview made noteworthy alike by Grant's noble generosity and by Lee's calm dignity in disaster.

After the war Lee set himself to heal the wounds of his people. Determined to take no part in any of the numerous controversies which the war aroused, he, though in financial straits like most Southerners, refused firmly to write his account of the great events in which he had taken a leading part He was offered and accepted the post of president of Washington college (afterwards Washington and Lee university) and there he spent his last years teaching, by example and precept, the youth of Virginia to be good Americans. He died on Oct. 12, 1870.

As a general Lee's chief characteristics were his rapid grasp of the possibilities of a military situation, his skilful use of interior lines of communication, his capacity for guessing what was in the minds of his opponents, and his understanding of their weaknesses. Few commanders have excelled him in the power of arousing devotion in his men Almost his only weakness was a tendency to trust his subordinates too much, and an unwillingness to force his decisions on them. It was this characteristic which made so grievous the loss of Jackson, who at once grasped what was in Lee's mind and devoted himself wholly and loyally to execute his chief's intentions.

Beyond and above all this, Lee's great contribution to the art of war was his understanding of the part field defences could play in aiding manoeuvre. In this he was years ahead of his time, and it was not until the beginning of the 20th century that his methods were really understood and applied by the military world. His high character, his moral courage, his noble nature, and his mastery of the art of war, make Robert E. Lee a notable figure in the pages of history.

LEE or **LEGH, ROWLAND** (d. 1543), English bishop, belonged to a Northumberland family and was educated at Cambridge. He obtained preferment through Cardinal Wolsey; after Wolsey's fall he rose high in the esteem of Henry VIII. and of Thomas Cromwell, serving both king and minister in the business of suppressing the monasteries, and he is said to have celebrated Henry's secret marriage with Anne Boleyn in January 1533 Lee took part in preparing the divorce proceedings against Catherine of Aragon, and in January 1534 he was elected bishop of Coventry and Lichfield, or Chester as the see was often called, taking at his consecration the new oath to the king as head of the English Church and not seeking confirmation from the pope. As bishop he remained in Henry's personal service, endeavouring to establish the legality of his marriage with Anne, until May 1534, when he was appointed lord president of the council in the marches of Wales After some years of hard and successful work in this capacity, he died at Shrewsbury in June 1543. Lee's letters to Cromwell, preserved in the Record Office, London, throw light on the bishop's career and on the lawless condition of the Welsh marches in his time.

LEE, SIR SIDNEY (1859–1926), English man of letters, was born of Jewish parents in London on Dec. 5, 1859. He was educated at the City of London school, and at Balliol College, Oxford, where he graduated in modern history in 1882. In the next year he became assistant-editor of the *Dictionary of National Biography;* in 1890 joint-editor, and on the retirement of Sir Leslie Stephen in 1891 editor He himself contributed to the work some 800 articles, mainly on Elizabethan authors or statesmen. His article on Shakespeare in the 51st volume (1897) of the *Dictionary* formed the basis of his *Life of William Shakespeare* (1898), which reached its sixth edition in 1907, 4th ed. of the revised version in 1925. Lee edited in 1902 the Oxford facsimile edition of the first folio of *Shakespeare's Comedies, Histories and Tragedies,* followed in 1902 and 1904 by supplementary volumes giving details of extant copies, and in 1906 by a complete edition of Shakespeare's *Works.* Besides editions of English classics his works include a *Life of Queen Victoria* (1902, 2nd ed. 1903), *Great Englishmen of the Sixteenth Century* (1904, 2nd ed. 1907), *Shakespeare and the Modern Stage* (1906), *The French Renaissance in England* (1910), *Principles of Biography* (1911) and *Shakespeare and the Italian Renaissance* (1915). At the time of his death, in London on Mar. 3, 1926, he was engaged on the second volume of his official biography of *King Edward VII.,* the first volume of which had appeared a year previously. Lee was knighted in 1911, and from 1913 to 1924 was professor of English literature in the East London college.

LEE, SOPHIA (1750–1824), English novelist and dramatist, daughter of John Lee (d. 1781), actor and theatrical manager, was born in London. Her first piece, *The Chapter of Accidents,* a one-act opera based on Diderot's *Père de famille,* was produced by George Colman at the Haymarket Theatre on Aug. 5, 1780. The proceeds were spent in establishing a school at Bath, where Miss Lee made a home for her sisters. Her subsequent productions included *The Recess, or a Tale of other Times* (1785), a historical romance; and *Almeyda, Queen of Grenada* (1796), a tragedy in blank verse; she also contributed to her sister's

Canterbury Tales (1797). She died at her house near Clifton on March 13, 1824. .

LEE, STEPHEN DILL (1833–1908), Confederate general in the American Civil War, was born at Charleston (S.C.), on Sept. 12, 1833, of a distinguished South Carolina family. Graduating from West Point in 1854, he served in the U S. army until 1861, resigning on the secession of South Carolina. He was aide-de-camp to Gen. Beauregard in the attack on Ft. Sumter, and captain of a light battery in Gen. Johnston's army later in the year 1861. Because of distinguished conduct on the fields of battle, he rose to the rank of brigadier-general in Nov. 1862, and took command of defences at Vicksburg. Until its surrender to Gen. Grant in July, 1863, he served with great credit, and on becoming a prisoner of war, was immediately exchanged, promoted major-general, and assigned to command the cavalry troops of that arm in the south-western theatre of war. After harassing the advance of Sherman's column on Meridian he took Gen. Polk's place as commander of the department of Mississippi. In June 1864, on Hood's promotion to command the army of Tennessee, he was made a lieutenant-general and assigned to command Hood's old corps in that army. He fought at Atlanta and Jonesboro, accompanied Hood in the bold advance to Nashville, and fought in the battles of Franklin and Nashville, after which, in the rout of the Confederate army, he kept his troops closed up, and for three consecutive days formed the fighting rearguard of the otherwise disintegrated army. Lee was himself wounded, but did not give up the command until an organized rearguard took over the post of danger. On recovery he joined Gen. J. E. Johnston in North Carolina, and he surrendered with Johnston in April 1865. After the war he settled in Mississippi and devoted himself to planting. He died at Vicksburg on May 28, 1908.

LEE, VERNON (pen-name of Violet Paget) (1856–), English essayist and novelist, was born in France of English parents on Oct. 14, 1856. She made her home in Italy, near Florence, and became one of the most sympathetic interpreters of the Italian scene, and of Italian art and letters. She was one of the most profound and imaginative essayists of her time, original in her judgments and her criticism; her books are witty and entertaining, and at the same time learned Her first book, *Studies of the Eighteenth Century in Italy* (1880), contained admirable studies of Goldoni and Metastasio, and later volumes of essays, notably *Belcaro* (1881) and *Euphorion, Essays on the Renaissance* (1884), fulfilled the high promise of the first. Vernon Lee wrote some novels and stories, among them being *Miss Brown* (3 vols., 1884), which disturbed the coteries at the time of its publication, and *Pope Jacynth and other Fantastic Tales* (1905). The two volumes of essays, *Gospels of Anarchy* (1908) and *Vital Lies* (1912), show her as an independent thinker on social and philosophic questions. *Satan the Waster* (1920), described as "a philosophic war tragedy with notes and introduction," is a powerful indictment of war, and embodies her pacifist creed.

LEE, a town of Berkshire county, Massachusetts, U.S.A., on the Housatonic, beautifully situated in the Berkshire hills, near the western boundary of the State. It is served by the New York, New Haven and Hartford railroad. The population in 1925 was 4,058. The town is a summer resort, and has quarries of fine white marble, large paper mills and other manufacturing industries. The first settlement was made in 1760 and the town was incorporated in 1777. During Shays' Rebellion it was the scene of an encounter (1786) in which 250 followers of Shays routed a body of State troops with a bogus cannon. The first paper-mill in the town was built in 1806, and for a time more paper was made in Lee than anywhere else in the United States. The Housatonic mill was probably the first (1867) in the country to make paper from wood-pulp.

LEECH, JOHN (1817–1864), English caricaturist, was born in London on Aug. 29, 1817. His father, an Irishman, was the landlord of the London Coffee House on Ludgate Hill, "a man," on the testimony of those who knew him, "of fine culture, a profound Shakespearian, and a thorough gentleman." From his father Leech inherited his artistic bent, which was evident in his early childhood. He was educated at Charterhouse, where Thackeray, his lifelong friend, was his schoolfellow, and at sixteen he began to study medicine at St. Bartholomew's Hospital. He was then placed under a Mr. Whittle, an eccentric practitioner, the original of "Rawkins" in Albert Smith's *Adventures of Mr. Ledbury,* and afterwards under John Cockle; but he drifted into the artistic profession. He was eighteen when his first designs were published, a quarto of four pages, entitled *Etchings and Sketchings by A. Pen, Esq.,* comic character studies from the London streets Then he drew some political lithographs, did rough sketches for *Bell's Life,* produced an exceedingly popular parody on Mulready's postal envelope, and, on the death of Seymour, applied unsuccessfully to illustrate the *Pickwick Papers.* In 1840 Leech began his contributions to the magazines with a series of etchings in *Bentley's Miscellany.* With Cruikshank he executed designs for the Ingoldsby Legends and Stanley Thorn, and much of his work at this time is reminiscent of Cruikshank.

In 1845 Leech illustrated *St. Giles and St. James* in Douglas Jerrold's newly started *Shilling Magazine,* with plates more vigorous and accomplished than those in *Bentley,* but it is in subjects of a somewhat later date, and especially in those lightly etched and meant to be printed with colour, that we see the artist's best powers with the needle and the acid Among such of his designs are four charming plates to Dickens's *Christmas Carol* (1844), the broadly humorous etchings in the *Comic History of England* (1847–1848), and the still finer illustrations to the *Comic History of Rome* (1852)—which last, particularly in its minor woodcuts, shows some exquisitely graceful touches. Among other noteworthy etchings are those in *Young Master Troublesome or Master Jacky's Holidays,* and the frontispiece to *Hints on Life, or How to Rise in Society* (1845)—a series of minute subjects linked gracefully together by coils of smoke, illustrating the various ranks and conditions of men, one of them—the doctor by his patient's bedside—almost equalling in vivacity and precision the best of Cruikshank's similar scenes. Then in the 'fifties we have the numerous etchings of sporting scenes, contributed, together with woodcuts, to the *Handley Cross* novels.

Turning to Leech's lithographic work, we have in 1841, the *Portraits of the Children of the Mobility,* an important series dealing with the humorous and pathetic aspects of London street Arabs. The lining itself has not the freedom which we find in some of Leech's other lithographs, notably in the *Fly Leaves,* published at the *Punch* office, and in the subject of the nuptial couch of the Caudles, which also appeared, in woodcut form, as a political cartoon, with Mrs. Caudle, personated by Brougham, disturbing by untimely loquacity the slumbers of the lord chancellor, whose haggard cheek rests on the woolsack for pillow. Leech was most prolific and individual in his work for wood-engraving. Among the earlier of such designs are the illustrations to the *Comic English* and *Latin Grammars* (1840), to *Written Caricatures* (1841), to Hood's *Comic Annual* (1842), and to Albert Smith's *Wassail Bowl* (1843), subjects mainly of a small vignette size, transcribed with the best skill of such woodcutters as Orrin Smith, and nof, like the larger and later *Punch* illustrations, cut at speed by several engravers working at once on the subdivided block. Leech's connection with *Punch* began in 1841, and lasted till his death on Oct 29, 1864; it resulted in the production of the best-known and most admirable of his designs.

Leech's first contribution appeared in the issue of August 7, a full-page illustration—entitled "Foreign Affairs"—of character studies from the neighbourhood of Leicester Square. His cartoons deal at first mainly with social subjects, and are rough and imperfect in execution, but gradually their method gains in power and their subjects become more distinctly political, and by 1849 the artist is strong enough to produce the splendidly humorous national personification which appears in "Disraeli Measuring the British Lion." About 1845 we have the first of that long series of half-page and quarter-page pictures of life and manners, executed with a hand as gentle as it was skilful. In addition to his work for the weekly issue of *Punch,* Leech contributed largely to the *Punch* almanacks and pocket-books, to *Once a Week* from 1859 till 1862, to the *Illustrated London News,* where some of his

largest and best sporting scenes appeared, and to innumerable novels and miscellaneous volumes. Of these *A Little Tour in Ireland* (1859) is noticeable as showing the artist's treatment of pure landscape.

In 1862 Leech held an exhibition of some of his *Punch* drawings, enlarged by a mechanical process, and coloured in oils by himself, with the assistance of his friend, J. E. Millais.

Biographies of Leech have been written by John Brown (1882), and Frith (1891).

LEECH, the popular name of members of the Hirudinea, a branch of the Chaetopod worms. In Anglo-Saxon the word leech or laece was used both for the blood-letting medicinal *Hirudo* and for the physician, but it is uncertain whether the animal was named after the physician or the physician after the animal. From their association with man, both as pests and as surgical agents, the leeches have acquired considerable importance. In tropical countries the land leeches are unanimously regarded as the most noxious of external parasites, and there are many accounts of persons being seriously injured or killed by their attacks.

Haeckel writes of the leeches of Ceylon: "In some of the forests, and particularly near the river banks, and the marshy jungles of the highlands and lower hills, it is impossible to take a step without being attacked by them. Not only do they creep along the ground seeking what they may devour—they are on every bush and tree, from which they frequently drop on the head and neck of the passer-by: while they always creep up his legs, nay, they can even spring to meet their victim." This account is borne out by all who are acquainted with the conditions in tropical forests.

In Egypt and the Near East an aquatic leech *Limnatis nilotica*, which lives in streams and ponds, is a serious menace to men and animals. It is swallowed with drinking water, and fastens itself to the larynx, the epiglottis, and the nasal cavities of the host. The result is a constant haemorrhage, which, if the parasite is not removed, may prove fatal. Napoleon's army in Egypt suffered from this leech, as did the soldiers in Palestine during the World War.

Although up to the present there has been no comprehensive record of the extent of damage done by leeches to domestic animals, the well-authenticated accounts by travellers and others of horses and baggage animals being severely injured by them, justify the assumption that this damage is considerable. According to one authority the drain on the American fisheries from these creatures is appreciable; and there is some evidence that in the Philippines the common rice-field leech is the carrier of the infective organism of rinderpest. J. P. Moore suggests that as this and closely related species are widely spread throughout India and Ceylon, they may be suspected of aiding in the transmission of this virulent cattle disease. Although a leech-bite is not specifically toxic, their habit of fastening on to ulcers and other diseased areas of their host's body constitutes them perfect carriers of bacterial infections.

As surgical agents they have largely fallen out of use in Europe. The late Sir Arthur Shipley showed that in India and Arabia leeches have been used in phlebotomy since the beginning of the Christian era; there are frequent references to the practice in Europe to be found in Pliny's *Natural History*. This mode of blood-letting reached its zenith in Europe during the early 19th century. Ebrard records that 57½ million of these creatures were imported into France in the year 1832, leech-farming being at that time a profitable industry. Huge quantities were brought in from Russia, Bessarabia, Astrachan and Trans-Caucasia, where the sectarian exiles made money by their exportation. The Russian Government actually passed a special "game-law" in 1848 forbidding their collection in May, June and July. Wordsworth wrote a fine poem entitled "The Leech-Gatherer."

Although leeches no longer form an essential part of the equipment of the modern surgeon, they still serve the cause of science. Their saliva contains a haemolysin known as hirudin, which, when mixed with the blood of a wound, prevents coagulation. This substance is used in surgery and was much in demand in the World War, when India, where practitioners of Aruvedic medicine still freely use leeches for blood-letting, became the main source of supply.

Another purpose for which leeches have been used is that of a barometer. Blainville records that in certain parts of France the country folk keep leeches in a bowl of water with earth at the bottom, and foretell the weather by the degree of their elevation in the bowl. Belief in their efficacy was not confined to the uneducated, for Dr. J. Forster stated that "Leeches confined in a glass of water, by their motions foretell rain and wind, before which they seem much agitated, particularly before thunder and lightning." This view, however, is not shared by the meteorologist of to-day. (C. C. A. M.)

LEEDS, FRANCIS OSBORNE, 5TH DUKE OF (1751–99), was born on Jan. 29, 1751, and was educated at Westminster school and at Christ Church, Oxford. He was a member of parliament in 1774 and 1775; in 1776 he became a peer as Baron Osborne, and in 1777 lord chamberlain of the queen's household. In the House of Lords he was prominent as a determined foe of the prime minister, Lord North, who, after he had resigned his position as chamberlain, deprived him of the office of lord-lieutenant of the East Riding of Yorkshire in 1780. He regained this, however, two years later. Early in 1783 the marquess of Carmarthen, as he was called, was selected as ambassador to France, but he did not take up this appointment, becoming instead secretary for foreign affairs under William Pitt in December of the same year. As secretary he was little more than a cipher, and he left office in April 1791. Subsequently he took some slight part in politics, and he died in London on Jan. 31, 1799. His *Political Memoranda* were edited by Oscar Browning for the Camden Society in 1884, and there are eight volumes of his official correspondence in the British Museum.

LEEDS, THOMAS OSBORNE, 1ST DUKE OF (1631–1712), English statesman, known as earl of Danby, son of Sir Edward Osborne, Bart., of Kiveton, Yorkshire, was born in 1631, and succeeded to the baronetcy and estates in 1647. He was elected M P. for York in 1665, and two years later, joined Buckingham in attacking Clarendon. He became successively joint treasurer of the navy with Sir Thomas Lyttelton (1668), commissioner for the State treasury (1669), sole treasurer of the navy (1671), and commissioner for the Admiralty (1673). In 1673 he was created Viscount Osborne in the Scottish peerage, and a privy councillor. After his appointment as lord-treasurer in June, he received an English peerage, and in 1674 was created earl of Danby. He was appointed the same year lord-lieutenant of the West Riding of Yorkshire, and in 1677 received the Garter.

A keen royalist and partisan of the Established Church, Danby opposed the Indulgence (1673), supported the Test Act, and spoke against the proposal for giving relief to the dissenters. In June 1675 he joined the bishops in advising the king strictly to enforce the laws against the Roman Catholics, their banishment from court and the suppression of conventicles; and a bill introduced by him increasing the penalties for recusants and priests was only thrown out as being too lenient, because it secured offenders from the charge of treason. He was foiled in his attempt to introduce a test oath for members of parliament, which declared resistance to the royal power to be a crime; and proposed other reactionary measures which were rejected.

In foreign affairs, though an enemy to France and Rome, Danby showed better sense. He terminated the war with Holland in 1674, became a correspondent of William, and was instrumental in effecting the marriage of William and Mary in 1677. But, in order to pursue this national policy, he found it necessary to acquiesce in the king's personal policy; although he was not a member of the Cabal ministry, he must have been cognisant of the terms agreed upon by Charles in the Treaty of Dover. In 1676, with Lauderdale, he consented to a treaty between Charles and Louis, ensuring agreement on foreign policy, Charles receiving an annual subsidy of £100,000. In 1678 Charles raised his price, and Danby demanded six million livres (£300,000) for three years. Simultaneously with these proceedings with Louis, Danby secured a bill for raising money for a war against France, for which some preparations were made, a league being concluded with Holland,

and troops actually sent there.

Fall of Danby.—Danby's fall was ensured when Montagu, disappointed of office, produced in the House of Commons (Dec. 20, 1678), two incriminating letters of Danby's, which were read by the speaker. Both at this time, and during the trial which followed, the fact that in both letters appeared the king's minutes, "I approve of this letter. C.R.," was ignored, thus emphasizing the constitutional principle that obedience to the sovereign can be no bar to an impeachment. Danby was charged with encroaching on the royal powers by treating of matters of peace and war without the knowledge of the council, with promoting the raising of a standing army on pretence of a war with France, with obstructing the assembly of parliament, with corruption and embezzlement in the treasury. He was found guilty by the Commons, but while his case was under discussion in the Lords, parliament was dissolved. The hostility of the new parliament forced Danby to resign his treasurership (1679), but he received a royal pardon, and a warrant for a marquessate. Proceedings against him were revived, however, and his banishment voted for by the Lords. This was rejected by the Commons, who passed an act of attainder, and on April 21, Danby was sent to the Tower, where he remained for nearly five years. In May 1681 he was actually indicted for Godfrey's murder on the accusation of Edward Fitz-Harris, but was released in 1684 on finding bail for £40,000.

After James's accession, Danby was discharged from his bail, and took his seat in the Lords as leader of the moderate Tory party. Driven into opposition by James's attacks on Protestantism, he became an agent of William of Orange, and as one of the seven leaders of the Revolution he occupied York in the prince's interest. For his services to William, he was created marquis of Carmarthen (1689) and lord-lieutenant of the three ridings of Yorkshire, but, greatly to his disappointment, he was not reinstated in the lord treasurership owing to his unpopularity with the Whigs. In 1690, however, he regained this post, which he retained till 1695 by bribery of members of parliament and the support of the king and queen. In 1690 he was appointed Mary's chief adviser during William's absence in Ireland, and in 1694 he was created duke of Leeds. In 1695 he was again impeached for receiving a bribe to procure a charter for the East India company, but, owing to insufficient evidence, the proceedings failed. He had for some time lost the real direction of affairs, when, in May 1699, he was compelled to retire from office. He died on July 26, 1712.

See the life, by Sidney Lee, in the *Dict. Nat. Biography* (1895); also *Add. MSS*, 26,040–95 (56 vols., containing his papers); in the *Duke of Leeds MSS. at Hornby Castle*, calendared in *Hist. MSS Comm.*, 11th Rep., pt. vii. pp. 1–43; *MSS. of Earl of Lindsay and J. Eliot Hodgkin; Add. MSS. 1894–1899*, Index and Calendar; *Hist. MSS. Comm.*, 11th Rep., pt. ii., *House of Lords MSS.*

LEEDS, a city and municipal county in the West Riding of Yorkshire, England, 185 m N.N.W. from London. Pop. (1921) 458,232. It is the largest unit in the urban region of West Yorkshire. It is on the river Aire, and lies above the marshy lowland which is liable to extensive flooding in winter. It early became a local market centre, attracting routes from all directions. To the north-west the Aire Valley leads to the Craven Gaps in the Pennine Highland—the lowest ways through the Pennines in the whole length from Tyne to Trent. South-west of Leeds lie the shortest ways through the highland, for here the Pennines are at their narrowest. Both road and rail routes have taken advantage of these physical conditions, with the result that Leeds has become an important nodal town. It occupies a central railway position and is served by the L.M.S.R. and L.N.E.R.; it is a half way station on the main route from London to Scotland via the Craven gap, and connects with Liverpool by the Leeds-Liverpool canal and Goole and the Humber by the Aire and Calder Navigation. It is the centre of an important coal and iron district, and, though regarded as the capital of the great manufacturing district of the West Riding, Leeds is not its centre, but on its border. East and north the country is agricultural; west and south lie the manufacturing towns of the woollen area.

History.—It is probable that pre-Roman routes and Roman roads crossed the Pennines near the present site of Leeds, but there is no evidence of them. Leeds (Loidis, Ledes) belonged to the kingdom or principality of Elmete, and was ruled by British chieftains until Edwin conquered Northumbria in the 7th century. At the time of the Norman conquest, the township consisted of seven estates, each held by a thane, but, by 1086, these had been united into a single manorial estate. Throughout the middle ages it retained its rural character long after it became commercially important. In 1207, the lord of the manor, Maurice Pagnell, granted a charter to the inhabitants and in 1626 it was created a municipal borough by Charles I. The object of the charter was the regulation and protection of the woollen trade by local authority. During the Commonwealth, Leeds gained, temporarily, parliamentary representation, and a new charter was issued in 1661, giving Leeds its first mayor. This was superseded in 1684 by a charter which placed the corporation under the absolute power of the crown in certain contingencies, but the charter of 1661 was restored by William III. and this still forms the basis of municipal constitution.

The town became a county borough in 1888 and was raised to the rank of a city in 1893. The city was extended by the addition of Roundhay, Seacroft, Shadwell and part of Crossgates in 1912, Middleton in 1919, part of Adel-cum-Eccup in 1925, and Eccup, Alwoodley, Thorpe Stapleton and part of Austhorpe in 1928. In 1918 the borough was divided into six constituencies, each area returning one member to parliament. In 1924, the city was constituted a single township under a separate board of guardians, by the amalgamation of the former townships of Leeds, Armley and Bramley, Holbeck and Hunslet, and the former parish of Osmondthorpe.

The original city of Leeds contains no historical buildings. With the growth of the borough in recent years, the Cistercian abbey of Kirkstall, founded in 1147, and the 12th century parish church of Adel have been included within the city boundary. The city has also acquired the mansion and park of Templenewsam, once the property of the Knights Templars; it was probably built in the first quarter of the 17th century.

Industries.—Leeds lies in the "soft water" area of the Pennines and this was a factor in the introduction of woollen manufacture in the 14th century. The industry became established in the Aire and Calder valleys, but it was not until the middle of the 16th century that Leeds was able to challenge the supremacy of York and Beverley. Even in the 17th century, cloth was made in the neighbouring villages to the east and was only finished and sold in the town. In the early 18th century Halifax took the lead in worsted developments and during the 19th century, Bradford developed until it is now easily the largest wool textile centre in the country With the Industrial Revolution the woollen industry of Leeds yielded pride of place to engineering. In the 18th and 19th centuries the city was, and still is, concerned mainly with industrial and agricultural equipment, and transport services. Transport by air is the latest type, parts for seaplanes and airplanes being produced at Leeds for erection at Brough. During the second half of the 19th century, engineering was, in turn, displaced by the wholesale clothing industry, which was really an outgrowth of the woollen and worsted manufactures. It was introduced in 1855 and is now the largest single industry in the town. About one third of the "ready-made" clothes are exported. A recent development is the establishment in Leeds of the Research Association for Woollen and Worsted Industries (incorporated 1918). During the second half of the 18th century, Leeds was famed for its pottery, but the industry lapsed in the 19th century and the potteries closed down in 1878. The linen trade arrived in 1788, and was soon a prosperous industry. Owing to competition with Belfast and Dundee, the mills were closed. Only two or three firms remain. To-day, the most important industries are wholesale clothing, engineering, woollen and worsted manufactures, printing, coal mining, leather industries and furniture trades Leeds has a reputation for colour-printing, and some of the most complicated and efficient printing machinery is produced. The development of transport has been an important factor in the concentration of industries. In 1659 the Aire was made navigable to Leeds, and in 1760 was linked with the Calder, forming the Aire and Calder Navigation. The Leeds and Liverpool canal was begun in 1770,

but was not completed until 1816. By 1848, Leeds was connected by rail with all important neighbouring towns.

The University of Leeds originated with the foundation of the Medical School in 1831. In 1874, the Yorkshire College of Science was established to supply instruction in the arts and sciences which are applicable to the manufactures, engineering, mining and agriculture of the county. In 1884, the college was amalgamated with the Medical School and in 1887 it became one of the constituent colleges of Victoria University, and so remained until its separate incorporation in 1904. In 1928 the foundation stone was laid of new buildings to be erected to meet growing requirements. Other educational establishments include a grammar school (founded in 1552), a city training college, a Wesleyan Methodist theological college and the lecture hall and museum of the Philosophical and Literary Society. Leeds is the seat of a Roman Catholic bishop with a pro-Cathedral dedicated to St. Anne.

LEE HIGHWAY, a United States highway starting at the Zero Milestone in Washington, D.C., and ending at San Diego, Calif., a distance of 3,141 miles. It is a national memorial to Gen. Robert Edward Lee. Lee highway is open and usable at all times. Its first thousand miles are through the Appalachian valleys from the vicinity of Washington to a point near Memphis, Tenn. Its second thousand miles rise gradually from the Mississippi river to the Rocky mountains, while the last third of it is a majestic mountain panorama. Among its many points of historic interest are the battlefield of Bull Run; Shenandoah National park; Luray caverns; Natural bridge, Va.; Wilson dam and bridge at Muscle Shoals, Ala.; Carlsbad caverns, Roswell, N.M.; Roosevelt dam and cliff dwellings, Arizona.

LEEK, market town, parliamentary division, Staffordshire, England, 157 m. N.W. of London on L.M.S. railway. Pop. (1921) 17,214. The town lies 640 ft. high near the head of the river Churnet. Cloud Hill rises to 1,190 ft. west of the town. The church of St. Edward the Confessor has an ornately-carved pillar of Danish work. An institute contains a free library, lecture hall, art gallery, and school of art. A grammar school was established in 1723. In the vicinity are ruins of the Cistercian abbey De la Croix, erected in 1214 by the earl of Chester. Leek formed part of the great estates of Aelfgar, earl of Mercia; it escheated to William the Conqueror. Later it passed to the earls Palatine of Chester, until given to the abbey De la Croix, which held it until its dissolution. In a charter given by the earl of Chester (temp. John) it is called a borough, but the town received no royal charter and failed to establish its burghal position.

LEEK, the *Allium Porrum* of botanists, a plant now considered as a mere variety of *Allium Ampeloprasum*, wild leek, produced by cultivation. The plant is probably of Eastern origin, since it was commonly cultivated in Egypt in the time of the Pharaohs, and is so to the present day; while as regards its first appearance in England both Tusser and Gerard—two of the earliest writers on this class of subject, the former of whom flourished in the early part and the latter in the later part of the 16th century—speak of it as being then commonly cultivated and used. It is more than probable that it was brought to England by the Romans. Italy was celebrated for leeks in the time of Pliny (*H.N.* xix. c. 6), according to whom they were brought into great esteem through the emperor Nero, derisively surnamed "Porrophagus," who used to eat them for several days in every month to clear his voice. The leek is very generally cultivated in Great Britain as an esculent, but more especially in Scotland and in Wales, being esteemed as an excellent vegetable, with properties very similar to those of the onion, but of a milder character. The whole plant, with the exception of the fibrous roots, is used in soups and stews. The sheathing stalks of the leaves lap over each other, and form a thickish stem-like base, which is blanched, and is the part chiefly preferred. These blanched stems are much employed in French cookery. They form an important ingredient in Scotch winter broth, and particularly in the national dish *cock-a-leekie*, and are also largely used boiled, and served with toasted bread and white sauce, as in the case of asparagus. Leeks are sown in the spring, earlier or later according to the soil and the season, and are planted out for the summer, being dropped into holes made with a stout dibble and left unfilled in order to allow the stems space to swell. When they are thus planted deeply the holes gradually fill up, and the base of the stem becomes blanched and prepared for use, a process aided by drawing up the earth round about the stems as they elongate. The leek is extremely hardy, and presents no difficulty in its cultivation, the chief point, as with all succulent esculents, being that it should be grown quickly upon well-enriched soil. The plant is of biennial duration, flowering the second year. The leek is the national symbol or badge of the Welsh, who wear it in their hats on St. David's Day. The origin of this custom has received various explanations, all of which are more or less speculative.

LEE OF FAREHAM, ARTHUR HAMILTON LEE, 1ST VISCOUNT, cr. 1922 (1868–), British politician, was born at Bridport, Dorsetshire on Nov. 8, 1868. Educated at Cheltenham and Woolwich, he entered the royal artillery in 1888, retiring with the rank of brevet-major in 1900. From 1893 until 1900 he was professor of strategy and tactics at the Royal Military College in Canada, during which period he organized the military survey of the frontier. In 1900 he entered the House of Commons as Conservative member for the Fareham division of Hampshire, which he represented for 18 years. He was civil lord of the admiralty from Oct. 1903 until the resignation of the Balfour ministry in 1905. In 1912 he carried through parliament an act aimed at the white slave traffic. On the outbreak of the World War he rejoined the army, and served as a colonel on the staff. In 1915–16 he was personal military secretary to the secretary for war (Lloyd George) and in 1917–18 director general of food supplies. He was created baron in 1918, and was sworn of the privy council in 1919. He joined Lloyd George's administration in 1919, first as minister of agriculture and then as first lord of the admiralty (Feb. 1921–Nov. 1922). He was a member of the Imperial cabinet in 1921, a delegate to the Washington Conference, Nov. 1921–Feb. 1922; and in 1923–24 chairman of the royal commission on the public services of India, for which he was created G.C.S.I. in 1925. In 1921 he presented to the nation, as a residence for the prime minister for the time being, the house and estate of Chequers.

LEER, a town and river port in the Prussian province of Hanover, on the right bank of the Leda near its confluence with the Ems, and at the junction of railways to Bremen, Emden and Münster. Pop. (1925) 12,232. Leer is a very old place, although it obtained municipal privileges only in 1823. Woollen fabrics, cigars, soap and earthenware are manufactured, and there are iron-foundries, distilleries and shipbuilding yards.

LEEUWARDEN, the capital of the province of Friesland, Holland, on the canal between Harlingen and Groningen, 33 m. by rail W. of Groningen. Pop. (1926) 46,676. Leeuwarden grew up round the court of the Frisian stadtholders; and it is an exceptionally clean town. The Prince's Garden, originally laid out by William Frederick of Nassau in 1648, was given to the town by King William I. in 1819. The royal palace, seat of the Frisian court from 1603 to 1747, is now the residence of the royal commissioner for Friesland. The Kanselary was begun in 1502 as a residence for the chancellor of George of Saxony (1539), governor of Friesland, but was only completed in 1571 and served as a court house until 1811. It was restored at the end of the 19th century to contain the provincial library and national archives.

Other noteworthy buildings are the weigh-house (1595), the town hall (1715), and the great church of St. Jacob, once the church of the Jacobins, and the largest monastic church in the Netherlands. The unfinished tower of Oldehove dates from 1529–32. The museum of the Frisian Society contains a collection of provincial antiquities, including two rooms from Hindeloopen, an ancient village of Friesland, some Frisian works

in silver of the 17th and 18th centuries, and a collection of porcelain and faïence. Leeuwarden is easily accessible from all parts of the province by road, rail and canal. The chief business is in stock of every kind, dairy and agricultural produce and fresh-water fish, a large quantity of which is exported. The industries include boat-building and timber yards, iron-foundries, copper and lead works, furniture, organ, tobacco and other factories, and the manufacture of gold and silver wares. The town is first mentioned in documents of the 13th century.

LEEUWENHOEK or **LEUWENHOEK, ANTHONY VAN** (1632–1723), Dutch microscopist, was born at Delft on Oct. 24, 1632, and died there on Aug. 26, 1723. For a time he was in a merchant's office in Amsterdam, but soon turned to the manufacture of microscopes and to the study of the minute structure of organized bodies by their aid. He found that single lenses of very short focus were preferable to the compound microscopes then in use, and though his researches were not conducted on any definite scientific plan, his powers of careful observation enabled him to make many interesting discoveries He extended M Malpighi's demonstration of the blood capillaries in 1668, and six years later gave the first accurate description of the red blood corpuscles In 1677 he described and illustrated the spermatozoa in dogs and other animals, though in this discovery Stephen Hamm had anticipated him by a few months; and investigated the structure of the teeth, crystalline lens, muscle, etc. In 1680 he noticed that yeast consists of minute globular particles, and he described the different structure of the stem in monocotyledonous and dicotyledonous plants. The first representation of bacteria is to be found in a drawing by Leeuwenhoek in the *Philosophical Transactions* of the Royal Society in 1683.

Leeuwenhoek's contributions to the *Philosophical Transactions* amounted to 375, and those to the *Memoirs of the Paris Academy of Sciences* to 27. Two collections of his works appeared during his life, one in Dutch (Leiden and Delft, 1685–1718), and the other in Latin (1715–22); a selection was translated by S Hoole (1798), *see* also W. A. Locy, *The Growth of Biology* (1925).

LEEWARD ISLANDS, a group in the West Indies. They derive their name from being further down the trade wind than the adjacent Windward Islands. They are the most northerly of the Lesser Antilles, and form a curved chain stretching S W. from Puerto Rico to Martinique. They include the Virgin Islands, St. Kitts, Nevis, Antigua, Montserrat, Guadeloupe, Dominica, Martinique and their various dependencies. The Virgin Islands are owned by Britain and the United States which bought St. Thomas from Denmark in 1916; St. Eustatius, Saba, and part of St. Martin by Holland; Guadeloupe, Martinique, St. Bartholomew and the remainder of St. Martin by France. The British islands (except Sombrero, used only as a lighthouse-station) form, under one governor, a colony divided into five presidencies: Antigua (with Barbuda and Redonda), St. Kitts-Nevis (with Anguilla), Dominica, Montserrat and the Virgin Islands Total pop. (1927) est. 121,955. There is one federal executive council nominated by the crown, and one federal legislative council—ten nominated and ten elected members. Of the latter, four are chosen by the unofficial members of the local legislative council of Antigua, two by those of Dominica, and four by the non-official members of the local legislative council of St. Kitts-Nevis. The federal legislative council meets once a year, usually at St. John, Antigua.

LE FANU, JOSEPH SHERIDAN (1814–73), Irish journalist and author, was born of an old Huguenot family at Dublin on Aug. 28, 1814. He entered Trinity college, Dublin, in 1833. Le Fanu was actively engaged in Irish journalism, both as editor and proprietor, from 1839 to 1858. In that year his wife died, and from that time he lived in retirement. He died in Dublin on Feb. 7, 1873. His best-known novels are *The House by the Churchyard* (1863) and *Uncle Silas, a Tale of Bartram Haugh* (1864). *The Purcell Papers*, Irish stories dating from his college days, were edited with a memoir of the author by A. P Graves in 1880.

LEFEBVRE, PIERRE FRANÇOIS JOSEPH (1755–1820), duke of Danzig (1808), marshal of France, was born at Rouffach in Alsace on Oct. 20, 1755. At the outbreak of the Revolution he was a sergeant in the Gardes françaises, and took the popular side. He was made a general of division in 1794 for distinguished service, and took part in the Revolutionary Wars from Fleurus to Stokach. At Stokach (1799) he received a severe wound and had to return to France, where he assisted Napoleon during the *coup d'état* of 18 Brumaire He was one of the first generals of division to be made marshal at the beginning of the First Empire. He fought at Jena, at the siege of Danzig (1806–7), in Spain (1808–9) and in 1807 commanded the Bavarian contingent. He commanded the Imperial Guard in Russia, 1812, fought through the last campaign of the Empire, and won fresh glory at Montmirail and Arcis-sur-Aube He was made a peer of France by Louis XVIII. but joined Napoleon during the Hundred Days, and was only permitted to resume his seat in the upper chamber in 1819. He died in Paris on Sept. 14, 1820.

LEFEBVRE, TANNEGUY (TANAQUILLUS FABER) (1615–1672), French classical scholar, was born at Caen, and died on Sept 12, 1672 For nearly 20 years he was professor at Saumur. One of his children was the famous Madame Dacier. Lefebvre, who was by no means a typical student in dress or manners, was a highly cultivated man and a thorough classical scholar. He brought out editions of various Greek and Latin authors—Longinus, Anacreon and Sappho, Virgil, Horace, Lucretius and many others. His most important original works are. *Les Vies des poètes Grecs* (1665); *Méthode pour commencer les humanités Grecques et Latines* (2nd ed, 1731), of which several English adaptations have appeared; *Epistolae Criticae* (1659).

In addition to the *Mémoires pour . . . la vie de Tanneguy Lefebvre,* by F. Graverol (1686), *see* the article in the *Nouvelle biographie générale,* based partly on the ms registers of the Saumur Académie.

LEFROY, HAROLD MAXWELL (1877–1925), British entomologist, was born at Crondall, Hants, on Jan. 20, 1877, and was educated at Marlborough and King's College, Cambridge. In 1899 he became entomologist to the Imperial Department of Agriculture for the West Indies, a position which he held until he was made in 1903 imperial entomologist for India. In 1912 he was appointed to the newly created chair of entomology at the Imperial College of Science and Technology, South Kensington, and in 1913 he became honorary curator of the insect house of the Zoological Gardens, London. He devoted himself particularly to the study of the life history of insects of economic importance, and as imperial silk specialist for India in 1915 and 1916 did much valuable work for the silk and cotton industries. During the World War as temporary lieut.-colonel in Mesopotamia he conducted sanitary measures against flies, and in 1917 served as an expert on the royal commission on wheat supplies, dealing effectively with the problem of beetles in wheat. He subsequently devised means of combating the depredations of the death watch beetle in old buildings. He died in London on Oct. 14, 1925, poisoned by the fumes of a gas with which he was experimenting for insect destruction.

His publications include *Indian Insect Pests* (1906); *Indian Insect Life* (1909); *A Manual of Entomology* (1923); and articles in *The West Indian Bulletin,* the *Agricultural Journal of India,* and many official papers

LEFT-HANDEDNESS: *see* HANDEDNESS.

LEG, the general name for those limbs in animals which support and move the body, and in man for the lower limbs of the body (*see* ANATOMY, *Superficial and Artistic;* MUSCULAR SYSTEM; SKELETON: *Appendicular*).

LEGACY, in English law, some particular bequest given or left by a testator in his will. The word is primarily applicable to gifts of personalty or gifts charged upon real estate. Legacies may be either specific, general or demonstrative A *specific legacy* is "something which a testator, identifying it by a sufficient description and manifesting an intention that it should be enjoyed in the state and condition indicated by that description, separates in favour of a particular legatee from the general mass of his personal estate," *e.g.,* a gift of "my portrait by X," naming the artist. A *general legacy* is a gift not so distinguished from the general mass of the personal estate, *e g.,* a gift of £100 or of a gold ring A *demonstrative legacy* partakes of the nature of both

the preceding kinds of legacies, *e.g.*, a gift of £100 payable out of a named fund is a specific legacy so far as the fund named is available to pay the legacy; after the fund is exhausted the balance of the legacy is a general legacy and recourse must be had to the general estate to satisfy such balance. Sometimes a testator bequeaths two or more legacies to the same person; in such a case it is a question whether the later legacies are in substitution for, or in addition to, the earlier ones. In the latter case they are known as *cumulative*.

If the estate of the testator is insufficient to satisfy all the legacies these must abate, *i.e.*, be reduced rateably; as to this it should be noticed that specific and demonstrative legacies have a prior claim to be paid in full out of the specific fund before general legacies, and that general legacies abate rateably *inter se* in the absence of any provision to the contrary by the testator. As a general rule, legacies given to persons who predecease the testator do not take effect; they are said to lapse; but by the Wills Act 1837, gifts to a child or other issue of the testator will not lapse if any issue of the legatee survive the testator. In the absence of any indication to the contrary a legacy becomes due on the day of the death of the testator, though for the convenience of the executor it is not payable till a year after that date. It frequently happens, however, that a legacy is given payable at a future date; in such a case, if the legatee dies after the testator but prior to the date when the legacy is payable it is necessary to discover whether the legacy was vested or contingent, as in the former case it becomes payable to the legatee's representative; in the latter, it lapses. In this, as in other cases, the test is the intention of the testator as expressed in the will; generally it may be said that a gift "payable" or "to be paid" at a certain fixed time confers a vested interest on the legatee, while a gift to A "at" a fixed time, *e.g.*, 21 years of age, only confers on A an interest contingent on his attaining the age of 21.

United States.—The common law doctrines applicable to the nature of legacies and the order in which they are to be paid are generally in force in the United States. Courts are averse from construing legacies to be specific unless it is clear that the testator so intended. Statutes have commonly modified the rigid common law rule that a legacy lapsed by the death of the legatee during the lifetime of the testator and the share of the estate thus bequeathed went to the residuary legatee or those next of kin of the testator who were entitled to take under the intestate laws. They usually provide that the benefit of a lapsed legacy shall descend to the issue of the legatee, but commonly limit this rule to legatees who are descendants of the testator or the close collaterals. Such legislation is based upon the theory that it approximates more closely to the testator's intention than the common law doctrine. Legislation has also enabled legatees more readily to bring suit for their legacies

LEGACY DUTY AND SUCCESSION DUTY. In the British fiscal system, gratuitous acquisitions of property taking place by reason of the death of an individual are charged to legacy duty or succession duty. These two duties, which are in reality complementary to one another—a fact which arises out of the history of their imposition (*see* ESTATE DUTIES)—together form that class of British death duties which is in the nature rather of an acquisition duty on a beneficiary than (as in the case of the estate duty) of a transfer duty on property.

All moveable property, wheresoever situate, devolving under the will or intestacy of an individual dying domiciled in some part of Great Britain is liable to legacy duty The moveable property, wheresoever situate, of a testator or intestate dying domiciled out of Great Britain is not liable to that duty.

All settled moveable property, wheresoever situate, not liable to legacy duty, of which property the forum of administration is in some part of Great Britain, is liable to succession duty. Settled moveable property which is the subject of a non-British trust is not liable to that duty.

All immoveable property which is situate in Great Britain is liable to succession duty, regardless either of the domicile of the testator, intestate or settlor, or of the beneficiary. But immoveable property situate out of Great Britain, devolving as such, is not liable to succession duty in any circumstances.

Rates of Duty.—The current scale of rates of legacy duty and succession duty is as follows:—

Relationship of the beneficiary (or the person of nearer consanguinity whom he or she has married) to the author of the bounty.	Rate of duty per cent.
Husband or wife, child or lineal descendant of child, father or mother or any lineal ancestor	1
Brother or sister, lineal descendant of brother or sister .	5
Any other person, including any related only by natural ties .	10
	In certain cases supplementary rates to a maximum of 1½% are chargeable excepting as between spouses.

The rates both of legacy duty and succession duty are thus regulated according to the degree of relationship, or the absence of relationship, between the beneficiary and the deceased. Both duties are, speaking generally, payable when the beneficiary becomes entitled to the enjoyment of the benefit, or when the subject matter of the gift is appropriated to him, but in certain circumstances both duties may be paid by instalments extending, in the case of real property, to a maximum period of eight years. The precise manner in which the value of the benefit is to be determined is specified by the various acts imposing and governing the duties, these acts containing provisions for determining the value of annuities, of legacies to be enjoyed in succession, of interests for life, and of other benefits of a peculiar nature.

Certain exemptions and reliefs common to both legacy duty and succession duty are provided, of which the most important are as follow.—

(a) No legacy duty is chargeable when the gross value of the personal estate is under £100; and no succession duty is chargeable when the principal value of all the successions derived from the same predecessor and passing on any death is under £100.

(b) Neither duty is chargeable on benefits arising under the will or intestacy of an individual on whose death the net value of the property passing in respect of which estate duty is payable (exclusive of property settled otherwise than by that individual's will) does not exceed £1,000.

(c) Individuals chargeable at the 1% rate of duty (*see* table) are exempted from both duties when:—

(i.) The principal value of the property passing on the death of the deceased in respect of which estate duty is payable (exclusive of property in which the deceased never had an interest, or of property of which he was never competent to dispose and which on his death passed to individuals other than the spouse, or lineal ancestor or descendant, of the deceased) does not exceed £15,000; or

(ii.) The value of the benefit together with that of any other benefits derived by the same individual from the testator, intestate, or predecessor, does not exceed £1,000, whatever may be the principal value of the property passing on the death of the deceased; or

(iii.) The beneficiary is the widow or child under the age of 21 years of the testator, intestate, or predecessor, and the value of the benefit, together with that of any other benefits derived by the same individual from the same testator, intestate, or predecessor, does not exceed £2,000, whatever may be the principal value of the property passing on the death of the deceased.

(d) When the net value of the property in respect of which estate duty is payable (exclusive of property settled otherwise than by the will of the deceased) exceeds £1,000, the amount of legacy duty and succession duty payable in respect of the property is not to exceed the amount by which the net value of the property as estimated for the purpose of estate duty exceeds £1,000.

(e) Neither duty is chargeable in respect of objects not yielding any income (*e.g.*, furniture, jewellery, etc.) given so as to be enjoyed by different persons in succession, whilst the same are so enjoyed. Duty becomes payable, however, if and when the same are disposed of.

(f) The duties are only chargeable in the case of objects which are deemed to be of national, scientific, historic, or artistic interest when the objects are sold, and then only in connection with the last death on which they passed. But complete exemption is afforded when the sale is to a national institution.

(W. H. C.)

LEGAL AID, a phrase which has acquired by usage and court decision a specific meaning and is now the standard term employed to denote giving to poor persons, gratis or for nominal fees, legal advice and assistance in their legal matters and supplying counsel to represent them in court in civil and criminal cases. Legal aid work is generally carried on by incorporated or otherwise legally constituted societies or bureaux. They maintain offices to which poor persons may apply as clients, employ salaried lawyers who devote all their time to interviewing, advising and acting in behalf of such poor persons as are found to have meritorious legal cases, and defray the cost of clerical wages and other operating expenses. Their funds come from contributions by philanthropic people in the community, from public grants, or both. Where legal aid is supported by the public treasury it is commonly established by ordinances, as a bureau of the welfare department of the municipal government. Where privately supported, the legal aid organization is either a charitable corporation formed for this specific purpose, or is a department of a general charitable corporation. In both cases the contributors elect the officers and directors to supervise the work. Officers who are devoted primarily to helping poor persons in criminal cases are usually called "public defenders."

In all civilized nations the individual's right to life, liberty and property depends on law. He can obtain protection or redress only through legal proceedings. Governments maintain courts to determine and enforce rights; but the expenses of litigation, including counsel fees, are more than poor persons can pay. Legal history reveals a constant and not over successful struggle to make adequate provisions for the poor so that they will not be denied justice. As modern society became more complex through industrialization and urbanization, the problem was intensified because these factors engendered a mass of new litigation and the rapid growth of population augmented the number of persons near the poverty line.

Solutions have been attempted along two lines The first consists of statutory provisions under which a poor person may appeal to a judge, satisfy him as to his poverty and the merit of his claim, and then be exempted from court costs and have a lawyer assigned to represent him. This plan is the backbone of the legal aid systems in Europe. Its structural defect is that it deals only with litigation and makes no provision for the multitude of cases in which the poor need counsel to advise them, to draw wills, contracts or other documents for them, or to conciliate, settle or otherwise adjust a controversy without a lawsuit, and in the aggregate such matters far outnumber the cases requiring resort to courts. Also this plan has broken down because overburdened courts and attorneys have been reluctant to assume the extra work it required of them. This has been felt in England, and in the United States it forced a general abandonment of the plan and the substitution of another. The second plan is exemplified by the legal aid societies and bureaux, which are intended to provide lawyers paid to act for the poor in all matters. Its defect lies in the fact that these organizations have developed independently, and not as integral parts of the administration of justice, and they are often forced to limit their service through lack of funds. A combination of the two plans would seem to provide an ideal solution, but this has been effectuated only in Sweden.

The United States.—Legal aid work is carried on most extensively in the United States. Beginning in 1876 in New York, where a group of public-spirited citizens of German origin formed a society and opened a legal aid office intended chiefly to serve German immigrants, followed in 1887–88 in Chicago, where two offices were opened, the movement steadily expanded until in 1917 there were 43 legal aid organizations operating in the larger cities and extending across the continent. After the World War growth was resumed and in 1928 there were about 70 well-established legal aid offices. These various societies and bureaux have given legal aid to approximately 2,500,000 poor applicants, have succeeded in collecting for them (mostly in small claims and wages) over $10,000,000, and have expended in the conduct of their work nearly $4,000,000. Statistics for 1927 showed 160,241 new cases received, $716,561 collected for clients, and $392,244 cost of operation.

All the societies and bureaux, having been formed in different cities by local groups, were independent of each other and autonomous until, in 1923, at a constitutional convention held in Cleveland, they organized the National Association of Legal Aid Organizations with power to co-ordinate their activities, especially in referring cases from one city to another, to guide the future development of the work, and to control legal aid in its national aspects Under this last power arrangements were made with the U S Supreme Court whereby poor persons appealing to it could be given legal assistance While these legal aid organizations are not an organic part of the American judicial structure, they play so important a part in the administration of justice that inevitably they are moving in that direction and more and more are deriving their support and leadership from the organized bar. A score of State bar associations have legal aid committees and the American Bar Association has, since 1921, maintained a standing committee on legal aid work. Through the National Association of Legal Aid Organizations co-operative relationships with other important groups have been established—with the Association of Governmental Labor Officials of the United States and Canada, with the Association of Industrial Accident Boards and Commissions and with the American Association for Organizing Family Social Work.

England and Scotland.—As early as the reign of Henry VII. a comprehensive statute was enacted establishing *in forma pauperis* procedure whereby the poor should have their writs for nothing and have counsel assigned to represent them. The procedure proved ineffective, it gradually fell into disuse, and its provisions were repealed in 1883. The problem, however, remained and grew. The establishment of the county courts with their summary procedure afforded partial relief; but court costs and the expense of counsel barred many just claims until in 1914 the Supreme Court of Judicature made effective new rules under which poor litigants in that court might be exempted from court costs and be represented by solicitors and barristers. This again proved inadequate, as it was impossible to secure the volunteer services of enough lawyers to meet the flood of applicants for relief, notably in divorce cases, and the rules were changed in 1926 so as to vest the major responsibility in the London Solicitors' Society, to which the Government made a grant for expenses. The general problem remains unsettled and continues a matter for inquiry by a special parliamentary commission.

The plan of establishing definite legal aid offices, analogous to those in the United States, has never taken root in England. Some university settlements and kindred charities have maintained evening office hours where volunteer solicitors are in attendance and can be consulted. But as these ventures have never been soundly financed and have continued only by virtue of the self-sacrificing labours of a few devoted persons, their activities have been severely restricted, and they are totally inadequate to cope with a problem of this magnitude.

The Scottish system is basically the same as the English, but has proved more effective in actual practice, perhaps because its procedure for legal aid has been in uninterrupted operation since 1574. The various solicitors' associations each year designate a number of their members to act as agents for the poor. After the applicant has produced satisfactory certificates from his parish proving his poverty, the agent files a petition to allow him to sue *in forma pauperis*. If this petition is approved by a tribunal of four attorneys, the applicant is admitted to the Poor Rolls and is exempted from paying the usual costs, and the court assigns him a counsel from a list prepared by the Faculty of Advocates. In this way almost 2,000 persons a year are given legal aid in litigation. This method proves more satisfactory in smaller cities and towns and invariably shows signs of strain when applied in large centres of population. In Edinburgh some additional service was found to be essential, and the Edinburgh Legal Dispensary was patterned after the Legal Aid Society in New York.

Continental Europe.—The French legal aid system of *l'assistance judiciaire gratuite* is closely analogous to the English

in forma pauperis and the Scottish poor rolls procedure. Its history traces back to the Code Napoléon, which probably represents the codification of earlier provisions, and it has always functioned with reasonable success. Attached to each court is a tribunal of representatives of the legal corporations (bar associations) which determines whether the applicant is indeed poor and has a proper claim. If so, the poor person is excused from the customary fees and is assigned a counsel who is helped in his work by law students, service in this capacity being required of them prior to admission to the bar. While this system makes the courts accessible to the poor, it fails to afford them legal aid in all non-litigious matters.

The other countries of continental Europe follow substantially the same plan and method, but there are some noteworthy variations. Denmark for over a century has had a splendid system of conciliation tribunals in which the small cases of the poor are given quick and inexpensive justice, and in Copenhagen there is a well-established legal aid office in which law students actively participate. Norway has a parallel system of conciliation tribunals but no legal aid organizations. In Sweden, the system of assigning counsel to act for poor persons works exceptionally well because it is based on the just principle that such counsel should be paid suitably for their work by order of the court. In addition a strong legal aid society exists in Stockholm under a law which provides that, if any municipality or district establishes a legal aid office, part of the expenses will be borne by the royal treasury. There have grown up in Germany a large number of legal aid bureaux, many of them affiliated with political parties or labour unions.

International Legal Aid.—The European nations concluded a Convention on Civil Procedure at The Hague in 1905, under which each nation extends to the citizens of every other the right to apply to its courts for the same legal aid as is afforded to its own poor. Thus, by reciprocity, a poor national of any European country may obtain legal aid from the courts of every other European country. Neither Great Britain nor the United States has become a signatory to this convention.

Under the auspices of the League of Nations there met at Geneva, in 1924, a committee of legal aid experts representing France, Great Britain, Italy, Japan, Norway, Spain and the United States, to devise plans for bringing all the legal aid agencies of the world into closer communication On their recommendation the Assembly of the League authorized its secretary-general to collect and publish the laws of the various nations making provisions for the poor and a list of all ascertainable legal aid organizations. The volume containing this information was published in 1928

LEGAL ARTICLES. All aspects of legal practice receive individual treatment and should be sought under their own headings. Such subjects as ADMIRALTY, ADMIRALTY, HIGH COURT OF, JURISDICTION, are given detailed treatment by experts; this is apparent also in key articles such as APPEAL; ARREST; BANKRUPTCY; CHANCERY; COMMONS; COMPANY LAW; CONTRACT; COPYRIGHT; CRIMINAL LAW; DEPORTATION; DIVORCE; ECCLESIASTICAL JURISDICTION; ENGLISH LAW; EVIDENCE; HOMICIDE; INDIAN LAW; INSANITY; INTERNATIONAL LAW, PUBLIC; INTERNATIONAL LAW, PRIVATE; JURISPRUDENCE, COMPARATIVE; JUVENILE OFFENDERS; LEGITIMACY; LIBEL AND SLANDER; LIQUOR LAWS; MANDATE; MARTIAL LAW; MEDICAL JURISPRUDENCE; OATH; PARLIAMENT; PARTNERSHIP PATENTS; PEACE; PEERAGE; PERMANENT COURT OF INTERNATIONAL JUSTICE; POLICE; POST AND POSTAL SERVICE; PRACTICE AND PROCEDURE; PRESS LAWS; PRISON; LAWS OF REAL PROPERTY AND CONVEYANCING; REPRESENTATION; ROMAN LAW; SECURITY; SENATE; SOVEREIGNTY; STATUTE; SUCCESSION; TORTURE; TREASON; TREATIES; TRUST AND TRUSTEES; VOTE AND VOTING; WILL.

Many shorter articles define law terms or outline procedure and references to these will be found in the key articles.

LEGAL EDUCATION. The subject of this article is education in English and United States law; *i.e.*, the law as administered in English and United States courts of justice.

Early Usage.—It is noteworthy, though when the causes are understood it is not surprising, that until about the middle of the last century legal education was not academic but vocational. It was not offered to or demanded by students who were not proposing to qualify for the practice of the law. The universities taught the canon law and the civil law. The first teacher of the civil law seems to have been Vacarius who was introduced into England in Stephen's reign by Archbishop Theobald and according to Gervase of Canterbury taught at Oxford. From this period the universities taught the canon law and the civil law and gave degrees as bachelor and doctor in both subjects. Moreover for a degree in each subject the student had to show knowledge of the other; indeed at Oxford for the degree in the canon law the bachelor had to go through a five years' course in the civil law.

After the Reformation teaching of the canon law was discouraged and practically ceased; though, as some compensation, in 1548 Henry VIII. founded the regius professorships of civil law at Oxford and Cambridge. It is noteworthy that in the ecclesiastical courts and in the courts administering the civil law practice was confined to persons who were proficient in civil law. The association of doctors of law, which eventually had its seat at Doctors' Commons, was founded in 1511.

To be admitted an advocate the applicant had to hold a degree as doctor of civil law, must have attended the ecclesiastical courts for a year, and must possess the fiat of the archbishop of Canterbury. The advocates had the monopoly of practice in the ecclesiastical courts and in the admiralty court, the judges of the courts being drawn from their ranks. While the courts existed they practised in the Star Chamber, and in the courts of the constable and marshal In this way there can be no doubt that the university teaching in canon and civil law influenced the development of English law.

But the universities did not, until a comparatively recent date, purport to teach English law as such. In fact, in the middle ages it can hardly be said that there was an English law that a university could teach. Principles had not developed; the substantive law was being generated in the interstices of procedure; the prospective lawyer had to master rules and enactments mainly concerned with real property and crime, disentangling tort from crime To understand the law at all he had to master a language not his own It is not surprising therefore that legal education was confined to those institutions founded by practising lawyers, which secured the sole power of regulating under the judges the entry to the profession, *i.e.*, the inns of court and of chancery.

The Inns of Court and of Chancery.—Here an elaborate system of training was developed. Teachers were appointed from practising members of the profession; they gave readings on legal subjects, often on particular statutes. Discussion took place between students and readers on the subject of lectures, and an organized system of moots, at which the younger barristers and students discussed a set question before their elders in hall, formed an important part of the training. The course for a student appears to have approximated to the traditional 7 years' apprenticeship, nor was he admitted to practise until he had taken part in such a course, though a test by examination had not then been devised. The system reached its zenith in the time of Henry VIII. We derive our detailed knowledge of it from a report made to that king in 1540 by commissioners who included Nicholas Bacon.

But this highly organized system of oral instruction broke down. Printed books began to record the rules of law and the decisions of the courts. The position of reader was encumbered with the heavy expenses of an elaborate feast; a sumptuary rule of one of the inns of court limited the charge to as much as £300. The cost

and the interference with practice made lawyers disinclined to undertake the duty. The days of the Commonwealth interrupted the collegiate system of the inns and though attempts were made after the Restoration by the judges and the benchers to restore the system, they failed.

By the beginning of the 18th century there may be said to have been no organized system of education. Students educated themselves from books, by attendance at the courts and by friendly discussion with one another and their elders. The dawn of a brighter day came with the lectures of Blackstone, first delivered at Oxford in 1753, and the publication of his *Commentaries* in 1765. He was created first Vinerian professor in 1758. The corresponding Cambridge chair, the Downing professorship in English law, was not founded till 1800. But his immediate successors did not make much contribution to legal education. Thus till well into the 19th century there was little or no organized teaching either at the universities or at the inns of court.

Maitland records that when Prof. Amos came to the Downing chair at Cambridge in 1850, the class in English law consisted of one M A., one B.A. and two undergraduates. By this date the inns of court had begun to feel the necessity of putting legal education on a proper footing. Individual attempts were made by the inns to give instruction to their students. In 1833 the Inner Temple instituted two lectureships, one on common law and equity, and the other on jurisprudence and international law. Though the lecturers appointed were such lawyers as Starkie and John Austin the attendance was poor and the lectureships were discontinued. Other inns about this time instituted lectures for their own students with varying success; but no concerted action was taken until 1852 when the four inns, acting upon a report of a joint committee, founded a committee of the four inns, which is the present council of legal education.

The Council of Legal Education.—The council set up five readerships in jurisprudence and civil law, real property, common law, equity and constitutional law and legal history. No system of compulsory examination was at first instituted. Before call, students had either to attend the lectures of two readers for a year, or pass an examination held by the council. In 1868 a third alternative was provided of reading in chambers for a year.

In 1871, however, the old alternatives were swept away. From Jan. 1, 1872, it was made essential to a call to the bar that the student should have passed a satisfactory examination. Teaching was to be provided in jurisprudence, international law (public and private), Roman civil law, constitutional law, legal history, common law, real and personal property, and equity. Three examinations were held in each year. Papers were set on all the above subjects: the students had to pass in Roman law, real and personal property, common law and equity.

The system of education and examination set up in 1871 continues, with modifications, to-day. The inns of court by their council of legal education both teach and examine. To be called to the bar, the student must pass an examination in the specified subjects. It is not, however, a condition of call that he should have attended the lectures of the council, or indeed any lectures at any school of law or university. A certain number of men pass the examination without attending lectures either of the council or elsewhere; notably men who have begun life in some other occupation. But the great majority have had a university education, and if they have not read law at the university, attend the council's lectures under the guidance of the council's chief educational officer, the director of legal education. At present the council provide a reader and assistant reader in Roman law, jurisprudence, international law and the conflict of laws; a reader in constitutional law (English and colonial) and legal history; a reader in evidence, procedure (civil and criminal) and criminal law; a reader and assistant reader in the law of real property and conveyancing; a reader and assistant reader in the common law; a reader and assistant reader in equity, and a lecturer in Hindu and Mohammedan law. Lectures are given continuously during the day throughout the educational term, the attendance varying from 40 to 90, according to the subject.

The Bar Examination.—The examination for call to the bar consists of two parts. In part I. the subjects are Roman law, constitutional law (English and colonial) and legal history, criminal law and procedure, real property and conveyancing: for the latter subject, however, Mohammedan law or Roman-Dutch law may be substituted at the option of the student. The student can take any of these subjects separately. The second part consists of common law, equity, the law of evidence and civil procedure, and a general paper on those subjects. The student must take these subjects together, and, unless he receives special leave, cannot take them until he has kept six terms. A student who has passed an equivalent university examination in Roman law is excused that subject in the bar examination. There is an occasional request from universities to extend this relief to other subjects also taught and examined in at the universities. The view generally held at the inns of court appears to be that the vocational examinations which they control should be conducted by persons who have professional and practical experience of the subjects in which they examine; and that for this reason it would be inexpedient, in the public interest, to allow university examinations with perhaps a more academic bias, and with varying standards, to be substituted.

The bar student has the indirect but valuable educational advantage of being a member of an inn of court and of consequent association with his fellow students and younger barristers. He has to keep 12 terms by dining six or three evenings a term in hall. In addition, the inns have now revived the ancient system of mooting, and moots are held each term, presided over by a judge or senior member of the bar, at which set subjects are argued by two students or young barristers on each side, in accordance with the procedure of courts of law, and are decided by the president. Moreover, it is customary for every student who can afford it to read in chambers for a year with a practising barrister, whose papers he reads, and for whom he drafts pleadings and opinions, which receive the master's correction. This period is often postponed, with advantage, till after call. It forms the most valuable part of legal training; and there are few men who have achieved success at the bar who will not gratefully attribute a large share in it to the training of a former master.

The Solicitors' Examination.—Admission to the solicitors' branch of the profession is controlled by the Law Society, who possess statutory powers given them originally by the Solicitors' Act of 1877 and extended by subsequent acts. In 1833 the Incorporated Law Society inaugurated a system of lectures on common law equity and conveyancing; and about 1836 the common law judges, by rules, and the master of the rolls, by order, made it necessary for an attorney or solicitor to pass an examination before being admitted. The examinations were conducted by a committee of the Society, under the general control of the judiciary. The examination was made statutory by the Solicitors' Act 1843, and under the statute the examination was continued under the original control, until by the Solicitors' Act of 1877 it was placed under the sole control of the Incorporated Law Society. At present the examination in law consists of two parts, the intermediate and the final. The intermediate is an examination on Stephen's *Commentaries* and on trust accounts and bookkeeping. The subjects for the final are the law of real property and conveyancing, equity, common law and bankruptcy, probate, divorce and admiralty law, ecclesiastical and criminal law, and proceedings before justices of the peace. The Law Society provides an organized system of education under their director of studies. They have a principal, a reader, tutors and assistant tutors who lecture during the educational term on the subjects provided for the examination, both intermediate and final. The scheme of education is on the basis of four terms attendance for the intermediate, and six terms for the final, there being three terms in the year. The lectures are supplemented by classes for discussion and informal tuition. There is also a system of tuition by correspondence classes.

It is now provided by statute (Solicitors' Act 1922) that a student shall not be admitted a solicitor unless he has attended for a year at a law school approved or provided by the Law Society. Such approved schools exist at nearly all the English universi-

ties, in some cases controlled or assisted by boards of studies, on which local solicitors are largely represented. Special schools have also been provided by the Law Society, sometimes in connection with university extramural teaching. But the student's practical education is secured by the necessity of service under articles to a solicitor for a period of five years—reduced to four or three years in the case of persons possessing varying educational qualifications.

Teaching at the Universities.—Meantime, contemporaneously with the development of organized teaching by the inns of court and the Law Society for vocational purposes, the universities have proceeded to provide definite teaching in English law. From about the year 1850, the Universities of Oxford and Cambridge began to take the subject seriously. It is impossible to pursue the history of the subject in existing universities old and new. For this article it is sufficient to say that nearly all English universities have a faculty of English Law, giving instruction by university professors and readers, and college lecturers: and in most cases granting degrees in law, or making law, or some portion of law, a necessary or optional subject for a degree. Many of the university teachers are amongst the foremost authorities in the profession on the subjects which they expound. They, together with the lecturers of the inns of court and the Law Society, have formed a Society of the Public Teachers of Law, which meets annually to discuss subjects of common interest, and publishes a journal.

No one can doubt that present teaching, based on deep research and moved by real enthusiasm, is producing valuable results. There is in existence an extensive system of education, academic and vocational. It is distributed over England, the bulk of the vocational teaching having its seat in London. For the most part it is thorough and scientific. The results are in practice satisfactory. There is no reason to suppose that the administration of the law falls below the highest standards of other countries, either in professional argument or judicial exposition. The control of the teaching is, however, vested in various independent bodies, academic and professional. There is no direct co-ordination. There have always been persons, highly qualified to form an opinion, who have desired to see a great school of law arise in London, either affiliated to the existing University of London or forming an independent legal university, to which the lawyers of the empire and others might resort for instruction and research. Such a school, it is thought, might eventually regulate the admission to the profession in its various branches. and possibly give vocational teaching a more scientific bias. It is a fine ideal and may in the future be attained. One of the practical difficulties is to allay the natural suspicions of the professional bodies who now control entrance to their own profession, and are anxious not to have their own effective practical standards depreciated. Another difficulty is raised by the inevitable questions of money and site.

Probably a step in the direction of this ideal, which would meet with little opposition, would be improved co-ordination of the teaching faculties given by university and professional bodies, and an extension of existing faculties so as to assist oversea lawyers both in instruction and research. Should legal education be confined, as it practically is now, to students who intend in one form or another to practise the profession of the law? This is too large a subject to be discussed in this article. There are some who hold that it would be to the public advantage that some knowledge of legal principles should form part of a general liberal education as it did in England in the 14th and 15th centuries. The education of a citizen, it is thought, should include some knowledge of the law which holds the State together and governs all his relations with it. Suspicion of the law as a mysterious and unintelligible force would be dispelled. Elementary difficulties in the affairs of life: in dealing with servants, making contracts and disposing of property, might be avoided. Some steps in this direction are being taken by the University of London which has made elementary law an optional subject in some of its Arts courses. There appears to be a wide field for an extension of legal education in this direction.

THE UNITED STATES

American legal education begins in 1784 (or perhaps 1782), when Judge Tapping Reeve of Litchfield, Conn., set up the first school for the teaching of the common law.

Early History.—There had been no legal profession in the colonies until the 18th century. Before the revolution a certain number of lawyers had received their training in England, in the inns of court. But a system of courts, manned by lawyers and requiring a trained profession to practise before them, was not called for by the economic condition of the colonies until toward the middle of that century; nor were the executive and legislative justice, characteristic of the colonial polity, wholly superseded by judicial justice until after the revolution. Legal education was at a low ebb in 18th century England. The universities had never taught the law of the land. The mediaeval system of the Inns of Court had decayed, and the system that now obtains had not been set up. Hence there were no good models at hand after the revolution, and American legal education had to develop its own methods. So far as the models were English, they were, first, the purely apprentice training of the lower branch of the profession in England (for in general the United States took the attorney or solicitor for its type, rather than the barrister), and, second, the academic lectures on the law of the land which began with Blackstone's lectures as Vinerian professor at Oxford. This example was followed eagerly in America. Wythe's lectures at William and Mary (1779), Wilson's at the College of Philadelphia, now the University of Pennsylvania (1790), Kent's at Columbia (1793) and Parker's at Harvard (1815) were of this type. They were not instruction in law to prospective lawyers so much as lectures to young gentlemen as part of their general cultural training. Later this plan of academic lectures upon law was grafted upon the apprentice training which was the first type of legal education in America.

After the Revolution, students ceased to go from America to the inns of court. Then education for the bar became distinctly American. Beginning from this point, three stages of development may be distinguished. These stages correspond to three periods in American legal history. The method of each stage is a response to the needs of the period in which it grew up.

Apprentice Training.—First, there is a stage of apprentice training, either in the office of a practising lawyer or in a law school organized as an expanded law office and applying office methods of instruction. This sort of training sufficed for the needs of the time immediately after the Revolution. The development of judicial justice administered in courts by trained judges called for practitioners who knew the lawyer's craft. When the United States took over English law as the law of its several commonwealths, in the first instance it took over English legal procedure. Except for land law, at the time of the Revolution the greater part of English law was expressed in terms of procedure. Thus there was need of lawyers who knew how to bring a lawsuit and how to conduct it through the courts. Apprentice training was adapted to this need. Judge Reeve's law school grew out of the practice of taking a number of students into a country law office where the press of business did not interfere with instruction. Just because it grew out of such a law office, the exact date of establishment of the school at Litchfield cannot be fixed.

The law schools of the period were modelled on that institution. In effect, they were but expanded law offices in which preceptors who were practising lawyers carried on the teaching side of the law office as their chief activity. Such was the Harvard law school, the oldest of the existing law schools in the United States, in its first stage (1817–29).

At this time there was little differentiation of local law. But the whole tendency of the apprentice training was to dwell upon the local and temporary rather than the universal and enduring

elements in the body of legal materials, and this unfortunate feature served to develop and entrench many provincialisms in the law of the several States, since, until, much later, the bulk of the profession was apprentice trained. In general the first stage prevailed until Joseph Story began to teach law at Harvard (1829). Also in many parts of the country the simpler needs of a rural or even pioneer society required nothing more than an apprentice-trained profession, so that the method of that stage has persisted in many localities into the present.

College Teaching.—A second stage begins with the appointment of Story as Dane professor at Harvard, and extends until the epoch-making work of Langdell after 1870. There was nothing in the way of a rule-of-thumb apprentice training, which, under 19th-century conditions, could be done better in a law school than in a law office. But with the growth of the law something more than a rule-of-thumb training in practice was required, and the second stage of legal education was a response. From Story to Langdell the law schools continually increased in influence. The accepted mode of training came to be study in a law school in which law was taught by lectures and from text-books with the teaching apparatus of the old-time college.

The era of expansion that followed the adoption of the Constitution called for creative juristic activity and creative legislation. Study of substantive law was called for. It was necessary to investigate each item of the common law of England with reference to its applicability to the conditions in the New World. The traditional materials of 17th-century English law had to be reshaped so as to make of them a common law for America. A mere apprentice training could not meet these demands. Text-books had to be written to guide the courts in the new departments of law, which were formative on every hand. These text-books came from the law schools and soon gained the upper hand as the bases of instruction, even where the whole spirit of instruction remained that of the first stage. The best examples of the second stage are the teaching of Story and Greenleaf, and later of Parsons, Washburn and Parker at Harvard, the teaching of Dwight at Columbia, and of Cooley and his colleagues at Michigan.

Scientific Study of Jurisprudence.—In a third stage there is scientific study of the legal system of English-speaking countries on the basis of the sources. An analytical and a historical method, as methods of a general science of law, are applied to the sources, and thus system is put into each branch and department of the law. By the time of the Civil War the formative period of American law and legal institutions was substantially at an end. With few exceptions, the great text-books that had guided the courts speak from before the Civil War In the last quarter of the 19th century, law books tend more and more to be mere indexes to the decisions: they cease to be creative. The need of the time had come to be in another direction.

Now there was need of systematizing the law which had developed in the period of growth. In response to this demand, within less than a decade after the end of the Civil War, Langdell, who was appointed to Story's chair at Harvard in 1870, had inaugurated the method of study from adjudicated cases which has come to prevail in the majority of American law schools of high grade. This method seeks, through analytical and historical study of the sources, to give a grasp of the traditional art of deciding cases on the basis of reported judicial experience. It teaches the traditional art of developing grounds of decision from the authoritative legal materials. This is the enduring element in Anglo-American law. Conditions in many localities, in which requirements for admission to the bar are low, and candidates have insufficient preliminary training to enable them to study the sources directly, have led to persistence of the method of lectures and text-book instruction in schools in which the teachers are actively engaged in practice, and hence the spirit is that of apprentice training. In such schools local law and procedure are chiefly stressed. Probably 60% of those who come to the bar to-day are trained in such schools.

Perhaps it is too soon to speak with assurance, but there are signs of a fourth stage, called for by the economic unification of the country, if not of the world, the growing importance of comparative law, and the increasing need of creative lawmaking and consequent demand for something more than the analytical and historical methods of the last half of the 19th century. Research professorships and research institutes are being set up in a number of university law schools, and an institute established at Johns Hopkins in 1928 plans to train writers, legal thinkers and law-makers rather than practising lawyers. Meanwhile the American Bar Association is pushing steadily for the requirements as to preliminary education and the scientific training developed in the third stage. (R. Po.)

LE GALLIENNE, RICHARD (1866–), English poet and critic, was born in Liverpool on Jan. 20, 1866. In 1889, he published *Volumes in Folio, The Book Bills of Narcissus* and *George Meredith: some Characteristics* (new ed., 1900). He is best known by the fantastic prose essays and sketches of *Prose Fancies* (2 series, 1894–1896), *Sleeping Beauty and other Prose Fancies* (1900), *The Religion of a Literary Man* (1893), *The Quest of the Golden Girl* (1897), *The Life Romantic* (1901), etc. Among his more recent works are *Pieces of Eight* (1919), and *The Junk Man and Other Poems* (1921). Subsequently he took up his residence in the United States.

LEGAL TENDER, a tender or offer, particularly of money, in satisfaction of a liability or debt and in accord with the proper legal requirements. *See* TENDER and PAYMENT.

LEGARÉ, HUGH SWINTON (1797–1843), American lawyer and statesman, was born in Charleston, S C., on Jan. 2, 1797. Before he was five he developed a permanent deformity (by which the growth and development of his legs was arrested) due to vaccine poisoning. In 1814 he graduated at the College of South Carolina He studied law for three years in South Carolina, and then spent two years abroad, studying French and Italian in Paris and jurisprudence at Edinburgh. In 1820–22 and in 1824–30 he was a member of the South Carolina legislature. In 1827, with Stephen Elliott (1771–1830), the naturalist, he founded the *Southern Review,* of which he was the sole editor after Elliott's death until 1834, when it was discontinued. In 1830–32 he was attorney-general of South Carolina, and, although a State's rights man, he strongly opposed nullification. At an appearance before the U S Supreme Court, his knowledge of civil law so strongly impressed Edward Livingston, the secretary of State, that he urged Legaré to devote himself to the study of this subject with the hope that he might influence American law toward the philosophy and even the forms and processes of Roman jurisprudence. Through Livingston, Legaré was appointed American chargé d'affaires at Brussels, where he perfected himself in civil law and the German commentaries on civil law In 1837–39, as a Union Democrat, he was a member of the National House of Representatives, and there ably opposed Van Buren's financial policy in spite of the enthusiasm in South Carolina for the subtreasury project. He supported Harrison in the presidential campaign of 1840, and when the cabinet was reconstructed by Tyler in 1841, Legaré was appointed attorney-general of the United States. On May 9, 1843, he was appointed secretary of State *ad interim,* after the resignation of Daniel Webster. On June 20, 1843, he died suddenly at Boston. As attorney-general he argued the famous cases, *The United States* v. *Miranda, Wood* v. *The United States,* and *Jewell* v. *Jewell.*

See *The Writings of Hugh Swinton Legaré* (2 vols., Charleston, S C., 1846), edited by his sister, Mrs. Mary Bullen, with a biographical sketch; and two articles by B. J. Ramage in *The Sewanee Review,* vol. x. (1902).

LEGAS, a Shangalla tribe, of a pure type of the Galla race. They occupy the upper Yabus valley, south-west Abyssinia, near the Sudan frontier. They are of very light complexion, tall and thin, with narrow hollow-cheeked faces, small heads and high foreheads. The chiefs' families are often of mixed blood, with perceptible Negro strain. They are a peaceful race, kind to their women and slaves, and energetic agriculturists. Mohammedanism has gained many converts among them.

LEGATE, BARTHOLOMEW (*c.* 1575–1612), English fanatic, was born in Essex and became a dealer in cloth. About the

beginning of the 17th century he became a preacher among a sect called the "Seekers," and appears to have held unorthodox opinions about the divinity of Jesus Christ. Together with his brother Thomas he was put in prison for heresy in 1611. Thomas died in Newgate gaol, London, but Bartholomew's imprisonment was not a rigorous one. James I. argued with him, and on several occasions he was brought before the Consistory Court of London, but without any definite result. Eventually Legate was tried before a full Consistory Court in Feb. 1612, and found guilty of heresy. He was burned to death at Smithfield on March 18, 1612. Legate was the last person burned in London for his religious opinions.

See T. Fuller, *Church History of Britain* (1655); and S. R. Gardiner, *History of England*, vol. ii. (1904).

LEGATE, a title now generally confined to the highest class of diplomatic representatives of the pope, though still occasionally used, in its original Latin sense, of any ambassador or diplomatic agent. According to the *Nova Compilatio Decretalium* of Gregory IX., under the title "De officio legati" the canon law recognizes two sorts of legate, the *legatus natus* and the *legatus datus* or *missus*. The *legatus datus* (*missus*) may be either (1) *delegatus*, or (2) *nuncius apostolicus*, or (3) *legatus a latere* (*lateralis, collateralis*). The rights of the *legatus natus* formerly included concurrent jurisdiction with that of all the bishops within his province. The commission of the *legatus delegatus* (generally a member of the local clergy) is of a limited nature, and relates only to some definite piece of work. The *legatus a latere* (almost invariably a cardinal, though the power can be conferred on other prelates) is in the fullest sense the plenipotentiary representative of the pope. He has the power of suspending all the bishops in his province, and no judicial cases are reserved from his judgment. Without special mandate, however, he cannot depose bishops or unite or separate bishoprics. At present *legati a latere* are not sent by the holy see, but diplomatic relations, where they exist, are maintained by means of nuncios, internuncios and other agents.

The history of the office of papal legate is closely involved with that of the papacy itself. If it were proved that papal legates exercised the prerogatives of the primacy in the early councils, it would be one of the strongest points of the Roman Catholic view of the papal history. Thus it is claimed that Hosius of Cordova presided over the council of Nicaea (325) in the name of the pope But the claim rests on slender evidence, it is even open to dispute whether Hosius was president at Nicaea, and though he certainly presided over the council of Sardica in 343, it was probably as representative of the emperors Constans and Constantius, who had summoned the council. Instances of delegation of the papal authority in various degrees become numerous in the 5th century, especially during the pontificate of Leo I. Vicarial or legatine powers had been conferred in 418 by Zosimus upon Patroclus, bishop of Arles. In 449 Leo was represented at the "Robber Synod," from which his legates hardly escaped with life; at Chalcedon, in 451, they were treated with singular honour, though the imperial commissioners presided. Another sort of delegation is exemplified in Leo's letter to the African bishops (*Ep.* 12), in which he sends Potentius, with instructions to inquire in his name, and to report. Augustine of Canterbury is sometimes spoken of as legate, but it does not appear that in his case this title was used in any strictly technical sense, although the archbishop of Canterbury afterwards attained the permanent dignity of a *legatus natus*. Boniface, the apostle of Germany, was in like manner constituted, according to Hincmar (*Ep.* 30), a legate of the apostolic see by Popes Gregory II. and Gregory III. According to Hefele (*Conc.* iv. 239), Rodoald of Porto and Zecharias of Anagni, who were sent by Pope Nicolas to Constantinople in 860, were the first actually called *legati a latere*. The policy of Gregory VII. naturally led to a great development of the legatine as distinguished from the ordinary episcopal function. From the creation of the mediaeval papal monarchy until the close of the middle ages, the papal legate played a most important rôle in national as well as church history. The further definition of his powers proceeded throughout the 12th and 13th centuries. From the 16th century legates *a latere* give way almost entirely to nuncios (*q.v.*).

See P. Hinschius, *Kirchenrecht*, i., 498 ff.; G. Phillips, *Kirchenrecht*, vol. vi., 680 ff.

LEGATION, a diplomatic mission of the second rank. The term is also applied to the minister's residence and its precincts. (*See* AMBASSADORS; DIPLOMACY.)

LEGATO, a musical term signifying smoothness or evenness of performance, a passage so marked being intended to be played or sung in as connected a manner as possible.

LEGENDRE, ADRIEN MARIE (1752–1833), French mathematician, was born on Sept. 18, 1752. He was brought up at Paris, where he completed his studies at the *Collège Mazarin*. His first published writings consist of articles forming part of the *Traité de mécanique* (1774) of the Abbé Marie, who was his professor; Legendre's name, however, is not mentioned. Soon afterwards he was appointed professor of mathematics in the *École Militaire* at Paris, and he was afterwards professor in the *École Normale*. In 1782 he received the prize from the Berlin Academy for his "Dissertation sur la question de balistique," a memoir relating to the paths of projectiles in resisting media. He also, about this time, wrote his "Recherches sur la figure des planètes," published in the *Mémoires* of the French Academy, of which he was elected a member in succession to J. le Rond d'Alembert in 1783. He was a commissioner for connecting geodetically Paris and Greenwich, his colleagues being P. F. A. Méchain and C. F. Cassini de Thury; General William Roy conducted the operations on behalf of England. During the revolutionary period he served on various scientific commissions. He also collaborated in drawing up French tables of logarithms of numbers, sines and tangents, and natural sines, called the *Tables du Cadastre*. (*See* LOGARITHMS.) The subject with which Legendre's name is most closely connected is elliptic functions, his researches extending over more than forty years. The last of the three supplements to his *Traité des fonctions elliptiques* was published in 1832. He died at Paris on Jan. 10, 1833, and the discourse at his grave was pronounced by Poisson.

Writings.—*Elliptic Functions.*—His first published writings upon the subject consist of two papers in the *Mémoires de l'Académie Française* for 1786 upon elliptic arcs. In 1792 he presented to the Academy a memoir on elliptic transcendents. The contents of these memoirs are included in the first volume of his *Exercices de calcul intégral* (1811). The third volume (1816) contains the very elaborate and now well-known tables of the elliptic integrals which were calculated by Legendre himself, with an account of the mode of their construction. In 1827 appeared the *Traité des fonctions elliptiques* (2 vols., 1825, 1826). Three supplements, relating to the researches of Abel and C. G. J. Jacobi, were published in 1828–1832, and form a third volume. Legendre had pursued the subject of elliptic integrals alone from 1786 to 1827, the results of his labours having been almost entirely neglected by his contemporaries, but his work had scarcely appeared in 1827 when the discoveries which were independently made by the two young and as yet unknown mathematicians Abel and Jacobi placed the subject on a new basis, and revolutionized it completely. The readiness with which Legendre, who was then seventy-six years of age, welcomed these important researches, that quite overshadowed his own, and included them in successive supplements to his work, does the highest honour to him. (*See* FUNCTION.) Legendre also made important researches in gamma functions.

Theory of Numbers.—Legendre's *Théorie des nombres* and Gauss's *Disquisitiones arithmeticae* (1801) are still standard works upon this subject. The first edition of the former appeared in 1798 under the title *Essai sur la théorie des nombres;* there was a second edition in 1808; a first supplement was published in 1816, and a second in 1825. The third edition, under the title *Théorie des nombres,* appeared in 1830 in two volumes. To Legendre is due the theorem known as the law of quadratic reciprocity, the most important general result in the science of numbers which has been discovered since the time of Fermat, and which was called by Gauss the "gem of arithmetic." It was first given by Legendre in the *Mémoires* of the Academy for 1785, but the accompanying demonstration was incomplete. (*See* NUMBER.)

Attractions of Ellipsoids.—Legendre was the author of four important memoirs on this subject. In the first of these, entitled "Recherches sur l'attraction des sphéroides homogènes," published in the *Mémoires* of the Academy for 1785, Legendre introduces the celebrated expressions which, though frequently called Laplace's coefficients, are more correctly named after Legendre. Legendre shows that Maclaurin's theorem with respect to confocal ellipsoids is true for any position of the external point when the ellipsoids are solids of revolution. (*See* Todhunter's *History of the Mathematical Theories of Attraction and the Figure of the Earth* [1873], the twentieth, twenty-second, twenty-fourth and twenty-fifth chapters of which contain a full and complete account of Legendre's four memoirs. *See* also SPHERICAL HARMONICS.)

Geodesy.—Besides the work upon the geodetical operations connecting Paris and Greenwich, of which Legendre was one of the authors, he published in the *Mémoires de l'Académie* for 1787 two papers on trigonometrical operations depending upon the figure of the earth, containing many theorems relating to this subject. The best known of these, which is called Legendre's theorem, is usually given in treatises on spherical trigonometry.

Method of Least Squares.—In 1806 appeared Legendre's *Nouvelles Méthodes pour la détermination des orbites des comètes*, which is memorable as containing the first published suggestion of the method of least squares. (*See* PROBABILITY.)

The Elements of Geometry.—Legendre's name is widely known on account of his *Eléments de géométrie*. It first appeared in 1794, and went through very many editions, and has been translated into almost all languages. An English translation, by Sir David Brewster, from the eleventh French edition, was published in 1823. In one of the notes Legendre gives a proof of the irrationality of π. This had been first proved by J. H Lambert in the Berlin *Memoirs* for 1768 Legendre's proof is similar in principle to Lambert's, but much simpler. On account of the objections urged against the treatment of parallels in this work, Legendre was induced to publish in 1803 his *Nouvelle Théorie des parallèles*.

An account of the principal works of Legendre is given in the *Bibliothèque universelle de Genève* for 1833, pp 45–82.

See Élie de Beaumont, "Memoir de Legendre," translated by C. A. Alexander, *Smithsonian Report* (1874).

LEGENDRE, LOUIS (1752–1797), French revolutionary, was born at Versailles on May 22, 1752. He kept a butcher's shop in Paris He was an ardent supporter of the Revolution, a member of the Jacobin club, and one of the founders of the club of the Cordeliers. Though of uneducated speech, he was gifted with a genuine eloquence He was prominent in the taking of the Bastille (July 14, 1789), the massacre of the Champ de Mars (July 1791) and the attack on the Tuileries (Aug. 10, 1792). In the Convention, he voted for the death of Louis XVI, and was sent on a mission to Lyons (Feb. 27, 1793) before the revolt of that town. He was a member of the *Comité de Sûreté Générale*, and contributed to the downfall of the Girondists. When Danton was arrested, Legendre at first defended him, but was intimidated by Robespierre. After the fall of Robespierre, Legendre took part in the reactionary movement, undertook the closing of the Jacobin club, was elected president of the Convention, and helped to bring about the impeachment of J. B. Carrier, the perpetrator of the *noyades* of Nantes. He was subsequently elected a member of the Council of Ancients, and died on Dec. 13, 1797

LEGENDRE COEFFICIENT AND FUNCTION: *see* SPHERICAL HARMONICS.

LEGERDEMAIN: *see* CONJURING.

LEGGE (afterwards BILSON-LEGGE), **HENRY** (1708–1764), English statesman, son of William Legge, 1st earl of Dartmouth (1672–1750), was born on May 29, 1708. He became private secretary to Sir Robert Walpole, and in 1739 was appointed secretary of Ireland, and subsequently held other offices. Although his conduct as envoy extraordinary to Frederick the Great (1748) earned the king's displeasure, he was made treasurer of the Navy on his return to England, and in 1754 he became chancellor of the Exchequer in the Newcastle ministry. His adherence to Pitt's policy secured his dismissal in Nov. 1756, but 12 months later he returned to his post, which he held till April 1757. On Pitt's return to office in the following July, Legge again became chancellor of the Exchequer, in which position he imposed new taxes on houses and windows. He was dismissed in March 1761 but continued to take part in parliamentary debates until his death on Aug. 23, 1764.

See John Butler, Bishop of Hereford, *Some account of the character of the late Rt. Hon. H. Bilson Legge* (1785).

LEGGE, JAMES (1815–1897), British Chinese scholar, born at Huntly, Aberdeenshire, was educated at King's college, Aberdeen, and at Highbury Theological college, London. In 1839 he started for China, where he was to undertake missionary work, but, as the country was not yet open to Europeans, he remained for three years teaching in the Anglo-Chinese college at Malacca, until it was removed to Hongkong. There he lived for 30 years, and began his monumental edition of the *Chinese Classics* with translation, prolegomena and notes (1861–86; new ed., 1893). In 1876 a chair of Chinese languages and literature was constituted at Oxford for his occupation. He died at Oxford on Nov. 29, 1897.

LEGHORN, city of Tuscany, Italy (Ital. *Livorno*, Fr. *Livourne*), chief town of the province of the same name, which consists of the commune of Leghorn and the islands of Elba and Gorgona. The town is the seat of a bishopric and of a large naval academy—the only one in Italy—and the third largest commercial port in the kingdom, situated on the west coast, 12 m. southwest of Pisa by rail, 10 ft. above sea-level. Pop (1921) 105,722 (town), 114,809 (commune). It is built along the seashore upon a healthy and fertile tract of land, an oasis in a zone of Maremma. Behind is a range of hills, the most conspicuous of which, the Monte Nero, is crowned by a frequented pilgrimage church and also by villas and hotels, to which a funicular railway runs. The town itself is almost entirely modern (an extension of the older pentagonal town, entirely surrounded by canals). The Fortezza Vecchia (1521–34), guarding the harbour, is picturesque Incorporated in it is a massive round tower, attributed to Matilda of Tuscany (*q.v.*), but by others thought to be of the 9th or 10th century. The Fortezza Nuova (1590) on the east side of the old town was erected under Ferdinand I, whose fine bronze statue, with four barbarian slaves round the pedestal, stands near the old harbour. The lofty Torre del Marzocco, erected in 1421 by the Florentines, is fine. The façade of the cathedral was designed by Inigo Jones. The old Protestant cemetery contains the tombs of Tobias Smollett (d. 1771) and Francis Horner (d. 1817), and a large number of other British graves, the trading community having formerly been of considerable importance: but the "factory" was closed in 1825. At the Villa Valsovano Shelley wrote the greater part of the *Cenci* in 1819. There is also a large synagogue founded in 1581. The exchange, the chamber of commerce and the clearing-house (one of the oldest in the world, dating from 1764) are united under one roof in the Palazzo del Commercio, opened in 1907. Many streets have been widened, and the road along the shore has been transformed into a shady promenade. Leghorn is the principal sea-bathing resort in this part of Italy, the season lasting from the end of June to the end of August. A spa for the use of the saline waters known as Acque della Salute has been constructed. Leghorn is on the main line from Pisa to Rome; a branch line runs to Colle Salvetti The harbour is protected by a breakwater nearly $\frac{3}{4}$ m. long The imports consist principally of machinery, coal, grain, dried fish, tobacco, wool and hides, and the exports of hemp, hides, olive oil, soap, coral, candied fruit, wine, straw hats, boracic acid, mercury and marble and alabaster. In 1926, 3,184 vessels of 2,824,548 tons entered the port, and disembarked 7,049 passengers and 1,479,874 tons of merchandise; the tonnage of those clearing it was practically identical, but only 3,462 passengers and 382,015 tons of merchandise were embarked. The older shipyards have been extended, and shipbuilding is carried on, especially by the Orlando yard which builds large ships for the Italian navy, while new industries—namely, glass-making and copper and brass-founding, electric power works, a cement factory, soap works, porcelain factories, flour-mills, oil-mills, a cotton yarn spinning factory, electric plant works, a ship-breaking yard, a motorboat yard, etc.—have

been established. Other important firms, Tuscan wine-growers, oil-growers, timber traders, colour manufacturers, etc., have head offices and stores at Leghorn, with a view to export. Coral is also worked here.

The earliest mention of Leghorn occurs in a document of 891, relating to the first church here; in 1017 it is called a castle. In the 13th century the Pisans tried to attract a population to the spot and built the lighthouse (1303–05), in the 14th Leghorn became a rival of Porto Pisano at the mouth of the Arno, which it was destined ultimately to supplant. Urban V. and Gregory XI. landed at Leghorn on their return from Avignon. Charles VI. of France sold it for 26,000 ducats to the Genoese (1407) from whom the Florentines purchased it in 1421. In 1496 the city made a successful defence against Maximilian and his allies, but was still small; in 1551 there were only 749 inhabitants. With the rise of the Medici came a rapid increase of prosperity; Cosmo, Francis and Ferdinand erected fortifications and harbour works, warehouses and churches with equal liberality, and the last especially gave a stimulus to trade by inviting "men of the East and the West, Spaniards and Portuguese, Greeks, Germans, Italians, Hebrews, Turks, Moors, Armenians, Persians and others," to settle and traffic in the city, as it became in 1606 Declared free and neutral in 1691, Leghorn was permanently invested with these privileges by the Quadruple Alliance in 1718; but in 1796 Napoleon seized all the hostile vessels in its port. It ceased to be a free city by the law of 1868. (T. A.)

See Pietro Vigo, *Livorno* (Bergamo, n.d.).

LEGIEN, CARL (1861–1920), German labour leader, was born on Dec. 1, 1861, in Marienburg, West Prussia. A turner by trade, he became in 1887 president of the turners' trade union, and from 1891 onwards was chairman of the general committee of the German federation of trade unions and editor of their *Korrespondenzblatt*. He took a prominent part in 1901 at the Copenhagen Congress which led to the foundation of the International Federation of Trade Unions. He was secretary of this body from 1903 till 1919. He was a strong supporter of the German Government during the World War, and after the war, in conjunction with Liepart, aided in founding the *Arbeitsgemeinschaft*, an organization intended to rebuild German industry in co-operation with the employers. He died in Berlin on Dec. 26, 1920. Legien wrote many works on trade-union questions, including *Die deutsche Gewerkschaftsbewegung* (1911).

LEGION, in early Rome, the levy of citizens marching out *en masse* to war (Lat. *legio*), like the citizen-army of any other primitive state. As Rome came to need more than one army at once and warfare grew more complex, *legio* came to denote a unit of 4,000–6,000 heavy infantry (including, however, at first some light infantry and at various times a handful of cavalry) who were by political status Roman citizens and were distinct from the "allies," *auxilia*, and other troops of the second class. The legionaries were regarded as the best and most characteristic Roman soldiers, the most trustworthy and truly Roman; they enjoyed better pay and conditions of service than the "auxiliaries." In A.D. 14 (death of Augustus) there were 25 such legions; later the number was slightly increased; finally about A.D. 290 Diocletian reduced the size and greatly increased the number of the legions. Throughout, the dominant features of the legions were heavy infantry and Roman citizenship. They lost their importance when the Barbarian invasions altered the character of ancient warfare and made cavalry a more important arm than infantry, in the late 3rd and 4th centuries A.D. (*see* further ROMAN ARMY). In the middle ages the word "legion" seems not to have been used as a technical term. In modern times it has been employed for organizations of an unusual or exceptional character, such as a corps of foreign volunteers or mercenaries. Perhaps the earliest example of this was the Provincial Legions formed in France by Francis I. (*see* INFANTRY). Napoleon, in accordance with this precedent, employed the word to designate the second-line formations which he maintained in France and which supplied the Grande Armée with drafts. The term "foreign legion" is often used for irregular volunteer corps of foreign sympathizers raised by states at war, often by smaller states fighting for independence. Unlike most foreign legions the "British Legion" which, raised in Great Britain and commanded by Sir de Lacy Evans (*q.v.*), fought in the Carlist wars, was a regularly enlisted and paid force. The term "Foreign Legion" is colloquially but incorrectly applied to-day to the *Régiments étrangers* in the French service, which are composed of adventurous spirits of all nationalities and have been employed in many arduous colonial campaigns.

The most famous of the corps that have borne the name of legion in modern times was the King's German Legion (see *Beamish's* history of the corps). The electorate of Hanover being in 1803 threatened by Napoleon, and no effective resistance being considered possible, the British government wished to take the greater part of the Hanoverian army into its service. But the acceptance by the Hanoverian government of this offer was delayed until too late, and it was only after the French had entered the country and the army as a unit had been disbanded that the formation of the "King's German Regiment," as it was at first called, was begun in England. This enlisted not only ex-Hanoverian soldiers, but other Germans as well. In January 1805 it had become a corps of all arms with the title of King's German Legion, comprising a dragoon and a hussar regiment, five batteries, two light and four line battalions and an engineer section, all these being afterwards increased. It served in many of the campaigns of the Napoleonic wars but its title to fame is its part in the Peninsular War, in which from first to last it was an acknowledged *corps d'élite*—its cavalry especially, whose services both on reconnaissance and in battle were of the highest value. The exploit of the two dragoon regiments of the Legion at Garcia Hernandez after the battle of Salamanca, where they charged and broke up two French infantry squares and captured some 1,400 prisoners, is one of the most notable incidents in the history of the cavalry arm. A general officer of the Legion, Charles Alten (*q.v.*), commanded the British Light Division in the latter part of the war. The Legion was rarely engaged as a unit, but was considered rather as a small army of the British type, most of which served abroad by regiments and battalions while a small portion and depot units were at home, the total numbers under arms being about 25,000. In 1815 the period of service of the corps had almost expired when Napoleon returned from Elba, but its members voluntarily offered to prolong their service. It lost heavily at Waterloo, in which Baring's battalion of the light infantry distinguished itself by its gallant defence of La Haye Sainte. The strength of the Legion at the time of its disbandment was 1,100 officers and 23,500 men. A short-lived "King's German Legion" was raised by the British government for service in the Crimean War. Certain Hanoverian regiments of the modern German army have kept up and embodied the traditions of units of the Legion, carrying Peninsular battle-honours on their standards and colours.

LEGITIM or **BAIRNS' PART,** in Scots law, the share of the moveable property of a parent which on his or her death vests against his or her will, in his or her unforisfamiliated children. If a father dies leaving a widow and children, the moveable property is divided into three equal parts; one-third part is legitim and is divided equally among the children, although they may be of different marriages (the issue of predeceased children do not share); another third goes to the widow as her *jus relictae*, and the remaining third, called "dead's part," is divisible among the children (and the issue of predeceasers of them) as intestate succession, or it may be disposed of by the father by will as he pleases. Should the father leave no widow, one-half of the moveable estate is legitim and one-half dead's part. Legitim is also due by statute from a mother's estate which suffers a similar tripartite or bipartite division. The children of a marriage may be effectively forisfamiliated by a clause in an antenuptial marriage contract giving them a provision in lieu of legitim. Any individual child may forisfamiliate himself by accepting a provision in lieu of legitim or by gratuitously renouncing his right to legitim during his parent's life. In questions between unforisfamiliated children claiming to share in the legitim fund equality of division requires that each child should collate advances to account of legitim received during the parent's lifetime. All countries which derive their civil law chiefly from the Roman,

whether directly or indirectly, prevent a parent from willing away more of his property than a fixed proportion.

LEGITIMACY AND LEGITIMATION. Legitimacy is the status of children whose parents are lawfully married. Legitimation is the mode in which such status is acquired by those whose parents were not lawfully married at the time when the children were born. It may be effected either by some special act of the Sovereign, as for example by a private act of parliament, or by the subsequent marriage of the parents after the birth of the children. Legitimation *per subsequens matrimonium* was regularly recognized by the Roman law and, in this respect as in so many others, the canon law, subject to some exceptions and variations, followed the Roman civil law in principle. The rule that the subsequent marriage of the parents of illegitimate children gives such children the status of legitimacy was also adopted in most countries which had legal systems based on the civil law. On the continent, in Scotland and in some States of America it was recognized but it might be subject to the exception that if when a child was born the parents could not have married, *e.g.*, if one of them had a husband or wife then living, that child was not legitimated by the subsequent marriage. In some cases it was considered that if such impediment to marriage existed even when the child was conceived, it could not become legitimate.

In England, on the other hand, legitimation by subsequent marriage was not allowed by the common law. So far back as the parliament of Merton in 1236 a controversy arose on the subject between the church and the barons. The authorities of the church then declared unanimously that by their law the children of parents born out of wedlock had always been considered as legitimate when the parents married afterwards. The lay barons, on the other hand, declared that this was not the law of England and used the often quoted phrase "nolumus leges Angliae mutari." The controversy went on in England for nearly 700 years, until the passing of the Legitimacy Act of 1926, which came into operation on Jan. 1, 1927. By that act, "where the parents of an illegitimate person marry or have married before or after the commencement of this act the marriage shall, if the father of the illegitimate person was or is at the date of the marriage domiciled in England or Wales, render that person, if living, legitimate from the commencement of the act or from the date of the marriage, whichever last happens." This general enactment, however, is subject to the proviso that "nothing therein shall operate to legitimate a person whose father or mother was married to a third person when the illegitimate person was born."

As regards property, the legitimation does not, except as expressly provided by the act, give the legitimated persons any rights, but among the express provisions on the subject are contained statements that such persons shall be entitled to take any interest in the estate of an intestate dying after the date of legitimation, or under any disposition coming into operation after that date. On the other hand, nothing in the act is to affect the succession to any dignity or title of honour. Prior to this act, many of the British colonies or dominions, including New Zealand (1894), South Australia (1898), Queensland (1899), New South Wales (1902) and Victoria (1903), had recognized the principle by special legislation, but generally registration was necessary to make the legitimation effective.

Now that the general principle of legitimation *per subsequens matrimonium*, which had been maintained by the Church for centuries, has been almost universally adopted it is highly desirable that an attempt should be made to put an end to the conflict of laws on matters of detail which still exists between different States. These differences may cause much dispute and hardship, especially as they appear in comparing the laws of different parts of the British empire and also of different States in America.

As regards children born in wedlock, the presumption is that at whatever time after the marriage a child is born that child is to be regarded as lawfully begotten by the husband. "Pater est quem nuptiae demonstrant." This rule, however, may be rebutted by evidence proving that access had been impossible at any time when in the course of nature the child could have been begotten If, however, intercourse could have taken place, the evidence of neither the husband nor wife is admissible to bastardize a child born in wedlock on the ground that intercourse had not in fact taken place. (*See* the decision of the House of Lords in the case of *Russell* v. *Russell*, 1924, A C. 687, in which the rule was fully discussed.) (A. H.)

United States.—To the general rule that legitimacy is the status of children whose parents are *lawfully married*, there are several notable exceptions in the American law. The laws of 16 States legitimate the issue of void marriages. In the case of bigamous marriages, the children may, nevertheless, be legitimate if one or both of the parties to the bigamous union were without knowledge of its illegality. This is the law in Maine, Massachusetts, District of Columbia, Indiana, Kentucky, Wisconsin, Nebraska, Michigan and New York. However, in Michigan, Nebraska and New York the children are legitimate only in relation to that parent, in the bigamous union, who was legally capable of contracting marriage. Subsequent marriage of the parents of children born out of wedlock is generally recognized in the American law as legitimating such children. This legal rule assumes that both parties to the marriage acknowledge the offspring as their own However, there are other methods by which the status of legitimacy may be attained. Alabama, Georgia, Mississippi, North Carolina and Tennessee authorize legitimation by judicial decree, while in Michigan it can be effected by a written instrument recorded like a deed and in Louisiana by a notarial act. In California, public acknowledgment of an illegitimate child as his own, by the father, and the receiving of it into his family, with the consent of his wife if he is married, establishes the child as legitimate. Similar provisions will be found in the laws of Arizona, Maine, Montana, Oklahoma, North and South Dakota, Nevada and Utah. A statute passed in North Dakota in 1917 declared every child to be the legitimate child of its natural parents with rights of support and education and of inheritance from the parents and their kindred. Another method of legitimating in some States is through the process of legal adoption. One or both parents may legally adopt illegitimate offspring and thus establish full legitimacy.

Several States give, without express legitimation, a right of inheritance to a child in case of acknowledgment by the father Kansas so provides when the father's acknowledgment has been general and notorious, or else in writing. New Mexico has the same provision. Other States permit inheritance where the paternity of the father has been proved during his lifetime. While legitimacy and inheritance are separate and distinct from legal procedures aimed merely at establishing support and maintenance for children born out of wedlock, it is important to note that there is a growing body of American legislation which enlarges the father's duties and responsibilities in the care and upbringing of his illegitimate offspring. The law in Minnesota, for example, provides that upon a legal adjudication of paternity, the father is subject to all the obligations for the care, maintenance and education of the child and to all the penalties for failure to discharge those obligations which would be imposed upon him if the child was his legitimate offspring. The Minnesota statute further provides extensive administrative aids in the enforcement of this law through the State and county public welfare machinery. North Dakota, among other States, has a somewhat similar law. The tendency of modern legislation in this field has been to enlarge the rights of the child born out of wedlock as against the father, and to impose upon the State a definite obligation to assist in the enforcement of those rights, in addition to a general duty of public guardianship and protection for such children.

See Ernst Freund, "Illegitimate Laws of the United States." in *U.S Children's Publication No. 42.* (W. Ho.)

LEGITIMISTS, the name of the party in France which after the revolution of 1830 continued to support the claims of the elder line of the house of Bourbon as the legitimate sovereigns "by divine right." The death of the comte de Chambord in 1883 dissolved the party, only an insignificant remnant, known as the Spanish Whites (*Blancs d'Espagne*), repudiating the act of renun-

ciation of Philip V. of Spain and upholding the rights of the Bourbons of the line of Anjou. The word *légitimiste* (from *légitime,* lawful) was not admitted by the French Academy until 1878; but meanwhile it had spread beyond France, and the English word legitimist is now applied to any supporter of monarchy by hereditary right as against a parliamentary or other title.

LEGNAGO, fortified town of Venetia, Italy, province of Verona, on the Adige, 29 m. by rail E. of Mantua, 52 ft. above sea-level. Pop. (1921) 7,756 (town), 18,657 (commune). Legnago is one of the famous Quadrilateral fortresses The present fortifications (now largely dismantled) were made in 1815, older defences having been destroyed by Napoleon in 1801. The territory is fertile, rice, cereals and sugar being grown. A branch line runs hence to Rovigo and another to Monselice.

LEGNANO, a town of Lombardy, Italy, province of Milan, 17 m N.W. of it by rail, 682 ft. above sea-level Pop (1921) 27,254. The church of S. Magno, built in the style of Bramante by G. Lampugnano (1504–1529), contains an altar-piece by Luini There are also remains of a castle of the Visconti. Legnano is the seat of important cotton (especially cotton finishing) and silk industries, with machine-shops, boiler-works, and dyeing.

Close by, the Lombard League defeated Frederick Barbarossa in 1176. A monument to commemorate the battle was erected on the field in 1876; another by Butti erected in 1900 is in the Piazza Frederico Barbarossa. The battle is of significance in military history as foreshadowing the end of the great era of cavalry supremacy. Frederick, in the spring of 1176, sending for reinforcements from south Germany, planned a determined effort to crush the league of the Guelf cities. With a small body of knights he marched to Como to meet these reinforcements and then sought to regain his headquarters at Pavia by a circuit round the enemy stronghold of Milan. Meanwhile, however, the Milanese had rallied to them large contingents of their allies and, quitting Milan, placed themselves astride Frederick's route. He attacked at once, despite his inferiority of numbers, and his cavalry scattered the Lombard cavalry, then pressing on to attack the infantry mass which lay in rear. But their charge was brought to a standstill by the close-knit ranks of the Milanese pikemen. Their resistance allowed their own cavalry to rally, and these, reinforced by the arrival of a fresh body from Brescia, charged the flank of Frederick's cavalry. Frederick himself was unhorsed, and his troops thereupon broke and fled. The small body of infantry—furnished by the citizen militia of Como—were slaughtered or captured without difficulty. Frederick, however, managed to escape and reach Pavia. On the Lombard side, the battle had given an illustration of the possibilities of a staunch infantry body as a stable pivot to the mobile arm.

LEGOUIS, EMILE (1861–), French scholar, was born at Honfleur on Oct. 31, 1861. Educated at Honfleur and in Paris, after teaching for a year at the Collège d'Avranches, he was made *agrégé d'anglais* in 1885. He was next appointed lecturer at Lyons; and after passing his doctorate in 1896, he became professor at Lyons. In 1904 Legouis was appointed special lecturer in English at the Sorbonne. He is the author of many important critical works on English literature, notably, with L. Cazamian, of the excellent *Histoire de la littérature anglaise* (1924).

Among his publications are *Le Général Michel Beaupuy,* with G. Bussière (1891); *La jeunesse de Wordsworth; Étude sur "Le Prélude,"* crowned by the Académie française (1896); *Shakespeare* (1899); *Morceaux choisis de la littérature anglaise,* with M. Beljame (1905); *Chaucer* (1910), and *Edmund Spenser* (1923). He also collaborated in the translation of Chaucer's *Canterbury Tales,* crowned by the Académie française, 1908.

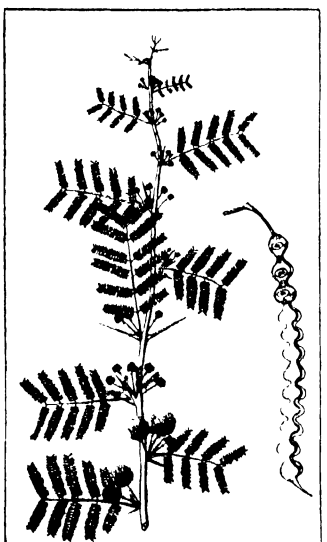
LEGOUVÉ, GABRIEL JEAN BAPTISTE ERNEST WILFRID (1807–1903), French dramatist, born in Paris on Feb. 5, 1807. Legouvé collaborated with A. E. Scribe in *Adrienne Lecouvreur* (1849), in which the title part was created by Rachel. Of the plays which he wrote alone the most famous is *Médée* (1855), which gave Ristori a great part, and led to Legouvé's election to the French Academy. As time passed on, however, he devoted more and more of his energy to lecturing and propaganda on woman's rights and the education of children, in both of which directions he was a pioneer in French society. His *La Femme en France au XIXme siècle* (1864), reissued, much enlarged, in 1878, and his other works, exercised great influence. He was for many years inspector-general of female education.

See his *Soixante ans de Souvenirs* (2 vols., 1886–87).

LEGROS, ALPHONSE (1837–1911), painter and etcher, was born at Dijon on May 8, 1837. In 1851 Legros left for Paris and, passing through Lyons, worked for six months as wall-painter under the decorator Beuchot, who was painting the chapel of Cardinal Bonald in the cathedral. In Paris he studied with Cambon, with Lecoq de Boisbaudran, and at the evening classes of the École des Beaux Arts. He sent two portraits to the Salon of 1857; one was rejected and formed part of the exhibition of protest organized by Bonvin in his studio; the other, which was accepted, was a profile portrait of his father, now in the museum at Tours. In 1859 Legros's "Angelus" was exhibited, the first of those quiet church interiors, with kneeling figures of women, by which he is best known as a painter. "Ex Voto," a work of great power and insight, painted in 1861, is now in the museum at Dijon.

Legros came to England in 1863. He became teacher of etching at the South Kensington school of art, and in 1876 Slade professor at University college, London. He was naturalized as an Englishman in 1881, and remained at University college 17 years. His influence there was exerted to encourage a certain distinction, severity and truth of character in the work of his pupils, with a simple technique and a respect for the traditions of the old masters, until then somewhat foreign to English art. Experiments in all varieties of art work were practised; whenever the professor saw a fine example in the museum, or when a process interested him in a workshop, he never rested until he had mastered the technique and his students were trying their 'prentice hands at it. Legros considered the traditional journey to Italy a very important part of artistic training, and he devoted a part of his salary to augment the income available for a traveling studentship. By his influence on such students of the Slade school as C. W. Furse, William Strang, William Rothenstein and Harrington Mann, English art was again brought into closer touch with the main European tradition, and he contributed not a little to the revival of draughtsmanship in England at the close of the 19th century His later works, after he resigned his professorship in 1892, were more in the free and ardent manner of his early days—imaginative landscapes, castles in Spain, and farms in Burgundy, etchings like the series of "The Triumph of Death," and the sculptured fountains for the gardens of the duke of Portland at Welbeck. He died at Watford on Dec. 8, 1911.

Pictures and drawings by Legros, besides those already mentioned, may be seen in the following museums: "Amende Honorable," "Dead Christ," bronzes, medals and 22 drawings in the Luxembourg, Paris; "Landscape," "Study of a Head," and portraits of Browning, Burne-Jones, Cassel, Huxley and Marshall, also "The Tinker" and six other works from the Ionides collection, at the Victoria and Albert museum, Kensington; "Femmes en prière," National Gallery of British Art; 35 drawings and etchings, the Print Room, British Museum; "Jacob's Dream" and twelve drawings of the antique, Cambridge; "Saint Jerome," two studies of heads and some drawings, Manchester; "The Pilgrimage" and "Study made before the Class," Walker art gallery, Liverpool; "Study of Heads," Peel Park museum, Salford. (C. Ho.; X.)

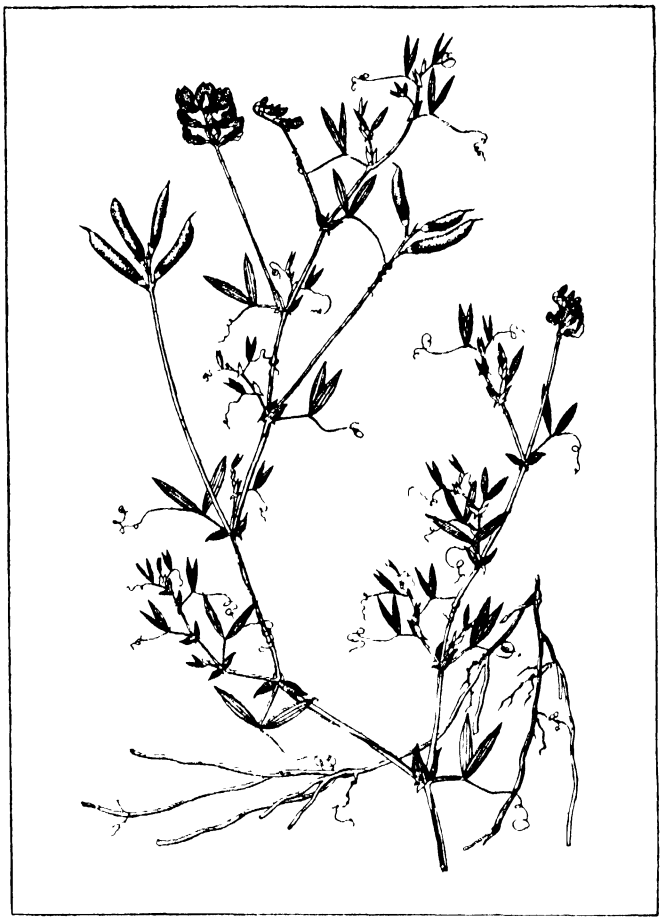


LEGUÍA, AUGUSTO B. (1863–), Peruvian man of affairs, statesman and executive, was born in the department of Lambayeque in 1863. He received his early education in Chile, and served with the Peruvian forces during the War of the Pacific (1879–81). At the end of the war he entered upon a business career, became head of the Latin-American department of the New York Life Insurance Company, and later was intimately connected with other business enterprises and industries. Turning his attention to politics in 1903 he was appointed secretary of the treasury, and in 1908 was elected president of the republic. In May 1909, a revolution in the capital very nearly cost him his life, and foreign complications throughout his term made it a stormy one. After his retirement he was the object of political

persecution and in 1913 was driven into exile. He returned to Peru in 1919 and was again elected president, but before the end of his predecessor's term, being warned that he would be prevented from taking office, he headed a revolt and seized the Government by a *coup d'état*. The following year he secured the passage of a new Constitution embodying several of the principles of the Mexican Constitution of 1917. In 1923 and again in 1927 the Constitution was amended to permit his re-elections. Under Leguía's administration Peru has experienced an era of prosperity. His Government has procured the investment of large sums of foreign capital in the country, and has made notable progress in public works and education, in stimulating industries and exploiting natural resources, in the construction of roads and railways, in the organization of a navy and naval defence (under United States guidance), and especially in reclaiming large tracts of desert land by means of irrigation.

See Graham H. Stuart, *The Governmental System of Peru* (Washington, 1925). (W. B. P.)

LEGUME, a dry pod formed from one carpel, splitting by both the front and the back suture into two similar pieces or valves. It characterizes such leguminous plants as the bean, etc. In an extended sense, but usually in the plural, as legumes, the term is applied to any vegetable used for food (*See* FRUIT; LEGUMINOSAE; PULSE.)



LEGUMINOSAE, the second largest family of seed-plants, containing about 600 genera with 12,000 species. It belongs to the series Rosales of the Dicotyledons, and contains three well-marked subfamilies, Papilionatae, Mimosoideae and Caesalpinioideae. The plants are trees, shrubs or herbs of very various habit. The British representatives, all of which belong to the suborder Papilionatae, include a few shrubs, such as *Ulex* (gorse, furze), *Cytisus* (broom) and *Genista*, but the majority, and this applies to the suborder as a whole, are herbs, such as the clovers, *Medicago, Melilotus*, etc., sometimes climbing by aid of tendrils which are modified leaf-structures, as in *Lathyrus* and the vetches (*Vicia*). Scarlet runner (*Phaseolus multiflorus*) has a herbaceous twining stem. Woody climbers (lianes) are represented by species of *Bauhinia* (Caesalpinioideae), which with their curiously flattened, twisted stems are characteristic features of tropical forests, and *Entada scandens* (Mimosoideae) also common in the tropics. These two suborders, which are confined to the warmer parts of the earth, consist chiefly of trees and shrubs such as *Acacia* and *Mimosa* belonging to the Mimosoideae, and the Judas tree of southern Europe (*Cercis*) and tamarind belonging to the Caesalpinioideae. The so-called acacia of European gardens (*Robinia Pseudacacia*) and laburnum are examples of the tree habit in the Papilionatae. Water plants are rare, but are represented by *Aeschynomene* and *Neptunia*, tropical genera. The roots of many species bear nodular swellings (tubercles), the cells of which contain bacterium-like bodies which have the power of fixing the nitrogen of the atmosphere. Hence the value of these plants as a crop on poor soil or as a member of a series of rotation of crops, since they enrich the soil by the nitrogen liberated by the decay of their roots.

AFTER DR. FLEMING, BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)

FIG. 1.—BABUL (ACACIA ARABICA)

Leaf Forms.—The leaves are alternate in arrangement and generally compound and stipulate. A common form is shown by the clovers, which have three leaflets springing from a common point (digitately trifoliate); pinnate leaves are also frequent as in laburnum and *Robinia*. In Mimosoideae the leaves are generally bipinnate. Rarely are the leaves simple as in *Bauhinia*. Various departures from the usual leaf-type occur in association with adaptations to different functions or environments. In leaf-climbers, such as pea or vetch, the end of the rachis and one or more pairs of leaflets are changed into tendrils. In gorse the leaf is reduced to a slender, spine-like structure, though the leaves of the seedling have one to three leaflets. In many Australian acacias the leaf surface in the adult plant is much reduced, the petiole be-

FROM CURTIS, "FLORA LONDINIENSIS"

FIG. 2.—MEADOW VETCHLING (LATHYRUS PRATENSIS)

ing at the same time flattened and enlarged, and frequently the leaf is reduced to a petiole flattened in the vertical plane; by this means a minimum surface is exposed to the intense sunlight. In the garden pea the stipules are large and foliaceous, replacing the leaflets, which are tendrils; in *Robinia* the stipules are spiny and persist after leaf-fall. In some acacias (*q.v.*) the thorns are hollow, and inhabited by ants as in *A. sphaerocephala*, a Central American plant, and various others. In some species of *Astragalus, Onobrychis* and others, the leaf-stalk persists after the fall of the leaf and becomes hard and spiny.

Leaf-movements occur in many of the genera. Such are the sleep-movement in the clovers, runner bean (*Phaseolus*), *Robinia* and *Acacia*, where the leaflets assume a vertical position at night-fall. Spontaneous movements are exemplified in the telegraph-plant (*Desmodium gyrans*), native of tropical Asia, where the small lateral leaflets move up and down every few minutes. The sensitive plant (*Mimosa pudica*) is an example of movement in response to contact, the leaves assuming a sleep-position if touched. The seat of the movement is the swollen base of the leaf-stalk, the so-called pulvinus.

Flowers and Fruit.—The flowers occur in simple clusters, such as the simple raceme (*Laburnum, Robinia*), which is condensed to a head in *Trifolium;* in *Acacia* and *Mimosa* the flowers are densely crowded. The flower is characterized by a hypogynous or slightly perigynous arrangement of parts, the anterior position of the odd sepal, the free petals, and the single median carpel with a terminal style, simple stigma and two alternating rows of ovules

on the ventral suture of the ovary which faces the back of the flower.

The arrangement of the petals and the number and cohesion of the stamens vary in the three suborders. In Mimosoideae, the smallest of the three, the flower is regular, and the sepals and petals have a valvate aestivation, and are generally pentamerous, but 3-6-merous flowers also occur. The sepals are more or less united into a cup, and the petals sometimes cohere at the base. The stamens vary widely in number and cohesion; in *Acacia* they are indefinite and free, in the tribe *Ingeae*, indefinite and monadelphous, in other tribes as many or twice as many as the petals. Frequently, as in *Mimosa*, the long yellow stamens are the most conspicuous feature of the flower. In Caesalpinioideae the flowers are zygomorphic in a median plane and generally pentamerous The sepals are free, or the two upper ones united as in tamarind, and imbricate in aestivation, rarely as in the Judas tree, valvate. The corolla shows great variety in form; it is imbricate in aestivation, the posterior petal being innermost.

The stamens, generally ten in number, are free, as in *Cercis*, or more or less united, as in *Amherstia*, where the posterior one is free and the rest are united. In tamarind only three stamens are fertile. The largest suborder, Papilionatae, has a flower zygomorphic in the median plane. The five sepals are generally united, and have an ascending imbricate arrangement; the calyx is often two-lipped. The corolla has five unequal petals with a descending imbricate arrangement; the upper and largest, the standard (*vexillum*), stands erect, the lateral pair, the wings or *alae*, are long-clawed, while the anterior pair cohere to form the keel or *carina*, in which are enclosed the stamens and pistil. The ten stamens are monadelphous, as in gorse or broom, or diadelphous, as in sweet pea (the posterior one being free), or almost or quite free; these differences are associated with differences in the methods of pollination. The ten stamens here, as in the last suborder, though arranged in a single whorl, arise in two series, the five opposite the sepals arising first. The carpel is sometimes stalked and often surrounded at the base by a honey-secreting disk; the style is terminal and in the zygomorphic flowers is often curved and somewhat flattened with a definite back and front. Sometimes as in species of *Trifolium* and *Medicago* the ovules are reduced to one. The pod or legume splits along both sutures into a pair of membranous, leathery or sometimes fleshy valves, bearing the seeds on the ventral suture. Dehiscence is often explosive, the valves separating elastically and twisting spirally, thus shooting out the seeds, as in gorse, broom and others. In *Desmodium*, *Entada* and others the pod is constricted between each seed, and breaks up into indehiscent one-seeded parts; it is then called a lomentum; in *Astragalus* it is divided by a longitudinal septum.

The pods show a very great variety in form and size. Thus in the clovers they are a small fraction of an inch, while in the common tropical climber *Entada scandens* they are woody structures more than a yard long and several inches wide. They are generally more or less flattened, but sometimes round and rod-like, as in species of *Cassia*, or are spirally coiled as in *Medicago*. In *Colutea*, the bladder-senna of gardens, the pod forms an inflated bladder which bursts under pressure; it often becomes detached and is blown some distance before bursting. In some cases the hard seed-coat itself is bright-coloured as in the scarlet seeds of *Abrus precatorius*, the so-called weather-plant. In the ground-nut (*Arachis hypogaea*), *Trifolium subterraneum* and others, the flower-stalks grow downwards after fertilization of the ovules and bury the fruit in the earth. In the suborders Mimosoideae and Papilionatae the embryo fills the seed or a small quantity of endosperm occurs, chiefly round the radicle. In Caesalpinioideae endosperm is absent, or present forming a thin layer round the embryo as in the tribe *Bauhinieae*, or copious and cartilaginous as in the *Cassieae*. The embryo has generally flat leaf-like or fleshy cotyledons with a short radicle.

Insects play an important part in the pollination of the flowers. In the two smaller suborders the stamens and stigma are freely exposed and the conspicuous coloured stamens serve as well as the petals to attract insects; in *Mimosa* and *Acacia* the flowers are crowded in conspicuous heads or spikes. The relation of insects to the flower has been carefully studied in the Papilionatae, chiefly in European species. Where honey is present it is secreted on the inside of the base of the stamens and accumulated in the base of the tube formed by the united filaments round the ovary. It is accessible only to insects with long probosces, such as bees. In these cases the posterior stamen is free, allowing access to the honey. The flowers stand more or less horizontally; the large, erect, white or coloured standard renders them conspicuous, the wings form a platform on which the insect rests and the keel encloses the stamens and pistil, protecting them from rain and the attacks of unbidden pollen-eating insects. In his book on the fertilization of flowers, Hermann Müller distinguishes four types of papilionaceous flowers according to the way in which the pollen is applied to the bee (*see* POLLINATION).

Distribution.—The family is cosmopolitan, and often forms a characteristic feature of the vegetation. Mimosoideae and Caesalpinioideae are richly developed in the tropical rain forests, where Papilionoideae are less conspicuous and mostly herbaceous; in sub-tropical forests arborescent forms of all three suborders occur. In the temperate regions, tree-forms are rare—thus Mimosoideae are unrepresented in Europe; Caesalpinioideae are represented by species of *Cercis*, *Gymnocladus* and *Gleditschia;* Papilionoideae by *Robinia;* but herbaceous Papilionatae abound and penetrate to the limit of growth of seed-plants in arctic and high alpine regions. Shrubs and under-shrubs, such as *Ulex*, *Genista*, *Cytisus*, are a characteristic feature in Europe and the Mediterranean area. Acacias are an important component of the evergreen bush-vegetation of Australia, together with genera of the tribe *Podalyrieae* of Papilionatae (*Chorizema*, *Oxylobium*, etc.). *Astragalus*, *Oxytropis*, *Hedysarum*, *Onobrychis* and others are characteristic of the steppe-formations of eastern Europe and western Asia.

The suborder Papilionatae of the family is well represented in Great Britain. Thus *Genista tinctoria* is dyers' greenweed, yielding a yellow dye; *G. anglica* is needle furze; other shrubs are *Ulex* (*U. europaeus*, gorse, furze or whin, *U. nanus*, a dwarf species) and *Cytisus scoparius*, broom. Herbaceous plants are *Ononis spinosa* (rest-harrow), *Medicago* (medick), *Melilotus* (melilot), *Trifolium* (the clovers), *Anthyllis Vulneraria* (kidney-vetch), *Lotus corniculatus* (bird's-foot trefoil), *Astragalus* (milk-vetch), *Vicia* (vetch, tare) and *Lathyrus*.

The most representative genera in the United States are as follows: *Baptisia* (false indigo), *Crotalaria* (rattlebox), *Lupinus* (lupine), *Trifolium* (clover), *Petalostemon* (prairie clover), *Robinia* (locust), *Astragalus* (milk vetch), *Desmodium* (tick trefoil), *Lespedeza* (bush clover), *Vicia* (vetch), *Lathyrus* (everlasting pea), *Gymnocladus* (Kentucky coffeetree), *Gleditsia* (honey locust), *Cassia* (senna), *Cercis* (redbud), *Mimosa* and *Acacia*. The conspicuous genus in the western United States is *Astragalus*, represented by about 275 species.

Economic Importance.—The family is of great economic value, containing many plants that are widely cultivated. The seeds, which are rich in starch and proteins, form valuable foods, as in pea, the various beans, vetch, lentil, ground-nut (*Arachis*) and others; seeds of *Arachis* and others yield oils; those of *Physostigma venenosum*, the Calabar ordeal bean, contain a strong poison. Many are useful fodder-plants, as the clovers (*Trifolium*) (*q.v.*), *Medicago* (e.g., *M. sativa*, lucerne [*q.v.*], or alfalfa); *Melilotus*, *Vicia*, *Onobrychis* (*O. sativa* is sainfoin, *q.v.*); species of *Trifolium*, lupine and others are used as green manure. Many of the tropical trees afford useful timber; *Crotalaria*, *Sesbania*, *Aeschynomene* and others yield fibre; species of *Acacia* and *Astragalus* yield gum; *Copaifera*, *Hymenaea* and others balsams and resins; dyes are obtained from *Genista* (yellow), *Indigofera* (blue) and others (*Haematoxylon campechianum* is logwood); of medicinal value are species of *Cassia* (senna leaves) and *Astragalus;* *Tamarindus indica* is tamarind, *Glycyrrhiza glabra* yields liquorice root. Well-known ornamental trees and shrubs are *Cercis* (*C. Siliquastrum* is the Judas tree), *Gleditschia*, *Genista*, *Cytisus* (broom), *Colutea* (*C. arborescens* is bladder-senna), *Robinia* and *Acacia;* *Wistaria sinensis*, a native of China, is a well-known climbing shrub; *Phaseolus multiflorus* is the scarlet runner; *Lathyrus*

(sweet and everlasting peas), *Lupinus, Galega* (goat's-rue) and others are herbaceous garden plants. *Ceratonia Siliqua* is the carob-tree of the Mediterranean, the pods of which (algaroba or St. John's bread) contain a sweet juicy pulp and are largely used for feeding live stock.

LEH, the capital of Ladakh and Baltistan, India, situated 4 m. from the right bank of the upper Indus 11,500 ft. above the sea, 243 m. from Srinagar and 482 m. from Yarkland. It is the great emporium of the trade which passes between India, Chinese Turkestan and Tibet. Here meet the routes leading from the central Asian khanates, Kashgar, Yarkand, Khotan and Lhasa. The two chief roads from Leh to India pass via Srinagar and through the Kulu valley respectively. Under a commercial treaty with the maharaja of Kashmir, a British officer is deputed to Leh to regulate and control the traders and the traffic, conjointly with the governor appointed by the Kashmir state. Leh has formed the starting-point of many an adventurous journey into Tibet, the best-known route being that called the Janglam, the great trade route to Lhasa and China, passing by the Manasarowar lakes and the Mariam La pass into the valley of the Tsanpo. Pop. (1921) 2,401. A Moravian mission has long been established here, with an efficient little hospital. There is also a meteorological observatory, the most elevated in Asia. (*See* LADAKH AND BALTISTAN.)

Considerable alarm was felt in August 1928 following an accidental block in the Shyok river in 1926, about 80 m. N. of Leh and 35 m. S. of the Karakorum pass. A glacier in 1926 pushed its snout across the gorge and thus made an ice dam said to be 480 ft. in height. The river-lake behind the dam was, by July 1928, 9 m. long, 25 ft. deep and 1,000 yd. wide, on the average. In early August (1928), the level of the lake rose steadily and a crack developed in the ice-dam. Apparently for the rest of the 1928 season the lake leaked slowly through the crack, so postponing the danger.

LEHAR, FRANZ (1870–), Hungarian operetta composer, was born at Komárom, Hungary, April 30, 1870. After studying at Vienna and Prague, he became a conductor. His opera *Kukuska,* afterwards called *Tatiana,* was performed in 1896, and since then he has written about 30 operettas. The popularity of his music is due to the charm of its melodies; and especially to the orchestration of his waltz themes, which, with their sensuous grace, are typical of 20th century light opera. His most famous musical comedies are *The Merry Widow* (1905) and *The Count of Luxemburg* (1909). He also wrote *The Man with the Three Wives; Gipsy Love; Eva;* and *Paganini* (1925).

LEHIGHTON, a borough of Carbon county, Pennsylvania, U.S.A., on the west bank of the Lehigh river, 26m. N.W. of Allentown. It is served by the Central of New Jersey and the Lehigh Valley railways. The population was 6,102 in 1920 (96% native white) and was estimated locally at 7,500 in 1928. The mining of anthracite is the principal occupation. There are also railroad shops, brick yards, machine shops, a meat-packing house and sundry other manufacturing industries. The borough was settled about 1746 and incorporated in 1866.

LEHIGH VALLEY RAILROAD, THE, constructed in 1855 between Easton and Mauch Chunk, Pa., by Asa Packer, operator of a coal mine, now extends from New York city to Buffalo and Suspension Bridge, N.Y., adjacent to Niagara Falls. The total mileage, including branch lines, some of which date back to 1836, is 1,364 miles. The main line is double tracked and the standard rail used weighs 136 lb. to the yard, the heaviest in use. In New York, its passenger trains use the Pennsylvania station, while in Buffalo it has its own terminal. By an arrangement with other lines through sleeping cars operate over the Lehigh Valley to Philadelphia, Toronto, Detroit and Chicago.

The Lehigh Valley railroad plays an important part in the Eastern business situation. In New York it operates pier and inland freight stations, while in New Jersey it has three rail-head terminals situated on New York bay at Jersey City, National Docks and Claremont. The last named is a modern rail and water development with facilities for loading ocean going vessels direct from cars. Terminals are also maintained at Bayonne, Newark, Perth Amboy, South Plainfield, Easton, Bethlehem, Allentown, Wilkes-Barre, Hazleton, Mount Carmel, Geneva, Rochester, etc. The Lehigh Valley investment in transportation property on December 31, 1927, was $272,937,948.

(E. E. Ls.)

LEHMANN, PETER MARTIN ORLA (1810–1870), Danish statesman, was born at Copenhagen on May 19, 1810. Although of German extraction his sympathies were with the Danish national party and he contributed to the liberal journal the *Kjöbenhavnsposten* while a student of law at the university of Copenhagen. From 1839 to 1842 he edited, with Christian N. David, the *Fädrelandet.* In 1848 he became leader of the "Eiderdänen," that is, of the party which regarded the Eider as the boundary of Denmark, and the duchy of Schleswig as an integral part of the kingdom, and a member of the cabinet of Count A. W. Moltke. He was employed on diplomatic missions to London and Berlin in connection with the Schleswig-Holstein question, and was for some months in 1849 a prisoner of the Schleswig-Holsteiners at Gottorp. A member of the Folkething from 1851 to 1853, of the Landsthing from 1854 to 1870, and from 1856 to 1866 of the Reichsrat, he became minister of the interior in 1861 in the cabinet of K. C. Hall, retiring with him in 1863. He died at Copenhagen on Sept. 13, 1870.

His book *On the Causes of the Misfortunes of Denmark* (1864) went through many editions, and his posthumous works were published in 1872–1874.

See Reinhardt, *Orla Lehmann og hans samtid* (1871); J. Clausen, *Af O. Lehmanns Papirer* (1903).

LEHMBRUCK, WILHELM (1881–1919), German sculptor, was born Jan. 4, 1881, at Meiderich near Duisburg, the son of a miner. He studied at the Düsseldorf academy, lived from 1910 to 1914 in Paris, and afterwards resided in Zürich and Berlin. Lehmbruck was a sculptor of great sensibility, and his art, especially in the last phase, is moving in its spirituality and tenderness. His best known works are: "Weibliche Figur," in Duisburg; "Weiblicher Torso," at The Hague; "Frau Lehmbruck," at Essen; "Knieende" at Mannheim; "Grosse Sinnende"; "Grosse Rückblickende"; "Sterbender Krieger"; "Sitzender Jüngling"; "Emporsteigender Jüngling," and a portrait of Fritz von Unruh in Frankfurt. He also produced numerous etchings of high merit. He died by his own hand in Berlin on March 25, 1919.

See Paul Westheim, *W. Lehmbruck* (1919).

LEHNIN, a village in the Prussian province of Brandenburg, situated between two lakes, which are connected by the navigable Emster with the Havel, 12 m. S.W. from Potsdam. Pop. (1925) 2,557. It contains the ruins of a Cistercian monastery called Himmelpfort am See, founded in 1180 and dissolved in 1542; and a parish church, formerly the monasterial chapel, restored in 1872–77. Brick-making and saw-milling are the chief industries.

The Lehnin Prophecy (*Lehninsche Weissagung, Vaticinium Lehninense*), a poem in 100 Leonine verses, made its appearance about 1690 and caused much controversy. It came to be regarded as a compilation and the date of its authorship placed about the year 1684; it had been thought to date from about 1350.

LEHRS, KARL (1802–1878), German classical scholar, was born at Königsberg on June 2, 1802. He was of Jewish extraction, but in 1822 he embraced Christianity. In 1845 he was appointed professor of ancient Greek philology in Königsberg university, and he died on June 9, 1878. His most important works are: *De Aristarchi Studiis Homericis* (1833, 2nd ed. by A. Ludwich, 1882), which laid a new foundation for Homeric exegesis (on the Aristarchean lines of explaining Homer from the text itself) and textual criticism; *Quaestiones Epicae* (1837); *De Asclepiade Myrleano* (1845); *Herodiani Scripta Tria emendatiora* (1848); *Populäre Aufsätze aus dem Altertum* (1856, 2nd much enlarged ed., 1875), his best-known work; *Horatius Flaccus* (1869), in which, on aesthetic grounds, he rejected many of the odes as spurious; *Die Pindarscholien* (1873). Lehrs was a man of very decided opinions, "one of the most masculine of German scholars"; he believed in a single authorship of the *Iliad,* and comparative mythology and the symbolical interpretation of myths he regarded as a species of sacrilege.

A. Ludwich edited Lehrs' correspondence (1894) and his *Kleine Schriften* (1902).

LEIBL, WILHELM (1844–1900), German subject painter, was born in Cologne, where his father was Musikdirektor of the cathedral, on Oct. 23, 1844. He studied at the Munich Academy, working chiefly under von Ramberg, and in 1869 exhibited his first painting at the Munich exhibition. In the following year he gained the Paris gold medal with his "Portrait of Frau Gedon," painted in the manner of Rembrandt. Coming under the influence of Courbet, he then went to work in Paris, but the outbreak of the Franco-German war sent him home after nine months. From 1770 to 1773 he lived in Munich and afterwards worked at small country places in Bavaria, settling eventually at Aibling, where he led the life of a peasant and painted the scenes around him. As he grew older he ceased to imitate the Dutch masters and followed his own strong instinct for colour, reproducing what he saw with a bold, sure touch. His superb technique enabled him to paint liquidly and broadly, and yet to do detail work of the utmost delicacy. Leibl has been called the first modern German realist. He died at Würzburg on Dec. 4, 1900.

"The Village Politicians" (1879), "In Church," a picture of three peasant women (1883), and "In a Provincial Town" (1894) are typical subject pictures. The portraits include "The artist Sattler with his dog" (1870), "Frau Gentz," and "Fräulein Kirchhoffer." He is well represented at Munich and in the Wallraf-Richartz Museum at Cologne.

A monograph on Leibl is included in Knackfuss's *Künstlerbiographien* (Leipzig, 1901).

LEIBNITZ or **LEIBNIZ, GOTTFRIED WILHELM** (1646–1716), philosopher, mathematician and man of affairs, was born on July 1, 1646 at Leipzig, where his father was professor of moral philosophy. Though the name Leibniz, Leibnitz or Lubeniecz was originally Slavonic, his ancestors were German, and for three generations had been in the employment of the Saxon Government. Young Leibnitz was sent to the Nicolai school at Leipzig, but, from 1652 when his father died, seems to have been for the most part his own teacher. From his father he had acquired a love of historical study. The German books at his command were soon read through, and with the help of two Latin books—the *Thesaurus Chronologicus* of Calvisius and an illustrated edition of Livy—he learned Latin at the age of eight. His father's library was now thrown open to him, to his great joy, with the permission, "Tolle, lege." Before he was 12 he could read Latin easily and had begun Greek; he had also remarkable facility in writing Latin verse. He next turned to the study of logic, attempting already to reform its doctrines, and zealously reading the scholastics and some of the Protestant theologians.

At the age of 15, he entered the University of Leipzig as a law student. His first two years were devoted to philosophy under Jakob Thomasius, a Neo-Aristotelian, who is looked upon as having founded the scientific study of the history of philosophy in Germany. It was at this time probably that he first made acquaintance with the modern thinkers who had already revolutionized science and philosophy, Francis Bacon, Cardan and Campanella, Kepler, Galileo and Descartes; and he began to consider the difference between the old and new ways of regarding nature. He resolved to study mathematics. It was not, however, till the summer of 1663, which he spent at Jena under E. Weigel, that he obtained the instruction of a mathematician of repute; nor was the deeper study of mathematics entered upon till his visit to Paris and acquaintance with Huygens many years later. The next three years he devoted to legal studies, and in 1666 applied for the degree of doctor of law, with a view to obtaining the post of assessor. Being refused on the ground of his youth he left his native town for ever. The doctor's degree refused him there was at once (Nov. 5, 1666) conferred on him at Altdorf—the university town of the free city of Nuremberg—where his brilliant dissertation procured him the immediate offer of a professor's chair. This, however, he declined, having, as he said, "very different things in view."

Leibnitz, not yet 21 years of age, was already the author of several remarkable essays. In his bachelor's dissertation *De principio individui* (1663), he defended the nominalistic doctrine that individuality is constituted by the whole entity or essence of a thing; his arithmetical tract *De complexionibus*, published in an extended form under the title *De arte combinatoria* (1666), is an essay towards his life-long project of a reformed symbolism and method of thought; and besides these there are juridical essays, including the *Nova methodus docendi discendique juris*, written in the intervals of his journey from Leipzig to Altdorf. This last essay is remarkable, not only for the reconstruction it attempted of the *Corpus Juris*, but as containing the first clear recognition of the importance of the historical method in law. Nuremberg was a centre of the Rosicrucians, and Leibnitz, busying himself with writings of the alchemists, soon gained such a knowledge of their tenets that he was supposed to be one of the secret brotherhood, and was even elected their secretary. A more important result of his visit to Nuremberg was his acquaintance with Johann Christian von Boyneburg (1622–72), formerly first minister to the elector of Mainz, and one of the most distinguished German statesmen of the day. By his advice Leibnitz printed his *Nova methodus* in 1667, dedicated it to the elector, and, going to Mainz, presented it to him in person. It was thus that Leibnitz entered the service of the elector of Mainz, at first as an assistant in the revision of the statute-book, afterwards on more important work.

Political Writings.—The policy of the elector, which the pen of Leibnitz was now called upon to promote, was to maintain the security of the German empire, threatened on the west by the aggressive power of France, on the east by Turkey and Russia. Thus when in 1669 the crown of Poland became vacant, it fell to Leibnitz to support the claims of the German candidate, which he did in his first political writing, *Specimen demonstrationum politicarum pro rege Polonorum eligendo*, attempting, under the guise of a Catholic Polish nobleman, to show by mathematical demonstration that it was necessary in the interest of Poland that it should have the count palatine of Neuburg as its king. But neither the diplomatic skill of Boyneburg, who had been sent as plenipotentiary to the election at Warsaw, nor the arguments of Leibnitz were successful and a Polish prince was elected to fill the vacant throne.

A greater danger threatened Germany in the aggressions of Louis XIV. (*see* FRANCE: *History*). Though Holland was in most immediate danger, the seizure of Lorraine in 1670 showed that Germany too was threatened. It was in this year that Leibnitz wrote his *Thoughts on Public Safety*, in which he urged the formation of a new "Rheinbund" for the protection of Germany, and contended that the States of Europe should employ their power, not against one another, but in the conquest of the non-Christian world, in which Egypt, "one of the best situated lands in the world," would fall to France. The plan thus proposed of averting the threatened attack on Germany by a French expedition to Egypt was discussed with Boyneburg, and obtained the approval of the elector. French relations with Turkey were at the time so strained as to make a breach imminent, and at the close of 1671, about the time when the war with Holland broke out, Louis himself was approached by a letter from Boyneburg and a short memorial from the pen of Leibnitz, who attempted to show that Holland itself, as a mercantile power trading with the East, might be best attacked through Egypt, while nothing would be easier for France or would more largely increase her power than the conquest of Egypt. On Feb. 12, 1672, a request came from the French secretary of State, Simon Arnauld de Pomponne (1618–99), that Leibnitz should go to Paris. Louis seems still to have kept the matter in view, but never granted Leibnitz the personal interview he desired, while Pomponne wrote, "I have nothing against the plan of a holy war, but such plans, you know, since the days of St. Louis, have ceased to be the fashion." Not yet discouraged, Leibnitz wrote a full account of his project for the king, and a summary of the same (*Consilium Aegyptiacum*) evidently intended for Boyneburg. But Boyneburg died in Dec. 1672, before the latter could be sent to him. Nor did the former ever reach its destination. The French quarrel with the Porte was made up, and the plan of a French expedition to Egypt disappeared from practical politics till the time of Napoleon. The history of this scheme, and the reason of Leibnitz's journey to Paris,

long remained hidden in the archives of the Hanoverian library. It was on his taking possession of Hanover in 1803 that Napoleon learned, through the *Consilium Aegyptiacum*, that the idea of a French conquest of Egypt had been first put forward by a German philosopher. In the same year there was published in London an account of the *Justa dissertatio* (*A Summary Account of Leibnitz's Memoir addressed to Lewis the Fourteenth*, ed. Granville Penn, 1803) of which the British Government had procured a copy in 1799. But it was only with the appearance of the edition of Leibnitz's works begun by Onno Klopp in 1864 that the full history of the scheme was made known.

Leibnitz had other than political ends in view in his visit to France. It was as the centre of literature and science that Paris chiefly attracted him. Political duties never made him lose sight of his philosophical and scientific interests. At Mainz he was still busied with the question of the relation between the old and new methods in philosophy. In a letter to Jakob Thomasius (1669) he contends that the mechanical explanation of nature by magnitude, figure and motion alone is not inconsistent with the doctrines of Aristotle's *Physics*, in which he finds more truth than in the *Meditations* of Descartes. Yet these qualities of bodies, he argues in 1668 (in an essay published without his knowledge under the title *Confessio naturae contra atheistas*), require an incorporeal principle, or God, for their ultimate explanation. He also wrote at this time a defence of the doctrine of the Trinity against Wissowatius (1669), and an essay on philosophic style, introductory to an edition of the *Anti-barbarus* of Nizolius (1670). Clearness and distinctness alone, he says, are what makes a philosophic style, and no language is better suited for this popular exposition than the German. In 1671 he issued a *Hypothesis physica nova*, in which, agreeing with Descartes that corporeal phenomena should be explained from motion, he carried out the mechanical explanation of nature by contending that the original of this motion is a fine aether, similar to light, or rather constituting it, which, penetrating all bodies in the direction of the earth's axis, produces the phenomena of gravity, elasticity, etc. The first part of the essay, on concrete motion, was dedicated to the Royal Society of London, the second, on abstract motion, to the French academy.

Mathematical Writings.—At Paris Leibnitz met with Arnauld, Malebranche and Christian Huygens. This was pre-eminently the period of his mathematical and physical activity Before leaving Mainz he was able to announce (in a letter to the duke of Brunswick-Lüneburg, 1671) an imposing list of discoveries, and plans for discoveries, arrived at by means of his new logical art, in natural philosophy, mathematics, mechanics, optics, hydrostatics, pneumatics and nautical science, not to speak of new ideas in law, theology and politics. Chief among these discoveries was that of a calculating machine for performing more complicated operations than that of Pascal—multiplying, dividing and extracting roots, as well as adding and subtracting. This machine was exhibited to the Academy of Paris and to the Royal Society of London, and Leibnitz was elected a fellow of the latter society in April 1673. He was made a foreign member of the French academy in 1700. In Jan. 1673 he had gone to London as an attaché on a political mission from the elector of Mainz, returning in March to Paris, and while in London had become personally acquainted with Oldenburg, the secretary of the Royal Society, with whom he had already corresponded, with Boyle the chemist and Pell the mathematician. It is from this period that we must date the impulse that directed him anew to mathematics By Pell he had been referred to Mercator's *Logarithmotechnica* as already containing some numerical observations which Leibnitz had thought original on his own part; and, on his return to Paris, he devoted himself to the study of higher geometry under Huygens entering almost at once upon the series of investigations which culminated in his discovery of the differential and integral calculus (*see* CALCULUS, DIFFERENTIAL AND INTEGRAL).

Shortly after his return to Paris in 1673, Leibnitz ceased to be in the Mainz service any more than in name, but in the same year entered the employment of Duke John Frederick of Brunswick-Lüneburg, with whom he had corresponded for some time. In 1676 he removed at the duke's request to Hanover, travelling thither by way of London and Amsterdam. At Amsterdam he had many discussions with Spinoza, read his unpublished *Ethica*, and copied various passages from it.

For the next 40 years, and under three successive princes, Leibnitz was in the service of the Brunswick family, and his headquarters were at Hanover, where he had charge of the ducal library. About 1686 his thoughts and energies were partly taken up with the scheme for the reunion of the Catholic and Protestant Churches. In that year he wrote his *Systema theologicum* (not published until 1819), in which he strove to find common ground for Protestants and Catholics in the details of their creeds. But it was soon found that the religious difficulties were greater than had at one time appeared. A further scheme of church union in which Leibnitz was engaged, that between the Reformed and Lutheran Churches, met with no better success.

Returning from Italy in 1690, Leibnitz was appointed librarian at Wolfenbüttel by Duke Anton of Brunswick-Wolfenbüttel. Some years afterwards began his connection with Berlin through his friendship with the electress Sophie Charlotte of Brandenburg and her mother the princess Sophie of Hanover. He was invited to Berlin in 1700, and on July 11 of that year the academy he had planned (*Akademie der Wissenschaften*) was founded, with himself as its president for life. His genealogical researches in Germany and Italy (1687–90)—through which he established the common origin of the families of Brunswick and Este—were not only preceded by an immense collection of historical sources, but enabled him to publish materials for a code of international law. The history of Brunswick itself was the last work of his life, and had covered the period from 768 to 1005 when death ended his labours.

It was in the years between 1690 and 1716 that Leibnitz's chief philosophical works were composed, and during the first ten of these years the accounts of his system were, for the most part, preliminary sketches. Indeed, he never gave a full and systematic account of his doctrines. His views have to be gathered from letters to friends, from occasional articles in the *Acta Eruditorum*, the *Journal des Savants*, and other journals, and from one or two more extensive works. In 1710 appeared the only complete philosophical work of his life-time, *Essais de Théodicée sur la bonté de Dieu, la liberté de l'homme, et l'origine du mal*, originally undertaken at the request of the late queen of Prussia, who had desired a reply to Bayle's opposition of faith and reason. In 1714 he wrote, for Prince Eugene of Savoy, a sketch of his system under the title of *La Monadologie*, and in the same year appeared his *Principes de la nature et de la grâce*. The last few years of his life were perhaps more occupied with correspondence than any others, and, in a philosophical regard, were chiefly notable for the letters, which, through the desire of the new queen of England, he interchanged with Clarke, *sur Dieu, l'âme, l'espace, la durée*.

Leibnitz died on Nov. 14, 1716, his closing years enfeebled by disease, harassed by controversy, embittered by neglect; but to the last he preserved the indomitable energy and power of work to which is largely due the position he holds as a man of almost universal attainments and almost universal genius. Neither at Berlin, in the academy which he had founded, nor in London, whither his sovereign had gone to rule, was any notice taken of his death. At Hanover, Eckhart, his secretary, was his only mourner; "he was buried," says an eyewitness, "more like a robber than what he really was, the ornament of his country" (*Memoirs of John Ker of Kersland*, by himself, 1726, i. 118). Only in the French academy was the loss recognized, and a worthy eulogium devoted to his memory (Nov. 13, 1717) The 200th anniversary of his birth was celebrated in 1846, and in the same year were opened the *Königlichsächsische Gesellschaft der Wissenschaften* and the *Kaiserliche Akademie der Wissenschaften* in Leipzig and Vienna respectively. In 1883 a statue was erected to him at Leipzig.

Leibnitz possessed a wonderful power of rapid and continuous work Even when travelling his time was employed in solving mathematical problems. He is described as moderate in his habits, quick of temper but easily appeased, charitable in his judgments

of others, and tolerant of differences of opinion, though impatient of contradiction on small matters. He is also said to have been fond of money to the point of covetousness; he was certainly desirous of honour, and felt keenly the neglect in which his last years were passed.

PHILOSOPHY OF LEIBNITZ

Doctrine of Substance.—The central point in the philosophy of Leibnitz was only arrived at after many advances and corrections in his opinions. This point is his new doctrine of substance (p. 702)[1], and it is through it that unity is given to the succession of occasional writings, scattered over 50 years, in which he explained his views.

More inclined to agree than to differ with what he read (p. 425), and borrowing from almost every philosophical system, his own standpoint is yet most closely related to that of Descartes, partly as consequence, partly by way of opposition. Cartesianism, Leibnitz often asserted, is the ante-room of truth, but the ante-room only. Descartes' separation of things into two heterogeneous substances only connected by the omnipotence of God, and the more logical absorption of both by Spinoza into the one divine substance, followed from an erroneous conception of what the true nature of substance is. Substance, the ultimate reality, can only be conceived as force. Hence Leibnitz's metaphysical view of the monads as simple, percipient, self-active beings, the constituent elements of all things, his physical doctrines of the reality and constancy of force at the same time that space, matter and motion are merely phenomenal, and his psychological conception of the continuity and development of consciousness. In the closest connection with the same stand his logical principles of consistency and sufficient reason, and the method he developed from them, his ethical end of perfection, and his crowning theological conception of the universe as the best possible world, and of God both as its efficient cause and its final harmony.

The ultimate elements of the universe are, according to Leibnitz, individual centres of force or monads. Why they should be individual, and not manifestations of one world-force, he never clearly proves[2]. His doctrine of individuality seems to have been arrived at, not by strict deduction from the nature of force, but rather from the empirical observation that it is by the manifestation of its activity that the separate existence of the individual becomes evident; for his system individuality is as fundamental as activity. "The monads," he says, "are the very atoms of nature—in a word, the elements of things," but, as centres of force, they have neither parts, extension nor figure (p. 705). Hence their distinction from the atoms of Democritus and the materialists. They are metaphysical points or rather spiritual beings whose very nature it is to act. As the bent bow springs back of itself, so the monads naturally pass and are always passing into action, without any aid but the absence of opposition (p. 122). Nor do they, like the atoms, act upon one another (p. 680); the action of each excludes that of every other. The activity of each is the result of its own past state, the determinator of its own future (pp. 706, 722). "The monads have no windows by which anything may go in or out" (p. 705).

Further, since all substances are of the nature of force, it follows that—"in imitation of the notion which we have of souls" —they must contain something analogous to feeling and appetite. Every monad is a microcosm, the universe in little[3], and according to the degree of its activity is the distinctness of its representation of the universe (p. 709). By the proportion of activity to passivity in it one monad is differentiated from another. There is neither vacuum nor break in nature, but "everything takes place by degrees" (p. 392), the different species of creatures rising by insensible steps from the lowest to the most perfect form (p. 312).

As in every monad each succeeding state is the consequence of the preceding, and as it is of the nature of every monad to mirror or represent the universe, it follows (p. 774) that the perceptive content of each monad is in "accord" or correspondence with that of every other (*cf.* p. 127), though this content is represented with infinitely varying degrees of perfection. This is Leibnitz's famous doctrine of pre-established harmony, in virtue of which the infinitely numerous independent substances of which the world is composed are related to each other and form one universe. It is essential to notice that it proceeds from the very nature of the monads as percipient, self-acting beings, and not from an arbitrary determination of the Deity. From this harmony of self-determining percipient units Leibnitz has to explain the world of nature and mind. Space and time are merely relative, the former an order of coexistences, the latter of successions (pp. 682, 752). Hence not only the secondary qualities of Descartes and Locke, but their so-called primary qualities as well, are merely phenomenal (p. 445). The monads are really without position or distance from each other; but, as we perceive several simple substances, there is for us an aggregate or extended mass. Body is thus active extension (pp. 110, 111). The unity of the aggregate depends entirely on our perceiving the monads composing it together. There is no such thing as an absolute vacuum or empty space, any more than there are indivisible material units or atoms from which all things are built up (pp. 126, 186, 277).

From Leibnitz's doctrine of force as the ultimate reality it follows that his view of nature must be throughout dynamical. And though his project of a *dynamic*, or theory of natural philosophy, was never carried out, the outlines of his own theory and his criticism of the mechanical physics of Descartes are known to us The whole distinction between the two lies in the difference between the mechanical and dynamical views of nature Descartes's principle is now enunciated as the conservation of momentum, that of Leibnitz as the conservation of energy. Like the monad, body, which is its analogue, has a passive and an active element. The former is the capacity of resistance, and includes impenetrability and inertia; the latter is active force (pp. 250, 687). Bodies, too, like the monads, are self-contained activities, receiving no impulse from without—it is only by an accommodation to ordinary language that we speak of them as doing so—but moving themselves in harmony with each other (p. 250).

Psychology.—The psychology of Leibnitz is developed in *Nouveaux essais sur l'entendement humain*, written in answer to Locke's famous *Essay*, and criticizing it chapter by chapter. In these essays he worked out a theory of the origin and development of knowledge in harmony with his metaphysical views, and thus without Locke's implied assumption of the mutual influence of soul and body. When one monad in an aggregate perceives the others so clearly that they are in comparison with it bare monads (*monades nues*), it is said to be the ruling monad of the aggregate, not because it actually does exert an influence over the rest, but because, being in close correspondence with them, and yet having so much clearer perception, it seems to do so (p. 683). This monad is called the entelechy or soul of the aggregate or body, and as such mirrors the aggregate in the first place and the universe through it (p. 710). Each soul or entelechy is surrounded by an infinite number of monads forming its body (p. 714); soul and body together make a living being, and, as their laws are in perfect harmony—a harmony established between the whole realm of final causes and that of efficient causes (p. 714)—we have the same result as if one influenced the other. Thus the body does not act on the soul in the production of cognition, nor the soul on the body in the production of motion. The body acts just as if it had no soul, the soul as if it had no body (p. 711). Instead, therefore, of all knowledge coming to us directly or indirectly through the bodily senses, it is all developed by the soul's own activity, and sensuous perception is itself but a confused kind of thought. Not a certain select class of our ideas only (as Descartes held), but all our ideas, are innate, though only worked up into actual thought in the development of knowledge (p. 212). To the aphorism made use of by Locke, "Nihil est in intellectu quod non prius fuerit in sensu," must be added the clause, "nisi intellectus ipse" (p. 223). The soul at birth is not comparable to a *tabula rasa*, but rather to an unworked block of marble, the hidden veins of which already determine the form it is to assume

[1] When not otherwise stated, the references are to Erdmann's edition of the *Opera philosophica*.

[2] See *Considérations sur la doctrine d'un esprit universel* (1702).

[3] Cf. *Opera*, ed. Dutens, II. ii. 20.

in the hands of the sculptor (p. 196). Nor, again, can the soul ever be without perception; for it has no other nature than that of a percipient active being (p 246). Apparently dreamless sleep is to be accounted for by unconscious perception (p. 223); and it is by such unconscious perceptions that Leibnitz explains his doctrine of pre-established harmony (p. 197).

In the human soul perception is developed into self-conscious thought, and there is, therefore, a vast difference between it and the mere monad (p. 464). As all knowledge is implicit in the soul, it follows that its perfection depends on the efficiency of the instrument by which it is developed. Hence the importance, in Leibnitz's system, of the logical principles and method, the consideration of which occupied him at intervals throughout his whole career. There are two kinds of truths—(1) truths of reason, and (2) truths of fact (pp 83, 99, 707). The former rest on the principle of identity (or contradiction) or of possibility, in virtue of which that is false which contains a contradiction, and that true which is contradictory to the false. The latter rest on the principle of sufficient reason or of reality (*compossibilité*), according to which no fact is true unless there be a sufficient reason why it should be so and not otherwise (agreeing thus with the *principium melioris* or final cause). God alone, the purely active monad, has an *a priori* knowledge of the latter class of truths; they have their source in the human mind, only in so far as it mirrors the outer world, *i e*, in its passivity, whereas the truths of reason have their source in our mind in itself or in its activity.

Both kinds of truths fall into two classes, primitive and derivative. The primitive truths of fact are, as Descartes held, those of internal experience, and the derivative truths are inferred from them in accordance with the principle of sufficient reason, by their agreement with our perception of the world as a whole They are thus reached by probable reasoning—a department of logic which Leibnitz was the first to bring into prominence (pp 84, 164, 168, 169, 343). The primitive truths of reasoning are identical (in later terminology, analytical) propositions, the derivative truths being deduced from them by the principle of contradiction. The part of his logic on which Leibnitz laid the greatest stress was the analysis of these rational cognitions into their simplest elements—for he held that the root-notions (*cogitationes primae*) would be found to be few in number (pp 92, 93) —and the designation of them by universal characters or symbols,[1] composite notions being denoted by the formulae formed by the union of several definite characters, and judgments by the relation of aequipollence among these formulae, so as to reduce the syllogism to a calculus. This is the main idea of Leibnitz's "universal characteristic," never fully worked out by him, which he regarded as one of the greatest discoveries of the age. An incidental result of its adoption would be the introduction of a universal symbolism of thought comparable to the symbolism of mathematics and intelligible to all thinkers (*cf.* p. 356). But the great revolution it would effect would chiefly consist in this, that truth and falsehood would be no longer matters of opinion but of correctness or error in calculation[2] (pp. 83, 84, 89, 93). The old Aristotelian analytic is not to be superseded; but it is to be supplemented by this new method, for of itself it is but the ABC of logic.

As the perception of the monad when clarified becomes thought, so the appetite of which all monads partake is raised to will, their spontaneity to freedom, in man (p. 669). The will is an effort or tendency to that which one finds good (p. 251), and is free only in the sense of being exempt from external control (pp. 262, 513, 521), for it must always have a sufficient reason for its action determined by what seems good to it. The end determining the will is pleasure (p. 269), and pleasure is the sense of an increase of perfection (p. 670). A will guided by reason will sacrifice transitory and pursue constant pleasures or happiness, and in this weighing of pleasures consists true wisdom. Leibnitz, like Spinoza, says that freedom consists in following reason, servitude in following the passions (p. 669), and that the passions proceed from confused perceptions (pp. 188, 269). In love one finds joy in the happiness of another; and from love follow justice and law.

Theology.—Leibnitz makes the existence of God a postulate of morality as well as necessary for the realization of the monads. His theology is worked out in the *Theodicée* and his view of the universe as the best possible world defended. He contends that faith and reason are essentially harmonious (pp. 402, 479), and that nothing can be received as an article of faith which contradicts an eternal truth, though the ordinary physical order may be superseded by a higher. The ordinary arguments for the being of God are retained by Leibnitz in a modified form (p. 375) Descartes's ontological proof is supplemented by the clause that God as the *ens a se* must either exist or be impossible (pp. 80, 177, 708); in the cosmological proof he passes from the infinite series of finite causes to their sufficient reason which contains all changes in the series necessarily in itself (pp. 147, 708); and he argues teleologically from the existence of harmony among the monads without any mutual influence to God as the author of this harmony (p. 430). In these proofs Leibnitz seems to have in view an extramundane power to whom the monads owe their reality, though such a conception evidently breaks the continuity and harmony of his system, and can only be externally connected with it. But he also speaks in one place at any rate[1] of God as the "universal harmony"; and the historians Erdmann and Zeller are of opinion that this is the only sense in which his system can be consistently theistic. Yet it would seem that to assume a purely active and therefore perfect monad as the source of all things is in accordance with the principle of continuity and with Leibnitz's conception of the gradation of existences. In this sense he sometimes speaks of God as the first or highest of the monads (p. 678), and of created substances proceeding from Him continually by "fulgurations" (p. 708) or by "a sort of emanation as we produce our thoughts."[2]

With his thoroughgoing optimism Leibnitz has to reconcile the existence of evil in the best of all possible worlds.[3] With this end in view he distinguishes (p. 655) between (1) metaphysical evil or imperfection, which is unconditionally willed by God as essential to created beings; (2) physical evil, such as pain, which is conditionally willed by God as punishment or as a means to greater good (*cf.* p. 510); and (3) moral evil, in which the great difficulty lies, and which Leibnitz makes various attempts to explain. He says that it was merely permitted, not willed, by God (p. 655), and, that being obviously no explanation, adds that it was permitted because it was foreseen that the world with evil would nevertheless be better than any other possible world (p 350). He also speaks of the evil as a mere set-off to the good in the world, which it increases by contrast (p. 149), and at other times reduces moral to metaphysical evil by giving it a merely negative character, or says that their evil actions are to be referred to men alone, while it is only the power of action that comes from God, and the power of action is good (p. 658).

The great problem of Leibnitz's *Théodicée* thus remains unsolved. The suggestion that evil consists in a mere imperfection, like his idea of the monads proceeding from God by a continual emanation, was too bold and too inconsistent with his immediate apologetic aim to be carried out by him. Had he done so his theory would have transcended the independence of the monads with which it started, and found a deeper unity in the world than that resulting from the somewhat arbitrary assertion that the monads reflect the universe

BIBLIOGRAPHY.—*Editions*.—Up to 1900 no attempt had been made to publish the complete works. Several editions existed, but a vast mass of mss. (letters, etc.) remained only roughly classified in the Hanover library. The chief editions were: (1) L. Dutens (Geneva, 1768), called *Opera Omnia*, but far from complete; (2) G. H. Pertz, *Leibnizens gesammelte Werke* (1843–63) (1st ser History, 4 vols.; 2nd ser. Philosophy, vol. i. correspondence with Arnauld, etc; ed. C. I. Grotefend; 3rd ser. Mathematics, 7 vols., ed. C. J. Gerhardt); (3) Foucher de Careil (planned in 20 vols., 7 published, Paris, 1859–75), the same editor having previously published *Lettres et opuscules inédits de Leibniz* (1854–57); (4) Onno Klopp, *Die Werke von Leibniz gemäss seinem*

[1] Different symbolic systems were proposed by Leibnitz at different periods; *cf.* Kvêt, *Leibnitzens Logik* (1857), p. 37.

[2] The places at which Leibnitz anticipated the modern theory of logic mainly due to Boole are pointed out in Mr. Venn's *Symbolic Logic* (1881).

[2] *Werke*, ed. Pertz, 2nd ser. vol. i, p. 167.

[3] "Si c'est ici le meilleur des mondes possibles, que sont donc les autres?"—Voltaire, *Candide*, ch vi.

Handschriftlichen Nachlasse in der Königlichen Bibliothek zu Hannover (1st series, Historico-Political and Political, 10 vols., 1864–77). The *Oeuvres de Leibnitz*, by A. Jacques (2 vols., 1846) also deserves mention. The philosophical writings had been published by Raspe. (Amsterdam and Leipzig, 1765), by J. E. Erdmann, *Leibnitii opera philos. quae extant Latina, Gallica, Germanica, omnia* (Berlin, 1840), by P. Janet (2 vols., Paris, 1866, 2nd ed., 1900), and the fullest by C. J. Gerhardt, *Die Philosophischen Schriften von G. W. Leibniz* (7 vols., 1875–90); *cf.* also *Die kleineren philos. wichtigeren Schriften* (trans. with commentary, J. H. von Kirchmann, 1879). The German works had also been partly published separately; G. E. Guhrauer (Berlin, 1838–40). Of the letters various collections had been published up to 1900, *e.g.*: C. J. Gerhardt (Halle, 1860) and *Der Briefwechsel von G. W. Leibnitz mit Mathematikern* (1899); *Corrispondenza tra L. A. Muratori e G. Leibnitz* (1899); and cf. *Neue Beitrage zum Briefwechsel zwischen D. E. Jablonsky und G. W. Leibnitz* (1899).

In 1900 it was decided by scholars in Berlin and Paris that a really complete edition should be published, and with this object four German and four French critics were entrusted with the preliminary task of correlating the mss. in the royal library at Hanover. This process resulted in the preparation of the *Kritischer Katalog der Leibnitz-Handschriften zur Vorbereitung der interakademischen Leibniz-Ausgabe* (1908), and certain other preliminary publications also were the outcome of it, *e.g.*, L. Couturat, *Opuscules et fragments inédits* (1903); E. Gerland, *Leibnizens nachgelassene Schriften physikalischen, mechanischen und technischen Inhalts* (1906); Jean Baruzi, *Leibniz* (1909), containing unedited mss. and a sketch-biography; *cf.* the same author's *Leibniz et l'organisation religieuse de la terre* (1907).

Translations.—Of the *Systema Theologicum* (1850, C. W. Russell), of the correspondence with Clarke (1717); *Works*, by G. M. Duncan (New Haven, 1890); of the *Nouveaux Essais*, by A. G. Langley (1894); the *Monadology and other Writings*, by R. Latta (Oxford, 1898).

Biographical.—The materials for the life of Leibnitz, in addition to his own works, are the notes of Eckhart (not published till 1779), the *Éloge* by Fontenelle (read to the French academy in 1717), the "Eulogium," by Wolf, in the *Acta Eruditorium* for July 1717, and the "Supplementum" to the same by Feller, published in his *Otium Hannoveranum* (Leipzig, 1718). The best biography is that of G. E. Guhrauer, *G. W. Freiherr von Leibnitz* (2 vols., Breslau, 1842; *Nachträge*, Breslau, 1846). A shorter *Life of G. W. von Leibnitz, on the Basis of the German Work of Guhrauer*, has been published by J. M. Mackie (Boston, 1845). More recent works are those of L. Grote, *Leibniz und seine Zeit* (Hanover, 1869); E. Pfleiderer, *Leibniz als patriot, Staatsmann, und Bildungstrager* (Leipzig, 1870); the slighter volume of F. Kirchner, *G. W. Leibniz: sein Leben und Denken* (Köthen, 1876); Kuno Fischer, vol. iii. in *Gesch. der neuern Philosophie* (5th ed., 1920).

Critical.—The monographs and essays on Leibnitz are too numerous to mention, but reference may be made to Feuerbach, *Darstellung, Entwicklung, und Kritik der Leibnitz'schen Phil.* (2nd ed., Leipzig, 1844); Nourrisson, *La Philosophie de Leibniz* (1860); R. Zimmermann, *Leibnitz und Herbart: eine Vergleichung ihrer Monadologieen* (Vienna, 1849); O. Caspari, *Leibniz' Philosophie beleuchtet vom Gesichtspunkt der physikalischen Grundbegriffe von Kraft und Stoff* (Leipzig, 1870); G. Hartenstein, "Locke's Lehre von der menschl. Erk. in Vergl. mit Leibniz's Kritik derselben dargestellt," in the *Abhandl. d. philol.-hist. Cl. d. K. Sächs. Gesells. d. Wiss.*, vol. iv. (Leipzig, 1865); G. Class, *Die metaph. Voraussetzungen' des Leibnitzischen Determinismus* (Tubingen, 1874); F. B. Kvêt, *Leibnitzens Logik* (Prague, 1857); the essays on Leibnitz in Trendelenburg's *Beitrage*, vols. ii. and iii. (1855–67); L. Neff, *Leibniz als Sprachforscher* (Heidelberg, 1870–71); J. Schmidt, *Leibniz und Baumgarten* (Halle, 1875); D. Nolen, *La Critique de Kant et la Métaphysique de Leibniz* (1875); and the exhaustive work of A. Pichler, *Die Theologie des Leibniz* (Munich, 1869–70). Among the more recent works are: C. Braig, *Leibniz: sein Leben und die Bedeutung seiner Lehre* (1907); E. Cassirer, *Leibniz' System in seinem wissenschaftlichen Grundlagen* (1902); L. Couturat, *La Logique de Leibniz d'après des documents inédits* (1901); L. Davillé, *Leibniz historién* (1909); Kuno Fischer, *G. W. Leibnitz* (1920); R. B. Frenzel, *Der Associationsbegriff bei Leibniz* (1898); R. Herbertz, *Die Lehre vom Unbewussten im System des Leibniz* (1905); H. Hoffmann, *Die Leibniz'sche Religionsphilosophie in ihrer geschichtlichen Stellung* (1903); W. Kabitz, *Die Philosophie des jungen Leibniz* (1909), a study of the development of the Leibnitzian system; H. L. Koch, *Materie und Organismus bei Leibniz* (1908); G. Niel, *L'Optimisme de Leibniz* (1888); Bertrand A. W. Russell, *A Critical Exposition of the Philosophy of Leibniz* (1900); F. Schmöger, *Leibniz in seiner Stellung zur tellurischen Physik* (1901); A. Silberstein, *Leibnizens Apriorismus in Verhältnis zu seiner Metaphysik* (1904); Stein, *Leibniz und Spinoza* (1890); F. Thilly, *Leibnizens Streit gegen Locke in Ansehung der angeborenen Ideen* (1891); R. Urbach, *Leibnizens Rechtfertigung des Uebels in der besten Welt* (1901); W. Werckmeister, *Der Leibnizsche Substanzbegriff* (1899); F. G. F Wernicke, *Leibniz' Lehre von der Freiheit des menschlichen Willens* (1890); H. Ganz, *Das Unbewusste bei Leibnitz in Beziehung zu Modernen Theorien* (Zurich, 1917); W. Wundt, *Leibniz* (Leipzig, 1917); H. Schmalenbach, *Leibniz* (München, 1921).

(W. R. So.)

LEICESTER, EARLS OF. The first holder of this English earldom belonged to the family of Beaumont, although a certain Saxon named Edgar has been described as the 1st earl of Leicester. Robert de Beaumont (d. 1118) is frequently but erroneously considered to have received the earldom from Henry I., about 1107; his son Robert was undoubtedly earl of Leicester in 1131. The 3rd Beaumont earl, another Robert, was also steward of England, a dignity attached to the earldom of Leicester from this time until 1399. The earldom reverted to the crown when Robert de Beaumont, the 4th earl, died in 1204.

In 1207 Simon IV., count of Montfort (*q.v.*), nephew and heir of Earl Robert, was confirmed in the possession of the earldom by King John, but it was forfeited when his son, the famous Simon de Montfort, was attainted and was killed at Evesham in 1265. Henry III.'s son Edmund, earl of Lancaster, was also earl of Leicester and steward of England, obtaining these offices a few months after Earl Simon's death, and the title remained with his heirs until it was merged in the crown on the accession of Henry IV.

In 1564 Queen Elizabeth created her favourite, Lord Robert Dudley, earl of Leicester (*q.v.*). At his death the title became extinct. In 1618 the earldom of Leicester was revived in favour of Robert Sidney, Viscount Lisle, a nephew of the late earl and a brother of Sir Philip Sidney; it remained in this family until the death of Jocelyn (1682–1743), the 7th earl of this line, in 1743. Jocelyn left no legitimate children, but a certain John Sidney claimed to be his son and consequently to be 8th earl of Leicester.

In 1744, the year after Jocelyn's death, Thomas Coke, Baron Lovel (*c.* 1695–1759), was made earl of Leicester, but the title became extinct on his death in 1759. The next family to hold the earldom was that of Townshend, George Townshend (1755–1811) being created earl of Leicester in 1784. When his son George Ferrars Townshend, the 3rd marquess (1778–1855), died the earldom again became extinct. Before this date, however, another earldom of Leicester was in existence. This was created in 1837 in favour of Thomas William Coke, who had inherited the estates of his relative Thomas Coke, earl of Leicester. To distinguish his earldom from that held by the Townshends Coke was ennobled as earl of Leicester of Holkham.

See G. E. C(okayne), *Complete Peerage*, vol. v. (1893).

LEICESTER, ROBERT DUDLEY, EARL OF (*c.* 1531–1588), English statesman, was the son of John Dudley, duke of Northumberland (*q.v.*), and brother of Guildford Dudley, the husband of Lady Jane Grey. After his brother's execution he shared in the disgrace of his family. He was sent to the Tower, and was sentenced to death; but the queen not only pardoned and restored him to liberty, but appointed him master of the ordnance On the accession of Elizabeth he was also made master of the horse. He was then, perhaps, about seven-and-twenty, and rose rapidly in the queen's favour. At an early age he had been married to Amy, daughter of Sir John Robsart. Amy visited her husband in the Tower during his imprisonment; but afterwards when, under the new queen, he was much at court, she lived a good deal apart from him. He visited her, however, at times, in different parts of the country, and his expenses show that he treated her liberally. In Sept. 1560 she was staying at Cumnor Hall in Berkshire, the house of one Anthony Forster, when she died from a fall downstairs, under circumstances which aroused suspicions of foul play. Her death had been surmised some time before as a thing that would remove an obstacle to Dudley's marriage with the queen, with whom he stood high in favour. The story of Amy Robsart is famous through Sir Walter Scott's treatment of it in *Kenilworth*. Her husband continued to rise in the queen's favour. She made him a knight of the Garter, and bestowed on him the castle of Kenilworth, the lordship of Denbigh and other lands in Warwickshire and in Wales. In Sept. 1564 she created him baron of Denbigh, and immediately afterwards earl of Leicester. In the preceding month, when she visited Cambridge, she at his request addressed the university in Latin. The honours shown him

excited jealousy, especially as he was known to entertain still more ambitious hopes, which the queen apparently did not discourage. The earl of Sussex, in opposition to him, strongly favoured a match with the archduke Charles of Austria. Meanwhile Elizabeth, in 1564, recommended Leicester as a husband for Mary Queen of Scots. It may be doubted how far the proposal was serious. A few years later he formed an ambiguous connection with the baroness dowager of Sheffield, claimed by the lady to have been a valid marriage, though it was concealed from the queen. But she married again during Leicester's life, when he, too, had found a new partner. Long afterwards, her son, Sir Robert Dudley, sought to establish his legitimacy; but his suit was stopped, and the documents connected with it sealed up by an order of the Star Chamber.

In 1575 Queen Elizabeth visited the earl at Kenilworth, where she was entertained for some days with great magnificence. Next year Walter, earl of Essex, died in Ireland, and Leicester's subsequent marriage with his widow again gave rise to very serious imputations. Report said that he had had two children by her during her husband's absence in Ireland, and, as the feud between the two earls was notorious, Leicester's enemies easily suggested that he had poisoned his rival. The marriage tended to Leicester's discredit and was kept secret at first; but it was revealed to the queen in 1579 by Simier, an emissary of the duke of Alençon, to whose projected match with Elizabeth the earl seemed to be the principal obstacle. The queen had some thought, it is said, of committing Leicester to the Tower, but was dissuaded from doing so by his rival the earl of Sussex. Leicester had not, indeed, favoured the Alençon marriage, but otherwise he had sought to promote a league with France against Spain. He and Burleigh had listened to proposals from France for the conquest and division of Flanders, and they were in the secret about the capture of Brill. When Alençon actually arrived, indeed, in August 1579, Dudley being in disgrace, showed himself for a time anti-French; but he soon returned to his former policy. He encouraged Drake's piratical expeditions against the Spaniards and had a share in the booty brought home. In Feb. 1582 he, with a number of other noblemen and gentlemen, escorted the duke of Alençon on his return to Antwerp to be invested with the government of the Low Countries. In 1584 he inaugurated an association for the protection of Queen Elizabeth against conspirators. About this time there issued from the press the famous pamphlet, supposed to have been the work of Parsons the Jesuit, entitled *Leicester's Commonwealth* (sometimes known as *Father Parsons' Green Coat*), which was suppressed by letters from the privy council, in which it was declared that the charges against the earl were to the queen's certain knowledge untrue; nevertheless they were believed in by some who had no sympathy with the Jesuits long after Leicester's death.

In 1585 Leicester was appointed commander of an expedition to the Low Countries in aid of the revolted provinces, and sailed with a fleet of 50 ships to Flushing. In January 1586 he was invested with the government of the provinces, but received a strong reprimand from the queen for acting without her authorization. Leicester was allowed to retain his dignity; but affairs did not prosper under his management. The most brilliant achievement of the war was the action at Zutphen, in which his nephew Sir Philip Sidney was slain. Disagreements increasing between him and the States, he was recalled by the queen; and in 1588 he was appointed lieutenant-general of the army mustered at Tilbury to resist Spanish invasion. After the crisis was past he was returning home to Kenilworth, when he was attacked by sudden illness and died at his house at Cornbury in Oxfordshire, on Sept. 4.

Such are the main facts of Leicester's life. Of his character it is more difficult to speak with confidence. Being in person tall and remarkably handsome, he improved these advantages by a very ingratiating manner. A man of ability and ambition, he was vain, and presumed at times upon his influence with the queen to a degree that brought upon him a sharp rebuff. Yet Elizabeth stood by him. He was a man of princely tastes, especially in architecture. At court he became latterly the leader of the Puritan party, and his letters were pervaded by expressions of religious feeling which it is hard to believe were insincere. Of the darker suspicions against him it is enough to say that much was certainly reported beyond the truth; but there remain some facts sufficiently disagreeable, and others, perhaps, sufficiently mysterious, to make a just estimate of the man a rather perplexing problem.

BIBLIOGRAPHY.—A general account of Leicester will be found in the Memoirs of the Sidneys prefixed to Collins's *Letters and Memorials of State;* but the fullest yet published is Sidney Lee's article in the *Dictionary of National Biography* (1888) where the sources are given. Leicester's career has to be made out from documents and state papers, especially from the Hatfield mss. and Major Hume's *Calendar* of documents from the Spanish archives bearing on the history of Queen Elizabeth. Of others the principal are Digges's *Compleat Ambassador* (1655), John Nichols's *Progresses of Queen Elizabeth* and the *Leycester Correspondence* edited by J. Bruce for the Camden Society. For Amy Robsart's death *see* the *English Historical Review*, xiii. 83, giving the full text (in English) of De Quadra's letter of Sept. 11, 1560, on which so much has been built.

LEICESTER, ROBERT SIDNEY, EARL OF (1563–1626), second son of Sir Henry Sidney (*q.v.*), was born on Nov. 19, 1563, and was educated at Christ Church, Oxford, afterwards travelling on the Continent for some years between 1578 and 1583. In 1585 he was elected member of parliament for Glamorganshire; and in the same year he went with his elder brother Sir Philip Sidney (*q.v.*) to the Netherlands, where he served in the war against Spain under his uncle Robert Dudley, earl of Leicester. After visiting Scotland on a diplomatic mission in 1588, and France on a similar errand in 1593, he returned to the Netherlands in 1596, where he rendered distinguished service in the war for the next two years. He had been appointed governor of Flushing in 1588, and he spent much time there till 1603, when, on the accession of James I., he returned to England. James raised him at once to the peerage as Baron Sidney of Penshurst, and he was appointed chamberlain to the queen consort. In 1605 he was created Viscount Lisle, and in 1618 earl of Leicester, the latter title having become extinct in 1588 on the death of his uncle, whose property he had inherited. (*See* LEICESTER, EARLS OF.) Leicester was a man of taste and a patron of literature, whose cultured mode of life at his country seat, Penshurst, was celebrated in verse by Ben Jonson. The earl died at Penshurst on July 13, 1626.

ROBERT SIDNEY, 2nd earl of Leicester of the 1618 creation (1595–1677), born on Dec. 1, 1595, was educated at Christ Church, Oxford; he was called to the bar in 1618, having already served in the army in the Netherlands during his father's governorship of Flushing, and having entered parliament as member for Wilton in 1614. In 1616 he was given command of an English regiment in the Dutch service; and having succeeded his father as earl of Leicester in 1626, he was employed on diplomatic business in Denmark in 1632, and in France from 1636 to 1641. He was then appointed lord-lieutenant of Ireland in place of the earl of Strafford, but he waited in vain for instructions from the king, and in 1643 he was compelled to resign the office without having set foot in Ireland. After his resignation of the lord-lieutenancy of Ireland, he retired into private life. In 1649 the younger children of the king were for a time committed to his care at Penshurst. He died at Penshurst on Nov. 2, 1677.

Leicester's eldest son, PHILIP, 3rd earl (1619–1698), known for the greater part of his life as Lord Lisle, became lieutenant-general of Ireland under Ormonde; he strongly favoured the parliamentary cause and in 1647 he was appointed lord-lieutenant of Ireland by the parliament. Named one of Charles I.'s judges, he refused to take part in the trial; but he afterwards served in Cromwell's council of state, and sat in the Protector's House of Lords. Lisle stood high in Cromwell's favour, but nevertheless obtained a pardon at the Restoration.

See *Sydney Papers*, ed. A. Collins (2 vols, 1746); *Sydney Papers*, edited by R. W. Blencowe (1825) containing the 2nd earl of Leicester's journal; Clarendon, *History of the Rebellion and Civil Wars in England* (8 vols., Oxford, 1826); S. R. Gardiner, *History of the Great Civil War* (3 vols., London, 1886–91).

LEICESTER, a municipal county and the county town of Leicestershire, England; on the river Soar, a southern tributary of the Trent, 99 m. N.N.W. from London by the L.M.S. railway. It is served also by the L.N.E. railway and by the Leicester canal. Pop. (1921) 234,143. Leicester was created a city in 1919.

The Romano British town of *Ratae Coritanorum,* on the Fosse

Way, was a municipality in A.D. 120–121. Leicester was called a "burh" in 918, and a city in Domesday. Until 874 it was the seat of a bishopric. In 1086 the king and Hugh de Grantmesnil had much land in Leicester; by 1101 the latter's share had passed to Robert of Meulan, to whom the rest of the town belonged. Leicester thus became the largest mesne borough. In the 13th century the town developed its own form of government by a mayor and 24 jurats. In 1464 Edward IV. made the mayor and four of the council justices of the peace. In 1489 Henry VII. added 48 burgesses to the council and made it a close body. In 1589 Elizabeth incorporated the town James I. granted charters in 1605 and 1610; and Charles I. in 1630. In 1684 the charters were surrendered; a new one granted by James II. was rescinded by proclamation in 1688.

Leicester was represented in parliament by two members from 1295 to 1918, it now has three. It has had a prescriptive market now held on Wednesday and Saturday since the 13th century. Leicester has been a centre for brewing and the manufacture of woollen goods since the 13th century. Knitting frames for hosiery were introduced about 1680. Boot manufacture became important in the 19th century.

Roman remains include a portion of Roman masonry known as the Jewry Wall; several pavements have been unearthed; among other remains, is a milestone from the Fosse Way, marking a distance of 2 m. from Ratae. St. Nicholas is early Norman with Roman material. St. Mary de Castro church, with Norman remains, including sedilia, shows Early English work in the tower and elsewhere, and has a Decorated spire. All Saints church has Norman remains. St. Martin's, mainly Early English, is a cruciform structure. St. Margaret's, with Early English nave, has extensive Perpendicular additions. North of the town are remains of an abbey of Black Canons founded in 1143. The ruins of the castle include parts of the Norman hall, two gateways, and the artificial Mount on which the keep stood The old town hall was formerly the gild-hall of Corpus Christi. There is a valuable library founded in the 17th century. The Trinity hospital was founded in 1331 by Henry Plantagenet, earl of Lancaster and of Leicester, and Wyggeston's hospital (1513). In 1921 a university college was founded. The Abbey Park is a pleasure ground; there are also Victoria Park, St. Margaret's Pasture and other grounds. The staple trade is hosiery, an old-established industry; there are also manufactures of elastic webbing, cotton and lace, rubber, boots and shoes, ebonite, furniture, tobacco and printing; ironworks, maltings and brick-works. Leicester became a county borough in 1888, and the bounds were extended and constituted one civil parish in 1892. A measure creating a diocese of Leicester has received the royal assent. The diocese embraces all of Leicestershire and St. Martin's church is the cathedral.

LEICESTER OF HOLKHAM, THOMAS WILLIAM COKE, Earl of (1754–1842), English agriculturist, known as Coke of Norfolk, was the eldest son of Wenman Roberts, who assumed the name of Coke in 1750. He was born on May 6, 1754 and succeeded to his father's estates at Holkham and elsewhere. From 1776 to 1784, from 1790 to 1806, and again from 1807 to 1832 Coke was member of parliament for Norfolk; he was a friend and supporter of Charles James Fox and a sturdy and aggressive Whig, acting upon the maxim taught him by his father "never to trust a Tory." Coke's chief interests, however, were in the country, and his fame is that of an agriculturist. His land around Holkham in Norfolk was poor and neglected, but he introduced many improvements, obtained the best expert advice, and in a few years wheat was grown upon his farms, and the breed of cattle, sheep and pigs greatly improved. It has been said that "his practice is really the basis of every treatise on modern agriculture" Under his direction the rental of the Holkham estate is said to have increased from £2,200 to over £20,000 a year. In 1837 Coke was created earl of Leicester of Holkham. Leicester, who was a strong and handsome man and a fine sportsman, died at Longford Hall in Derbyshire on June 30, 1842. He was twice married, and Thomas William, his son by his second marriage, succeeded to his earldom.

See A. M. W. Stirling, *Coke of Norfolk and his Friends* (1907).

LEICESTERSHIRE, a midland county of England, bounded north by Nottinghamshire, east by Lincolnshire and Rutland, south-east by Northamptonshire, south-west by Warwickshire, and north-west by Derbyshire, also touching Staffordshire on the west. The area is 823·6 sq. miles.

The main topographical feature of Leicestershire is the broad valley of the Soar, running south to north and separating the Charnwood forest from the uplands of the east. The river also divides the county geologically, the Jurassic forming the higher land of the east, and the Triassic the plain of the west with masses of older rocks protruding in places forming higher land. North-west of Leicester is the Charnwood forest, composed of pre-Cambrian volcanic ashes, grits and slates into which igneous rocks of granitic and dioritic composition were intruded in later pre-Cambrian times. These emerge from the Trias plain of Keuper-Marls and form a series of barren ridges which contrast with the deep fertile valleys of red marl between them. There are intrusions of igneous rocks south-west of Leicester at Sapscot, Croft, etc. West of the Charnwood forest are the outcrops of the Carboniferous limestones and coal measures of the Leicester coalfield which represents the southward projection of the Pennine system below the Trias. These are faulted in places. The region was heavily glaciated in the Pleistocene and the older beds have been covered with boulder clay, whilst the gravel and sand beds in the valleys, which have yielded remains of mammoths, represent a late phase of the Ice age.

History and Early Settlement.—Leicestershire is poor in pre-historic remains, the earliest being "Neolithic" implements of flint and other stone found on the north of the Charnwood forest, around Leicester and Mount Sorrel, and at Osbaston in the south-west in the unforested patches. There is some evidence of Bronze age settlements in south Leicestershire, and also on Beacon hill in the Charnwood forest which seems to have been in early times an important place for defensive purposes. At the time of the Roman invasion the region was sparsely populated by the Coritani. Even in Roman times there is little evidence of settlement apart from Leicester itself, and Venonae at the crossing of the Fosse way and Watling street. Leicester (Ratae) also was a cross-roads on the Fosse way. There are a few minor settlements along these two routes, on Watling street, which runs along the south-western boundary, and Fosse way, traversing the county northwards through Leicester to Lincoln.

The district which is now Leicestershire was reached in the 6th century by Anglian invaders who, making their way across the Trent, penetrated as far as Leicester, the fall of which may be dated at about 556. In 679 the district formed the kingdom of the Middle Angles within the kingdom of Mercia, and on the subdivision of the Mercian see in that year was formed into a separate bishopric having its see at Leicester. In the 9th century the district was subjugated by the Danes, and Leicester became one of the five Danish boroughs. It was recovered by Aethelflaed in 918, but the Northmen regained their supremacy shortly after, and the prevalence of Scandinavian place-names in the county bears evidence of the extent of their settlement. Leicestershire was a shire in the 10th century, and at the time of the Domesday survey was divided into the four wapentakes of Guthlaxton, Framland, Goscote and Gartree. The Leicestershire survey of the 12th century shows an additional grouping of the vills into small hundreds, which have completely disappeared. In the reign of Edward I. the divisions appear as hundreds, and in the reign of Edward III. the additional hundred of Sparkenhoe was formed out of Guthlaxton. Before the 17th century Goscote was divided into East and West Goscote. Until 1566 Leicestershire and Warwickshire had a common sheriff, the shire-court for the former being held at Leicester. Leicestershire constituted an archdeaconry within the diocese of Lincoln from 1092 until its transference to Peterborough in 1837. In 1143 the Benedictine monks founded an abbey near Leicester; a nunnery was founded at Gracedieu in 1240, and an Augustinian priory in Charnwood in the 12th century.

The main historical events connected with the county were the siege and capture of Leicester by Henry II. in 1173 on the

rebellion of the earl of Leicester, and the surrender of Leicester to Prince Edward in 1264. Parliament was held at Leicester in 1414. The battle of Bosworth was fought in the county in 1485. In the Civil War the greater part of the county favoured the parliament, though the mayor and some members of the corporation of Leicester sided with the king, and in 1642 the citizens of Leicester on a summons from Prince Rupert lent Charles £500. In 1645 Leicester was twice captured by the Royalist forces. Before the Conquest large estates in Leicestershire were held by Earls Ralf, Morcar, Waltheof and Harold, but the Domesday survey of 1086 reveals an almost total displacement of English by Norman landholders, only a few estates being retained by Englishmen as under-tenants. The first lay-tenant mentioned in the survey is Robert, count of Meulan, ancestor of the Beaumont family and afterwards earl of Leicester, to whose fief was annexed the holding of Hugh de Grantmesnil. Robert de Toeni, another Domesday tenant, founded Belvoir castle (the seat of the dukes of Rutland) and priory. The fief of Robert de Buci was bestowed on Richard Basset, founder of Laund abbey, in the reign of Henry I. Loughborough was an ancient seat of the Despenser family, and Brookesby was the seat of the Villiers and the birthplace of George Villiers, the famous duke of Buckingham. Melton Mowbray was named from its former lords, the Mowbrays, descendants of Nigel de Albini, the founder of Axholme priory.

The woollen industry flourished in Leicestershire in Norman times, and in 1343 Leicestershire wool was rated at a high value. Coal was worked at Coleorton in the early 15th century and at Measham in the 17th century. The famous blue slate of Swithland has been quarried from time immemorial, and the limestone quarry at Barrow-on-Soar is also very old; the monks of the abbey of St. Mary de Pré formerly enjoyed the tithe of its produce. The staple manufacture of the county, that of hosiery, originated in the 17th century, the chief centres being Leicester, Hinckley and Loughborough, and before the development of steam-driven frames in the 19th century hand framework knitting of hose and gloves was carried on in about a hundred villages. Wool-carding was an extensive industry before 1840.

In 1290 Leicestershire returned two members to parliament. Under the Reform Act of 1832 the county returned four members in two divisions until the Redistribution of Seats Act of 1885, under which it returned four members in four divisions.

The most noteworthy churches are found in the towns, as at Ashby-de-la-Zouch, Hinckley, Leicester, Loughborough, Lutterworth, Market Bosworth, Market Harborough and Melton Mowbray. The principal old castle is that of Ashby-de-la-Zouch, while at Kirby Muxloe there is a picturesque fortified mansion of Tudor date. There are several good Elizabethan mansions, as that at Laund, in the east of the county.

Industries.—The soil is loamy and affords rich pasture for cattle and sheep, especially east of the Soar, while the corn crops are grown chiefly on the lighter soil of the west. The proportion of pasture land is large and is increasing. Dairy farming is extensively carried on, Stilton cheese is manufactured near Melton Mowbray on the Melton ridge and is said to be localized because of the flavour which the soil gives to the milk. Cattle are reared in large numbers, while of sheep the New Leicester breed is well known. It was introduced by Robert Bakewell the agriculturist, who was born near Loughborough in 1725. He also improved the breed of horses by the importation of mares from Flanders. The county specializes in the fattening of two-year-old cattle in the summer; these are sold in autumn, leaving large areas free for hunting.

The county is specially famed for fox-hunting, Leicester and Melton Mowbray being favourite centres, while the kennels of the Quorn hunt are located at Quorndon near Mount Sorrel. For this reason Leicestershire is rich in good riding horses.

Coal is worked in the Leicester coalfield around Coalville, Coleorton and Moira, which is of a quality suited for household use. Most of it is consumed in other districts owing to lack of large industries in the county. Iron of a low grade is worked around Tilton, Corby and Besborough, and there are iron furnaces at Holwell and Asfordby. Limestone is worked in various parts, and in the Soar valley there are large limeworks manufacturing hydraulic cement. Granites are quarried near Mount Sorrel, Bardon and Groby for road making, and also at Sapscot and Stoney Stanton. Apart from the mining industries, the staple manufacture of Leicestershire is hosiery centred at Leicester, with minor centres at Hinckley, Barwell and East Stilton, for which the long staple wool is obtained from home-bred sheep. Cotton hose are also manufactured. Loughborough also has hosiery factories and in addition is an engineering and bell founding centre. Leicester is the centre of the leather industry and the towns of the Soar and the Wreake valleys are also engaged in this industry. There are large rubber works at Leicester and at Melton Mowbray elastic webbing and iron founding are carried on.

The L.M.S. railway serves Market Harborough, Leicester and Loughborough, having an important junction at Trent (on that river) for Derby and Nottingham. Branches radiate from Leicester to Melton Mowbray, to Coalville, Ashby-de-la-Zouch, Moira and Burton-upon-Trent, with others through the mining district of the north-west which is also served by a branch of the L.M.S railway from Nuneaton to Market Bosworth, Coalville and Loughborough. This company serves Market Harborough from Rugby, and branches of the L.N.E. railway serve Market Harborough, Leicester and Melton Mowbray. The L.N.E. railway passes through Lutterworth, Leicester and Loughborough. The principal canals are the Union and Grand Union, which with various branches are connected with the Grand Junction, and the Ashby-de-la-Zouch canal, which joins the Coventry canal at Nuneaton. The Loughborough canal serves that town, connecting with the river Soar.

Administration.—The area of the administrative county is 532,789 ac.; the population (1921) 494,469. The county contains six hundreds. The municipal boroughs are: Leicester, the county town and a county borough (pop. in 1921, 234,143), Loughborough, 25,847. The county is in the Midland circuit and has one court of quarter sessions. The county borough of Leicester has a separate court of quarter sessions and a separate commission of the peace. The county is divided into four parliamentary divisions (Melton, Loughborough, Bosworth, Harborough), each returning one member; and the parliamentary borough of Leicester returns three members. A new measure brings the county into the diocese of Leicester. It was formerly in the diocese of Peterborough.

See *Victoria County History, Leicestershire;* W. Burton, *Description of Leicestershire* (1622); John Nicholls, *History and Antiquities of the County of Leicester* (London, 1795–1815).

LEIDY, JOSEPH (1823–1891), American scientist, was born at Philadelphia, Pa., on Sept. 9, 1823. After receiving an early education in private schools he entered the University of Pennsylvania and in 1844 graduated in medicine. He soon after became librarian and a curator at the Academy of Natural Sciences of Philadelphia, and in 1847 was made chairman of the board of curators, which position he held for a period of 44 years. In 1853 he was appointed professor of anatomy at the University of Pennsylvania, which position he held until his death, becoming director of the biological department in 1884. In addition to these duties he was professor of natural history at Swarthmore college from 1871 also until his death. He won distinction as an anatomist, especially in the field of comparative anatomy. His *Elementary Treatise on Human Anatomy* (1861; rev. and enl., 1889) was for many years the classic American text-book on the subject. His *Researches into the Comparative Anatomy of the Liver* (1848) was the first thorough study of that organ. Leidy spent much time in microscopical study of the lower forms of life. His book *A Flora and Fauna Within Living Animals* (1853) was the first important study of the parasites of the alimentary canal. Leidy's discovery of *Trichina spiralis* in pork led to Leuckart's discovery of the cause and mode of preventing trichinosis in man. In 1886 Leidy expressed his opinion that hookworm was the cause of pernicious anemia in the United States. He also became the chief American authority of his time on protozoa. His *Fresh Water Rhizopods of North America* (1879) is still a standard work. This, and many others of his books are illustrated by his own

drawings, noted for their delicate accuracy, especially in microscopical studies. His *Synopsis of Entozoa*, described and named more than 100 new species.

It was as a vertebrate palaeontologist, however, that Leidy won his chief fame. Before his time there were but a few scattered papers on the subject in America, and the discovery of new fossil deposits in the western States offered him an unparalleled opportunity to lay the foundation of American palaeontology, his knowledge of comparative anatomy being his chief aid in the work. His *Ancient Fauna of Nebraska* (1853) was the most important contribution to the subject in America up to that time. He followed this with monographs on the extinct sloth tribe, the extinct ox, horse, etc., and in 1865 published *Cretaceous Reptiles of the United States*. All the fossils of the F. V. Hayden Expedition in the Rocky Mountains (1853–66) were given to Leidy for determination, the results appearing in *Extinct Mammalian Fauna of Dakota and Nebraska* (1869), which contained many species and genera unknown to science, and others hitherto not known to have existed on the American continent The book is described by H. F. Osborn as "with the possible exception of Cope's *Tertiary Vertebrates*, the most important palaeontological work which America has produced" The discovery of Eocene material in Wyoming and Oregon beds, geologically older than the Nebraska and Dakota beds, provided the material for Leidy's last major palaeontological work, *Contributions to the Extinct Vertebrate Fauna of the Western Territories* (1873). His death occurred at Philadelphia on April 30, 1891

BIBLIOGRAPHY.—H. F. Osborn, "Biographical Memoir of Joseph Leidy," National Academy of Sciences, *Biographical Memoirs*, vol. vii. (1913); H. C. Chapman, "Memoir of Joseph Leidy," Academy of Natural Sciences of Philadelphia, *Proceedings* (1891); W S. W. Ruschenberger, "Sketch of the Life of Joseph Leidy," Am. Philos. Soc., *Proceedings*, vol. xxx. (1892). All contain extensive bibliographies of Leidy's writings, that in Osborn listing over 600 titles. *Researches in Helminthology and Parasitology*, a collection of Leidy's papers, was edited by J. Leidy, Jr. in 1904.

LEIF ERICSSON (*fl.* 999–1000), Scandinavian discoverer of America, of Icelandic family, the first known European discoverer of "Vinland," "Vineland" or "Wineland, the Good," in North America. He was a son of Eric the Red (*Eirikr hinn raudi Thorvaldsson*), the founder of the earliest Scandinavian settlements—from Iceland—in Greenland (985). In 999 he went from Greenland to the court of King Olaf Tryggvason in Norway, and was commissioned by him to proclaim Christianity in Greenland. Leif was driven far out of his course by contrary weather—this time to lands (in America) "of which he had previously had no knowledge," where "self-sown" wheat grew, and vines, and "mösur" wood. Leif took specimens of all these, and returned to his father's home in Brattahlid on Ericsfiord in Greenland.

Such is the account of the *Saga of Eric the Red*, supported by a number of briefer references in early Icelandic and other literature. The less trustworthy history of the *Flatey Book* makes Biarni Heriulfsson in 985 discover Helluland (Labrador?) as well as other western lands which he does not explore, not even permitting his men to land; while Leif Ericsson follows up Biarni's discoveries, begins the exploration of Helluland, Markland and Vinland, and realizes some of the charms of the last named, where he winters. But this secondary authority (the *Flatey Book* narrative) which till lately formed the basis of all general knowledge as to Vinland, abounds in contradictions and difficulties from which *Eric the Red Saga* is comparatively free. Looking at the record in *Eric the Red Saga*, it would seem probable that Leif's Vinland answers to some part of southern Nova Scotia. *See* VINLAND. (As to Helluland and Markland *see* THORFINN KARLSEFNI.)

The MSS. of *Eric the Red's Saga* are Nos. 544 and 557 of the Arne-Magnaean collection in Copenhagen; the MS. of the *Flatey Book*, was presented in 1662 to the Royal Library of Denmark, of which it is still one of the chief treasures. These leading narratives are supplemented by Adam of Bremen, *Gesta Hammaburgensis ecclesiae pontificum*, chap. 38 (247 Lappenberg) of book iv. (often separately entitled *Descriptio Insularum Aquilonis;* Adam's is the earliest extant reference to Vinland, *c.* 1070); we have also notices of Vinland in the *Libellus Islandorum* of Ari Frodi (*c.* 1120), the oldest Icelandic historian; in the *Kristni Saga* (repeated in Snorri Sturlason's *Heimskringla*); in *Eyrbyggia Saga* (*c.* 1250); in *Gretti Saga* (*c.* 1290); and in an Icelandic chorography of the 14th century, or earlier, partly derived from the famous traveller Abbot Nicolas of Thing-eyrar (†1159). (C. R. B.)

LEIGH, EDWARD (1602–1671), English Puritan and theologian, born at Shawell, Leicestershire, was educated at Magdalen hall, Oxford, from 1616, and subsequently became a member of the Middle Temple. In 1636 he entered parliament as member for Stafford, and during the Civil War held a colonelcy in the parliamentary army. The public career of Leigh terminated with his expulsion from parliament with the rest of the Presbyterian party in 1648. His works include: *Critica Sacra, containing Observations on all the Radices of the Hebrew Words of the Old and the Greek of the New Testament* (1639–44; new ed., with supp. 1662).

LEIGH, market town, parliamentary and municipal borough of Leigh, Lancashire, England, 13 m. W. of Manchester and 21 m. N.E. of Liverpool. On the L.M.S. railway (Leigh and West Leigh station) and L.N.E. railway (West Leigh and Bedford station). Pop. (1921) 45,532. The ancient parish church of St. Mary the Virgin was, with the exception of the tower, rebuilt in 1873 in the Perpendicular style. The grammar school, date of foundation unknown, is well endowed. The chief industries are, manufacture of silk, artificial silk, and cotton, glass making, iron foundries, brewing, flour milling and extensive coal mining. Several fine old houses are still left near Leigh.

LEIGHTON, FREDERICK LEIGHTON, BARON (1830–1896), English painter and sculptor, the son of a physician, was born at Scarborough on Dec. 3, 1830. He was taken abroad at a very early age, and studied in many different centres, as his family were constantly moving from place to place. He himself declared that he owed most to the teaching of Edward Steinle.

Earlier Work.—The picture which made his reputation in England was "Cimabue's Madonna carried in procession through the Streets of Florence," which appeared at the Royal Academy in 1855, and was purchased by Queen Victoria. Although, since his infancy, he had only visited England once (in 1851, when he came to see the Great Exhibition), he was not quite unknown in the cultured and artistic world of London, as he had made many friends during a residence in Rome of some two years or more after he left Frankfort in 1852. Amongst these were Giovanni Costa, Robert Browning, James Knowles, George Mason and Sir Edward Poynter, then a youth, whom he allowed to work in his studio. He also met Thackeray, who wrote from Rome to the young Millais: "Here is a very versatile young dog, who will run you close for the presidentship one of these days." During these years he painted several Florentine subjects—"Tybalt and Romeo," "The Death of Brunelleschi," a cartoon of "The Pest in Florence according to Boccaccio," and "The Reconciliation of the Montagues and the Capulets." In 1858 he visited London and made the acquaintance of the leading Pre-Raphaelites—Rossetti, Holman Hunt and Millais. In the spring of 1859 he was at Capri, always a favourite resort of his, and made many studies from nature, including a very famous drawing of a lemon tree. It was not till 1860 that he settled in London and in 1866 he took up his quarters at his celebrated house in Holland Park Road, with its Arab hall decorated with Damascus tiles. There he lived till his death.

Classical Pictures.—Amongst the finest of his classical pictures were—"Syracusan Bride leading Wild Beasts in Procession to the Temple of Diana" (1866), "Venus disrobing for the Bath" (1867), "Electra at the Tomb of Agamemnon," and "Helios and Rhodos" (1869), "Hercules wrestling with Death for the Body of Alcestis" (1871), "Clytemnestra" (1874), "The Daphnephoria" (1876), "Nausicaa" (1878), "An Idyll" (1881), two lovers under a spreading oak listening to the piping of a shepherd and gazing on the rich plain below; "Phryne" (1882), a nude figure standing in the sun; "Cymon and Iphigenia" (1884), "Captive Andromache" (1888), now in the Manchester Art Gallery; with the "Last Watch of Hero" (1887), "The Bath of Psyche" (1890), now in the Tate Gallery, "The Garden of the Hesperides" (1892), "Perseus and Andromeda" and "The Return of Persephone," now in the Leeds Gallery (1891); and "Clytie," his last work (1896).

Leighton was one of the most thorough draughtsmen of his day. His sketches and studies for his pictures contain the essence of his conceptions, and much of their beauty was often lost in the elaboration of the finished picture. He seldom succeeded in retaining the freshness of his first idea more completely than in his last picture—"Clytie"—which was left unfinished on his easel. He rarely painted sacred subjects. The most beautiful of his few pictures of this kind was the "David musing on the Housetop" (1865). Others were "And the Sea gave up the Dead which were in it" (1892), now in the Tate gallery, and the terrible "Rizpah" of 1893. His diploma picture was "St. Jerome," exhibited in 1869. Among the most individual and beautiful of his pictures are "The Summer Moon," two Greek girls sleeping on a marble bench, and "The Music Lesson."

Leighton also painted a few portraits, and executed a few pieces of sculpture.

As president of the Royal Academy, Leighton was punctilious in the discharge of his duties, ready to give help and encouragement to artists, and his tenure of the office was marked by some wise and liberal reforms. His death occurred on Jan. 25, 1896, and he was buried in the crypt of St. Paul's cathedral. The contents of his studio were sold at Christie's in the same year; but a large number of his drawings has been secured for exhibition at Leighton House, now a museum.

Leighton was elected an academician in 1868, and succeeded Sir Francis Grant as president in 1878, when he was knighted. He was created a baronet in 1886, and was raised to the peerage in 1896, immediately before his death. He had numerous honorary degrees, foreign distinctions, decorations and prizes. (C. Mon.)

See the Royal Academy Catalogue, Winter Exhibition, 1897; C. Monkhouse, *British Contemporary Artists* (1899); Ernest Rhys, *Frederick, Lord Leighton* (1898, 1900); Mrs. Russell Barrington, *The Life, Letters and Work of Frederick Leighton* (1906).

LEIGHTON, ROBERT (1611–1684), archbishop of Glasgow, was born, probably in London (others say at Ulishaven, Forfarshire), the eldest son of Dr. Alexander Leighton, the author of *Zion's Plea against the Prelacie*, and one of the victims of the Laudian persecution. Robert was educated at the university of Edinburgh, where he took his M.A. in 1631. He then spent several years in France. Either at this time or later he came into contact with the Jansenists. In 1641 he was ordained Presbyterian minister of Newbattle, Midlothian, and in 1643 signed the Covenant. In 1652 he resigned his charge and went to Edinburgh, where early in 1653 he was appointed principal of the university, and primarius professor of divinity.

In 1661, when Charles II. had resolved to force Episcopacy once more upon Scotland, he fixed upon Leighton for one of his bishops (*see* Scotland, Church of). The Episcopacy which he contemplated was that modified form which had been suggested by Archbishop Ussher, and to which Baxter and many of the best of the English Nonconformists would have readily given their adherence. Leighton travelled with the new bishops in the same coach from London towards Scotland, but having become, as he told Burnet, very weary of their company (as he doubted not they were of his), and having found that they intended to make a kind of triumphal entrance into Edinburgh, he left them at Morpeth and retired to the earl of Lothian's at Newbattle. He very soon lost all hope of being able to build up the church by the means which the government had set on foot, and his work, as he confessed to Burnet, "seemed to him a fighting against God." He did, however, what he could, governing his diocese (that of Dunblane) with the utmost mildness, and endeavouring to persuade the Presbyterian clergy to come to an accommodation with their Episcopal brethren. After a hopeless struggle of three or four years to induce the government to cease the persecution of the Covenanters, he went up to London in 1665 to resign his bishopric, but was induced by Charles to remain. In 1669 Leighton again went to London and made fresh representations on the persecution of the Covenanters, and in 1670 he reluctantly agreed to accept the archbishopric of Glasgow. He now redoubled his efforts for conciliation between Presbyterians and the Episcopacy, but had no success. He resigned the archbishopric in 1674 and retired to Broadhurst, Sussex, where he spent the happiest years of his life. He died suddenly in a London inn in 1684.

Leighton was little suited to the part he had to play in Scotland. He was made for the meditative life, and his aloofness from every day life brought on him the dislike of both the conflicting parties in the church. It is stated that he left orders that all his mss. should be destroyed after his death. But fortunately for the world this charge was disregarded. His writing seems to flow without effort; it is the easy unaffected outcome of his saintly nature. It was a common reproach against Leighton that he had leanings towards Roman Catholicism, and perhaps this is so far true that he had formed himself in some degree upon Pascal and Thomas à Kempis.

The best account of Leighton's character is that of Bishop Burnet in *Hist. of his Own Times* (1723–34). *See* the editions of his *Works* published by W. West (7 vols., 1869–75), selections (with biography) by Dr Blair of Dunblane (1883); Andrew Lang, *History of Scotland* (1902).

LEIGHTON BUZZARD, a town in Bedfordshire, England, 40 m. N.W. of London by the L.M.S. railway. Pop. (1921) 6,797. It lies in the valley of the Ouzel, a tributary of the Ouse. The Grand Junction canal follows its course, and gives the town extensive water-communications. The church of All Saints is cruciform, with central tower and spire. It is mainly Early English. On one of the tower-arch pillars are some early carvings of jocular character. The market cross is of the 14th century. Leighton has a considerable agricultural trade, and some industry in straw-plaiting, gravel, sand and clay pits nearby, coach building, paper making and gardening.

LEININGEN, the name of an old German family, whose lands lay principally in Alsace and Lorraine. The first count of Leiningen about whom anything certain is known was a certain Emicho (d. 1117), whose family became extinct in the male line when Count Frederick, a Minnesinger, died about 1220. Frederick's sister, Liutgarde, married Simon, count of Saarbrücken, and Frederick, one of their sons, inheriting the lands of the counts of Leiningen, took their arms and their name. Having increased its possessions the Leiningen family was divided about 1317 into two branches; the elder of these, whose head was a landgrave, died out in 1467. On this event its lands fell to a female, the last landgrave's sister Margaret, wife of Reinhard, lord of Westerburg, and their descendants were known as the family of Leiningen-Westerburg. Later this family was divided into two branches, those of Alt-Leiningen-Westerburg and Neu-Leiningen-Westerburg, both of which are represented to-day.

Meanwhile the younger branch of the Leiningens, known as the family of Leiningen-Dagsburg, was flourishing, and in 1560 this was divided into the lines of Leiningen-Dagsburg-Hartenburg, founded by Count John Philip (d. 1562), and Leiningen-Dagsburg-Heidesheim or Falkenburg, founded by Count Emicho (d. 1593). In 1779 the head of the former line was raised to the rank of a prince of the Empire. In 1801 this family was deprived of its lands on the left bank of the Rhine by France, but in 1803 it received ample compensation for these losses. A few years later its possessions were mediatized, and they are now included mainly in Baden, but partly in Bavaria and in Hesse.

See Brinckmeier, *Genealogische Geschichte des Hauses Leiningen* (Brunswick, 1890–91).

LEINSTER, a province of Ireland, occupying the middle and south-eastern portion of the island, and extending to the left bank of the Shannon. It includes the following counties, Longford, Westmeath, Meath, Louth, King's County, Kildare, Dublin, Carlow, Wicklow, Kilkenny and Wexford (*qq.v.* for topography, etc.). Leinster (*Laighen*) was one of the early Gaelic provinces of Ireland. Meath, the modern county of which is included in Leinster, was the name of a separate province created in the 2nd century A.D. The MacMurroughs, kings of Leinster retained their position until 1171, and their descendants maintained independence in Carlow and Wexford as late as the 16th century. In 1170 Richard Strongbow married Aoife, daughter of the last king Diarmid, and thus acquired a claim to the kingdom but accepted Leinster instead from Henry II. as a fief of the Crown. His daughter Isabel married William Marshal,

earl of Pembroke, and when the family died out in the male line (1243), heiresses shared the territory of Leinster, which was now divided into five liberties, namely, Carlow, Kilkenny, Wexford, Kildare and Leix. The history of Leinster thereafter passes to the several divisions which were gradually organized into the present counties.

LEIPER, ROBERT THOMPSON (1881–), British biologist, was born at Kilmarnock on April 17, 1881, and educated at Warwick school, and Birmingham and Glasgow universities. In 1904 he was awarded a Carnegie research scholarship in biology. In 1907 he was appointed on the Egyptian government survey in Uganda; he also accompanied research expeditions to the Gold Coast (1905), Nigeria (1912), China (1914) and British Guiana (1921). During the World War (1915–16) he was attached as consultant parasitologist to the R.A.M.C. bilharzia mission in Egypt. From 1919–21 he was director of the prosectorium at the Zoological gardens, London. He edited the *Journal of Helminthology*, and is professor of helminthology in the University of London, and director of the division of medical zoology of the London School of Hygiene and Tropical Medicine.

His works include: *Researches on Egyptian Bilharziosis* and numerous papers on medical, veterinary and general helminthology.

LEIPZIG, city of Germany, the first town of the republic of Saxony in size and commercial importance, 70 m. N.W. of Dresden and 111 m. S.W. of Berlin by rail, and 6 m. from the Prussian frontier. It lies 350 ft. above sea-level in a plain, just above the junction of three small rivers, the Pleisse, the Parthe and the Elster, which flow in various branches through or round the town Leipzig in point of trade and industries ranks among German cities immediately after Berlin and Hamburg. It possesses the third largest German university, and is seat of the supreme tribunal of the German republic. It consists of the old, or inner city, and of the inner and outer suburbs. Many villages have been incorporated with the city, and with these accretions the population in 1925 amounted to 679,159

Antiquities.—The old town has narrow streets and numerous houses of the 16th and 17th centuries, with high-pitched roofs. Upon the market square the four main business streets converge, and its north side is occupied by the old Rathaus, a Gothic edifice built in 1556. Behind the market square and the main street lies a labyrinth of narrow streets interconnected by covered courtyards and alleys, with extensive warehouses and cellars. The whole, in the time of the great fairs, is packed with merchandise and thronged with a motley crowd. Close to the old Rathaus is Auerbach's *Hof*, built about 1530 and immortalized in Goethe's *Faust* It has a curious old wine vault (Keller) which contains a series of mural paintings of the 16th century, representing the legend on which the play is based. Near by is the picturesque Königshaus, for several centuries the palace of the Saxon monarchs in Leipzig In the south-west corner of the inner town lay the Pleissenburg, or citadel, modelled, according to tradition, on that of Milan, and built early in the 13th century. Here Luther in 1519 held his momentous disputation. The round tower was long used as an observatory and the building as a barrack. With the exception of the tower, the citadel has been removed and its site is occupied by the new Rathaus. The business of Leipzig is chiefly concentrated in the inner city, but the headquarters of the book trade lie in the eastern suburb. Upon the Augustusplatz is the main building of the university. The oldest church, in its present form, is the Paulinerkirche, built in 1229–40, and restored in 1900, with a curiously grooved cloister; the largest in the inner town is the Thomaskirche, with a high-pitched roof dating from 1496, and memorable for its association with J. Sebastian Bach, who was organist here. On the east is the Johanneskirche, round which raged the last conflict in the battle of 1813, when it suffered severely from cannon shot. In it is the tomb of Bach, and opposite its main entrance is the Reformation monument, with bronze statues of Luther and Melanchthon. Here is the new Gewandhaus, or Konzerthaus, built in 1880–84, the old Gewandhaus, or Drapers' hall, in the inner town having again been devoted to commercial use as a market hall during the fairs. Immediately opposite to it is the new university library. Between the university library and the new Gewandhaus stands a monument of Mendelssohn. Immediately to the east of the school of arts is the building of the supreme tribunal of the German republic, the Reichsgericht, which was built in 1888–95, and bears a dome crowned by a bronze figure of Truth. In the centre of the book-trade quarter stand close together the modern Buchhändlerhaus (booksellers' exchange), the great hall decorated with allegorical pictures by Sascha Schneider, and the Buchgewerbehaus, a museum of the book trade. The city also has an astronomical observatory.

Education, etc.—The university of Leipzig, founded in 1409 by a secession of 400 German students from Prague, is one of the most influential in the world It has large revenues derived to a great extent from house property in Leipzig and estates in Saxony. To the several faculties also belong various collegiate buildings, notably, to the legal, that of the *Collegium beatae Virginis* in the Petersstrasse, and to the philosophical the *Rothe Haus* on the promenade facing the theatre.

As a musical centre Leipzig is known all over the world for its associations with J. S. Bach, its excellent conservatorium, and for the series of concerts given annually in the Gewandhaus. The prominence of the publishing interest has attracted to Leipzig a large number of authors, and made it a literary centre of considerable importance. Hundreds of newspapers and periodicals are published here, and the city has always been distinguished for its cosmopolitan spirit.

Commerce.—The outstanding importance of Leipzig as a commercial town is mainly derived from its great fairs, which annually attract merchants from all parts of Europe, and from Persia, Armenia and other Asiatic countries. The most important fairs are held at Easter and in September, and are said to have been founded as markets about 1170. The smaller New Year's fair was established in 1458 and there are still others. Under the fostering care of the margraves of Meissen, and then of the electors of Saxony they attained great popularity. In 1268 the margrave of Meissen granted a safe-conduct to all frequenters of the fairs, and in 1497 and 1507 the emperor Maximilian I. greatly increased their importance by prohibiting the holding of annual markets at any town within a wide radius of Leipzig. During the following centuries on account of the wars the trade of the Leipzig fairs considerably decreased, but it recovered after the accession of Saxony to the German Customs Union (*Zollverein*) in 1834. Since then wares that can be safely purchased by sample appear at the fairs in steadily diminishing quantities, while others, such as hides, furs and leather, which require to be actually examined, show as marked an increase. The principal commodity is furs (chiefly American and Russian); other articles disposed of are leather, hides, wool, cloth, linen and glass.

In the trades of bookselling and publishing Leipzig occupies a unique position being said to take the first place in the world for the number and total value of its sales. Leipzig contains about 200 printing-works, some of great extent, and a corresponding number of type-foundries, binding-shops and other kindred industries.

Other industries include the manufacture of artificial flowers, wax-cloth, chemicals, various oils and essences, beer, mineral waters, tobacco and cigars, paints, cardboard, musical and surgical instruments, textiles (cotton and hosiery), machinery, lace, india-rubber wares, rush-work and paper, the preparation of furs, and ironfounding. These industries are mostly carried on in the suburbs.

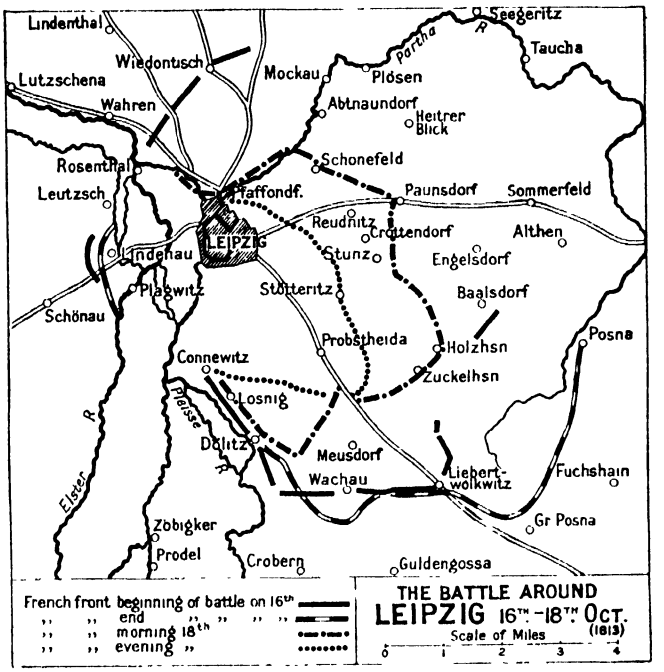
Leipzig possesses one of the largest railway stations in the world and from it radiate lines to all the great German cities—to Berlin, Frankfort on the Oder, Breslau, Dresden, Regensburg, Cassel and Magdeburg.

History.—Leipzig owes its origin to a Slav settlement between the Elster and the Pleisse, which was in existence before the year 1000, and its name to the Slav word *lipa*, a lime tree. There was also a German settlement near this spot, probably round a castle erected early in the 10th century by the German king, Henry the Fowler. The district was part of the mark of Merseburg, and the bishops of Merseburg were the lords of extensive areas around the settlements. In the 11th century Leipzig is mentioned as a fortified

place and in the 12th it came into the possession of the margrave of Meissen, being granted some municipal privileges by the margrave, Otto the Rich, before 1190. Its favourable situation in the midst of a plain intersected by the principal highways of central Europe, together with the fostering care of its rulers, cooperated toward raising Leipzig to the position of a very important commercial town. Powers of self-government were acquired by the council (*Rat*) of the town, the importance of which was enhanced during the 15th century by several grants of privileges from the emperors. When Saxony was divided in 1485 Leipzig fell to the Albertine, or ducal branch of the family, whose head, Duke George, gave new rights to the burghers.

During the Thirty Years' War Leipzig suffered six sieges and on four occasions was occupied by hostile troops, being retained by the Swedes as security for the payment of an indemnity from 1648 to 1650. After 1650 its fortifications were strengthened; its finances were put on a better footing; and its trade, especially with England, began again to prosper, important steps being taken with regard to its organization. Towards the end of the 17th century the publishing trade began to increase very rapidly, partly because the severity of the censorship at Frankfurt-on-Main caused many booksellers to remove to Leipzig. Since 1825 it has become the general headquarters of the German book-trade; and its annual fair, attended by booksellers of all nations, has attained a world-wide importance.

The immediate neighbourhood of Leipzig has been the scene of several battles, two of which are of more than ordinary importance. These are the battles of Breitenfeld, fought on Sept 17, 1631, between the Swedes under Gustavus Adolphus and the imperialists, and the great battle of Leipzig, known in Germany as the *Volkerschlacht* (Battle of the Nations) (*see* below)



In the German Revolution which followed the end of the World War Leipzig was the scene of much bloodshed. Further disturbances continued for several days during the formidable revolutionary agitation which recurred in the Spring of 1920. *See* also SAXONY

Towards the middle of the 18th century Leipzig was the seat of the most influential body of literary men in Germany, over whom Johann Christoph Gottsched, like his contemporary, Samuel Johnson, in England, exercised a kind of literary dictatorship. Then, if ever, Leipzig deserved the epithet of a "Paris in miniature" (*Klein Paris*) assigned to it by Goethe in his *Faust*. The young Lessing produced his first play in the Leipzig theatre, and the university counts Goethe, Klopstock, Jean Paul Richter, Fichte and Schelling among its alumni. Schiller and Gellert also resided for a time in Leipzig, and Sebastian Bach and Mendelssohn filled musical posts there. Among the celebrated natives of the town are the philosopher Leibnitz and the composer Wagner.

LEIPZIG, BATTLE OF, or more grandiloquently BATTLE OF THE NATIONS, the engagements of Oct. 16, 18 and 19, 1813, which ended in the defeat of Napoleon and the destruction of what remained of the *grande armée*. That Napoleon fought at Leipzig at all was due to the Allied threat to concentrate at that city and cut him off from his base, marked on Oct. 3 by Blücher's defeat of Bertrand, and advance to Kemberg, Bernadotte's passage of the Elbe at Acken and Rosslau, and Schwarzenberg's advance south of Leipzig. The initiative, as throughout the war of 1813, had passed to his opponents: moreover, in pursuance of diplomatic rather than strategic ends, he left St. Cyr and Lobau with three corps in Dresden even after he had decided to move westwards (Oct. 8).

On Oct. 14–15 the first conflict took place at Wachau, where Murat threw back the van of Schwarzenberg's army advancing from the south. Napoleon's dispositions were complete by the night of Oct. 15 and the battle began next morning (*see* plan). The Allies were in two armies, the Prussian Blucher attacking from the north, the Austrian Schwarzenberg from the south Bernadotte with his Swedes was, probably of intention, hanging

back. He had no wish, entertaining the hopes he did of a French crown, to become famous for a victory over French troops and he probably shared in an unusual degree the general fear of Napoleon's abilities. Blücher's main strength lay on the eastern side of the river Elster, before Möckern, where he faced Marmont. West of the Elster Bertrand covered the sole French line of retreat, the Frankfort highway, his opponent being Gyulay. The main attack was made by Schwarzenberg from the south, and against him Napoleon launched his heaviest blows. The allies had 325,000 effective troops to the French 214,000.

Schwarzenberg, a commander of second-rate abilities, nearly gave the victory to the French early in the day. He adopted the plan of attempting to outflank Napoleon's forces by extending his army to the left, beyond Connewitz Such a movement was perfectly possible on paper, but in fact the low-lying meadows of the Pleisse and Elster were an almost impassable swamp The Austrian forces were before long helplessly entangled: they were in fact mired. Meanwhile, the French troops had withstood the general assault and by midday Napoleon judged that the time was ripe for his grand stroke, which was to be to smash through the enemy's centre as far as Guldengossa and roll up his right. It is stated that the artillery attack at this time was so severe that the French cannon was no longer heard in separate shots but as one continuous roll. By two o'clock Victor, Oudinot, Mortier and MacDonald were beyond Guldengossa, but the village itself still held out, until the cavalry, directed by Murat, Kellerman and Latour Maubourg, were launched upon it in a magnificent charge The allied forces were driven out in apparent disaster, but ruin was averted by the tsar Alexander, who overruled Schwarzenberg, withdrawing from him the Russo-Austrian reserves, which he sent with the Cossack guard against Murat, who was forced to retreat. Marmont meanwhile had been forced to withdraw before Blücher, while Bertrand had driven back Gyulay.

The day had thus ended indecisively, but victory might yet have gone to the French. On the next day, however, when the allies did not attack, Napoleon was overcome by the curious lassitude which reappears so frequently in this campaign, "a carelessness" wrote Marmont, "which it is impossible to explain."

He amused himself by sending a useless message to the emperor of Austria suggesting negotiations and on the 18th, when the Allies renewed the attack, the French position was unimproved, while the Allies had at last received the assistance of Bernadotte. The battle of the 18th, as may be seen from the plan, was fought on a somewhat different field. In the north, as before, Marmont slowly withdrew before Blücher, Ney (around Paunsdorf) before Bennigsen and Bernadotte. Beyond the Elster Bertrand routed Gyulay. The fiercest fighting of all took place at Probstheida and Stötteritz, under Napoleon's own eyes, where the combined Russians and Austrians repeatedly flung themselves in vain upon the French lines, until human bodies formed the ground upon which the armies fought. The ferocious conflict continued until nightfall when with the cessation of the battle news was brought to Napoleon that 35,000 Saxons had deserted to the enemy. This, together with the absence of the victory on which he had calculated, made retreat essential, but the emperor sat for nearly an hour in a stupor before he gave the necessary orders.

The French troops streamed all night across the one stone bridge over the Elster (the temporary wooden structure erected by French engineers early collapsed). In the morning the Allies, realizing what was occurring, pressed their attack, and the retreat grew hastier and more confused. At last, at two o'clock, as the main French army had crossed the river, the Allies stormed the town. By an idiotic mistake a French subaltern had blown up the bridge, and as the French rearguard came crashing through the town they found their last retreat cut off. Horse and foot were forced into the river; some, like MacDonald, swam across; many, like Poniatowski, were drowned; 20,000 French soldiers were captured (*see* NAPOLEONIC CAMPAIGNS; NAPOLEON).

(R. W. P.)

LEIRIA, an episcopal city on the river Liz and on the Lisbon-Figueira da Foz railway. Pop. (1911) 4,697; district, pop. (1920) 279,124; area 1,317 sq. m. The principal buildings of Leiria are the ruined citadel, which dates from the 13th century and the cathedral, a small Renaissance building erected in 1571 but modernized in the 18th century. The main square of the city is named after the poet Francisco Rodrigues Lobo, who was born here about 1580. Between Leiria and the Atlantic there are extensive pine woods known as the Pinhal de Leiria, which were planted by King Dinis (1279–1325) with trees imported from the Landes in France, in order to give firmness to the sandy soil. In the neighbourhood there are glass and iron foundries, oil wells and mineral springs. Leiria, the Roman Colippo, was taken from the Moors in 1135 by Alphonso I. King Dinis made it his capital. In 1466 the first Portuguese printing-press was established here; in 1545 the city was made an episcopal see.

LEISLER, JACOB (*c.* 1635–1691), American political agitator, was born probably in Frankfurt-on-Main, Germany, about 1635. He went to New Netherland in 1660 as a soldier in the service of the Dutch West India company, married a wealthy widow and successfully engaged in trade. When news of the imprisonment of Governor Andros in Massachusetts was received, a group of rebels under Leisler's command, fired largely by anti-Papist sentiment, took possession of Ft. James, and announced their determination to hold it until the arrival of a Protestant governor commissioned by the new sovereigns. After Lieut.-Governor Francis Nicholson sailed for England, a committee of safety was organized by the popular party, and Leisler was appointed commander-in-chief. Under authority of a letter from the home Government addressed to Nicholson, or in his absence to "such as for the time being take care for preserving the peace and administering the laws in His Majesty's province of New York," he assumed the title of lieutenant-governor in Dec. 1689, appointed a council and took charge of the Government of the entire province. He summoned the first intercolonial congress in America, which met in New York on May 1, 1690, to plan concerted action against the French and Indians. Leisler refused to surrender the fort to Maj. Richard Ingoldsby, who landed with his soldiers in Jan. 1691, and after some controversy an attack was made on March 17 in which two soldiers were killed and several wounded. When Col. Henry Sloughter, who had been commissioned governor of the province, arrived two days later Leisler hastened to give over to him the fort and other evidences of authority. He and his son-in-law, Jacob Milborne, who had many powerful colonial opponents, were charged with treason for refusing to submit to Ingoldsby, were convicted, and executed on May 16, 1691. Their estates were, however, later restored to their families and the attainder reversed. There has been much controversy among historians with regard both to the facts and to the significance of Leisler's brief career as ruler in New York.

Soc., *Collections* (1868); *Narratives of the Insurrections* ("Original Narratives of Early American History," 1915).

LEISNIG, a town in the republic of Saxony on the Freiberger Mulde, 7 m. S.E. of Grimma by rail from Leipzig to Dresden via Döbeln. Pop. (1925) 7,712. About 1080 it passed into the possession of the counts of Groitzsch, but was purchased in 1157 by the emperor Frederick I., who committed it to the charge of counts. It fell to Meissen in 1365, and later to Saxony. High above the town lies the old castle of Mildenstein, now used as administrative offices. Industries include the manufacture of cloth, furniture, boots, cigars, toys, beer, machinery and chemicals.

LEITH or **PORT OF LEITH,** incorporated with Edinburgh, Scotland, in 1920, had a population of 80,488 in 1911. It is situated on the south shore of the Firth of Forth. It has stations on the L.N.E. and L.M.S. railways, and a branch line (L.N.E.) to Portobello.

The town is a thriving centre of trade and commerce, and the second port of Scotland. St. Mary's in Kirkgate, the parish church of South Leith, was founded in 1483 and restored in 1852. Here David Lindsay (1531–1613), its minister, James VI.'s chaplain and afterwards bishop of Ross, preached before the king the thanksgiving sermon on the Gowrie conspiracy (1600). John Logan, the hymn-writer and reputed author of "The Ode to the Cuckoo," was minister for thirteen years; and in its graveyard lies the Rev. John Home, author of *Douglas,* a native of Leith. Trinity House (1817), which contains some interesting portraits, was founded in 1555 as a home for old and disabled sailors, but on the decline of its revenues it became the licensing authority for pilots. There is a fine academy and technical school. The east and west piers are favourite promenades, and the waterway between them is the entrance to the harbour.

The oldest industry is shipbuilding, which dates from 1313. Here in 1511 James IV. built the "St. Michael." Other important industries are engineering, sugar-refining, meat-preserving, flour-milling, sailcloth-making, soap-boiling, rope, sail, soap and paint making, tanning, chemical manure-making, wood-sawing, brewing, distilling and fish-curing. The chief imports are grain, timber and sugar, and the chief exports coal, iron and cotton goods. Leith is the headquarters of the whisky business in Great Britain, and stores also large quantities of wine from Spain, Portugal and France. There are excellent docks, with a total acreage of 106, 8 dry docks and capacious warehouses. A new dock is planned to extend northwards into the Forth. Apart from coasting trade there are constant sailings to the leading European ports, the United States, Canada, Japan, etc. Leith Fort, built in North Leith in 1779 for the defence of the harbour, is now the headquarters of the Royal Artillery in Scotland. Leith is the head of a fishery district. The town sends one member to parliament.

Leith figures as Inverleith in the foundation charter of Holyrood abbey (1128). In 1329 Robert I. granted the harbour to the magistrates of Edinburgh, who did not always use their power wisely. They forbade, for example, the building of streets wide enough to admit a cart, a regulation that accounted for the number of narrow wynds and alleys in the town. Had the overlords been more considerate incorporation with Edinburgh would not have been so bitterly resisted. Several of the quaint bits of ancient Leith yet remain. During the centuries of strife between Scotland and England its situation exposed the port to attack both by sea and land. At least twice (in 1313 and 1410) its shipping was burned by the English, who also sacked the town in 1544—when

the 1st earl of Hertford destroyed the first wooden pier—and 1547. After the death of James V., Leith became the stronghold of the Roman Catholic and French party from 1548 to 1560, Mary of Guise, queen regent, not deeming herself secure in Edinburgh. In 1549 the town was walled and fortified by Montalembert, sieur d'Essé, the commander of the French troops, and endured an ineffectual siege in 1560 by the Scots and their English allies. A house in Coalhill is thought to be the "handsome and spacious edifice" erected for her privy council by Mary of Guise.

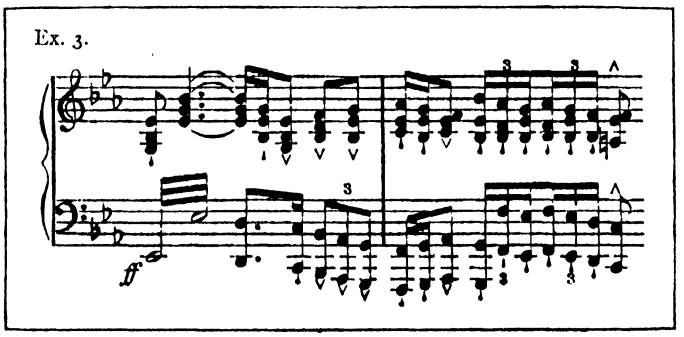
LEITMERITZ: *see* LITOMERICE.

LEITMOTIV (leading motive), a term invented by Hans von Wolzogen (b. 1848), the well-known Wagnerian analyst and commentator, as a convenient designation for the characteristic and constantly-recurring musical motives, also known sometimes as "representative themes," which play such an all-important part in Wagnerian opera and the development of which as a musical device constitutes one of Wagner's most important contributions to the technique of opera. For though, as has often been pointed out, Wagner did not actually invent the principle of representative themes, which had been employed earlier in a rudimentary manner by Mozart, Weber and others, he developed it so enormously and utilized its possibilities with such consummate resourcefulness and skill as to make it practically a new thing and to produce in the result a kind of opera utterly different from any which had been known before.

And yet the principle in itself is so simple and, as it now seems, so obvious, that it might be thought surprising that it had never been turned to better account previously. But the average composer might certainly well despair of employing the system with the amazing skill and resourcefulness displayed by Wagner. A whole treatise might indeed be written on the wonders of the leading motive system as it was developed by Wagner and in the case of which one knows not whether most to admire the felicity and expressiveness of the themes themselves or the wonderful manner in which they are subsequently developed.

Especially remarkable is the way in which they are modified and metamorphosed in correspondence with the varying requirements of the action and the development of the drama. An oft-quoted instance from the "Ring" is the transformation which the simple joyous motive of "Siegfried's Horn Call"—ex. 1:

Ex. 1.

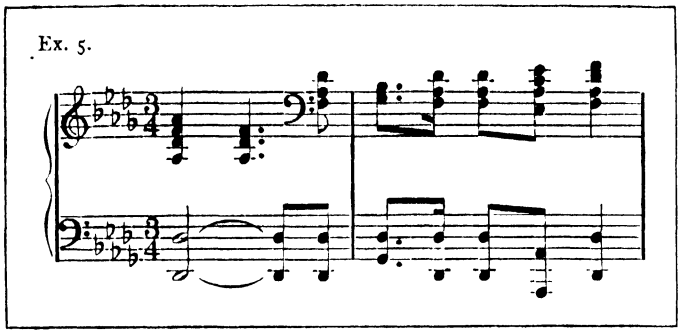


undergoes when later, in *Götterdämmerung*, it is employed, richly harmonized, to characterize the more matured Siegfried—ex. 2:

Ex. 2.

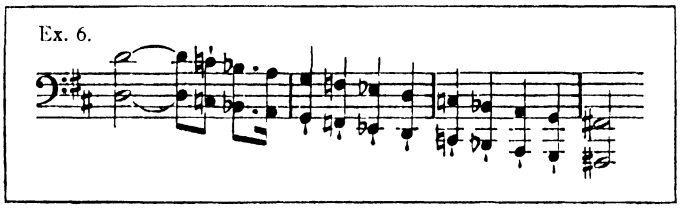
and finally, in the sublime Trauermarsch, is still further enriched and ennobled to express the emotions associated with his death and apotheosis—ex. 3:

Ex. 3.



But this is only one of countless examples which might be cited. Such an elementally simple theme, for instance, as that of the so-called "Bondage" motive from the *Ring*, consisting of two notes only, is made to undergo the most astonishing transformations as the drama proceeds, while as one of innumerable other examples one may take the transformation of the bare and not particularly alluring theme of the "ring" itself—ex. 4:

Ex. 4.



into the gorgeous strains of the noble "Walhall" motive—ex. 5:

Ex. 5.

Another typical instance, not so well known, of the ingenuity with which one theme is sometimes converted into another of a totally different character is afforded by the transformation of the simple and severe motive known variously as that of the "Spear" or the "Treaty"—ex. 6:

Ex. 6.

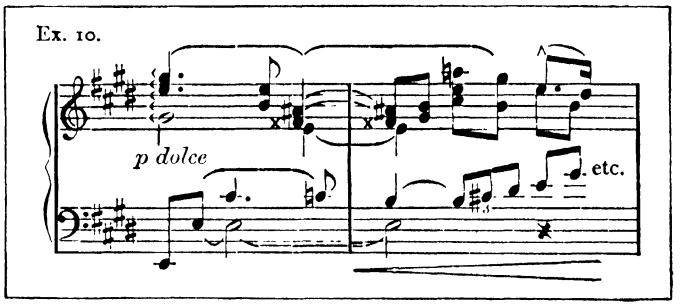
into the heroic and richly-expressive theme of the "World's Heritage"—ex. 7:

Ex. 7.

the actual notes of the melodic outline being precisely the same but changed out of all recognition by the successive leaps to the octave, the alteration of the rhythm and the addition of the splendid harmonization.

All of the foregoing examples have been chosen from the *Ring* but it hardly needs saying that *Tristan und Isolde* and *Die Meistersinger* supply others in plenty no less striking. Take for instance a beautiful one from the third act of *Tristan und Isolde*, in the case of which the psychological situation is one of exceptional complexity since it combines in equal measure the emotions of both the utmost grief and the highest joy. In other words the stricken Tristan lies actually dying but in his delirium fancies that Isolde has come to him and is consequently filled with ecstasy. How then does Wagner solve the problem? In the simplest and at the same time the most extremely effective manner imagirable. That is to say he *combines* the "Grief" motive—ex. 8:

Ex. 8.



with the "Rapture" motive—ex. 9:

Ex. 9.

and thereby obtains the following indescribably expressive and poignant result, conveying at one and the same time all the rapture and all the pathos of the situation—ex. 10:

Ex. 10.

A more striking instance of the subtle possibilities of the leading motive principle when employed by a master it would not be easy to find, though it could be paralleled again and again in Wagner's scores, and in the light of such examples one may well wonder how Debussy could ever have brought himself to perpetrate his foolish gibe at what he called the "visiting card" principle.

The leading motive method is invaluable moreover not merely in the more obvious way, as a means of providing the kind of music most in keeping with the ever-varying requirements of the dramatic situation, but also as a means of providing the best kind of material for the construction of the entire musical fabric. In the case of Wagner's later works the instrumental portion of the score consists more often than not of nothing but one continuous network of interwoven motives, thereby affording in place of the mere "accompaniment" of the older composers a feast of never-ending interest and delight to the ear—and this, be it noted, whatever may be the character of the vocal part at any given moment.

Invaluable indeed are the uses of the leading motive principle in this respect inasmuch as it permits of the voice parts being kept quite restrained and unemotional in character when the dramatic situation requires this without any diminution of the musical interest, which is maintained by the instrumental foundation in a manner which would otherwise be almost impossible. Take as illustration the scene from the first act of *Die Meistersinger* in which Pogner is unfolding to the assembled mastersingers his scheme for the singing contest. His remarks being purely expository and quite unemotional in character naturally call for vocal expression to correspond and so it is in quite level and conversational tones, as it were, that Pogner expounds his plan. But this entails no sacrifice whatever of the musical interest since this is maintained at the highest level by the uninterrupted flow of lovely motives—the "St. John's Day" motive, the "Guild" motive, the "Art Union" motive, and so on—of which the instrumental accompaniment is made up.

Since Wagner showed the way nearly all subsequent operatic composers have followed his example and adopted the same procedure, although there have been some notable exceptions. Puccini, for instance, adopted the leading motive principle only to the most limited extent and Debussy, in his only opera, *Pelléas et Mélisande,* did not employ it at all. Richard Strauss on the other hand has pushed it to its extremest limits, displaying therein, alike in his symphonic poems and in his operas, an amount of ingenuity which is sometimes more apparent than the inspiration And this is of course the danger of the leading motive system, especially when it is carried out by inferior practitioners, namely the risk of its becoming a purely mechanical exercise in theme-juggling. But even in this event the result is likely to be at least more interesting than when the older method is employed.

(H. A. Sc.)

LEITRIM, a county of Ireland in the province of Connaught, bounded north-west by Donegal bay, north-east by Fermanagh, east by Cavan, south-east by Longford, south-west by Roscommon and west by Sligo. Area 392,381 ac. or about 613 sq. miles. Pop. (1926) 55,888.

The county has a floor of Carboniferous Limestone, which forms scarped hills near Donegal bay. The northern part of the county is a tableland, of which the highest summits belong to the Truskmore hills, reaching 1,712 ft.; with Benbo, 1,365 ft. and Lackagh 1,446 feet. The underlying sandstone appears at Lough Melvin, and again on the margin of a Silurian area in the extreme south. The Upper Carboniferous series, dipping southward, form mountainous country round Lough Allen, where the name of Slieve Anierin records the abundance of clay-ironstone beneath the coal seams. The sandstones and shales of this series scarp boldly towards the valley of the Bonnet, across which rises the ridge of ancient gneiss which forms, in Benbo, the north-east end of the Ox mountains. The ironstone was smelted in the upland at Creevelea down to 1859, and the coal is worked in a few thin seams.

The principal river is the Shannon, which, issuing from Lough Allen, forms the south-western boundary of the county with Roscommon. The Bonnet rises in the north-west and flows to Lough Gill, and the streams of Drones and Duff separate Leitrim from Donegal and Sligo. Besides Lough Allen, which has an area of 8,900 ac., the principal lakes are Lough Macnean, Lough Scur, Lough Garadice and Lough Melvin. Lough Melvin and the coast rivers afford rod fishing, the lough being noted for its trout.

Co. Leitrim, under the name of Hy Bruin-Brenny, formed the western part of Brenny or Breffny. It was for a long time held by the O'Rourkes, a family which long maintained its independence. Leitrim was not created a county until 1583. Large confiscations were made in the reigns of Elizabeth and James I., in the Cromwellian period, and after the Revolution of 1688.

There are "druidical" remains near Fenagh and at Letterfyan, and monastic ruins at Creevelea near the Bonnet, and in the parish of Fenagh. There was a Franciscan friary at Jamestown. The abbeys of Mohill, Annaduff and Drumlease have been converted into parish churches. Among the more notable old castles are Manor Hamilton now in ruins, and Castle John on an island in Lough Scur. A village named Leitrim about 4 m. N. of Carrick-on-Shannon is said to have been the seat of an early bishopric.

The climate is moist and unsuitable for grain crops. On the higher districts the soil is stiff and cold, and retentive of moisture, but some valleys are fertile. Lime, marl and similar manures are abundant. Potatoes are grown, but oats, the principal grain crop, are scanty. The live stock consists chiefly of cattle, pigs and poultry. Coarse linens for domestic purposes are manufactured and coarse pottery is also made. The Sligo, Leitrim and Northern Counties railway, connecting Sligo with Enniskillen, crosses the north of the county, by way of Manor Hamilton; the Mullingar and Sligo line of the Great Southern has a station at Carrick-on-Shannon; while connecting with this line at Dromod is the line to Ballinamore and Arigna, and to Belturbet in Co. Cavan. The administrative counties of Leitrim and Sligo together return seven members to Dáil Eireann.

LEIX (or LAOIGHIS) COUNTY (formerly Queen's County), a county of Ireland, in the province of Leinster,

bounded north-west and north by Offaly County, east by Kildare, south by Carlow and Kilkenny, and west by Tipperary; area, 424,723 ac., or about 664 sq. miles. Pop. (1926) 51,549. The limestone plain prevails in the county, but the high coalfield, shared with Kilkenny and Carlow, rises from it in the south; while the Slieve Bloom mountains (Arderin, 1,733 ft.), a round-backed Old Red Sandstone mass with Silurian inliers, dominate the lowland west of Maryborough. The limestone itself produces a range of hills near Stradbally, on which stands the fortress of Dunamase. Esker gravels provide sandy soils in many places. Clay ironstone was formerly raised in connection with the anthracite from the coalfield. The Barrow which has its source in the Slieve Bloom mountains, and which forms at various points the boundary with Offaly County, Kildare and Carlow, and the Nore, which enters the county from Tipperary near Borris-in-Ossory, are the principal rivers. The largest lake is Lough Anaghmore on the north-western boundary. The Grand canal enters the county at Portarlington, and runs southwards to the Barrow in Kildare, a branch passing westwards 12 m. to Mountmellick.

The territory now included in Co Leix covered the districts of Leix, Slewmargy, Irry and part of Glenmaliry, until in 1556 it was made shire ground. Three miles south of Stradbally is Dun of Clopook, an ancient dun or fort occupying the whole extent of the hill. Aghaboe, where there are the ruins of the abbey, was formerly the seat of the bishopric of Ossory. There are no remains of the abbey of Timahoe founded by St. Mochua in the 6th century, but in the neighbourhood there is a round tower, 96 ft. high. Abbeyleix, a small market town south of Maryborough, had a famous 12th century Cistercian foundation. The church of Killeshin, in the south-east of the county, exhibits Norman carving. Among the principal old castles are the ruined fortress of the O'Mores occupying the precipitous rock of Dunamase, 3 m. E. of Maryborough, Borris-in-Ossory on the Nore, and Lea Castle on the Barrow, near Portarlington, erected by the Fitzgeralds about 1260, burnt by Edward Bruce in 1315, again rebuilt, and in 1650 laid in ruins by the soldiers of Cromwell.

Originally a great extent of the surface was occupied with bog, but much has been recovered by draining. It is generally fertile except in the hilly districts towards the north, and there is some remarkably rich land in the south-east. Dairy farming is extensively practised. Agriculture forms the chief occupation, but the manufacture of woollen and cotton goods is carried on to a small extent. The main line of the Great Southern railway traverses the county from north-east to south-west by way of Portarlington and Maryborough; from the latter town branches run north to Mountmellick and south to Waterford, and from Ballybrophy a line runs west to Birr (Parsonstown) and to Limerick. The administrative counties of Leix and Offaly together return five members to Daíl Eireann. The county town is Maryborough (Port Laoighise) with a population of 3,272.

LEIXÕES, a seaport and harbour of refuge of northern Portugal; in 41° 9′ 10″ N., 8° 40′ 35″ W., 3 m. N. of the mouth of the Douro. Leixões is included in the parish of Matozinhos (pop. 1911, 12,786) and constitutes the main port of the city of Oporto (*q.v.*), with which it is connected by an electric tramway. The harbour, of artificial construction, has an area of over 220 acres, and admits vessels of any size, the depth at the entrance being nearly 50 ft. The trade of the port is mainly in British hands, and large numbers of British ships call at Leixões between Lisbon and Liverpool, London or Southampton.

LEJEUNE, LOUIS FRANÇOIS, Baron (1770–1848), French general, painter, and lithographer, was born at Versailles. As aide-de-camp to General Berthier he took an active part in many of the Napoleonic campaigns and his vigorous battle-pictures executed mainly from sketches and studies made on the field, enjoyed a great vogue. The German campaign of 1806 brought him to Munich, where he visited the workshop of Senefelder, the inventor of lithography. Lejeune was so fascinated by the possibilities of the new method that he then and there made the drawing on stone of his famous "Cossack" (printed by C. and T. Senefelder, 1806). While he was dining, one hundred proofs were printed, one of which he subsequently submitted to Napoleon. The introduction of lithography into France was greatly due to the efforts of Lejeune. Many of his battle-pictures were engraved by Coiny and Bovinet.

See Fournier-Sarlovèze, *Le Général Lejeune* (Paris, *Libraire de l'art*).

LEKAIN, the stage name of Henri Louis Cain (1728–1778), French actor, who was born in Paris on April 14, 1728, the son of a silversmith. He was educated at the collège Mazarin, and joined an amateur company of players against which the Comédie Française obtained an injunction. Voltaire supported him for a time and enabled him to act in his private theatre and also before the duchess of Maine. After a struggle of seventeen months he was received, by order of Louis XV., at the Comédie Française. Among his best parts were Herod in *Mariamne*, Nero in *Britannicus* and similar tragic rôles. Lekain had the benches removed on which privileged spectators formerly sat encumbering the stage. He also protested against the method of sing-song declamation prevalent and against the practice of dressing all parts in contemporary costumes. He died in Paris on Feb. 8, 1778.

See *Mémoires* (1801) with his correspondence with Voltaire, Garrick and others. They were reprinted with a preface by Talma in *Mémoires sur l'art dramatique* (1825).

LEKEU, GUILLAUME (1870–1894), Belgian composer, was born at Heusy in the province of Liége on Jan. 20, 1870. He studied at the conservatoire of Verviers and afterwards became a pupil of César Franck and D'Indy in Paris. A lyric scene *Andromeda* gained for him the second Prix de Rome in Belgium. His early death from typhoid on Jan. 31, 1894, at Angers cut short a very promising career. He is best known by his sonata for violin and piano in G, dedicated to Ysaye and much played by him. It contains a very striking slow movement, written in $\frac{7}{8}$ alternating with $\frac{4}{8}$ and $\frac{8}{8}$ time, with a middle section based on a quasi-traditional air of great beauty. In treatment and feeling this work was far ahead of its time.

See A. Pissier, *Guillaume Lekeu* 1906; O. Séré, *Musiciens français d'aujourd'hui* 1922; M. Lorrain, *Guillaume Lekeu, sa correspondance, sa vie, son oeuvre*, Liége, 1923.

LELAND, CHARLES GODFREY (1824–1903), American author, was born at Philadelphia Aug. 15, 1824, and graduated at Princeton in 1845. For the three following years he travelled abroad for his health and studied at Heidelberg, Munich and Paris. He was in Paris during the revolution of 1848, and took an active part in it. He then returned to Philadelphia, and after being admitted to the bar in 1851, devoted himself to writing and to editorial work on various papers and magazines in Philadelphia, New York and Boston. He served in the Union Army for a brief time, prospected for oil, and then returned to journalism. In 1868 he became known as the humorous author of *Hans Breitmann's Party*, which was followed by other volumes of the same kind, collected in 1871, with the title of *Hans Breitmann's Ballads*. These pioneer dialect poems, burlesquing the German American, at once became popular and resulted in his being given a master's degree from Harvard, largely at the instance of James Russell Lowell. In 1869 he went to Europe, and till 1880 was occupied with literary work. After returning to Philadelphia for six years, where he made an ardent struggle for the introduction of hand-work in the schools, he again lived in Europe, generally at Florence, where he died March 20, 1903. Though his humorous verses were most attractive to the public, Leland was a serious student of folk-lore, particularly of the gypsies, his writings on the latter, *The English Gypsies and their Language* (1873); *The Gypsies* (1882); *Gypsy Sorcery and Fortune-telling* . . . (1891), being recognized as valuable contributions to the literature of the subject. His numerous other publications include *Poetry and Mystery of Dreams* (1855), *Meister Karl's Sketch-book* (1855), *Sunshine in Thought* (1863), *Egyptian Sketch-book* (1873), *Abraham Lincoln* (1879), *The Minor Arts* (1880), *Algonquin Legends of New England* (1884), *Hans Breitmann in Tyrol* (1894).

See his *Memoirs* (1893), and *Charles Godfrey Leland* by his niece Elizabeth R. Pennell (1906), who also wrote a memoir for the 1914 edition of the *Hans Breitmann Ballads*.

LELAND, JOHN (1691–1766), English Nonconformist

divine, born at Wigan, Lancashire, and educated in Dublin, was appointed first assistant and afterwards sole pastor of a congregation of Presbyterians in New Row. This office he continued to fill until his death on Jan. 16, 1766. He received the degree of D.D. from Aberdeen in 1739. His first publication was *A Defence of Christianity* (1733), in reply to Matthew Tindal's *Christianity as old as the Creation;* it was succeeded by his *Divine Authority of the Old and New Testaments asserted* (1738), in answer to *The Moral Philosopher* of Thomas Morgan. His chief work, the *View of the Principal Deistical Writers that have appeared in England* (1754–56), throws light on the deistic movement of the 18th century.

His *Discourses on various Subjects*, with a *Life* prefixed, was published posthumously (4 vols., 1768–89).

LELAND (LEYLAND or LAYLONDE), **JOHN** (*c.* 1506–1552), English antiquary, born in London, was educated at St. Paul's school under William Lilly, and at Christ's College, Cambridge. He graduated at Cambridge in 1521, and subsequently studied at All Souls College, Oxford, and in Paris under François Dubois (Sylvius). On his return to England he took holy orders. He had been tutor to Lord Thomas Howard, son of the 3rd duke of Norfolk, and to Francis Hastings, afterwards earl of Huntingdon. Meanwhile Henry VIII. presented him to the rectory of Peuplingues in the marches of Calais in 1530. He was librarian and chaplain to the king, and in 1533 he received a novel commission under the great seal as king's antiquary, with power to search for records, manuscripts and relics of antiquity in all the cathedrals, colleges and religious houses of England. Probably from 1534, and definitely from 1536 onwards to 1542, he was engaged on an antiquarian tour through England and Wales. He sought to preserve the mss. scattered at the dissolution of the monasteries, but his powers did not extend to the actual collection of mss. Some valuable additions, however, he did procure for the king's library, chiefly from the abbey of St. Augustine at Canterbury. He received the rectory of Haseley in Oxfordshire; his support of the church policy of Henry and Cranmer being further rewarded by a canonry and prebend of King's College (now Christ Church), Oxford, and a prebend of Salisbury. In a *Strena Henrico* (pr. 1546), addressed to Henry VIII. in 1545, he proposed to execute from the materials which he had collected in his journeys a topography of England, an account of the adjacent islands, an account of the British nobility, and a great history of the antiquities of the British Isles. He did not complete these great undertakings, for he was certified insane in March 1550, and died on April 18, 1552.

The bulk of Leland's work remained in ms. at the time of his death, and various copies were made, one by John Stowe in 1576. After passing through various hands the greater part of Leland's mss. were deposited by William Burton, the historian of Leicestershire, in the Bodleian at Oxford. They had in the meantime been freely used by other antiquaries, notably by Bale, Camden and Dugdale. The account of his journey in England and Wales received its name *The Itinerary of John Leland* from Thomas Burton and was edited by Thomas Hearne (9 vols., Oxford, 1710–12; other editions in 1745 and 1770). The scattered portions dealing with Wales were re-edited by Miss L. Toulmin Smith in 1907. His other most important work, the *Collectanea*, in four folio ms. volumes was also published by Hearne (6 vols., Oxford, 1715). His *Commentarii de scriptoribus Britannicis*, which had been used and distorted by his friend John Bale, was edited by Anthony Hall (2 vols., Oxford, 1709). Some of Leland's mss., which formerly belonged to Sir Robert Cotton, passed into the possession of the British Museum.

For accounts of Leland *see* John Bale, *Catalogus* (1557); Anthony à Wood, *Athenae Oxonienses;* W. Huddesford, *Lives of those eminent Antiquaries John Leland, Thomas Hearne and Anthony à Wood* (Oxford, 1772). A life of Leland, attributed to Edward Burton (*c.* 1750), from the library of Sir Thomas Phillipps, printed in 1896 contains a bibliography. *See* also the biography by Sidney Lee, in the *Dict. Nat. Biog.* The *Strena Henrico* was re-edited in 1549 by John Bale as *The Laboryeuse Journey and Serche of J. Leylande for Englandes Antiquitees geven of him for a Neu Yeares Gifte*, etc., modern ed. by W. A. Copinger (Manchester, 1895).

LELAND STANFORD JR. UNIVERSITY (STANFORD UNIVERSITY), near Palo Alto (Calif.), U.S.A., in the beautiful Santa Clara valley, was founded in 1885 by Leland Stanford (1824–93), and by his wife, Jane Lathrop Stanford (1825–1905), as a memorial to their only child, Leland Stanford jr., who died in 1884 in his 17th year. The founder was governor of California in 1862–63 and United States senator from 1885 till his death. The doors were opened in 1891 to 559 students. The university campus consists of Stanford's former Palo Alto farm, comprising about 9,000ac. From it there are views of San Francisco bay, of the Coast Range, particularly of Mt. Hamilton some 30m. E., with the Lick observatory on its summit, of mountain foothills and of the redwood forests towards Santa Cruz.

The buildings, designed originally by H. H. Richardson and completed by his successors, Shepley, Rutan and Coolidge, are of soft buff sandstone in a style adapted from the old California mission (Moorish-Romanesque) architecture, being long and low with wide colonnades, open arches and red-tiled roofs.

The building plans of the university contemplate the addition of a quadrangle on either side of the original group. The Thomas Welton Stanford art gallery and the university library have already been constructed in that quadrangle, in which the Hoover war library, the law library and the departments of journalism and education are to be placed. Outside the quadrangles are other buildings, a museum of art and archaeology, based on collections made by Leland Stanford, jr., chemical and engineering laboratories, service buildings, gymnasia and the H. J. Ryan high voltage laboratory. There is an arboretum of some 300ac. This arboretum is to be made the centre of a plant research station. The Hopkins marine station, which is maintained at Pacific Grove on the Bay of Monterey, has two good buildings, one of them, the Jacques Loeb laboratory, a gift of the Rockefeller Foundation The university maintains the Stanford medical school, the Lane and Stanford hospitals, the Stanford school for nursing and the Lane medical library in San Francisco

The founders wished the university "to qualify students for personal success and direct usefulness in life; to promote the public welfare by exercising an influence on behalf of humanity and civilization, teaching the blessings of liberty regulated by law, and inculcating love and reverence for the great principles of government as derived from the inalienable rights of man to life, liberty and the pursuit of happiness." The entrance requirements of the university are flexible, no subject except English composition being required The minimum preparation is that of the ordinary four-year high school course which must be completed with recommended units in 15 subjects. Recently the work of the university has been so reorganized that the first two years constitute a so-called lower division with certain specified subject requirements, including biology, a course in citizenship, etc. The number of men students received in this lower division is at present 450 each October. Degrees are granted upon the recommendation of the departments and schools of the university. It is anticipated that with the development of the junior college the main emphasis of the work of the university will be upon the advanced and graduate years. The departments of the university are organized into schools. At present schools of law, medicine, education, biology, social science, engineering, business, letters and physical science are in existence and the work of students seeking advanced degrees is in charge of a graduate school which embraces representatives of all parts of the university. The influence of sectarianism and politics is barred from the university by its charter, and by its private origin and private support. Nevertheless its policy is that of State service of the most liberal type. The president of the university has the initiative in all appointments and in all matters of general policy. Within the university the faculty power lies in an academic council. An advisory board of nine professors, elected by the academic council without nomination, accords its approval or disapproval to all appointments and all major policies before they are presented to the board of trustees by the president. In 1921 the Food Research Institute of Stanford university was organized, with the help of the Carnegie Corporation of New York, to make a study of the production, distribution and consumption of food. In 1926 the Harris J. Ryan high voltage laboratory was established with the help of the General Electric Company and the various power companies of the Pacific coast. It contains a generating set for experimental purposes capable of discharging over

2,000,000 volts. Through the generosity of the Daniel Guggenheim Fund for the Promotion of Aeronautics, Inc., an experimental laboratory in aeronautics, known as the Daniel Guggenheim Experimental Laboratory, was established in 1926.

The university received from its founders securities and land worth about $30,000,000. Most of the large ranch holdings of the university were sold in 1919. In 1927 the university had $29,228,632.04 of productive funds. In 1927 the volumes in the library numbered 420,516, of which 65,601 were in the Lane medical library and 29,727 in the law library. Herbert Hoover, a graduate of Stanford, presented to the university the Hoover war library, comprising 54,521 volumes and numerous documents covering the history of the World War. In the autumn quarter of 1927 the students numbered 3,412, of whom 500 were women and 683 graduates. Limitation in funds and equipment are responsible for restrictions in the student body to something over 3,000. Although originally instruction was free, there is now a tuition fee of $85 a quarter. A tuition note system enables students to postpone payment till three or more years after graduation. Military training is not required, but there is a field artillery unit and an ordnance unit of the reserve officers training corps. During the World War, Stanford was represented by 3,000 of its members, graduates and undergraduates. A students' army training corps unit was organized in the war period. The university campus has been zoned and space reserved for a residence hall system for men and women, together with their athletic fields. The large extent of the campus has made it possible to develop athletic fields of large size and of considerable diversity, together with open-air swimming pools and other facilities possible because of the mild climate. Dr. David Starr Jordan was the first president of the university. He was succeeded in 1913 by Dr. John Casper Branner. Upon his retirement, Jan. 1, 1916, Dr. Ray Lyman Wilbur became president. (R. L. W.)

LELEGES. Various traditions were current among the Greeks respecting earlier inhabitants of their country. They were inclined to assign the comprehensive name of Pelasgians to all such peoples, but among them distinguished Carians and Leleges whom they regarded as akin. The Carians existed as a people in South-western Anatolia in historical times, and the earliest extant mention of the Leleges is the record in the Iliad (x. 429, xx. 96) of their presence at Troy as allies of the Trojans. They were from Asia Minor. Herodotus records their former presence in the Greek islands, while both Strabo and Pausanias place them in various regions of the Peloponnese and Central Greece. There is evidence that they were settled also in parts of Thrace, Macedonia and Illyria.

A large class of Greek place-names, notably those in *-ισσος* and *-ινθος*, testifies to the presence on the mainland of a people closely associated with Asia Minor. A view now widely held is that Greek-speaking peoples first came to Greece from the north about the 17th century B.C., subduing the population, who had been in contact with the Minoan civilization, and attacking the Cretans themselves. It was these people, according to this view, who set up the Mycenean civilization. Of the language of the early inhabitants nothing is known and it would be rash to assert that they did not speak Greek. This in no way means that the Minoans did so. The Carian language is now definitely regarded as non-Indo-European. Moreover, though the conquest of Greece by northern tribes is an undoubted fact, the question of the Greek-speaking peoples' occupation of Greece is not so simple as to be solved by the mere postulation that northern conquerors brought the language. The Achaeans were a great power in the eastern Aegean in the 14th century, and the view is gaining ground that there were early Greek migrations from east to west across the Aegean. It is, however, certain that there were Asianic peoples occupying the islands and the Greek mainland in a period that the historical Greeks regarded as ancient, and that the name of one of these tribes was Leleges.

LELEWEL, JOACHIM (1786–1861), Polish historian, geographer and numismatist, born at Warsaw on March 22, 1786, was educated at the university of Vilna, and became in 1807 a teacher in a school at Krzemieniec in Volhynia, in 1814 teacher of history at Vilna, and in 1818 professor and librarian at the university of Warsaw. He returned to Vilna in 1821. His popularity with the students made him obnoxious to the Russian government, and at Vilna Novosiltsev was then all-powerful. Lelewel was removed from his professorship in 1824, and returned to Warsaw, where he was elected a deputy to the diet in 1829 and joined the revolutionary movement. On the suppression of the rebellion he escaped to Germany, and went on to Paris in 1831. The government of Louis Philippe, at the request of the Russian ambassador, ordered him to quit French territory in 1833. He went to Brussels, where for nearly thirty years he earned a scanty livelihood by his writings. He died on May 29, 1861, in Paris.

Lelewel, a man of austere character, simple tastes and the loftiest conception of honour, was a lover of learning for its own sake. His literary activity was enormous, extending from his *Edda Skandinawska* (1807) to his *Géographie des Arabes* (2 vols., Paris, 1851). One of his most important publications was *La Géographie du moyen âge* (5 vols., Brussels, 1852–1857), with an atlas (1849) of fifty plates entirely engraved by himself. His works on Polish history are based on minute and critical study of the documents; they were collected under the title *Polska, dzieje i rzeczy jej rozpatrzywane* (*Poland, her History and Affairs surveyed*), in 20 vols. (Posen, 1853–1876).

See autobiography (*Adventures while Prosecuting Researches and Inquiries on Polish Matters*) printed in his *Polska*.

LELY, SIR PETER (1618–1680), English painter, was born at Soest, Westphalia. His father, a military captain, was called van der Faes; the nickname of Lely, by which he was generally known, was adopted by his son as a surname. After studying under Peter de Grebber at Haarlem, Lely removed to England in 1641. There he at first painted historical subjects and landscape; he soon became so eminent in his profession as to be employed by Charles to paint his portrait shortly after the death of Vandyck. He afterwards portrayed Cromwell. At the Restoration he won the favour of Charles II., who made him his state-painter, and knighted him. He formed a famous collection, containing drawings, prints and paintings by the best masters. His great example was Vandyck. Lely's paintings are carefully finished, warm and clear in colouring, and animated in design. The graceful posture of the heads, the delicate rounding of the hands, and the broad folds of the draperies are admired in many of his portraits. The eyes of the ladies are drowsy with languid sentiment, and allegory of a commonplace sort is too freely introduced.

His most famous work is a collection of portraits of the ladies of the court of Charles II, known as "the Beauties," formerly at Windsor castle, and now at Hampton Court palace. Of his few historical pictures, the best is "Susannah and the Elders," at Burleigh house. He died in London, and was buried in Covent Garden church, where a monument was erected to his memory. Pepys characterized Lely as "a mighty proud man and full of state." His only disciples were J. Greenhill and J. Buckshorn.

LE MAÇON (or LE MASSON), **ROBERT** (*c.* 1365–1443), chancellor of France, was born at Château du Loir, Sarthe. He was ennobled in March 1401, and became six years later a councillor of Louis II., duke of Anjou and king of Sicily. A partisan of the house of Orleans, he was appointed chancellor to Isabella of Bavaria and to the count of Ponthieu, afterwards Charles VII. When Paris was surprised by the Burgundians on the night of May 29, 1418, he assisted Tanguy Duchâtel in saving the dauphin. By the influence of John the Fearless, duke of Burgundy, he was excluded from the political amnesty known as the peace of Saint Maur des Fossés, though he retained his seat on the king's council. He was by the dauphin's side when John the Fearless was murdered at the bridge of Montereau on Sept. 10, 1419. He resigned the seals at the beginning of 1422; but he continued to exercise great influence, and in 1426 he effected a reconciliation between the king and the duke of Brittany. He supported Joan of Arc at court; and he signed the patent of

nobility for the Arc family in December 1429 In 1430 he was once more entrusted with an embassy to Brittany. He died on Jan. 28, 1443.

See C. Bourcier, "Robert le Masson," in the *Revue historique de l'Anjou* (1873); and the *Nouvelle biographie générale*, vol. xxx.

LE MAIRE DE BELGES, JEAN (1473–*c.* 1525), French poet and historiographer, nephew of Jean Molinet, was born at Bavai in Hainault. In his first poems he calls himself a disciple of Molinet. In certain aspects he does belong to the school of the *grands rhétoriqueurs*, but he was emancipated from their affectations by his studies in Paris and at Lyons, a centre of the French Renaissance. In 1503 he was attached to the court of Margaret of Austria, duchess of Savoy, afterwards regent of the Netherlands, and became her librarian and a canon of Valenciennes. To her were addressed his most original poems, *Epistres de l'amand verd*, the *amant vert* being a green parrot belonging to his patroness. Le Maire gradually become more French in his sympathies, eventually entering the service of Anne of Brittany. His prose *Illustrations des Gaules et singularitez de Troye* (1510–12) is largely adapted from Benoît de Sainte More. Le Maire probably died before 1525. Etienne Pasquier, Ronsard and Du Bellay all acknowledged their indebtedness to him. In his love for antiquity, his sense of rhythm, and even the peculiarities of his vocabulary he anticipated the *Pléiade*.

His works were edited in 1882–85 by J. Stecher, who wrote the article on him in the *Biographie nationale de Belgique*. *See* also P. A. Becker, *Jean le Maire, der erste humanistische Dichter Frankreichs* (1893).

LEMAÎTRE, JULES (1853–1914), French critic and dramatist, was born at Vennecy (Loiret) on April 27, 1853. His early years were spent in university teaching, but from 1884 onwards he devoted himself entirely to literature. He succeeded J. J. Weiss as dramatic critic of the *Journal des Débats*, and subsequently filled the same office on the *Revue des Deux Mondes*. His volumes of *contes* include *Myrrha* (1903) and *En marge des vieux livres* (1905). His plays include: *Révoltée* (1889), *Le député Leveau*, and *Le Mariage blanc* (1891), *Les Rois* (1893), *Le Pardon* and *L'Age difficile* (1895), *La Massière* (1905) and *Bertrade* (1906). He was admitted to the French Academy on Jan. 16, 1896. His political views were defined in *La Campagne nationaliste* (1902), lectures delivered in the provinces by him and by G. Cavaignac. He conducted a nationalist campaign in the *Echo de Paris*, and was for some time president of the Ligue de la Patrie Française, but resigned in 1904, and again devoted himself to literature. He died at Tavers (Loiret) on Aug. 5, 1914

LE MANS, a town of north-western France, capital of the department of Sarthe, 77 m. S.W. of Chartres on the railway from Paris to Brest. Pop. (1926) 61,888. As the capital of Aulerci Cenomanni, Le Mans was called Suindinum or Vindinum. The Romans built walls round it in the 3rd century, and traces are still to be seen. In the same century the town was evangelized by St. Julian, its first bishop. Ruled at first by his successors—notably St. Aldric—Le Mans became in the middle ages the capital of the counts of Maine. About the middle of the 11th century the citizens secured a communal charter, but in 1063 the town was seized by William the Conqueror, who deprived them of their liberties, which were recovered when the countship of Maine had passed to the Plantagenet kings of England. Le Mans was taken by Philip Augustus in 1189, recaptured by John, subsequently confiscated and later ceded to Queen Berengaria, who did much for its prosperity. It was several times besieged in the 15th and 16th centuries. In 1793 it was seized by the Vendéens, who were expelled by the Republicans. In 1799 it was again occupied by the Chouans. It stands just above the confluence of the Sarthe and the Huisne. Several bridges connect with the quarter of Pré on the right bank. The cathedral was originally founded by St. Julian, to whom it is dedicated. The nave dates from the 11th and 12th centuries. Some stained glass in the nave, from the first half of the 12th century, is the oldest in France; the west window represents the legend of St. Julian. The south lateral portal (12th century) and the choir are richly decorated. The cathedral also has curious tapestries and some remarkable tombs, including that of Berengaria, queen of Richard Coeur de Lion. Close to the western wall is a megalithic monument nearly 15 ft. in height. The church of La Couture, part of an old abbey founded in the 7th century by St. Bertrand, has a porch of the 13th century with fine statuary. The hôtel de ville was built in 1756 on the site of the former castle of the counts of Maine; the prefecture (1760) occupies the site of the monastery of La Couture, and contains an archaeological museum. Among the old houses are the Hôtel du Grabatoire of the Renaissance, once a hospital for the canons and the so-called house of Queen Berengaria (16th century). Le Mans is the seat of a bishopric dating from the 3rd century, of a prefect, and of a court of assizes. The more important industries are the state manufacture of tobacco, tanning, hemp-spinning, bell-founding, flour-milling, the founding of copper and other metals, and the manufacture of railway wagons, machinery and agricultural implements, motors, rope, cloth and stained glass. The fattening of poultry is an important industry, and there is trade in cattle, cloth, farm-produce as well as in wines. The town is an important railway centre.

Battle of Le Mans.—Le Mans (Jan. 10–12, 1871) was the culmination of General Chanzy's retreat into western France after the winter campaign in Beauce and Perche (*see* FRANCO-GERMAN WAR). The Germans advanced with three army corps in first line and one in reserve. On Jan. 9th the centre corps (III) drove an advanced division of the French from Ardenay (13 m. E. of Le Mans). On the next day Chanzy's main defensive position was approached, and there was a severe struggle for the villages along the front of the French centre. On the 11th Chanzy attempted a counter-offensive from many points, but the Germans were able to drive him back, and as their cavalry now began to appear beyond his extreme left flank, he retreated in the night of the 11th on Laval, the Germans occupying Le Mans after a brief rearguard fight on the 12th.

LE MARCHANT, JOHN GASPARD (1766–1812), English major-general, was the son of an officer of dragoons. John Le Marchant, a member of an old Guernsey family. Le Marchant entered the army in 1781, and attained the rank of lieutenant-colonel in 1797. In 1801 his scheme for establishing at High Wycombe and Great Marlow schools for the military instruction of officers was sanctioned by parliament, and a grant of £30,000 was voted for the "royal military college," the two original departments being afterwards combined and removed to Sandhurst. Le Marchant was its lieutenant-governor for nine years, and he trained many officers who served under Wellington in the Peninsula. Le Marchant was given the command of a cavalry brigade in 1810, and distinguished himself in several actions; he was killed at the battle of Salamanca on July 22, 1812.

See Sir D. Le Marchant, *Memoirs of General Le Marchant* (1841).

LE MARS, a city of north-western Iowa, U.S.A., on the Floyd river, 25m. N.N.E. of Sioux City; the county seat of Plymouth county. Le Mars is the seat of Western Union college, established in 1900 by five conferences of the United Evangelical church. The city was founded about 1870 and incorporated in 1881.

LEMBERG (Polish, *Lwow*), a province of Poland bounded on the west by Cracow, on the north by Lublin, on the east by Tarnpol provinces and on the south by the province of Stanislawów and the Carpathians, the ancient frontier of Poland and Slovakia. Area, 27,024 sq km. The province comprises the hilly country leading up to the Low Beskids, the valley of the San, and the highlands of Roztocze in the north-east linking the plateau of Lublin with that of Podolia. It is drained by the San and its tributaries and the upper waters of the Dniester. Pop. (1921) 2,718,000, of whom 56·6% were Poles, 35·8% Ruthenians and 7% Jews. By religion 46·5% were Roman Catholics, 41·3% Orthodox and Uniates, and 11·5% Jews. Ethnographically, the province is the meeting place of Poles and Russians. Originally part of the principality of Halicz, it was annexed to Poland in 1349 and remained part of Poland till the first partition when it was annexed to Austria as the province of Galicia.

The chief occupation of the people is agriculture. Wheat, rye, barley and oats are grown. Very important is the production of beetroot for sugar, while maize is grown in some districts. The export of agricultural products to western Europe was very

important after the occupation of Dantzig, the centre of the trade being Jaroslaw on the San. Industry is mainly based on agricultural products, but the main economic importance of the province rests on the oilfields of Boryslaw. The town of Lemberg formerly held a leading position in the trade of Europe with the East. As the capital of Galicia under Austria it continued to flourish, but the artificial severance of relations with the rest of Poland through the connection with Austria made trade stagnate in the 19th century. The province contains 28 districts, 2,203 rural communes and 60 towns, the most important being Lemberg, Przemysl, Drohobycz, Rzeszow, Jaroslaw, Belz and Lubaczow. The province was one of the chief military areas during the World War and suffered greatly. The battle of Rawa Ruska and the siege of Przemysl were the most important military operations in the province. The peasants have shown a great talent for economic co-operation and political organization and have played an important part in the new political life of Poland.

LEMBERG, BATTLES OF. Lemberg (Polish, Lwów), the capital town of Galicia, was twice during the World War the centre of a series of battles. The first series constituted the opening campaign between Russia and Austro-Hungary in Aug. and Sept. 1914; it resulted in the defeat of the Austrians and the occupation by the Russians of the whole of Eastern Galicia. The second series was fought some ten months later during the great Russian retreat which was started by Mackensen's offensive on the Dunajec in May 1915. It gave Austria re-possession of Lemberg and of practically the whole of Eastern Galicia.

The main concentration of the Austro-Hungarian forces for action against Russia at the opening of war in Aug. 1914 was made in Central and Eastern Galicia. In the general plan of the Central Powers the rôle of the Austro-Hungarian army was to engage the main Russian forces till the German army had overwhelmed France and was free to transfer its principal weight to the Eastern theatre. Two main alternatives were open to the Austrians, to await attack or themselves to take the offensive. If the former course were chosen, the line of the river San, between the Carpathians and the Vistula, was indicated as the strongest available position. On this they might well hope by an active defence to hold up the maximum Russian effort for some time and to win local successes by counter-attack. But defence entailed not only the abandonment of Eastern Galicia but also the surrender of the passes over the Eastern Carpathians and the opening of a road into Hungary. This might have serious political consequences. Moreover, in the years preceding the War, the military opinion of almost every country in Europe had proclaimed insistently that offensive action was the solution of all major difficulties in war. Certainly Conrad von Hötzendorf, the chief of the Austrian general staff, optimistic by temperament, was not the man to adopt a defensive attitude willingly. He determined to attack, though the advantages hoped for from a speedier mobilization were not secured owing to errors made during the preliminary deployment against Serbia.

The chosen line of attack was northwards against one flank of the Polish salient; probably Conrad hoped that a German offensive might eventually be made from East Prussia against the other flank of the salient. The problem of supply was not easy, since the terrain between the Vistula and Bug rivers, where the advance was to be made, had been left, at the instance of the Russian general staff, without good communications in anticipation of the Austrian plan. It was indeed the obvious direction of any invasion of Russia from Galicia, since an advance eastwards would leave the lines of communication exposed, while to the north-east lay the trackless marshes of the Pripet.

The Rival Forces.—The Austrian main forces were divided into four armies, of which two, the I. (Dankl) and IV. (Auffenberg), were to carry out the offensive directed on Chelm (Kholm) and Lublin respectively; the II. (Bohn-Ermolli) and III. (Brudermann) were to be deployed east of Lemberg to hold off the Russian armies advancing from the Kiev district. The II. Army had, however, been originally dispatched to the Serbian frontier, and was at first represented by one corps only, the XII. (Kövess). North of the Vistula, Kummer's group of Austrian Landsturm and Woyrsch's corps of German Landwehr were to advance on Sandomierz and Doblin (Iwangorod) respectively, to protect the left flank of the I. Army and to foster a Polish rising in favour of Austria.

The Russians also deployed four armies on their south-western front. Their plan was almost the exact counterpart of the Austrian. They purposed to hold the Austrian offensive wing by a defensive force of two armies on the line Lublin-Chelm, and to smash the Austrian defensive wing by an offensive group of two armies advancing west from the Kiev military district on Lemberg. Each of the opponents was thus dependent on the power of his defensive wing to resist the shock of the other's striking force long enough to enable him to gain a decision by his main effort.

Both armies had large masses of cavalry, but there was a pronounced difference in their tactics. The Austrian cavalry seldom practised dismounted fire action and were singularly ineffective on foot; the Russian cavalry, on the other hand, fought largely as mounted infantry. The Russian artillery shot well and was far more effective than the Austrian, but the musketry of the Austrian infantryman was better than that of his rival; he was also handier in manoeuvre. The morale on both sides was excellent at the beginning, although that of the Austrian was to deteriorate rapidly under defeat. In the higher command the Russians held the advantage. Ivanov, the generalissimo of the south-western front, was no strategist, though an experienced and well-loved commander; but his chief of staff, Alexieff, was one of the best brains of the army; and in Ruzski (III. Army), Plehve (V. Army), Brusilov (VIII. Army), and Ewarth (IV. Army) he had under him probably the four ablest army commanders in Russia—certainly the four most successful. Conrad, the virtual commander-in-chief of the Austrian armies—the Archduke Friedrich was the nominal head—was a man of determined and obstinate character, but a better strategist in the office than in the field; nor were the Austrian army commanders the equals of the Russian.

Numerically, the Russians had a slight advantage. The Austrian striking wing, which comprised 350 battalions, 150 squadrons and 150 batteries, was superior in strength to the Russian IV. and V. Armies which had each four corps and two cavalry divisions; but their defensive wing (200 battalions, 170 squadrons, 130 batteries) was considerably inferior to the Russian III. and VIII. Armies, especially before the arrival of the two corps of the II. Army which had been left opposite Serbia.

On Aug. 15, before concentration was complete, the Austrian cavalry pushed forward to ascertain the Russian movements, but gathered little information. On Aug. 20 the I. and IV. Armies began their offensive. The first engagements in the neighbourhood of Krasnik were favourable to the Austrians, the advanced troops of the Russian IV. Army being driven back on Lublin. The Austrian I. Army was strengthened by Kummer's Landsturm Corps, which crossed the Vistula to join it, while Woyrsch's Corps of German Landwehr was in close touch on the left bank of the Vistula. The mission of these two formations to foment an insurrection in Russian Poland had proved fruitless.

The Battles of 1914.—The Austrian IV. Army now became engaged in a battle with the Russian V. Army, which lasted from Aug. 26 to Sept. 1. Assisted by the Archduke Joseph Ferdinand's group, which had been formed from troops of the III. Army to manoeuvre between its left and right of the IV. Army, Auffenberg attempted a double envelopment of the Russian force. This manoeuvre gained a considerable initial success, but before the Austrians could exploit it, events in Eastern Galicia occasioned their recall.

Meanwhile the Austrian covering force (II. and III. Armies) had met with disaster. Although the II. Army consisted of one corps only and the III. Army was weakened by the absorption of the Archduke Joseph Ferdinand's group in the Kómarow battle, yet the High Command sent the two armies forward to the attack. They joined battle with the Russian III. and VIII. Armies on Aug. 26 on the line of the Złota Lipa about Złoczów. On the evening of Aug. 27 they were forced to retreat. Reinforced by the VII. Corps from Serbia, they again gave battle on the Gnila

Lipa on Aug. 29 and 30, and again suffered defeat. They now fell back through Lemberg, which was evacuated on Sept. 2, and took up a defensive position west of the city on the line of the Wereszyca and the Gródek lakes.

The rear of the advancing Austrian I. and IV. Armies was seriously threatened by the failure of the eastern wing. The question now arose of withdrawing the whole of the Austrian forces to the line of the San, or of continuing the battle round Lemberg on a different plan. Conrad chose the bolder course and determined to seek an immediate victory. He ordered the IV. Army to break off pursuit of the Russians and to change front from north to south. The plan was that this army should strike towards Lemberg at the right flank of the advancing Russians, while the II. and III. Armies held them frontally. The complicated wheel of the IV. Army had been executed by Sept. 5. On Sept. 6 it commenced its march southwards, leaving behind a group under the Archduke Joseph Ferdinand to protect its rear. As it advanced south, its left column became engaged with the right of the Russian III. Army and was pinned to the east of Rawa-Ruska, while the centre and right columns, meeting no resistance, continued southwards, and eventually wheeled into line with the Austrian III. and II. Armies, facing east.

Conrad changed his plan again; he had missed with his left, so now, like an obstinate but unskilful boxer, swung his right at the enemy, viciously but ineffectively. On Sept. 7 he ordered the IV. Army to stand fast and hold the Russians to their ground, while the II. and III. Armies left their prepared defensive positions and struck northward at the Russian left wing. A radical change of plan so hurriedly evolved was hardly likely to succeed. The II. and III. Armies could make little ground, while the position of the IV. Army rapidly became untenable. In its rear the I. Army was being forced back from Lublin by the reinforced Russian IV. Army, while the Russian V. Army had rallied and was again advancing, driving before it the Archduke Joseph Ferdinand's weak group. Finally the left wing of the IV. Army itself was being outflanked north of Rawa-Ruska by the Russian III. Army. On Sept. 11 Conrad issued orders for a general retreat to the line of the San.

Austrian Retreat.—The withdrawal was successfully carried out without serious interference by the Russians. The II. Army retired in the direction of Sambor, and the III. towards Przemyśl, the IV. on Jarosław, and the I., together with Kummer's and Woyrsch's forces, to the lower San. The detachments farther east, along the Dniester, retired to the Carpathians. The line of the San was not held for long. The Russian IV. Army had been reinforced by the IX. Army from Warsaw and forced a passage of the lower San on Sept. 14. The Austrians were too shaken and disorganized to enter on a new battle, and resumed their retreat, leaving the fortress of Przemyśl to stand siege. They finally halted on Sept. 26 some 50 m. E. of Cracow on the line of the Dunajec by Tarnow and Gorlice to the Carpathians. The Russians, who also required a pause for reorganization—since the losses had been very heavy on the Russian as well as on the Austrian side—made no serious attempt to follow up beyond the San.

The advantage of "interior lines" which the Austrians enjoyed in this campaign had been partly discounted by the great size of modern armies and the time required to obtain the decision in a battle. It is true that the Germans were at this very period gaining brilliant successes by action on interior lines against Samsonov and Rennenkampf in East Prussia, but their achievements were only rendered possible by the inertia of Rennenkampf. In Galicia, the continued pressure of Ruzski's and Brusilov's armies on the Austrian detaining wing denied to Conrad the time required to complete his successes in Poland. But the Austrian High Command appear to have depended too much on opportunist strategy. It is difficult to trace in their original organization for the campaign any recognition of the need for that "mass of manoeuvre," capable of being transferred from one wing to the other, which is the essence of action on interior lines. Also, the ineffectiveness for delaying action of their masses of cavalry deprived the Austrians of a powerful weapon. The Russian scheme of operations was straightforward and demanded only driving power by the higher commanders and hard fighting and marching by the troops. An opportunity of turning the Austrian retreat into a rout seems, however, to have been missed, when the IX. Army from Warsaw directly reinforced the IV. Army instead of being directed west of the Vistula on the Austrian line of retreat.

The Battles of 1915.—The fighting which led up to the second series of battles round Lemberg in the summer of 1915 is described under the heading DUNAJEC-SAN. After being driven from the San, the Russian III. Army (now under Lesh instead of Radko Dimitriev) and VIII. Army (Brusilov) took up a position to the north-west and west of Lemberg. Their line ran from the Vistula along the heights north of the Tanew river, thence west of Rawa-Ruska by Magierów and Janów to the Wereszyca river and Gródek lakes. The XI. and IX. Armies continued the line south-east along the Dniester.

Mackensen's pursuing force consisted of the Austrian IV., German XI. and Austrian II. Armies, in that order from north to south. On the Dniester were Linsingen's Southern Army and Pflanzer-Baltin's VII. Army. In the number of available formations there was no great disparity between Mackensen's group of armies and the Russian III. and VIII. Armies; on each side there were about 40 infantry divisions, and the Russians had five or six cavalry divisions to Mackensen's two. But the two Russian armies now embraced an improvised assembly of formations and units taken from all parts of the line; even so their losses had not been made good and they were much under strength; there was a shortage of ammunition, both for guns and rifles; and morale had suffered under two and a half months of continual defeat.

As usual, the main thrust at the Russian position was delivered by the German XI. Army. It was directed through Magierów against the line Zólkiew-Rawa-Ruska, approximately at the joint between the Russian III. and VIII. Armies. The assault was made on June 19, after the Russian position had been battered by the German guns, and the attackers broke right through to the Rawa-Ruska-Lemberg railway. Brusilov held on to a fortified position west of Lemberg till the 22nd, and then evacuated it under the threat that came from the north and the direct pressure from the Austrian II. Army.

The Russian armies were now split apart; the VIII. Army retired fighting to the line of the Upper Bug and Gniła Lipa; at the same time the XI. and IX. Armies gave up the Dniester line below Halicz. The III. Army meanwhile, to protect the left flank of the Warsaw salient, was forced to retire north towards Lublin and Chełm. To fill the gap between the III. and VIII. Armies, a new army, the XIII. under Gorbatovski, was formed of troops drawn from the right of the III. Army and left of the VIII. The Austrian armies were also re-grouped; the II. Army, the Southern Army and VII. Army were to continue the pursuit eastwards; Mackensen with the IV., XI. and a new "Army of the Bug," to be formed under Linsingen, was to strike northwards between the Bug and Vistula; while the I. Army, withdrawn from the west of the Vistula, was to fill the gap between the two army groups.

The Eastern group drove the Russians back at the beginning of July from the Gniła Lipa to the Zlota Lipa; no further fighting took place here till the end of August. Farther east, Pflanzer-Baltin's VII. Army and Lechitski's IX. were engaged in an indecisive conflict along the Dniester between July 14 and 19. Meanwhile on Mackensen's front the Austrian IV. Army had been heavily counter-attacked near Krasnik by the Russian IV. Army and had been driven back some distance, losing 17,000 prisoners. The check was only temporary, and so soon as the re-grouping was completed, Mackensen again advanced. For further operations of this force, *see* BREST-LITOVSK, BATTLES OF.

LEMERCIER, NÉPOMUCÉNE (1771–1840), French poet and dramatist, was born in Paris on April 21, 1771. His father had been intendant successively to the duc de Penthièvre, the comte de Toulouse and the unfortunate princesse de Lamballe, who was the boy's godmother. Lemercier wrote his tragedy of *Méléagre,* produced at the Théâtre Français, before he was 16. *Le Tartufe révolutionnaire,* a parody full of the most audacious political allusions, was suppressed after the fifth representation. In 1795 appeared Lemercier's masterpiece *Agamemnon,* called by Charles Labitte the last great antique tragedy in French literature. It was violently attacked later by Geoffroy, who stigmatized it as a bad caricature of Crébillon. *Quatre métamorphoses* (1799) was written to prove that the most indecent subjects might be treated without offence. The *Pinto* (1800) was the result of a wager that no further dramatic innovations were possible after the comedies of Beaumarchais. It is a historical comedy on the subject of the Portuguese revolution of 1640. This play was construed as casting reflections on the first consul, who had hitherto been a firm friend of Lemercier. His extreme freedom of speech finally offended Napoleon, and the quarrel proved disastrous to Lemercier's fortune for the time. None of his subsequent work fulfilled the expectations raised by *Agamemnon,* with the exception perhaps of *Frédégonde et Brunehaut* (1821). In 1810 he was elected to the Academy, where he consistently opposed the romanticists, refusing to give his vote to Victor Hugo. In spite of this, he has some pretensions to be considered the earliest of the romantic school. Indeed his *Christophe Colomb* (1809), advertised on the playbill as a *comédie shakespirienne* (*sic*), showed no respect for the unities. Its numerous innovations provoked such violent disturbances in the audience that one person was killed and future representations had to be guarded by the police. Lemercier wrote four long and ambitious epic poems: *Homère, Alexandre* (1801), *L'Atlantiade, ou la théogonie newtonienne* (1812) and *Moïse* (1823), as well as an extraordinary *Panhypocrisiade,* a romantic production in 20 cantos, which has the sub-title *Spectacle infernal du XVIe du siècle.* The first 16 cantos appeared in 1819; the last four in 1832. In it 16th-century history, with Charles V. and Francis I. as principal personages, is played out on an imaginary stage by demons in the intervals of their sufferings. Lemercier died on June 7, 1840 in Paris.

LEMERY, NICOLAS (1645–1715), French chemist, was born at Rouen on Nov. 17, 1645. After learning pharmacy in his native town he became a pupil of C. Glaser's in Paris, and then went to Montpellier, to lecture on chemistry. He next established a pharmacy in Paris, still continuing his lectures, but in 1683, being a Calvinist, he was obliged to retire to England. In the following year he returned to France, and turning Catholic in 1686 was able to reopen his shop and resume his lectures. He died in Paris on June 19, 1715. Lemery held chemistry to be a demonstrative science, and so confined himself to the straightforward exposition of facts and experiments. Of his *Cours de chymie* (1675) he lived to see 13 editions, and for a century it maintained its reputation as a standard work. His other publications included *Pharmacopée universelle* (1697), *Traité universel des drogues simples* (1698), *Traité de l'antimoine* (1707), together with a number of papers contributed to the French Academy.

LEMERY, a municipality (with administration centre and 28 *barrios* or districts) of the province of Batangas, Luzon, Philippine islands, on Balayan bay and the Pansipit river, opposite Taal (with which it is connected by a bridge) and about 50 m. S. of Manila. Pop. (1918), 15,647. The rich agricultural region produces rice, sugar, corn and cotton, and breeds many horses and cattle. It is a port for coasting vessels and has a considerable commerce. In 1918, it had 272 household industry establishments with output valued at 75,300 pesos, and 22 sugar mills. There were six public schools. It is an old place and has always had many traders. Many people of Lemery were killed during the eruption of the volcano of Taal in 1911 and considerable damage was done to property. The language spoken is Tagalog.

LEMGO, a town of Germany, in the republic of Lippe, 9 m. N. from Detmold and on the railway Hameln-Lage. Pop. (1925) 11,489. Its somewhat gloomy aspect, and narrow lanes flanked by 15th century gabled houses, has gained for it the sobriquet of the "Witches' nest" (*Hexen-Nest*). The town was a member of the Hanseatic league. Its industries are spinning, weaving, brewing and the manufacture of leather, furniture and cigars.

LEMIRE, JULES AUGUSTE (1853–), French priest and social reformer, was born at Vieux-Berquin (Nord) on April 23, 1853. He was educated at the college of St. Francis of Assisi, Hazebrouck (1878–93) where he was professor of philosophy and rhetoric. In 1897 he was elected deputy for Hazebrouck and was returned unopposed at the elections of 1898, 1902 and 1906. He organized a society called *La Ligue du coin de terre et du foyer,* to secure, at the expense of the State, a piece of land for every French family desirous of possessing one. The abbé Lemire sat in the chamber of deputies as a conservative republican and Christian Socialist. In Dec. 1893 he was seriously injured by the bomb thrown by the anarchist Vaillant from the gallery of the chamber. He wrote *Le Cardinal Manning et son action sociale* (1892), and *Le coin de terre et le foyer* (1897).

LEMMING, a small Scandinavian rodent, *Lemmus lemmus,* belonging to the mouse tribe (*Muridae*), and nearly related to the voles. About 5 in. long, the lemming is clad in yellowish-brown fur, marked with spots of black and brown. The head is short and rounded, the eyes bead-like and the short, rounded ears are almost concealed by the fur. The tail is short and the feet small, each with five claws adapted to digging. The lemming inhabits the fells of the central mountain chain of Scandinavia. They are prolific breeders, bringing forth at least two broods of, generally, five young in a year. Their food is entirely vegetable. In disposition they are restless, courageous and pugnacious. The most remarkable feature about the lemmings is their migrations. These occur at irregular intervals, whenever an unusually favourable combination of circumstances had led to overcrowding on the fells. Then, impelled by a migratory instinct, the lemmings descend into the lower levels in countless multitudes and proceed in a straight line until they reach the sea, into which they plunge and are drowned. They march only by night, feeding and sleeping by day, and devour all vegetable food that comes in their way. This migration may take several years, and, notwithstanding the swarms of carnivorous mammals and birds that prey on them, and all the efforts of man, they breed with such prodigality as actually to increase in numbers during their journey. It has been suggested that this line of march is a survival from the old times when there was dry land over the Baltic and North seas.

Over east Europe, North Asia and North America, the genus is represented by the allied *L. obensis,* and in Alaska occurs *L. nigripes.* The circumpolar banded lemming, *Dicrostonyx torquatus,* which turns white in winter, possesses double claws on one of the toes of the fore feet.

For the habits of the lemmings, *see* R. Collett, *Myodes Lemmus, its Habits and Migrations in Norway.*

LEMNISCATE: *see* CURVE, SPECIAL.

LEMNOS, an island in the north of the Aegean Sea. area about 150 sq. miles. Pop. (1920) about 4,000. It is mountainous, with sheep pasture and very fertile valleys. No forests remain and all wood is brought from Thasos or the mainland. There are mulberries and other fruit crops, but no olives. The population is Greek, with a Turkish minority till recently. The chief towns are Kastro, on the west coast, with excellent harbour, foreign consulates, and the archbishoprics of Lemnos and the neighbouring island of Ai-Strati (St. Eustratius): Mudros on the south coast, at the head of a spacious landlocked bay of high naval value.

The most famous product of Lemnos is the medicinal earth, *terra sigillata,* formerly popular over western Europe, and still used locally. The name (=Gr. Λημνία σφραγίς) is derived from the stamp impressed on each piece; in ancient times the stamp was the head of Artemis. The earth was considered in ancient times a cure for old festering wounds, and for the bite of poisonous snakes. The Turks now believe that a vase of this earth destroys the effect of any poison drunk from it—a belief which the ancients attached to the earth from Cape Kolias in Attica. Galen went to

see the digging of this earth; on one day in each year a priestess performed the due ceremonies, and a wagon-load was dug out. At the present time the day is Aug. 6, the feast of Christ the Saviour. Till recently the Turkish *hodja* as well as the Greek priest were present to perform the ceremonies, which take place before daybreak. The earth is sold by apothecaries in stamped cubical blocks. The hill from which the earth is dug is a dry mound, void of vegetation, beside the village of Kotchinos, and about two hours from the site of Hephaestia (*Palaiokastro*) on the east coast. In ancient times the island was sacred to Hephaestus, who fell when Zeus hurled him out of Olympus. This tale, and the name Aethallia, were supported by stories of volcanic activity and subsidence of islets. But all such disturbance has ceased. The name Lemnos is said to be Thracian, and the earliest inhabitants, the Sinties, have a Thracian tribe-name. The proverbial "Lemnian deeds" were the murder of all the men by the island women, on two traditional occasions. The Argonauts found only women there; whose queen Hypsipyle bore to Jason (*q.v.*) a son Euneus, who reigned during the Trojan War. His "Minyan" subjects were expelled by the Pelasgians, and survivors found refuge in Sparta and colonized Thera later. The sojourn of the wounded Philoctetes in Lemnos during the Trojan War is the subject of Sophocles' *Philoctetes.*

Darius of Persia conquered Lemnos after the fall of Polycrates, but it was captured by Miltiades of Athens from the Thracian Chersonese, and remained an Athenian possession (secured by a cleruchy (*q.v.*) until Macedon acquired it. The Romans declared it free in 197 B.C. but restored it to Athens in 166. From the Byzantine empire it passed to Greeks, Italians and Turks (1657), and was beseiged by Russians in 1770. All these changes reflect its great naval importance. In classical times Lemnos had two towns, Myrina (on the steep rock of Kastro) and Hephaestia (Palaeokastro) on the east coast, with a fine harbour, now silted.

LEMON, MARK (1809–70), playwright and editor of *Punch,* was born in London on Nov. 30, 1809. More than 60 of his melodramas, operettas and comedies were produced in London. At the same time he contributed to a variety of magazines and newspapers, and founded and edited the *Field.* In 1841 Lemon and Henry Mayhew conceived the idea of a humorous weekly paper to be called *Punch,* and when the first number was issued, in July 1841, were joint-editors and, with the printer and engraver, equal owners. The paper was for some time unsuccessful, Lemon keeping it alive out of the profits of his plays. On the sale of *Punch* Lemon became sole editor for the new proprietors, and under his control it became a power in English life. Lemon wrote a host of novelettes and lyrics, over a hundred songs, a few three-volume novels, several Christmas fairy tales and a volume of jests. He died at Crawley, Sussex, on May 23, 1870.

LEMON, the fruit of *Citrus Limonia,* which is often regarded as a variety of *Citrus medica,* the citron. The wild stock of the lemon tree is said to be a native of the valleys of Kumaon and Sikkim in the North-west provinces of India, ascending to a height of 4,000 ft., and occurring under several forms. Sir George Watt (*Dictionary of Economic Products of India,* ii. 352) regards the wild plants as wild forms of the lime or citron and considers it highly probable that the wild form of the lemon has not yet been discovered.

The lemon seems to have been unknown to the ancient Greeks and Romans, and to have been introduced by the Arabs into Spain between the 12th and 13th centuries. In 1494 the fruit was cultivated in the Azores, and largely shipped to England. As a cultivated plant the lemon is now met with throughout the Mediterranean region, in Spain and Portugal, in California and Florida, and in almost all tropical and sub-tropical countries. Risso and Poiteau enumerate forty-seven varieties of this fruit, although they maintain as distinct the sweet lime, *C. Limetta,* with eight varieties, and the sweet lemon, *C. Lumia,* with twelve varieties, which differ only in the fruit possessing an insipid juice.

The lemon is more delicate than the orange, although both are injured by severe cold (temperatures below 25° or 20° F). Unlike the orange, which presents a fine close head of deep green foliage, it forms a straggling bush, or small tree, 10 to 12 ft. high, with paler, more scattered leaves, and short angular branches with sharp spines in the axils. The flowers possess a sweet odour quite distinct from that of the orange, the outside of the corolla having a purplish hue. The fruit, which is usually crowned with a nipple, consists of an outer rind or peel, the surface of which is more or less rough from the convex oil receptacles imbedded in it, and of a white inner rind, which is spongy and nearly tasteless, the whole of the interior of the fruit being filled with soft parenchymatous tissue, divided into about ten to twelve compartments, each generally containing two or three seeds. The white inner rind varies much in thickness in different kinds, but is never so thick as in the citron. As lemons are much more profitable to grow than oranges, on account of their keeping properties, and from their being less liable to injury during voyages, the cultivation of the lemon is preferred in Italy wherever it will succeed. In damp valleys it is liable like the orange (*q.v.*) to be attacked by a fungus sooty mould, the stem, leaves, and fruit becoming covered with a blackish dust. This is coincident with or subsequent to the attacks of a small oval brown insect, *Chermes hesperidum.* Trees not properly exposed to sunlight and air suffer most severely from these pests. Syringing with resin-wash or milk of lime when the young insects are hatched, and before they have fixed themselves to the plant, is a preventive. Since 1875 this fungoid disease has made great ravages in Sicily among the lemon and citron trees, especially around Catania and Messina. Heritte attributes the prevalence of the disease to the fact that the growers have induced an unnatural degree of fertility in the trees, permitting them to bear enormous crops year after year. This

FLOWERING BRANCH OF THE LEMON TREE (CITRUS LIMONUM)
A. Flower with two petals and two bundles of stamens removed; slightly enlarged. B. Fruit cut across to show structure and seeds

loss of vitality is in some measure met by grafting healthy scions of the lemon on the bitter orange, but trees so grafted do not bear fruit until they are eight or ten years old.

The lemon tree is exceedingly fruitful, a large one in Spain or Sicily ripening as many as three thousand fruits in favourable seasons. In the south of Europe lemons are collected more or less during every month of the year, but in Sicily the chief harvest takes place from the end of Oct. to the end of Dec., those gathered during the last two months of the year being considered the best for keeping purposes. The fruit is gathered while still

green. After collection the finest specimens are picked out and packed in cases, each containing many hundreds of fruits, and also in boxes, three of which are equal to two cases, each lemon being separately packed in paper. The remainder, consisting of ill-shaped or unsound fruits, are reserved for the manufacture of essential oil and juice. The exportation is continued as required until April and May. The large lemons with a rougher rind, which

BY COURTESY OF THE CANADIAN PACIFIC RAILWAY

A WILD LEMON TREE (CITRUS LIMONUM), SHOWING TYPICAL GROWTH

appear in the London market in July and August, are grown at Sorrento near Naples, and are allowed to remain on the trees until ripe.

Lemons are grown on a large scale in California where 95% of the lemon trees in the United States are found. They are produced chiefly in the coastal region of Southern California in the region adjoining the Pacific Ocean where the climate is mild and equable the year round, which seems to favour continuous flowering and fruit production of the lemon tree. More than three-fourths of the 43,000 acres of bearing lemons are found in five counties of Southern California; more than one-fourth of the bearing lemon trees in America are in Los Angeles County. In the period 1924–28 the annual production ranged from 5,000,000 to 7,500,000 boxes per annum. This was somewhat in excess of the demand as the average annual consumption of lemons in the United States was only about 5,500,000 boxes. Only the best lemons are sent to the market; the poorer ones being used for manufacturing citric acid, pectin, lemon oil, and other by-products. The two chief varieties of lemons grown in California are the Lisbon, a variety introduced from Portugal, and the Eureka, a variety originated from seed grown in California. Most of the orchards planted recently are of selected strains of the Eureka lemon, which is an early-bearing vigorous variety, almost thornless and with fruit that is almost free from seed.

Candied lemon peel is usually made in England from a larger variety of the lemon cultivated in Sicily on higher ground than the common kind, from which it is distinguished by its thicker rind and larger size. This kind, known as the Spadaforese lemon, is also allowed to remain on the trees until ripe, and when gathered the fruit is cut in half longitudinally and pickled in brine, before being exported in casks. Before candying the lemons are soaked in fresh water to remove the salt. Of the numerous varieties the wax lemon, the imperial lemon and the Gaeta lemon are considered to be the best. Lemons are also imported into England to a less extent from the Riviera of Genoa.

Lemons of ordinary size contain about 2 oz. of juice, of specific gravity 1·039–1·046, yielding on an average 32·5 to 42·53 grains of citric acid per oz. The amount of this acid, according to Stoddart, varies in different seasons, decreasing in lemons kept from Feb. to July, at first slowly and afterwards rapidly, until at the end of that period it is all split up into glucose and carbonic acid —the specific gravity of the juice being in Feb. 1·046, in May 1·041 and in July 1·027, while the fruit is hardly altered in appearance. Besides citric acid, lemon juice contains 3 to 4% of gum and sugar, albuminoid matters, malic acid and 2·28% of inorganic salts

The simplest method of preserving lemon juice in small quantities for medicinal or domestic use is to keep it covered with a layer of olive or almond oil in a closed vessel furnished with a glass tap, by which the clear liquid may be drawn off as required. Ten per cent of alcohol must be added to lemon juice if it is to be kept From it are prepared the *syrupus limonis* (dose ½–2 drachms), which consists of sugar, lemon juice and an alcoholic extract of lemon peel, and also citric acid itself. Lemon juice is practically impure citric acid (*q.v.*). Lemon juice was largely used on shipboard as a preventive of scurvy; its value being now known to be due to its high content of vitamines.

By the Merchant Shipping Act (1867) every British ship going to other countries where lemon or lime juice cannot be obtained was required to take sufficient to give 1 oz. to every member of the crew daily. Of this juice it requires about 13,000 lemons to yield 1 pipe (108 gallons). Sicilian juice in November yields about 9 oz. of crude citric acid per gallon, but only 6 oz. if the fruit is collected in April. The crude juice was formerly exported to England, and was often adulterated with sea-water, but is now almost entirely replaced by lime juice. A concentrated lemon juice for the manufacture of citric acid is prepared in considerable quantities, chiefly at Messina and Palermo, by boiling down the crude juice in copper vessels over an open fire until its specific gravity is about 1·239, seven to ten pipes of raw making only one of concentrated lemon juice. "Lemon juice" for use on shipboard is prepared also from the fruits of limes and Bergamot oranges. It is said to be sometimes adulterated with sulphuric acid on arrival in England.

Essence or Essential Oil of Lemon.—The essential oil contained in the rind of the lemon occurs in commerce as a distinct article It is manufactured chiefly in Sicily, at Reggio in Calabria, and at Mentone and Nice in France. The small and irregularly shaped fruits are employed while still green, in which state the yield of oil is greater than when they are quite ripe. The best is known as *Essence de citron au zeste,* or, in the English market, as perfumers' essence of lemon, inferior qualities being distinguished as druggists' essence of lemon. Essence of lemon is chiefly brought from Messina and Palermo. The chief constituent of oil of lemon is the terpene, $C_{10}H_{16}$.

The lime, *Citrus aurantifolia,* is sometimes regarded as a var. of *C. medica.* It is a native of India, ascending to about 4,000 ft. in the mountains, and occurring as a small, much-branched thorny bush. The small flowers are white, the fruit is small and generally oval, with a thin, light green or lemon-yellow bitter rind, and a very sour, good flavoured juicy pulp. It is extensively cultivated throughout the West Indies, especially in Dominica, Montserrat and Jamaica and is grown to some extent in the Florida Keys and on the mainland of Florida but only in the extreme south as the lime is very subject to injury from winter cold. The plants are grown from seed in nurseries and planted out about 200 to the acre. They begin to bear from about the third year, but full crops are not produced until the trees are six or seven years old. The ripe yellow fruit is gathered as it falls. The fruit is bruised

by hand in a funnel-shaped vessel known as an *écuelle*, with a hollow stem; by rolling the fruit on a number of points on the side of the funnel the oil cells in the rind are broken and the oil collects in the hollow stem—this is the essential oil or essence of limes. The fruits are then taken to the mill, sorted, washed and passed through rollers and exposed to two squeezings. Two-thirds of the juice is expressed by the first squeezing, is strained at once and exported as raw juice. The product of the second squeezing, together with the juice extracted by a subsequent squeezing in a press, is strained and evaporated down to make concentrated juice; ten gallons of the raw juice yield one gallon of the concentrated juice. The raw juice is used for preparations of lime juice cordial, the concentrated for manufactures of citric acid.

On some estates citrate of lime is now manufactured in place of concentrated acid. Distilled oil of limes is prepared by distilling the juice, but its value is low in comparison with the expressed oil obtained by hand as described above. Green limes and pickled limes preserved in brine are largely exported to the United States, and more recently green limes have been exported to the United Kingdom. Limalade or preserved limes is an excellent substitute for marmalade.

A spineless form of the lime appeared as a sport in Dominica in 1892, and is now grown there and elsewhere, on a commercial scale. A form with seedless fruits has also recently been obtained in Dominica and Trinidad independently.

The Everglade variety of lime, originated by hybridization in Florida, has a larger proportion of perfect flowers than the ordinary lime and sets and holds a better crop under the attacks of the wither-tip disease common in the West Indies.

The name lemon is also applied to some other fruits. The Java lemon is the fruit of *Citrus javanica*, the pear lemon of a variety of *C. Limetta*, and the pearl lemon of *C. margarita*. The fruit of a passion flower, *Passiflora laurifolia*, is sometimes known as the water-lemon, and that of a Berberidaceous plant, *Podophyllum peltatum*, as the wild lemon. In France and Germany the lemon is known as the citron, and hence much confusion arises concerning the fruits referred to in different works. The essential oil known as oil of cedrat is usually a factitious article instead of being prepared, as its name implies, from the citron (Fr. *cédratier*). An essential oil is also prepared from *C. Lumia*, at Squillace in Calabria, and has an odour like that of bergamot but is not quite so powerful.

LEMONADE. A beverage consisting of lemon-juice mixed with water and sweetened. The word is sometimes used to designate what is merely flavoured aerated water (*see* AERATED WATERS), in which case the true lemonade is called lemon squash (a name originally applied to the pulp of lemons drunk with sugar and soda water). Lemonade of excellent quality is made by squeezing the juice of lemons, to which is added boiling water, white sugar (to taste, but plentifully) and the rinds of the squeezed lemons. The mixture is covered and left to grow cold. If it is to be kept for any length of time, it is strained and usually a very small amount of tartaric or citric acid is added.

LEMONNIER, ANTOINE LOUIS CAMILLE (1844–1913), Belgian poet, was born at Ixelles, Brussels, on March 24, 1844, and died at Brussels on June 13, 1913. He studied law, and then took a clerkship in a government office, which he resigned after three years. He retired to Namur, and developed the intimate sympathy with nature which informs his best work. *Nos Flamands* (1869) and *Croquis d'automne* (1870) date from this time. *Paris-Berlin* (1870), a pamphlet pleading the cause of France, and full of the author's horror of war, had a great success. His capacity as a novelist, in the fresh, humorous description of peasant life, was revealed in *Un Coin de village* (1879). In *Un Mâle* (1881) he achieved a different kind of success. It deals with the amours of a poacher and a farmer's daughter, with the forest as a background. Cachaprès, the poacher, seems the very embodiment of the wild life around him. The rejection of *Un Mâle* by the judges for the quinquennial prize of literature in 1883 made Lemonnier the centre of a school, inaugurated at a banquet given in his honour on May 27, 1883. *Le Mort* (1882), which describes the remorse of two peasants for a murder they have committed, is a masterpiece in its vivid representation of terror. After 1885 he turned aside from local subjects for some time to produce a series of psychological novels, books of art criticism, etc., assimilating more closely to French contemporary literature.

The most striking of Lemonnier's later novels are: *L'Hystérique* (1885); *Happe-chair* (1886), often compared with Zola's *Germinal; Le Possédé* (1890); *La Fin des bourgeois* (1892); *L'Arche, journal d'une maman* (1894), a quiet book, quite different from his usual work; *La Faute de Mme Charvet* (1895); *L'Homme en amour* (1897); and, with a return to Flemish subjects, *Le Vent dans les moulins* (1901); *Petit Homme de Dieu* (1902), and *Comme va le ruisseau* (1903). In 1888 Lemonnier was prosecuted in Paris for offending against public morals by a story in *Gil Blas*, and was condemned to a fine. In a later prosecution at Brussels he was defended by Edmond Picard, and acquitted; and he was arraigned for a third time, at Bruges, for his *L'Homme en amour*, but again acquitted. He represents his own case in *Les Deux consciences* (1902). *L'Ile vierge* (1897) was the first of a trilogy to be called *La Légende de la vie*, which was to trace, under the fortunes of the hero, the pilgrimage of man through sorrow and sacrifice to the conception of the divinity within him. In *Adam et Ève* (1899), and *Au Coeur frais de la forêt* (1900), he preached the return to nature as the salvation not only of the individual but of the community. Among his other more important works are *G. Courbet, et ses oeuvres* (1878); *L'Histoire des Beaux-Arts en Belgique 1830–1887* (1887); *En Allemagne* (1888), dealing especially with the Pinakothek at Munich; *La Belgique* (1888), an elaborate descriptive work with many illustrations; *La Vie belge* (1905); *Alfred Stevens et son oeuvre* (1906); *L'Ecole belge de la peinture* (1906).

Lemonnier spent much time in Paris, and was one of the early contributors to the *Mercure de France*. He began to write at a time when Belgian letters lacked style; and with much toil, and some initial extravagances, he created a medium for the expression of his ideas. He explained something of the process in a preface contributed to Gustave Abel's *Labeur de la prose* (1902). His prose is magnificent and sonorous, but abounds in neologisms and strange metaphors.

See L. Bazalgette, *Camille Lemonnier* (1904); Rency, *Camille Lemonnier* (1922).

LEMONNIER, PIERRE CHARLES (1715–1799), French astronomer, was born on Nov. 23, 1715, in Paris, where his father was professor of philosophy at the collège d'Harcourt. His first recorded observation was made before he was sixteen, and the presentation of an elaborate lunar map procured for him admission to the Academy at the early age of twenty. He was chosen in the same year to accompany P. L. Maupertuis and Alexis Clairault on their geodetical expedition to Lapland. In 1738, shortly after his return, he explained, in a memoir read before the Academy, the advantages of J. Flamsteed's mode of determining right ascensions. His persistent recommendation of English methods and instruments contributed effectively to the reform of French practical astronomy, and constituted the most eminent of his services to science. He corresponded with J. Bradley, was the first to represent the effects of nutation in the solar tables, and introduced, in 1741, the use of the transit-instrument at the Paris observatory. He visited England in 1748, and, in company with the earl of Morton and James Short the optician, continued his journey to Scotland, where he observed the annular eclipse of July 25. The liberality of Louis XV., in whose favour he stood high, furnished him with the means of procuring the best instruments, many of them by English makers.

Amongst the fruits of his industry may be mentioned a laborious investigation of the disturbances of Jupiter by Saturn, the results of which were employed and confirmed by L. Euler in his prize essay of 1748; a series of lunar observations extending over fifty years; some interesting researches in terrestrial magnetism and atmospheric electricity, in the latter of which he detected a regular diurnal period; and the determination of the places of a great number of stars, including twelve separate observations of Uranus, between 1765 and its discovery as a

planet. In his lectures at the collège de France he first publicly expounded the analytical theory of gravitation, and his timely patronage secured the services of J. J. Lalande for astronomy. He died at Héril near Bayeux on May 31, 1799.

He wrote *Histoire céleste* (1741); *Théorie des comètes* (1743), a translation, with additions of Halley's *Synopsis; Institutions astronomiques* (1746), an improved translation of J. Keill's textbook *Nouveau zodiaque* (1755); *Observations de la lune, du soleil, et des étoiles fixes* (1751–75); *Lois du magnétisme* (1776–78), etc.

See J. J. Lalande, *Bibl. astr.*, p. 819 (also in the *Journal des savants* for 1801); F. X. von Zach, *Allgemeine geog. Ephemeriden* iii. 625; J. S. Bailly, *Hist. de l'astr. moderne*, iii.; J. B. J. Delambre, *Hist. de l'astr. au XVIIIe siècle*, p. 179; J. Mädler, *Geschichte der Himmelskunde*, ii. 6; R. Wolf, *Geschichte der Astronomie*, p. 480.

LEMOYNE, JEAN BAPTISTE (1704–1778), French sculptor, was the pupil of his father, Jean Louis Lemoyne, and of Robert le Lorrain. He was a great figure in his day, around whose modest and kindly personality there waged opposing storms of denunciation and applause. Lemoyne's more important works have for the most part been destroyed or have disappeared. We have still a remarkable series of important busts, of which those of women are perhaps the best. Among these are "Fontenelle" (at Versailles), "Duc de la Vallière" (Versailles), "Comte de St. Florentin," and "Crébillon" (Dijon Museum), "Mlle. Chiron" and "Mlle Dangeville," both produced in 1761 and both at the Théâtre Français in Paris.

LEMPRIERE, JOHN (*c.* 1765–1824), English classical scholar, was born in Jersey, and educated at Winchester and Pembroke college, Oxford. He is chiefly known for his *Bibliotheca Classica* or *Classical Dictionary* (1788), which, edited by various later scholars, long remained a readable reference book in mythology and classical history. He was headmaster of Abingdon and Exeter grammar schools, and later held a living in Devonshire. He died in London on Feb. 1, 1824. He also published *Universal Biography* (1808).

LEMUR, the name applied to the more primitive members of the PRIMATES (*q.v.*), which do not come under the designation of either monkeys or apes, and constitute the sub-orders *Lemuroidea* and *Tarsioidea*, the latter including only the Malayian genus *Tarsius*. The other sub-order includes the true lemurs of Madagascar and the Comoro Islands, the galagos (*q.v.*) of tropical East Africa, the lorises (*q.v.*) of eastern Asia and the aye-aye (*q.v.*) from Madagascar. In the true lemurs, the tail is long and imperfectly prehensile. With the exception of the second toe of the hind-foot, the digits have well-formed, flattened nails as in the majority of monkeys. In the members of the typical genus *Lemur*, as well as in the allied *Hapalemur* and *Lepidolemur*, none of the toes or fingers are connected by webs, and all have the hind-limbs of moderate length, and the tail long. The maximum number of teeth is 36. Some of the species are nocturnal and others diurnal; all subsist on a mixed diet, which includes birds, reptiles, eggs, insects and fruit. Most are arboreal, but the ring-tailed lemur (*L. catta*) often dwells among rocks. The species of the genus *Lemur* are diurnal, and may be recognized by the length of the muzzle, and the large tufted ears. In some cases, as in the black lemur (*L. macaco*) the two sexes are differently coloured. The gentle lemurs (*Hapalemur*) have a rounder head, with smaller ears and a shorter muzzle, and a bare spiny patch on the fore-arm. The sportive lemurs (*Lepidolemur*) are smaller and the adults generally lose their upper incisors. The head is short and conical, the ears large, round and mostly bare, and the tail shorter than the body. Like the gentle lemurs they are nocturnal. (*See* AVAHI, AYE-AYE, GALAGO, INDRI, LORIS, POTTO, SIFAKA and TARSUS.)

LENA, THE, river of Asiatic Russia, which flows from the western slopes of the Baikal mountains to the Arctic Ocean and has a length of about 3,000 m. and a drainage area of roughly 1,000,000 sq.m. Its tributaries probably number 1,000 and the volume of its water entering the Arctic is calculated to be 11,000 cubic yds. per second. It rises in 54° 10′ N. and 107° 55′ E. as a clear mountain torrent and, until it is joined by the Vitim on its right bank, flows through forest-clad cliffs of red sandstone. The Vitim rises in a small lake in the Barguzinsk mountains at 5,530 ft. above sea level, 80 m. from the east coast of Lake Baikal. After a semicircular course of 1,200 m. through a little-explored tundra and forest plateau region, it joins the Lena at the town of Vitim in 59° 55′ N., 112° 23′ E., and altitude 670 ft. The Lena then flows through thickly wooded plains until it receives its right bank tributary the Olekma, whose head-waters are on the eastern slopes of the Vitim plateau. The Olekma flows for 800 to 1,000 m. through an almost uninhabited valley, in a forested and mountainous country and enters the Lena near Olekminsk, at an altitude of 375 ft. above sea level; its strong current affects the Lena for 20 m. below the confluence. Some distance further down, the Botama joins the Lena on the right, and in this neighbourhood are the famous Lena *Stolbi* or columns of perpendicular limestone cliffs, rising in places to 2,000 ft. and having remarkably even green and red strata, each about 20 in. thick. Yakutsk in 62° 5′ N., 129° 40′ E., is a nodal trading point, where the river widens and trails branch off on the west to the Vilui river and its short portage to the Lower Tunguska, and on the east through Allakh to Okhotsk, and also northward to the Kolyma river. A hundred miles below Yakutsk, on the right bank, the Lena is joined by the Aldan, 1,500 m. in length and navigable for 800 m. The headwaters of this stream rise near those of the Zeya and Olekma on the Aldan plateau; its eastern branches are but 40 to 50 m. from the Sea of Okhotsk, and of its tributaries, the Uchur is 350 m. long, the Amga 800 m. and the Maya 400 m. Below the mouth of the Aldan, the Lena flows for 1,200 m. with an average fall of 2 in. per mile; throughout this part of its course it is a majestic stream varying from 4 to 20 m. in breadth, with unstable alluvial islands interrupting its course and with sandy banks stretching inland on either side. About lat. 64° N. it is joined on the left bank by the Vilui, rising south of the Vilui mountains, and flowing for 1,500 m. to its delta on the Lena. It is navigable for 900 m., and has a drainage area of about 2,000 sq.m., the north-east of which is mainly marsh. From lat. 66° N. it becomes narrower, and from Bulun to the delta flows between the Khara-Ulakh mountains on the east and the Lower Chekanovsk mountains on the west. It discharges in a delta which begins 100 m. inland and is 250 m. wide on the coast line. This delta is a vast sandbank, intersected in every direction by numberless channels of all sizes, which change their direction from year to year and render navigation difficult. The many low flat islands are covered with moss and grass during the short summer, when fish is abundant. In winter the natives rely entirely on dried or frozen fish, but their stock often gives out with disastrous results. Upon the breaking up of the ice in the upper portions of the river, great blocks are carried down by the floods and piled up on the delta, still frozen to a depth of several feet; these blocks tear away huge portions of the bank and alter the navigable channels completely. The delta ice, as a rule, begins to break up about July 10 and freezing over is usually complete by Oct. 15. At Yakutsk the respective dates are June 10 and Oct. 12, while at Kirensk in 57° 56′ N. they are May 24 and Nov. 4. Steamer traffic on the Lena has a total annual freightage of about 15,000 tons and consists mainly of stores for the Vitim mining districts, and to a small extent of trade from Okhotsk via the Aldan and other routes. Furs, fossil ivory and small quantities of fish are brought from the north. The delta was discovered in 1637 by the Cossack Elisei Busa, who sailed down the Lena and through the western arm of the delta to the Olenek river where he wintered. In 1737 Prontschischev and his young wife attempted to sail from the Lena delta to the Yenisei, but both died of scurvy. Laptev made further attempts in 1739. Dezhnev's voyage from the Lena through the straits later named after their re-discoverer Bering, took place in 1648. A tragedy of the Lena delta was the loss of many of de Long's party in 1881. He was an American whose steamer the *Jeannette* was wrecked in June, 1881, north-east of the New Siberian islands in 77° 15′ N. and 154° 59′ E. His party broke up into three groups; one boat, under Chipp, was lost and the other two boats, under Melville and de Long were separated. Melville and his party reached the Lena delta safely and at Bulun met two of de Long's party sent on to search for food and help. Melville arrived too late and found de Long

and his party dead from starvation, under circumstances showing that his last act had been to try to place the results of his observations in safety. A wooden cross is erected on Monument Cape in memory of de Long and the eleven others who perished. In 1878 Nordenskiöld on the Vega expedition was accompanied by a vessel, the *"Lena,"* which, under the command of Johansen successfully sailed from the Arctic up the Lena to Yakutsk, and this vessel later continued to make three voyages per annum from Yakutsk to Bulun, a distance of 800 m. The Lena and its tributaries are rich in minerals; the Vitim and Aldan gold mines and the salt of the Vilui are successfully exploited. For further details *see* under YAKUTSK, *Far Eastern area* and *Siberian area*, as also for the sulphur springs and iron and aluminium mud cures.

See A. E. Nordenskiöld, *The Voyage of the Vega* (1881); G. W. Melville, *In the Lena Delta* (1885) and *Handbook of Siberia and Arctic Russia* I.D. 1207 (1920).

LENA GOLDFIELDS LIMITED. This company was originally formed in July, 1908, for the purpose of acquiring a 70% interest in the Lena Gold Mining Company in Russia (the *Lenskoie*) established in 1863, which worked large gold mining properties in the Lena Vitim district. The properties were nationalised in 1917.

An agreement was entered into in November, 1925, between the Lena Goldfields Limited and the Government of the Union of Soviet Socialist Republics whereby a concession was granted comprising the gold mines in the Lena Vitim district for 30 years, in which the Lena Goldmining District Company was formerly interested; the iron and copper mines and works, including the well-known Degtiarka deposit, in the Urals for 50 years, in which the Sissert Company was formerly interested; in addition to which the Revda Iron and Steel Works, formerly owned by the Government, was included; the large mining area in the Altai for 50 years containing lead, zinc, copper, gold and silver, and in which the Altai Mines Limited was formerly interested.

Since taking over the concession, work has been continued on the gold mines in Siberia and at present a 17½ cubic ft. dredge has been erected for the purpose of dredging the large area containing 110,000,000 cu. yards of gold-bearing gravel sufficient to keep four large dredges at work for 15 years

The Revda and Sissert Works have, and are still being modernised and extended with a view to greater production in the future, and necessary arrangements have been made for the erection of large iron works at Seversky. (F. W. W. G.)

LE NAIN, the name of three brothers, LOUIS, ANTOINE and MATHIEU, who occupy a peculiar position in the history of French art. Although they figure amongst the original members of the French Academy, their works show no trace of the influences which prevailed when that body was founded. Their sober execution and choice of colour recall characteristics of the Spanish school, and when the world of Paris was busy with mythological allegories, and the "heroic deeds" of the king, the three Le Nains devoted themselves chiefly to subjects of humble life such as "Boys Playing Cards," "The Forge," or "The Peasants' Meal," (Louvre). The Le Nain signature is rare, and is never accompanied by initials which might enable us to distinguish the work of the brothers. Their lives are lost in obscurity; all that can be affirmed is that they were born at Laon in Picardy towards the close of the 16th century. About 1629 they went to Paris; in 1648 the three brothers were received into the Academy, and in the same year both Antoine and Louis died. Mathieu lived on till August 1677; he bore the title of chevalier, and painted many portraits. The National Gallery, London, has a small "Portrait group" signed Le Nain. The British museum has some fine drawings.

See Champfleury, *Essai sur la vie et l'oeuvre des Le Nain* (1850), and *Catalogue des tableaux des Le Nain* (1861); and A. Valabrègue, *Les frères Le Nain* (1904).

LENAU, NIKOLAUS, the pseudonym of NIKOLAUS FRANZ NIEMBSCH VON STREHLENAU (1802–1850), Austrian poet, who was born at Csatád near Temesvar in Hungary, on Aug. 15, 1802. In 1819 the boy went to the University of Vienna; he subsequently studied Hungarian law at Pressburg and then spent the best part of four years in qualifying himself in medicine. But he was unable to settle down to any profession. He had early begun to write verses; and a disposition to sentimental melancholy, stimulated by love disappointments and by the prevailing fashion of the romantic school of poetry, settled into gloom after his mother's death in 1829. Soon afterwards a legacy from his grandmother enabled him to devote himself wholly to poetry. His first published poems appeared in 1827, in J. G. Seidl's *Aurora*. In 1831 he went to Stuttgart, where he published a volume of *Gedichte* (1832) dedicated to the Swabian poet Gustav Schwab. Here he also made the acquaintance of Uhland, Justinus Kerner, Karl Mayer and others; but his restless spirit longed for change, and he determined to seek for peace and freedom in America. In Oct. 1832 he landed at Baltimore and settled on a homestead in Ohio.

But the reality of life in "the primeval forest" fell lamentably short of the ideal he had pictured, and in 1833 he returned to Germany, where the appreciation of his first volume of poems revived his spirits. From now on he lived partly in Stuttgart and partly in Vienna. In 1836 appeared his *Faust*, in which he laid bare his own soul to the world; in 1837, *Savonarola*, an epic in which freedom from political and intellectual tyranny is insisted upon as essential to Christianity. In 1838 appeared his *Neuere Gedichte*, which prove that *Savonarola* had been but the result of a passing exaltation. Of these new poems, some of the finest were inspired by his hopeless passion for Sophie von Löwenthal, the wife of a friend, whose acquaintance he had made in 1833 and who "understood him as no other." In 1842 appeared *Die Albigenser*, and in 1844 he began writing his *Don Juan*, a fragment of which was published after his death. Soon afterwards he began to show signs of aberration, and in Oct. 1844 he was placed under restraint. He died in the asylum at Oberdöbling near Vienna on Aug. 22, 1850. Lenau's fame rests mainly upon his shorter poems; even his epics are essentially lyric in quality He is the greatest modern lyric poet of Austria, and the typical representative in German literature of the pessimistic *Weltschmerz* which, beginning with Byron, reached its culmination in the poetry of Leopardi.

Lenau's *Sämtliche Werke* were published in 4 vols. by A Grün (1855); but there are several more modern editions, as those by M. Koch in Kurschner's *Deutsche Nationalliteratur*, vols. 154–155 (888), and by E. Castle (2 vols, 1900). *See* A. Schurz, *Lenaus Leben, grösstenteils aus des Dichters eigenen Briefen* (1855); L. A. Frankl, *Zu Lenaus Biographie* (1854, 2nd ed., 1885); A. Marchand, *Les Poètes lyriques de l'Autriche* (1881); L. A. Frankl, *Lenaus Tagebuch und Briefe an Sophie Löwenthal* (1891); A. Schlossar, *Lenaus Briefe an die Familie Reinbeck* (1896); L. Roustan, *Lenau et son temps* (1898); E. Castle, *Lenau und die Familie Löwenthal* (1906).

LENBACH, FRANZ VON (1836–1904), German painter, was born at Schrobenhausen, in Bavaria, on Dec. 13, 1836. His father was a mason, and the boy was intended to follow his father's trade. With this view he was sent to school at Landsberg, and then to the polytechnic at Augsburg. However, when he had seen the galleries of Augsburg and Munich, he obtained his father's permission to become an artist, and worked for a short time in the studio of Gräfle, the painter; after this he devoted much time to copying. Thus he was already accomplished in technique when he became the pupil of Piloty. In 1856 he painted the "Shepherd Boy" (Schack Gallery, Munich). In 1858 he accompanied Piloty to Italy. A few interesting works remain as the outcome of this first journey—"A Peasant seeking Shelter from Bad Weather" (1858) and "The Arch of Titus" (Palfy collection, Budapest). By these early works which were painted from nature and which were attacked for their "trivial realism" he paved the way for the realistic movement in Germany. On returning to Munich, he was at once called to Weimar to take the appointment of professor at the Academy. But he did not hold it long, having made the acquaintance of Count Schack, who commissioned a great number of copies for his collection. Lenbach returned to Italy the same year, and there copied many famous pictures. He set out in 1867 for Spain, where he copied not only the famous pictures by Velasquez in the Prado, but also some landscapes in the museums of Granada and the Alhambra (1868). But he is best known for his portraits. At a time when idealized

and effeminate portraits were the fashion, he succeeded in becoming the most favoured portrait painter in Germany by his powerful interpretations of men of strong character. He counted among his sitters the greatest men of his time; his portraits of Bismarck are famous. He painted the emperor William I., Richard Wagner, Franz Lizst, Paul Heyse, Wilhelm Busch, Moritz Schwind, Helmholtz, Gladstone, Minghetti, Morelli.

LENCA, a group of Indians who formerly occupied central Honduras and eastern Salvador. Vocabularies collected in Chilanga, Similatón, Opatorio, Guajiguiro and Yanalanquira show local variations in speech. In Salvador these Indians are scarcely distinguishable from the ladino population. In Honduras, however, Lenca living amid rugged mountains have maintained their ancient customs in semi-independence. During recent years they have availed themselves of the unsettled state of the country to raid defenceless villages. Ancient ruined cities formerly occupied by the Lenca testify to a former high cultural level. Many of these cities are perched on lofty hill tops and are strongly fortified.

See Walter Lehmann, *Zentral Amerika,* I. Teil, Band ii. (1920); E. G. Squier, "A Visit to the Guajiquero Indians," in *Harper's New Monthly Magazine,* Oct. 1859.

LENCLOS, NINON DE (1615–1705), the daughter of a gentleman of good position in Touraine, was born in Paris in November 1615. Her long and eventful life divides into two periods, during the former of which she was the typical Frenchwoman of the gayest and most licentious society of the 17th century, during the latter the recognized leader of the fashion in Paris, and the friend of wits and poets. She had a succession of lovers, among them being Gaspard de Coligny, the marquis d'Estrées, La Rochefoucauld, Condé and Saint Evremond. Queen Christina of Sweden visited her, and Anne of Austria was powerless against her. Eventually she settled down to the social leadership of Paris. Among her friends she counted Mme. de la Sablière, Mme. de la Fayette and Mme de Maintenon. Her long friendship with Saint Evremond deserves notice. They had been lovers in their youth, and throughout his long exile the wit seems to have kept a kind remembrance of her. The few really authentic letters of Ninon are those addressed to her old friend.

If Ninon owes part of her posthumous fame to Saint Evremond, she owes at least as much to Voltaire, who was presented to her as a promising boy poet by the abbé de Chateauneuf. To him she left 2,000 francs to buy books, and his letter on her was the chief authority of many subsequent biographers. Her personal appearance is, according to Sainte-Beuve, best described in *Clélie,* a novel by Mlle. de Scudéry, in which she figures as Clarisse. Her distinguishing characteristic was neither beauty nor wit, but high spirits and perfect evenness of temperament.

The letters of Ninon published after her death were, according to Voltaire, all spurious, and the only authentic ones are those to Saint Evremond, which can be best studied in Dauxmesnil's edition of *Saint Evremond,* and his notice on her. Sainte-Beuve has an interesting notice of these letters in the *Causeries du Lundi,* vol. iv. The *Correspondance authentique* was edited by E. Colombey in 1886. *See* also Helen K. Hayes, *The Real Ninon de l'Enclos* (1908); and Mary C. Rowsell, *Ninon de l'Enclos and her century* (1910); E. Magne, *Ninon de Lenclos. Portraits et documents inédits* (1925), pp. 266.

L'ENFANT, PIERRE CHARLES (1754–1825), engineer and architect, was born in Paris, France, on Aug. 2, 1754. After completing his education as an architect and engineer, he became an officer in the French colonial troops. His enthusiasm for the American cause brought him, in 1777, to the colonies, where he volunteered in the Continental army at his own expense. In Feb. 1778, he was commissioned captain of engineers. His various military services, knowledge of fortification, and work as a disciplinarian won the admiration of Gen. Washington and other officers, and in 1783, Congress promoted him to major of engineers.

When the Society of the Cincinnati was founded in May 1783, he was commissioned to design its insignia, and as he was about to sail for France, assisted in organizing the French branch of that society. Upon his return to America, he established himself as an architect and engineer in New York city.

Following the decision of Congress to establish the capital on the banks of the Potomac, L'Enfant prepared a plan for the city. The plan was noted for the breadth of its avenues, the large tracts set aside for gardens, parks and squares and for the general logic of its arrangements. It was prepared on such a "scale as to leave room for that aggrandizement and embellishment which the increase of the wealth of the nation will permit it to pursue at any period, however remote." His plan was accepted, and he was employed in March 1791 to direct the work, but his "untoward disposition," as President Washington said, resulted in his withdrawal from active supervision in March, 1792, though his plan was in general followed.

L'Enfant failed to obtain satisfactory remuneration or recognition for his plan of the national capital, and died poor and disappointed on June 14, 1825, in Prince George county, Md. On April 28, 1909, his body was removed to Arlington National Cemetery, where a monument was erected to him by Congress.

LENGLEN, SUZANNE (1899–), French lawn-tennis player, was born at Compiègne, May 24, 1899. She was taught to play tennis by her father and began to show brilliance at an early age, winning the championship of Picardy when only 14 years old. In June 1914 she won the hard court singles and doubles in Paris. During the World War she played in exhibition matches on the Riviera for the French Red Cross 1916–8. In 1919 she made her first appearance at the Wimbledon tournament and won both the singles and doubles championships, defeating Mrs. Lambert Chambers in the final round. In the following year at Wimbledon she won the ladies' singles and the mixed doubles title with G. L. Patterson. In Aug. 1921, after again winning the singles and doubles at Wimbledon, she visited America and was defeated by Mrs. Mallory. In the following year Mlle. Lenglen defeated Mrs. Mallory 6–2, 6–0 at Wimbledon. In the same year she won the French National Championship, took all three championships in the Brussels tournament and was undefeated throughout the season. She again won the singles at Wimbledon in 1923 and 1925, but was obliged to retire in 1924 owing to illness, as she was also in 1926. She became a professional in 1926 and toured the United States playing matches in a number of cities. In 1927 she played in England and on the Continent but in September, 1928, announced her retirement from further competition. (*See* LAWN TENNIS.)

LENIN, VLADIMIR ILYICH ULYANOV (1870–1924), founder and guiding spirit of the Soviet Republics and the Communist International, the disciple of Marx, the leader of the Bolshevik party and the organizer of the Oct revolution in Russia, was born on April 9 (22), 1870, in the town of Simbirsk, now Ulyanovsk. His father, Ilya Nicolaevitch, was a schoolmaster. His mother, Maria Alexandrovna, was the daughter of a doctor named Berg. His eldest brother (b. 1866) joined the "Narodovoltze" (a revolutionary terrorist society), and taking part in the unsuccessful attempt on the life of Alexander III., was executed (1891); this was a determining factor in Lenin's life.

Early Life.—The third of a family of six, Lenin completed his course at the Simbirsk gymnasium in 1887, winning the gold medal He entered the Kazan University to study law, but was sent down in Dec. of the same year for taking part in a gathering of students and was banished to the country. It was not till the autumn of 1889 that he was allowed to return to Kazan, where he began the systematic study of Marx and met the members of the local Marxist circle. In 1891 Lenin passed the law examinations of the St. Petersburg University, and in 1892 he began to practise as a barrister at Samara, appearing for the defence in several trials. His life, however, was chiefly filled by the study of Marxism and its application to the economic and political development of Russia and subsequently of the whole world.

In 1894 he moved to St. Petersburg, and began his propaganda work. To this period belong Lenin's first polemical writings directed against the popular party and passed from hand to hand in manuscript form. Soon after, Lenin started in the Press a theoretical struggle against the falsifiers of Marx. In April 1895

he first went abroad to meet Plekhanov, Zasulich, Axelrod and the Marxist group known as the "Osvobozhdenie Truda" (Deliverance of Labour). On his return to St. Petersburg, he organized the illegal "Union for the liberation of the Working Class," which rapidly became an important organization, carrying on propaganda among the workers. In Dec. 1895 Lenin and his closest collaborators were arrested. He spent the year 1896 in prison, and in Feb. 1897 he was exiled for three years to the Yenisei province in eastern Siberia. In 1898 he married N. K. Krupskaya, a comrade in the St. Petersburg Union and his faithful companion for the remaining 26 years of his life. During his exile he finished his most important economic work, *The Development of Capitalism in Russia,* based on an enormous mass of statistical material (1899). In 1900 Lenin went to Switzerland to arrange, with the "Deliverance of Labour" group, the publication of a revolutionary paper intended for Russia. At the end of the year the first number of the paper *Iskra* (The Spark) appeared in Munich, with the motto "From Spark to Flame." Its aim was to give a Marxian interpretation of the problems of the revolution, with the political watchwords of the struggle, and to form a centralized "underground" revolutionary party of Social Democrats, which, standing at the head of the proletariat, should open the struggle against Tsarism. The idea of an organized party leadership of the struggle of the proletariat in all its forms and manifestations, which is one of the central ideas of Leninism, is closely connected with the idea of the hegemony of the working class within the democratic movement of the country. This idea found direct expression in the programme of the dictatorship of the proletariat when the development of the revolutionary movement had prepared the conditions for the Oct. revolution.

Bolsheviks and Mensheviks.—The second Congress of the R.S.D.R.P. (Brussels, London) in July and Aug. 1903 accepted the programme worked out by Plekhanov and Lenin, but ended with the historic split of the party into Bolsheviks and Mensheviks. Thereupon Lenin entered on his separate path as leader of the Bolshevik section, later the Bolshevik party. The differences concerned tactics and finally the party programme. The Mensheviks tried to bring the policy of the Russian proletariat into line with that of the liberal bourgeoisie. Lenin saw in the peasantry the closest ally of the proletariat. Occasional agreements and closer relations with the Mensheviks failed to arrest the constant widening of the two lines—the revolutionary and the opportunist—the proletarian and the bourgeois. The struggle with the Mensheviks forged the policy which led to the break with the Second International (1914), to the Oct. revolution (1917) and to the change of the party's name from Social Democrat to Communist (1918).

A revolutionary situation was created in the country by the defeat of the army and navy in the Russo-Japanese War, the shooting of the workers on Jan. 9 (22) in 1905, by agrarian disturbances and political strikes. Lenin's programme was the preparation of an armed rising of the masses against Tsarism, and the creation of a provisional Government to organize the revolutionary democratic dictatorship of the workmen and peasants for the deliverance of the country from Tsarism and serfdom. The third congress of the party, consisting exclusively of Bolsheviks (May 1905), passed a new agrarian programme which included the confiscation of the domains of landowners. In Oct. 1905 the All-Russian strike began. On the 17th of the month the Tsar issued his manifesto about the "Constitution." In the beginning of Nov. Lenin returned to Russia from Geneva, and appealed to the Bolsheviks to bring into the party wider circles of workers, but to retain their illegal apparatus in anticipation of counter-revolutionary blows.

In the events of 1905 Lenin distinguished three main features—(1) the temporary seizure by the people of real political freedom, (2) the creation of new if only potential revolutionary power in the shape of soviets of workers', soldiers' and peasants' deputies; (3) the use of force by the people against those who had employed it against them. Those conclusions, from the events of 1905, became the guiding principles of Lenin's policy in 1917 and led to the dictatorship of the proletariat in the form of the Soviet State.

The rising in Moscow at the end of Dec., lacking as it did the support of the army, without simultaneous risings in other towns and sufficient response in the country districts, was quickly suppressed. The Liberal bourgeoisie came to the front. The epoch of the first two Dumas began. At this time, Lenin formulated the principles of the revolutionary exploitation of parliamentary methods as a means of fresh attack. In Dec. 1907 Lenin left Russia, to return only in 1917. Now (in 1907) began the epoch of victorious counter-revolution, prosecutions, exile, executions and emigration. Lenin led the struggle against the Mensheviks, the advocates of the liquidation of the "underground" party—hence those known as "liquidators"—and of the change of their methods into legal ones within the framework of the existing régime; against the "conciliators" who tried to take up an intermediate position between Bolshevism and Menshevism—against the Socialist revolutionaries who tried to make up for the inertia of the masses by personal terrorism; finally, against those Bolsheviks, the so-called "callers-off," who demanded the recall of the Social Democratic deputies from the Duma in the name of immediate revolutionary activity.

At the same time, Lenin carried on an extensive campaign against the attempt to revise the theoretic basis of Marxism on which his whole policy was founded. In 1908 he wrote a major treatise directed against the essentially idealistic philosophy of Mach, Avenarius and their Russian followers, who tried to unite empiric criticism with Marxism. Lenin proved that the methods of dialectical materialism as formulated by Marx and Engels were confirmed by the development of scientific thought in general and natural science in particular. Thus Lenin's constant revolutionary struggle went hand in hand with his theoretical controversies.

The years 1912–14 were marked in Russia by a fresh outburst of activity in the workers' movement. Breaches made their appearance in the counter-revolutionary régime. At the beginning of 1912 Lenin summoned a secret conference of the Russian Bolshevik organizations in Prague. The "liquidators" were declared to be outside the party. The split with the Mensheviks became final. A new central committee was elected. Lenin organized from abroad the publication in St. Petersburg of a legal newspaper, *Pravda,* which in its constant conflict with the censorship and the police exercised a guiding influence on the vanguard of the working class. In July 1912 Lenin, together with his closest colleagues, moved from Paris to Cracow in order to be in closer touch. The revolutionary movement in Russia was growing, and was thereby giving the Bolsheviks the preponderance. Lenin sent articles under different pseudonyms almost every day to the Bolshevik legal newspapers, drawing the inevitable inferences from them in the illegal ("underground") Press. At this time, as well as before and after it, N. K. Krupskaya was the centre of the organizing work. She received comrades from Russia, gave instructions to others on their way there, set up "underground" connections, wrote, coded and decoded letters. It was in the small town of Poronin in Galicia that the declaration of war found Lenin. The Austrian police suspected him of being a Russian spy and arrested him; he was, after a fortnight, expelled to Switzerland.

Internationalism.—A new and international phase of Lenin's work now opened. His manifesto, published in the name of the party on Nov. 1, 1914, denounced the imperialistic character of the War and the war guilt of all the great powers, who had long been preparing a sanguinary struggle for the purpose of widening their markets and destroying their rivals. The patriotic agitation of the bourgeoisie on both sides, who threw the blame each upon the other, was shown to be a manoeuvre to deceive the workers. The manifesto points out that the majority of Social Democratic leaders were on the side of the bourgeoisie of their own country, thus violating the resolutions of the International Socialist congresses and bringing about the downfall of the Second International. The defeat of their "own" governments should be the slogan of the Social Democrats of all countries. Lenin subjects to a merciless criticism not only Socialist patriotism, but that

pacifism which, while occupied with platonic protests, withdraws from the revolutionary struggle with Imperialism. The struggle with pacifism develops into a great struggle with those elements of the working class movement which are midway between the Social Democrats and the Communists, supporting the former in actual practice.

The theorists and politicians of the Second International redoubled the accusations of anarchism which they had before brought against Lenin. As a matter of fact, all Lenin's work was characterized by a twofold struggle, on the one hand with reformism which from the beginning of the War gave its support to the imperialist policy of the propertied classes, and on the other hand with anarchism and all the different varieties of revolutionary adventurists.

On Nov. 1, 1914 Lenin promulgated a programme for the creation of a new International "to undertake the task of organizing the forces of the proletariat for the revolutionary attack on capitalist governments, for the civil war against the bourgeoisie of all countries, for the attainment of political power and the victory of Socialism"

In Sept. 1915 (Sept. 5 and 8) there was held at Zimmerwald in Switzerland the first conference of European Socialists who were opposed to the imperialistic war. Thirty-one delegates were present. The left wing of the Zimmerwald conference and of the later one at Kiental adopted Lenin's demand for the transformation of the imperialist war into a civil war, and became the nucleus of the future Communist International. The latter worked out its programme, tactics and organization under Lenin's guidance, and it was he who directly inspired the decisions of the first four congresses of the Communist International.

Lenin was prepared for his struggle on an international scale not only by his profound knowledge of Marxism and his experience of the revolutionary party organization in Russia, but also by his intimate acquaintance with the workers' movement throughout the world. He was master of the English, German and French languages, and could read Italian, Swedish and Polish. He was firmly opposed to the mechanical application of the methods of one country to another, and he investigated and decided questions concerning revolutionary movements, not only in their international reactions, but also in their concrete national form.

Revolution of 1917.—The revolution of Feb. 1917 found Lenin in Switzerland. His attempts to reach Russia met with the opposition of the British Government, and he decided to travel through Germany. The success of this plan gave occasion to Lenin's enemies for a fierce campaign of slander, which, however, was powerless to prevent him from assuming the leadership of his party and shortly afterwards of the revolution.

On the night of April 4, on leaving the train, Lenin made a speech in the Finlyandsky station in Petrograd. He repeated and developed the leading ideas it contained in the days which followed. The overthrow of Tsarism, he said, was only the first stage in the revolution. The bourgeois revolution could no longer satisfy the masses. The task of the proletariat was to arm, to strengthen the power of the Soviets, to rouse the country districts and to prepare for the conquest of supreme power in the name of the reconstruction of society on a Socialist basis.

This far-reaching programme was not only unwelcome to those engaged in propagating patriotic Socialism, but even roused opposition among the Bolsheviks themselves. Plekhanov called Lenin's programme "crazy." Lenin, however, foresaw that the distrust of the bourgeoisie and of the Provisional Government would grow stronger daily, that the Bolshevik party would obtain a majority in the Soviets and that the supreme power would pass into their hands. The small daily *Pravda* became at once in his hands a powerful instrument for the overthrow of bourgeois society.

The policy of coalition with the bourgeoisie pursued by the patriotic Socialists, and the hopeless attack which the Allies forced the Russian Army to assume at the front roused the masses and led to armed demonstrations in Petrograd in the first days of July. The struggle against Bolshevism became intense. On July 5th forged "documents" were published by the counter-revolutionary secret service, purporting to prove that Lenin was acting under the orders of the German general staff. In the evening "reliable" detachments summoned from the front by Kerensky and Cadet officers from the districts round Petrograd occupied the city. The popular movement was crushed The hounding of Lenin reached its height. He now began to work "underground," hiding first in Petrograd with a worker's family and then in Finland.

The July days and the retributions which followed aroused a burst of energy in the masses. The Bolsheviks obtained a majority in the Soviets of Petrograd and Moscow Lenin demanded decisive action to seize the supreme power. "Now or never!" he repeated in passionate articles, letters and interviews.

The Soviet of People's Commissaries.—The rising against the Provisional Government coincided with the opening of the second Congress of the Soviets on Oct. 25. Lenin, after being in hiding for three and a half months, appeared in the Smolny Institute and directed the fight. In the night sitting of Oct. 27 he proposed a draft decree about peace which was passed unanimously and another about the land, which was passed with one dissentient and eight abstentions. The Bolshevik majority, supported by the left wing of the Socialist revolutionaries, declared that supreme power was now vested in the Soviets. The Soviet of People's Commissaries was appointed, with Lenin at the head.

Having obtained the land of the estate owners, the peasants supported the Bolsheviks. The Soviets became masters of the situation. The constituent assembly which was elected in Nov. and met on Jan. 5 was an anachronism. The conflict between the two stages of the revolution was at hand. Lenin did not hesitate for an instant. On the night of Jan. 7 the All-Russian Central Executive Committee, on Lenin's motion, passed a decree dissolving the constituent assembly. The dictatorship of the proletariat, said Lenin, meant the greatest possible degree of democracy for the toiling majority of the people, putting in the hands of labour all those material goods (buildings for meetings, printing presses and so on) lacking which "liberty" remains an illusion. The dictatorship of the proletariat in Lenin's view is a necessary stage in the abolition of class divisions in society.

The question of war and peace provoked a new crisis. A considerable proportion of the party demanded a "revolutionary war" against the Hohenzollerns, leaving out of account altogether the economic situation of Russia and the temper of the peasantry. Lenin felt that it was necessary for propaganda purposes to drag out negotiations with the Germans for as long as possible. But he demanded that, in the event of a German ultimatum, peace should be signed even at the price of a loss of territory or the payment of an indemnity. The revolution kindling in the west would sooner or later undo the hard terms of peace. Lenin's political realism manifested itself in all its strength in regard to this question. The majority of the Central Committee in opposition to Lenin made a further attempt to avoid yielding to German imperialism by declaring the state of war at an end, but refusing at the same time to sign an imperialistic peace. This led to a renewed attack by the Germans. After heated debates in the Central Committee at the sitting of Feb. 18 Lenin won a majority for his proposal that negotiations should be reopened forthwith, and that the German terms which were now still more unfavourable should be signed.

The Soviet Government on Lenin's initiative transferred itself to Moscow. Peace having been attained, Lenin now brought before the party and the country the whole question of its economic and cultural organization.

The greatest trials, however, were still to come. By the end of the summer of 1918 Central Russia found itself surrounded by a ring of fire. Hand in hand with the Russian counter-revolution there came the rising of the Czechoslovaks on the Volga; on the north and south came the British intervention (in Archangel on Aug. 2, in Baku on Aug. 14). Food supplies were cut off. Lenin never ceased to direct his party and the Government. He carried on propaganda work, roused the masses, organized the getting of corn; followed the enemy's movements, was in direct communication with the Red Army. He followed the international situation, finding his bearings by the dissensions in the camps of the imperialists. He found time for interviews with foreign revolu-

tionaries and with Soviet engineers and economists.

On Aug. 30 the Social-Revolutionary Kaplan aimed two shots at Lenin when on his way to a workers' meeting. This attack intensified the civil war. Lenin's strong constitution quickly recovered from the effect of his wounds. During his convalescence he wrote a pamphlet, *The Proletarian Revolution and the Renegade Kautsky,* directed against the most prominent theorist of the Second International. By Oct. 22 he was again speaking in public.

The New Economic Policy.—The war on the home fronts remained his chief occupation. Economic and administrative problems had necessarily to take a subordinate place. The civil war fed from abroad was at its height. The struggle ended at the beginning of 1921 with the utter defeat of the counter-revolution and the Government grew in strength. The fact that the War had not led immediately to a proletarian revolution in Europe had enormously increased the difficulties of Socialist reconstruction, which was impossible without agreement between the proletariat and the peasantry. The system of requisitioning superfluities from the peasants must be replaced by a tax correctly assessed. Private interchange of commodities must be allowed. These measures began a new phase in the development of the Oct. (Nov.) revolution, that known as the "new economic policy."

In his policy within the Soviet Federation Lenin tried in every way to create for the nationalities which had been oppressed under Tsarism, conditions of free national development. He made unsparing war against all imperialist tendencies especially within the party itself—the purity of whose ideas he guarded with the utmost jealousy. The charges of oppressing nationalities made against Lenin and his party with reference to Georgia, etc., were the product of the sharp class warfare within the nation.

The principles of national self-determination, Lenin insisted on applying in full to colonial peoples. His doctrine was that the Western European proletariat should refrain from mere declarations of sympathy with oppressed nationalities, and instead should join them in the struggle against imperialism.

At the eighth congress of Soviets (1920) Lenin made a report on the work carried out on his initiative for the drafting of a plan for the electrification of the country. The gradual effort towards a high degree of technical development is the mark of the successful transformation from the system of small scale peasant economy, with its lack of co-ordination, to the system of large scale Socialist production based on a single, comprehensive plan. "Socialism is a Soviet Govt. plus electrification."

Death.—The exhaustion brought on by excessive hard work over a number of years ruined Lenin's health. Sclerosis attacked his cerebral arteries. At the beginning of 1922 his doctors forbade him daily work. From June to Aug. the disease made rapid progress, and for the first time he began to lose the power of speech and in Dec. he became paralysed in the right arm and leg. He died on Jan. 21, 1924, at 6.30 P.M., at Gorky, near Moscow. His funeral was the occasion for an unexampled manifestation of love and grief on the part of millions.

Lenin's outward appearance was distinguished by simplicity and strength. He was below the middle height, with the plebeian features of the Slavonic type of face, brightened by piercing eyes; and his powerful forehead and still more powerful head gave him a marked distinction. He was tireless in work to an unparalleled degree. He put the same exemplary conscientiousness into reading lectures in a small workmen's club in Zurich and in organizing the first Socialist State in the world. He appreciated and loved to the full science, art and culture, but he never forgot that as yet these things are the property of a small minority. His way of life in the Kremlin was little different from his life as an emigré abroad. The simplicity of his daily habits was due to the fact that intellectual work and intense struggle not only absorbed his interests and passions but also gave him intense satisfaction. His thoughts never ceased to labour at the task of freeing the workers.

His works include: *Ekonomicheskoye soderzhaniye narodnichestvai Kritika evo v Knige g. Struve, 1895* (The Economic Content of the popular party and Mr. Struve's criticism of it. The reflection of Marxism on bourgeois literature); *K. Kharakteristike ekonomicheskovo romantisma* (1897) (The characteristics of economic romanticism), Sismondi and our Sismondists; *Razvitiye Kapitalisma v Rossie,* 1899 (The development of Capitalism in Russia). The process of making a home market for large scale industry; *Chto Dyelat,* 1902. (What is to be done?) French trans. *Que Faire?* The most urgent question of our movement; *Dve taktiki sotsial—demokratii v demokraticheskoi revolyutsii,* 1905 (Two tactics of the Social Democracy in the democratic revolution); *Agrarnaya programma sotsial demokratii v pervoi russkoi revolyutsii 1905–1907* (1907) (The agrarian programme of the Social-Democrats in the first Russian revolution 1905–07); *Za 12 let.,* 1908 (During 12 years), Two tendencies in Russian Marxism and Russian Social Democracy; *Materialism i empiriokrititsism,* 1909 (Materialism and empiriocriticism). Critical observations on a reactionary philosophy; *Krakh II. Internatsionala,* 1915 (Collapse of the Second International. Eng. trans., 1919); *Sotsialism i voina,* 1915 (Socialism and War. LENINGRAD, the chief town of the Leningrad Area and the second largest city in the U.S.S.R. Pop. (1926) 1,592,158. Its name was originally St. Petersburg, but after the outbreak of war with Germany in 1914 this Germanic name was changed to Petrograd, grad being a form of the Russian *gorod,* a town. After the death of Lenin in 1924 the name was altered to Leningrad. It stands at the head of the Gulf of Finland, on the islands and shores of the mouth of the Neva river, and is the only outlet to the Baltic remaining to Russia. Although its foundation as a city dates from 1703, the Neva outlet for trade is very ancient. According to early chronicles, the way from the Varangii to the Greeks was up the Dnieper, by a portage to the river Lovot, down the Lovot to Ilmen lake, via the Volkhov to Lake Ladoga, and thence along the Neva river to the Gulf of Finland, wares being probably discharged on Vasilyevskiy or Basil island in the Neva delta. Peter the Great chose the site of the city without any consideration of physical suitability, basing his choice entirely on proximity to western Europe and outlet to the Baltic.

The islands and arms of the channels of the Neva are flat and low-lying marshes, and the delta plain is exposed to floods, especially when the westerly autumn gales force the waters of the Gulf of Finland into the Neva channel. The floods of 1824 and 1924 were particularly disastrous. The evaporation from the swamps and the northerly situation make the climate damp and severe, winter lasting from November to April and the Neva being frozen for six months. The summer nights of June and July are brief twilights reminiscent of the Arctic summer.

So many labourers lost their lives in the difficult task of building the city on piles in the marshes that Leningrad has the reputation of being built on bones. The building of the harbour and the gradual development of factory industries brought an influx of industrial workers to the city, and the unfortunate condition

of these workers contrasted sharply with the luxury and display of the court, so that if Moscow sums up much of the whole complex history of Russia, Leningrad gives the clearest picture of the causes of the unrest that led to the upheaval of 1917. The first strike occurred in 1749 amongst the textile workers, and the proletariat early had the support of the students of the university, who were repeatedly subjected to political persecution, imprisonment and exile.

The Régime of Terror.—The gloomy Peter Paul fortress, where political prisoners were incarcerated and frequently died from their hardships and the Alexeyevsky Ravelin, in whose damp cells many prisoners also died, including Ivan Possoshkov, the author of "Poverty and Wealth" were perpetual reminders to the proletariat and *intelligentsia* of the régime of oppression. The prison of the bastion of the former has been disused since 1922. From the mid-eighteenth century onwards, governors and governed lived side by side in Leningrad in an atmosphere of contempt, fear and repression on one side and of hate, fear and terrorist outbreaks of bomb attacks and revolutionary attempts on the other, until the cataclysm of 1917. The wide difference in outlook between the governing classes of Russia and those of western countries is vividly expressed in the declaration of Uvarov, minister of education from 1833–49, that his aim was to construct "dams" that would hold up the flow of new ideas into Russia, and that he hoped to retard the westernization of the country by 50 years. Leningrad had been specially built by Peter the Great to admit new ideas; its educational institutions had been largely staffed from the first by foreign teachers and its contact with the western world was close. It was thus the place where the struggle between conservatism and the effects of the impact of outside thought was sharpest.

Here the 1825 Dekabrist mutiny occurred; it witnessed the terrorist acts of the 1870 to 1880 Narodnaya Volya groups and the 1905 revolution received its baptism of blood near the Winter Palace. The 1917 revolution broke out here and in July of that year there began the Bolshevist movement culminating in the October 1917 revolution. The luxury and display of wealth are gone, but poverty and unemployment are still widespread.

Architectural Developments.—The city has a suburb, Viborg, on the north of the Neva, but the main part lies on the left bank, and a bridge connects the two parts. The terminus of the railway to Finland lies on the north bank. The railway terminus for Moscow and Murmansk lies on the left bank, and the line crosses the river in a north-easterly direction. The Okhta bridge connects the left bank with the right bank Okhta suburb. The numerous islands Vasilyevskiy (Basil), Petrograd, the Apothecaries' island, Kamenniy, Krestovskiy and Elagin are all built over and are connected by stone, wooden, floating or boat bridges. Three main streets, with three great canals intersecting them, form the nucleus of the city, with numbers of smaller streets and canals parallel. The longest and most important street is the former Prospekt Nevskiy, now Prospekt of the 25th of October, which connects the centre of the city with the terminus of the ancient highway to Moscow, now the site of the railway station for that town. The Admiralty buildings erected in 1703–4 became the centre of the city and the wide *Prospekts* or streets radiate outward from it in straight lines.

The Peter Paul fortress and the baroque Alexander Nevskiy cathedral were designed by Domenico Tresini. From 1741–61 bridges were built, swamps drained, streets paved and parks laid out, and the architect Rastrelli in the mid-eighteenth century designed a series of baroque buildings, including the Winter Palace and the Smolniy monastery. During the reign of Catherine II. there was much building activity and the transition style of Delamothe, Velton and Rinaldi and the classical style of Guarenghi, Starov and Bazhenov replaced the baroque, giving the city a strong, regular appearance reminiscent of ancient Palmyra. Embankments of the famous Finnish grey and pink granite were built along the Neva at that time.

The greatest architectural development was in the time of Alexander I. (1801–25), when "architectural landscapes" in which buildings supplemented one another as parts of a united whole were designed by Thomon, Zakharov, Voronikhin and Rossi. The Strelka on Basil island, the Castle (now Uritzky) place, Peter's (now Dekabrists') place and Theatre street (now Rossi street) are examples of this period.

Educational Institutions.—The educational institutions are of great importance. The Academy of Sciences (*see* ACADEMIES), opened in 1726, has been responsible for many surveys in Russia and its museums, Asiatic, anthropological, ethnographical, botanic, geological, mineralogical and zoological are justly famous, as are its publications. The recent researches of I. P. Pavlov, director of the physiological laboratories of the Russian Academy of Sciences on "Conditioned Reflexes" are world famous, as is the soil survey of Glinka and Prasolov, carried out under the auspices of the Dokuchaev Institute of Soils.

Among the numerous other museums are the Russian, with a particularly fine Buddhist section, the Hermitage, the Palace of Art, the Agricultural museum, the Court Stables museum, the Museum of People's Health and Children's Welfare, the Museum of Commercial Navigation, the Tolstoy museum, the Jewish museum, and the Museum of the Revolution. The work of the Geographical Society with branches in many parts of Russia, is widely known as is that of the Entomological Society.

Other educational institutions are the Leningrad State university, the Communist university, the Communist University for National Minorities, the Polytechnical institute, the Estonian Pedagogical institute, the Institute of Modern Oriental Languages, the Academy of History of Material Culture, the Academy of Fine Arts, and medical, agricultural, forestry, mining and other places of technical instruction. The State Public library, founded in 1814, has a collection of three million books, including many priceless manuscripts. In 1917 it was enriched by books confiscated from private libraries, but in compliance with the Riga Peace Treaty of 1920, many valuable books were returned to Poland. Some rare manuscripts and books, including the Koran of the Caliph Osman, were returned to the Central Asiatic republics.

Many of the primary and secondary schools are well equipped and there is a Jewish High school. In 1926 a Faculty for Northern Nationalities was established, which has 200 students representing 31 nationalities, Samoyedes, Kamchadals, Golds, Tungus, Ostyaks, Lapps, Gilyaks, Chukchee, etc. A boarding house is run, the students taking turns for household tasks. Many hardships have to be overcome by the students in their long journey over trackless marshy wastes to reach Leningrad, the journey sometimes occupying months. It is hoped that these students will return to their tribes and help to raise the standard of life there.

Several factories have classes for workers, and there are crèches for the children of working mothers. There are homes for orphan children, the legacy of the 1914–20 period, but here, as elsewhere in Russia, homeless waifs still haunt the streets, partly because their terrible experiences have made them wild and determined to escape from control. The lessening of the problem of overcrowding, owing to the transference of the centre of government to Moscow in 1918 when the Germans advanced into the Baltic provinces, and the increased attention to child welfare have diminished the former high infant mortality rate. Tuberculosis and other lung diseases, partly engendered by the damp foundations of the city, still take a high toll of the population.

For a detailed description of the architecture of Leningrad and the present contents of its museums, see *Guide to the Soviet Union, Moscow,* 1925 (In English).

Industries.—A ship canal (1875–88) made Leningrad a seaport and greatly increased its trade. The channel is 25 to 28 ft. deep. Steamers discharge in the Gutuyev basin (depth 21 ft.) and there are separate harbours for coaling vessels and for timber. The imports are coffee, madder, indigo, corn-meal, dyewoods, cotton, cotton-stuffs and yarns, machinery and mill work, woollen fabrics and yarn, linen fabrics and yarn, coals, salt, iron, lead, shot, hardware, wire, spices, fruits, tobacco and herrings and the exports, tallow, hemp, flax, grain, linseed, timber, copper,

hides, potash, bristles, hemp-seed, vegetable oil, furs, leather, fox, hare and squirrel skins, canvas and coarse linen, cordage, caviare, wax, isinglass, quilts, tar, oil-cake, naphtha, and spirits.

An ice-breaking campaign has been carried out to lessen the time of the closure of the port through winter frost and in 1926 during December, which in former times was a closed month, 73 ships entered the harbour and 98 left it, 175,000 tons of grain being exported in that month. Until the breaking off of diplomatic relations between Great Britain and Russia in 1927, Great Britain had replaced Germany as the chief import and export country for Leningrad; 51·3% of the imports into Leningrad in 1926 were from Britain and she received 31·8% of the exports from that city.

Germany and Finland supply most of the imports of Leningrad, and Germany, Finland and Estonia take most of the exports. The cutting off of the Finnish, Baltic and Polish background to the trade of Leningrad had an adverse effect on the city, but on the other hand it made her port the only Russian outlet to the Baltic. In recent years trading links between Leningrad and Riga have revived and Latvia has made special arrangements as regards railway gauge to encourage this trade. The industries of Leningrad, though depending on imports from other regions for metal and other raw material and also on imported foodstuffs for the workers, still occupy a prominent place and the recent provision of electric power is helping to solve the problem of fuel supply.

Metal and machinery manufactures occupy the first place and include the building of steamers and war vessels, the manufacture of engines, machinery and agricultural implements and of electro-technical equipment. The Putilov works specialize in the production of steel and of wire drawing plates for nail factories and of motor tractors, engines, turbines, etc., and the Sevkabel works in the manufacture of enamelled wire and high voltage cables. The making of pneumatic hammers for ferro-concrete casting of centrifugal pumps, steel tramcars, manometers, galvanometers and electro-magnetic measuring instruments has been successfully introduced since 1917.

The manufacture of chemicals, including celluloid and various medicinal preparations has developed markedly also, beginning about the year 1923. Textiles and ready-made clothing, galoshes and other rubber goods, leather goods, tobacco, paper, furniture, matches, printing, foodstuffs and the making of alcoholic drinks are other branches of industry.

The fact that Leningrad has survived the violent fluctuations in its fortunes since 1914, is still the second city of Russia and is developing new branches of industry, speaks much for its vitality. After the outbreak of war in 1914, the expansion of war industries resulted in a marked increase of the population which reached in 1916 a total of 2,416,000. During 1917 it was in a constant turmoil of civil fighting, while in 1918 it was threatened by the German armies and by the disturbances in Poland and the Baltic provinces, while its inner life was further disorganized by the removal of the government to Moscow. It also bore the brunt of the attacks of Kerensky and General Krasnov and of the attempt of General Yudenich in 1919. By 1920, its population had fallen to 722,000; its industry and trade were practically at a standstill and in that year and the next, in common with most of Russia, it faced famine and disease. Yet by 1923 its population had reached 1,071,103 and its trade and industry were reviving. The destructive floods of 1924 added heavily to its burdens, but by 1926 its population was 1,592,158 and the city was turning its attention to the introduction of new skilled industries, to the improvement of its port facilities and to new scientific and educational work.

LENINGRAD AREA, an administrative division of the Russian S.F.S.R., created in June, 1927, from the provinces of Leningrad, Murmansk, Novgorod, Pskov and Cherepovetz. Area 359,027 sq. kilometres. Pop. (1926) 6,391,964, of whom 1,592,158 are concentrated in the town of Leningrad. The Murmansk district (*q.v.*), with the Kola peninsula (*q.v.*), is distinct from the rest of the area in structure, climate and general conditions of life, but has been included in the Leningrad area because of the importance of Murmansk as an ice-free port all the year round, and because of the completion in 1917 of a railway line between Leningrad and Murmansk. The remaining provinces Leningrad, Cherepovetz, Pskov and Novgorod adjoin and consist mostly of flat and marshy land, except for the Valdai plateau (600–1,000 ft.) which extends into the south-eastern part of the province of Novgorod and the small Duderhof plateau (300–550 ft.) in the south of Leningrad province.

The whole region is covered with boulder clay, very often arranged in *eskers* or ridges, the bottom moraine of the Scandinavian and Finnish ice-sheet which covered the region in the glacial epoch. Numerous small lakes, with some large ones, notably Ladoga, Peipus or Chudskoe (the southern extension of which is often called Pskov), Ilmen and Byelo Ozero, immense marshes, often covered with forests of birch and elm, and small streams flowing either into the Baltic sea, the lakes, or the tributaries of the Volga and the western Dwina, are the most characteristic features of the district.

The marshes can be crossed only when frozen. Six centuries ago they were even less accessible, but the slow upheaval of north-west Russia, going on at a rate of three or more feet per century, has exercised a powerful influence on the drainage of the country, while artificial drainage has been carried out on a large scale. The soils consist mainly of glacial sands, post glacial clays, sands and peat bogs, with thick alluvial deposits in the valleys of the Neva and some other streams.

The proximity of the Baltic influences the climate, which is damp and cold, average January temperature at Leningrad, Novgorod, and Pskov respectively 15° F, 14·5° and 17·1°, average July temperature 64°, 62·5° and 64·8°. The average annual rainfall is 20 in., with a maximum in July and August and a minimum in spring and the prevailing winds are from the south-west. The rivers are frozen from 140 to 160 days, while snow lies on the ground from 120 to 160 days.

Forest covers 50% of the area, Cherepovetz and Leningrad having most and Pskov least forest; the oak is found south of a line roughly from the town of Cherepovetz to that of Leningrad, while north of that line are coniferous forests.

Soil and climatic conditions are more favourable to cattle and dairy produce and root, grass and technical cultures than to grain growing, especially as heavy summer rain may ruin grain crops. Leningrad provides a ready market for meat and dairy produce and flax is in great demand for the textile industry and is also exported. But much grain is grown for local needs. Pskov is the most important meat producing region, while Novgorod, Leningrad and Cherepovetz come next. Beef, veal, pork and mutton are produced in quantity, but the town of Leningrad needs more meat than is produced in all four provinces. Milk is produced in Leningrad province for sale in the town, while Novgorod and Cherepovetz are the chief butter producing areas; dairying is just beginning intensively in Pskov. Wool is used by the peasants for homespun. Bee-keeping is a supplementary source of income; honey and wax were exports from Novgorod in very ancient times.

The system of cultivation in the division is still in many cases the uneconomical three-field of tradition, but more productive many field systems, with more frequent sowing of grass and clover are gradually being introduced. The use of manure is increasing, and 4,000 tons of artificial manure were used in 1924–5 as against 1,500 tons in 1923–4, and better agricultural implements have been introduced. The government and co-operative societies grant credit to peasants for the purchase of such instruments.

Collective farming is little developed, possibly 1% of the land being worked in this way. Co-operative systems are more numerous in Cherepovetz and Leningrad than in Pskov and Novgorod. Flax growing is improving and increased by 33⅓% in Pskov between 1924–6 and by 50% in Novgorod. In Leningrad province flax is less cultivated; it demands 102 working days as against 24 for grass and the peasants in this area are attracted to factory labour. The chief grain crops are rye and oats; barley occupying a much smaller place except in Pskov. Potatoes and vegetables are increasingly produced for the Leningrad market, Pskov

and Leningrad provinces occupying the first place and Cherepovetz the last in this respect. The area under potatoes increased by nearly 25% in Novgorod between 1924 and 1926. Apples are grown in Pskov and Novgorod and berry fruits in Leningrad province for the town market.

Agriculture and stock raising suffered severely during the terrible times following the 1914 war and especially in the post-revolution period, but since 1924 a marked improvement has set in and in some cases the 1913 level has been passed. Cattle-breeding and flax cultivation have again attained an export character; grain growing is still for local needs only and the town of Leningrad depends on the Ukraine, the Volga area and Siberia for its grain supply and upon Vologda province and Siberia to supplement its meat, eggs and butter supplies. The Ukraine, the south-east region, Turkestan and Siberia supply sugar, tobacco, oil seeds, wool, cotton, silk, leather and hemp to the town.

Timber production is fully developed as regards saw-milling, but except in Leningrad paper, cardboard and cellulose production has no importance. Matches are made in Novgorod, Leningrad and Cherepovetz. The peasants make wooden articles of every description, household utensils, sledges, carts, etc. Timber is still the chief fuel used by the peasants. In the forested areas hunting is a supplementary source of income, though in Cherepovetz (*q.v.*), it has an export character. Wolves and bears greatly increased during 1914–20 and rewards are now offered for their capture. At the same time efforts are being made to introduce laws for the prevention of the destructive exploitation of fur-bearing animals in Cherepovetz, Pskov and Novgorod. In Leningrad province there is very little hunting. Fishing is productive in the lakes and streams, especially in Ilmen and Byelo Ozero. There is little mineral wealth.

The region is deficient in fuel, but has much unexploited hydro-electric power. The first step in its utilization was the opening of the Volkhov hydro-electric station in 1926–7, which has a capacity of 55,000 kilowatts. A drawback to this station is the low water in late summer when only three out of its eight turbines are working. The Red October station on the right bank of the Neva river near Leningrad, working on peat fuel, is able to supplement this deficiency. Two smaller stations have been opened on the Svir river and the Marii waterway and part of the railway will in future use electricity. The cheapening of manufactured products now that factories depend less on imported coal, with heavy freight costs, is already apparent. Moreover the use of hydro-electric power and peat permits the export of timber which was previously used for fuel.

Industries.—The striking feature of industrial production in the area is the concentration of factory industry in the town of Leningrad (*q.v.*), which has a population of over a million and a half, while no other town reaches 40,000 and only four towns reach 20,000. In the Leningrad province itself only Kronstadt, which is a fortress and not an industrial town reaches 20,000. The smaller industries of the provinces of Novgorod, Pskov and Cherepovetz, which depend on local raw material and local markets, recovered from the disastrous 1914–20 years much more rapidly than Leningrad, where large scale industry dependent on other regions for fuel and raw material and to a large extent on foreign capital and markets, had reached a complex stage in pre-war times. Novgorod has recovered most rapidly, its saw-milling, furniture, match, pottery, glass and paper industries being now at pre-war level.

Other industries of the province are linen manufacture, brewing, distilling, the making of leather goods, bricks, tiles, candles, etc. In Cherepovetz saw-milling is the most important industry, though it is still less than in pre-war times, partly because of efforts to prevent destructive exploitation of the forests. Leather goods, boots and shoes and matches are produced in much greater quantity than in 1913, but textiles and glass have not yet recovered. In Pskov, which was a war zone, the effects of 1914–20 are still marked, especially as the cutting off of land to the west altered the balance of trade after peace was restored. Local production in 1924 had reached 44% only of the 1913 level, the chief occupations being the making of leather and wooden articles. Textiles, glass, food-stuffs, peat and metal production, bristles, printing and paper had not by 1924 reached 10% of the 1913 level. Peasant industries throughout the whole region are less developed than in other parts of Russia.

Communications.—Although Leningrad has three waterways, the Marii, Tikhvin and Vyshne-Volochok, linking it with the Volga system, the railways take a far greater share in freightage than the waterways. The severity of the climate prevents navigation for five to six months during the winter, and low water in late summer also hampers it. The Tikhvin waterway is available for small steamers only, and most goods go via the Marii route. In 1924 the total freightage was 40% of pre-war freightage, due largely to the cutting off of much land on the west which formerly was included in Russia.

Road communication suffers here, as in many other regions of Russia from the spring thaws and the autumn rains, which convert unmetalled tracks into seas of mud. In connection with the general poor road construction in Russia it must be remembered that Russia was the eastern outpost of Europe against nomad raiding tribes and that the government was thus obliged to concentrate on a few strategic roads for protection against them. The Soviet government is now endeavouring to provide better surface roads to enable agricultural products to reach the railways and in the Leningrad area, especially in 1927–28, many miles of macadamised roads have been laid down. The two ports of the area are Leningrad and Murmansk. Most imports and exports go through the former, since the latter is in an initial stage of development and also involves heavy rail freightage costs. The chief towns (*q.v.*), are Leningrad, Pskov, Novgorod, Staraya Russa, Kronstadt and Cherepovetz.

Population and History.—The population in Novgorod, Pskov and Cherepovetz provinces is mainly Great Russian, with 1% of Estonians in Pskov, and 1% of Karelians in Cherepovetz. In Leningrad province, excluding the city itself 77·9% are Great Russians, 11·5% Finns and 5·5% Estonians. The population of the town, as of all seaports, is mixed, 83% being Russian; other nationalities represented are Poles, Jews, Estonians, Letts, Lithuanians and Finns.

An interesting commentary on the present stage of development in Russia and on the lack of communications is the fact that in 1925–6, Professor Zolotariev discovered in the Leningrad province tribes of Veps, Izhors and Vods, numbering 10 to 15,000, whose language, akin to Finnish had been thought to be extinct. The Vod tribes were living in mud huts; they hand on swords from generation to generation instead of names A settlement of Veps in the Lodeinopol district had no wheeled vehicles. Settlement, especially in Novgorod province, where stone age remains of Neolithic date are numerous round the beds of former lakes, is very ancient. The region between Lake Ladoga and the Gulf of Finland was inhabited in the 9th century chiefly by Finnish tribes, though even at that date there was some Slav penetration.

The site of Leningrad was at that time a swamp. But Novgorod (*q.v.*), about 100 m. S.E. of Leningrad, was already a flourishing city, with a marked republican tendency, where merchants trading in slaves, fur, honey and wax along the Baltic-Black Sea route were in the ascendancy. The Varangian chief, Rurik, according to Nestor's chronicle, fortified a small Slav town on the Volkhov, called it Novgorod (New Town) and established himself there as prince. After the decline of Kiev, Novgorod became the chief centre of Russian city life and later extended its power over the surrounding district and established colonies in the Far North, extending from Lapland to Siberia; possibly traders from these colonies penetrated to the Ob in their quest for fur. At its period of greatest expansion all the lands beyond Byelo Ozero, including the north Dwina country, Russian Lapland, the region between Lake Onega and the White Sea coastlands, the upper Kama basin, the Pechora basin and the land on both sides of the Urals, had trading colonies from Novgorod.

In 1700 Peter the Great declared war on Sweden, and in 1703 captured the Swedish fortress on the Neva, and laid the foundations of the cathedral to St. Peter and St Paul and of a fort which received his own name. In 1704 the fort of Kronslott was

erected on the island of Kotlin, and the Admiralty on the Neva, opposite the fortress. Determined "to open a window to the west," and wearied of the opposition of Moscow to his reforms, the emperor decided to build a new city on the marshy ground, driving piles into the swamp to serve as foundations.

In thus founding a channel for trade with the Baltic, Peter the Great restored an ancient trade current of Russia, to which Novgorod and Pskov had owed their rise, and the new city rapidly developed. The later construction of canals and railways linking it with the rest of the Russian empire further added to its importance. The development of the Ural and of the Ukrainian mining and metallurgical industries did not destroy the importance of the city. Even the removal after the 1917 revolution of the administrative centre to Moscow, the real heart of Russia, at a time when industry was at its lowest ebb and when the loss of the Baltic provinces and Poland was adversely affecting Leningrad, has merely checked, not ruined, the development of the city. One factor in this is that the very loss of these areas concentrated all trade through the Baltic to Russia in the only remaining port, Leningrad.

The presence of this large city population has modified local agriculture in the direction of meat, milk, dairy and vegetable production, has markedly diminished peasant petty trades and has intensified forest clearing to meet its fuel needs. Along with this has gone the opening up of the four provinces by canals, roads and railways, though much remains to be done. The general literacy rate, especially in the environs of Leningrad is high. (*See* NOVGOROD; PSKOV.)

LENKORAN, a town of Russia in the Azerbaijan S.S.R., in 38° 46′ N., 48° 51′ E, on the Caspian sea, at the mouth of a small stream of the same name, close to a large lagoon. Pop. (1926) 11,878. The town has no railway link and consequently has little trade. Taken by storm on New Year's day 1813 by the Russians, Lenkoran was surrendered by Persia to Russia by the Treaty of Gulistan, along with the khanate of Talysh, of which it was the capital.

The DISTRICT OF LENKORAN (2,117 sq.m.) is a thickly wooded mountainous region, shut off from the Persian plateau by the Talysh range (7,000–8,000 ft. high), and with a narrow marshy strip along the coast. The climate is exceptionally moist and warm (annual rainfall 52·79 in.; mean temperature in summer 75° F, in winter 40°), and fosters the growth of even Indian species of vegetation. The iron tree (*Parrotia persica*), the silk acacia, *Carpinus betulus, Quercus iberica,* the box tree and the walnut flourish freely, as well as the sumach, the pomegranate, and the *Gleditschia caspica*. The Bengal tiger is not infrequently met with, and wild boars are abundant. The Talyshes, belonging to the Iranian family, and speaking an independently developed language closely related to Persian, are the aboriginal population.

In the northern half of the district the Tatar element predominates and there are a number of villages settled by Russian Raskolniks (Nonconformists). Agriculture, bee-keeping, silkworm-rearing and fishing are the principal occupations.

LENNEP, JACOB VAN (1802–1868), Dutch poet and novelist, was born on March 24, 1802 at Amsterdam, where his father, David Jacob van Lennep (1774–1853), a scholar and poet, was professor of eloquence and the classical languages in the Athenaeum. Lennep graduated in law, and settled as an advocate in Amsterdam. He made his first real hit with the *Nederlandsche Legenden* (2 vols., 1828) and his fame was further raised by his patriotic songs at the time of the Belgian revolt, and by his comedies *Het Dorp aan de Grenzen* (1830) and *Het Dorp over de Grenzen* (1831), which also had reference to the political events of 1830. In 1833 he broke new ground with the publication of *De Pleegzoon* (*The Adopted Son*), the first of a series of historical romances in prose, which gave him in Holland a position somewhat analogous to that of Sir Walter Scott in Great Britain. He died at Oosterbeek near Arnheim on Aug. 25, 1868.

There is a collected edition of his *Poetische Werken* (13 vols., 1859–72), and also of his *Romantische Werken* (23 vols., 1855–72). *See* also a bibliography by P. Knoll (1869); and Jan ten Brink, *Geschiedenis der Noord-Nederlandsche Letteren in de XIXe Eeuw* (No. iii.).

LENNEP, a town in the Prussian Rhine province, 18 m. E. of Düsseldorf, and 9 m. S. of Barmen by rail, at a height of 1,000 ft. above sea level. Pop. (1925) 14,120. It carries on important manufactures of the finer kinds of cloth, hosiery and yarn and also of iron and steel goods.

LENNOX, a name given to a large district in Dumbartonshire and Stirlingshire, which was erected into an earldom in the latter half of the 12th century. It embraced the ancient sheriffdom of Dumbarton and nineteen parishes with the whole of the lands round Loch Lomond.

Alwin, first earl of Lennox, died before 1217. The second Alwin had ten sons; one founded the clan Macfarlane. Maldouen, the 3rd earl, was a witness to the treaty between Alexander II., of Scotland, and Henry III., at Newcastle in 1237.

In 1392 the earldom reverted to the king, who re-granted it to Duncan the 8th earl. In 1424, when Murdoch, then duke of Albany, ransomed James I. from his long captivity, Duncan went with the Scottish party to Durham, and next year he was executed; the widowed duchess of Albany, now also countess of Lennox, lived at Inchmurrin, Loch Lomond, until her death. Elizabeth, her sister, married Sir John Stewart of Darnley. Their grandson, Sir John Stewart, made a lord of parliament as Lord Darnley, became earl of Lennox in 1473. Matthew, 2nd earl of this line, left a son John, 3rd earl, who was murdered in 1526. His son Matthew, the 4th earl, married Margaret Douglas, the heir of the 6th earl of Angus by his wife, Margaret Tudor, sister of Henry VIII. and widow of James IV. Their eldest son Henry Lord Darnley married Mary, queen of Scots. He was murdered in 1567, and his son James became king of Scotland.

The title passed from James VI. to the king's uncle, Charles; in 1578 it was granted to Robert Stewart, second son of John, 3rd earl, but he in 1580 exchanged it for that of earl of March, and the earldom of Lennox was given to Esme Stewart, grandson of the 3rd earl. In 1581 Esme became duke of Lennox, earl of Darnley, Lord Aubigny, Tarboulton and Dalkeith. His son, Ludovic, was given his father's honours and estates, and was created Lord Settrington (1613), earl of Newcastle and duke of Richmond (1623). He died in 1624, being succeeded in his Scottish titles by his brother Esme, already earl of March, Lord Clifton of Leighton Bromswold (1619) and seigneur d'Aubigny in France. James, 4th duke of Lennox, was created duke of Richmond in 1641. In 1660 the titles passed from the 5th duke to Charles, Lord Stuart of Newbury and earl of Lichfield. He was drowned in 1672, and his sister Katharine, wife of Henry O'Brien, heir apparent of the 7th earl of Thomond, was served heir to him. Her only daughter, the countess of Clarendon, was mother of Theodosia Hyde, ancestress of the present earls of Darnley.

The Lennox dukedom was given by Charles II., with the titles of earl of Darnley and Lord Tarbolton to Charles Lennox, duke of Richmond, earl of March and Lord Settrington, son of the duchess of Portsmouth. The ancient lands of Lennox he sold to the duke of Montrose.

The wife of the 4th duke, Lady Charlotte Gordon, brought her family estates to the Lennoxes; the additional name of Gordon being taken by the 5th duke of Richmond and of Lennox. The 6th duke was granted the titles of duke of Gordon and earl of Kinrara (1876).

See *Scots Peerage,* ed. by J. B. Paul, vol. v. (Edinburgh, 1904–11); *The Lennox* by William Fraser (Edinburgh, 1874) and G. E. C[okayne], *Complete Peerage,* vol. v., pp. 60–68 (1893).

LENNOX, CHARLOTTE (1720–1804), British writer, daughter of Colonel James Ramsay, lieutenant-governor of New York, was born in 1720. She went to London in 1735, and, being left unprovided for at her father's death, she began to earn her living by writing. She made some unsuccessful appearances on the stage and married in 1748. Her chief works are: *The Female Quixote; or the Adventures of Arabella* (1752), a novel; *Shakespear illustrated; or the novels and histories on which the plays . . . are founded* (1753–54); *The Life of Harriet Stuart* (1751), a novel; and *The Sister,* a comedy produced at Covent Garden (Feb. 18, 1769).

LENNOX, MARGARET, COUNTESS OF (1515–1578), daughter of Archibald Douglas, 6th earl of Angus, and Margaret Tudor, daughter of Henry VII. of England and widow of James IV. of Scotland, was born at Harbottle castle, Northumberland, on Oct. 8, 1515. On account of her nearness to the English crown, Lady Margaret Douglas was brought up chiefly at the English court in close association with the Princess Mary, who remained her fast friend throughout life. She was high in Henry VIII.'s favour, but was twice disgraced; first for an attachment to Lord Thomas Howard, who died in the Tower in 1537, and again in 1541 for a similar affair with Sir Charles Howard, brother of Queen Catherine Howard. In 1544 she married a Scottish exile, Matthew Stewart, 4th earl of Lennox (1516–71), who was regent of Scotland in 1570–71. During Mary's reign the countess of Lennox had rooms in Westminster palace; but on Elizabeth's accession she removed to Yorkshire, where her home at Temple Newsam became a centre for Catholic intrigue. By a series of successful manoeuvres she married her son Henry Stewart, Lord Darnley, to Mary, queen of Scots. In 1566 she was sent to the Tower, but after the murder of Darnley in 1567 she was released. She was at first loud in her denunciations of Mary, but was eventually reconciled with her daughter-in-law. In 1574 she again aroused Elizabeth's anger by the marriage of her son Charles, earl of Lennox, with Elizabeth Cavendish, daughter of the earl of Shrewsbury. She was sent to the Tower with Lady Shrewsbury, and was only pardoned after her son's death in 1577. Her diplomacy largely contributed to the future succession of her grandson James to the English throne. She died on March 7, 1578.

LENO, DAN, the stage-name of George Galvin (1861–1904), English comedian, who was born at Somers Town, London, in Feb. 1861. His parents were actors, known as Mr. and Mrs. Johnny Wilde. Dan Leno was trained to be an acrobat, but soon became a dancer, travelling with his brother as "the brothers Leno," and winning the world's championship in clog-dancing at Leeds in 1880. Shortly afterwards he appeared in London at the Oxford, and in 1886–87 at the Surrey theatre. In 1888–89 he was engaged by Sir Augustus Harris to play the Baroness in the *Babes in the Wood,* and from that time he was a principal figure in the Drury Lane pantomimes. He was the wittiest and most popular comedian of his day, and delighted London music-hall audiences.

LENOIR CITY, a town of Loudon county, Tenn., U.S.A., on the Tennessee river, 24m. S.W. of Knoxville. It is on Federal highways 11 and 70 and is served by the Southern railway. The population was 4,216 in 1920 (99·5% native white). The manufactures include cotton yarn and hosiery, lumber and handles.

LENORMAND, HENRI-RENÉ (1882–), French dramatist, was born on May 3, 1882, in Paris, and was educated at the Lycée Jansen de Sailly, afterwards graduating at the Sorbonne. His first important play, *Les Possédées,* was produced in 1909 at the Théâtre des Arts; but for his first success he had to wait until, ten years later, Georges Pitoëff staged at his theatre in Geneva *Le Temps est un Songe* (1919) and *Les Ratés* (1920). These plays were subsequently transferred to Paris and well received. They were followed by *Le Simoun,* produced by Firmin Gémier and Gaston Baty at the Comédie Montaigne (1920), and by *Le Mangeur de Rêves,* produced by Pitoëff first in Geneva and afterwards in Paris (1922). The author by this time held a leading position among the younger dramatic authors of France, and in 1925 became the President of the *Théâtre des Jeunes Auteurs.* Gémier, director of the Odéon, revived *Le Simoun* in 1922, and produced in succession *La Dent Rouge* (1922) and *L'Homme et ses Fantômes* (1924). His later plays include *A l'Ombre du Mal* (1924), *Le Lâche* (1925), *L'Amour Magicien* (1926) and *Mixture* (1927). *Le Temps est un Songe* is the first of the plays included in the complete edition of his dramatic works (Georges Crès et Cie.), and that play may be regarded as the beginning of his career as a dramatist of international repute.

Lenormand's plays have since been produced throughout the world and translated into many languages. The fundamental inspiration of the dramatist is the conflict of positive good with an equally positive and creative principle of evil, combined with an equally vivid sense of destiny as determined by motives, latent and often unconfessed, in the minds of his protagonists. *Le Mangeur de Rêves* should be read, not as the analysis of a Freudian complex but as a modern replica of the tragedy of *Oedipus Rex.* In the modern tragedy, however, the fate of the characters is determined by a revelation of motives existing subconsciously in their minds. (J. PA.)

LENORMANT, FRANÇOIS (1837–1883), French Assyriologist and archaeologist, was born in Paris on Jan. 17, 1837, the son of a well known archaeologist, Charles Lenormant, who died at Athens on Nov. 24, 1859, when father and son were visiting Greece. Lenormant became sub-librarian of the Institute (1862), and professor of archaeology at the *Bibliothèque Nationale* (1874). He made many archaeological expeditions in the Mediterranean. He died in Paris on Dec. 9, 1883. Lenormant's most famous work is *Origines de l'histoire d'après la Bible.* He was one of the first to recognize in the cuneiform inscriptions the existence of a non-Semitic language now known as Accadian.

LENOX, a town of Berkshire county, Massachusetts, U.S.A., on the Housatonic river, near the west boundary of the State. It is served by the New York, New Haven and Hartford railroad. The population in 1925 was 2,895. The district has been a summer and autumn resort since 1835. Lenox was settled about 1750 and became an independent town in 1767. It has associations with Nathaniel Hawthorne, Fanny Kemble, Henry Ward Beecher, Catherine M. Sedgwick, Harriet Hosmer, Maria S. Cummins and many other men and women of prominence.

LENS (lons), a town of northern France, department of Pas-de-Calais, 13 m. N.N.E. of Arras by rail on the Déûle and on the Lens canal. Pop. (1926), 30,099. In 1648 the neighbourhood of Lens was the scene of a celebrated victory gained by Louis II. of Bourbon, prince of Condé, over the Spaniards. Lens was captured by the Germans in Oct. 1914 and held until 1918. In this district the front line remained stable, with the result that Lens was reduced to a heap of ruins. Reconstruction is actively going on, but the ruins of houses and mine heads may still be seen. Lens occupies a central position on the coalfields of Pas-de-Calais, and was in 1914 one of the chief coalmining centres in France, but destruction of the machinery and flooding of the mines during the German occupation has caused post-war production to be far below pre-war output. Liévin (pop. 24,054), likewise a coal centre, lies 2½ m. W.S.W.

LENS, in optics, an instrument which refracts the luminous rays proceeding from an object in such a manner as to produce an image, real or virtual, of the object (from Lat. *lens,* lentil, on account of the similarity of the form of a lens to that of a lentil seed). It is generally made of glass, although for special purposes, when it is desired to transmit rays which are strongly absorbed by glass, or for special refraction and dispersion, other substances, such as rock salt or fluorspar, are employed. For the general scientific principles governing the passage of light through lenses and systems of lenses *see* OPTICS. For the behaviour of lenses in various instruments *see* MICROSCOPE; PHOTOGRAPHY (for the photographic lens), TELESCOPE. For the lens of the eye *see* VISION.

THE MANUFACTURE OF LENSES

A typical method of making a lens involves seven separate processes: (1.) *Cutting* from a large block of glass a piece of suitable size by means of a rotating thin iron blade, one foot in diameter, whose edge, against which the glass is pressed, is charged with small fragments of diamond ($\frac{1}{100}$ in. diameter, and less), the rate of rotation being 240 times a minute. (2.) *Roughing, i.e.,* shaping with carborundum (the grains being of about $\frac{1}{50}$ in. diameter) made into a mud with water and smeared on a flat horizontal cast iron plate, of 3½ feet in diameter, which rotates sixty times a minute. (3.) *Roughing to curve* on both sides with similar carborundum on rotating cast iron dishes of the desired curvature. (4.) *Trueing to curve* on similar, but more accurate, iron dishes with emery mud whose grains are from 0·1 mm. down to 0·05 mm. diameter. (5.) *Smoothing* the lens—a process like the trueing but in which emery grains down to about 0·01 mm. diameter or less are used. (6.) *Polishing* with wet jewellers-rouge on polishers consisting of iron dishes whose sur-

faces are coated with pitch. (7.) *Edging* the lens on a lathe, by means of a brass plate whose surface is fed with trueing emery, until the lens is circular and of the required diameter; the lens being so chucked that the circular edge is concentric with the thickest (or thinnest) part of the lens. The words in italics are those in general use to describe these processes. The dimensions, speeds, etc., are subject to modification in different workshops.

History.—The references of Pliny and other ancient writers show that burning glasses were known to them in the form of glass spheres filled with water; and passages from Greek and Roman writers have been cited as showing that they knew of the magnifying properties of lenses, or at least of such glass spheres filled with water. One of the most thorough reviews of the subject (T. H. Martin, "Sur des instruments d'optique faussement attribués aux anciens par quelques savants modernes," *Bulletino di Bibliografia e di Storia delle Scienze matematiche e fisike*, Vol. iv. 1871. *See* also E. Wilde *Geschichte der Optik*, 1838–43) denies to the ancients all knowledge of spectacle lenses whether for short or long sight, or indeed of any kind of lenses, if we except the spheres of glass filled with water referred to above; and maintains that the lens-shaped glasses or crystals which have been found from time to time among the relics of departed civilizations were made by polishers of jewels for purposes of ornament.

We must come to the end of the thirteenth century for the first authentic mention of the use of lenses, which appears to be that of Meissner (1260–80) when he expressly states that old people derive advantage from spectacles (*see* E. Bock, *Die Brille u. ihre Geschichte* 1903). In the archives of the old Abbey of Saint-Bavon-les-Gand, the statement is found that Nicolas Bullet a priest, in 1282 used spectacles in signing an agreement (*see* P. Pansier, *Histoire des Lunettes* 1901). The first picture in which spectacles are known to have appeared is by Tommaso da Modena, in the Church of San Nicola in Treviso, and is of date 1360. In a sermon delivered February 23, 1305, Giordano da Rivalto stated that "it was only twenty years since the art of making spectacles was discovered" (*see* P. Pansier, *Histoire des Lunettes*). It may be accepted, from this and like evidence that the use of spectacles dates from a little prior to 1280; the industry of a host of enquirers has produced no certain evidence that a lens, as such, of any kind had been intentionally made by man previously to this date. William Bourne gives an account, very imperfect, but yet sufficient to show that processes for making lenses were then in use (about 1585) very like those still extant (W. Bourne, *A Treatise on the properties and qualities of glasses for optical purposes*, Brit. Mus., Lands. ms. 121, undated but author refers to a book written by him seven years previously which is probably his *Treasure for Travellers*, 1578). Very different is the account which is given by Baptista Porta of Naples in his famous book *Magia Naturalis, Libri Viginti* (Frankfurt, 1591). The following extract is from bk. xxvii., ch. 21 in the English translation (*Natural Magick by John Baptista Porta, a Neapolitane in Twenty Books*, 1658), but the matter is identical with the Latin edition of 1591. The translation has, however, rendered the original *pilae vitreae*—the phrase employed (as by Pliny) to describe *hollow* glass balls—by "Glass-balls"; and the reader must bear this in mind if he wishes to follow the description correctly: "In Germany there are made Glass-balls, whose diameter is a foot long, or thereabouts. The Ball is marked with the Emrilstone round and is so cut into many small circles, and they are brought to Venice. Here with a handle of wood are they glewed on, by Colophonia melted. And if you will make Convex Spectacles, you must have a hollow iron dish, that is a portion of a great sphere, as you will have your spectacles more or less Convex; and the dish must be perfectly polished . . . upon the Dish or Ball, there is strewed white-sand, that comes from Vincentia, commonly called Saldame, and with water it is forcibly rubbed between our hands, and that so long until the superficies of that circle shall receive the Form of the Dish, namely a Convex superficies . . . then rubbing it over again with powder of Tripolis that it may be exactly polished; when it is perfectly polished, you shall make it perspicuous thus. They fasten a woollen-cloth upon wood; and upon this they sprinkle water of Depart, and powder of Tripolis; and by rubbing it diligently, you shall see it take a perfect glass."

Manzini's book (*L'Occhiale all' occhio Dioptrica Pratica*, Bologna, 1660) shows that a well developed technique was in use in Italy in 1660; while in 1671 appeared *La Dioptrique Oculaire* by a Père Cherubin d'Orléans which not only deals with optics, with telescopes (including binocular) and microscopes, their theory, construction and use, but with the working of lenses, and of various machines invented by himself for that purpose. He writes on all these matters from actual experience, and the tools and materials which he used were almost identical with many still widely used. No other writer has given so adequate a description of the making of lenses until quite recently, and his machines are a great advance on those described by Manzini.

About this time Hooke was working on the microscope (*see* his *Micrographia* 1667). He describes a way of making microscope objective lenses, in which he drew a piece of broken Venice glass into a thin thread, then held one end of this thread in a flame till a globule of glass was formed. He then polished a flat surface on the thread side of the globule, first on a whetstone then on a smooth metal plate with tripoli. These lenses, however, being too small he used good plano-convex object glasses, and there is no indication that he made these himself.

The great Dutch microscopist, Leeuwenhoek, made his own lenses, but left no account of his methods, for reasons that he gives in a letter to Leibnitz dated 28th September 1715. "As to your idea of encouraging young men to polish glass—as it were to start a school of glass polishing—I do not myself see that would be of much use. Quite a number, who had time on their hands at Leyden, became keen on polishing glasses, owing to my discoveries; indeed there were three masters of that art in that town, who instructed students who were interested in such things. But what was the result of their labour. Nothing at all, so far as I have learnt." (Leeuwenhoek, *Epistolae Physiologicae super Compluribus Naturae Arcanis*, 1719.) Newton (*Optiks* 1721) makes some important remarks on polishing, which though referring to mirrors are also applicable to lenses; and appears to have been the first to use pitch for polishing, an important innovation.

Herschel in 1774 used a pitch polisher for polishing the speculum mirrors, some of them very large, for his telescope. He mentions (*see* his *Collected Papers* Roy. Soc. and R.A.S., 1912) that the polishing operation was carried out by ten men on one occasion. He gave an account of the polishing of a large speculum by a machine which he made to avoid the necessity of employing so many men, but gives no very clear description of the machine, nor any illustration of it. Fraunhofer, who made telescope lenses of great excellence, is said to have been the first to use proof spheres for testing the accuracy of his surfaces. Lord Rosse described before the Royal Society (*see* his *Collected Papers* 1926) a machine for polishing large specula, and in the course of the same papers he describes the mode of preparation of his rouge by calcination, at a dull red heat, of peroxide of iron produced as a precipitate with ammonia water from a dilute solution of iron sulphate.

Grinding and Polishing.—The object of lens polishing is to produce regular transparent surfaces of revolution on a piece of glass or other clear substance. The surfaces are usually required to be flat or spherical, while occasionally slight departures from these shapes are needed in order to obtain some optical advantage not otherwise attainable. The process is divided into two others, viz., grinding and polishing. The nature of ground glass surfaces was studied very thoroughly by Preston (*Trans. Opt. Soc.* 1922). He shows quite conclusively that such surfaces consist of a great number of conchoidal fractures from which pieces of glass have been broken; he has observed too that below this obviously broken surface there is a region in which there are small cracks which must be removed by polishing if the surface is to be perfectly clear.

There is no general agreement about the nature of polished glass surfaces. The late Lord Rayleigh (who had observed, though

not with the particularity of Preston, that in grinding glass the particles of abrasive appear to act by breaking out small fragments) thought that the process of polishing was not continuous with that of grinding, but consisted of a removal of molecular layers of the surface of the glass; and he measured the amount of glass so removed (*see* his *Scientific Papers*, vol. iv., 1901, and *Proc. Roy. Inst.*, March, 1901). He attributed to Herschel the opinion that polished surfaces differ from ground ones only in the fragments removed being smaller; the process in each case being that of attrition. Attempts made by Rayleigh to discover whether the surface of polished glass were different in physical properties from the mass failed to reveal any certain difference between the surface and the interior. Some accept the conclusions of Beilby from his observations on metals, glass and Iceland Spar. According to Beilby (*Proc. Roy. Soc.* A, vol. lxxii., and other papers) in polishing the surface molecules are set in gliding motion by the polisher so that they form an extremely thin film of fluid subject to surface tension, which, he thinks, accounts for the smooth surface which is left by polishing. This view is supported by French who finds strong support for it from his own experiments (*Trans. Opt. Soc.* 1916 and 1917). These and other possible views are critically considered with evidence from his own work by Preston whose conclusion is that the process of polishing glass is principally one of ultra-microscopic abrasion (*Trans. Opt. Soc.* 1926).

Materials, Machines and Tools.—The machines in general use (with the exception of those referred to later for the mass production of high quality lenses) are very simple and pretend to no accuracy of construction. The accuracy of the surface to be produced is very high. A piece of plate glass of, say 6 in. square may have inequalities of $\frac{1}{100}$ in., and from a number of specimens a piece with errors no more than $\frac{1}{1,000}$ in. may be selected. The surfaces of good spectacle lenses depart from true spheres by amounts of the order of $\frac{1}{10,000}$ in., while the optical work in good binoculars has rarely errors of as much as $\frac{1}{100,000}$ in.; and, finally, the best optical work of the few firms of highest repute may depart from the ideal aimed at by less than 1×10^{-6} in. To obtain such precision by mechanical guidance of the tool would be a hopeless task, even were the mechanism perfectly rigid, the polishers free from wear or flow, and the films of polishing substances of invariable thickness. None of these conditions are complied with, and the optician must rely for the production of accurate polished surfaces on quite other principles than those used by the engineering machinist. He is satisfied, then, with a machine which will move his polisher to and fro over the surface of his lens or block of lenses—from say 6 to 250 times a minute, according to the size of the work. Simultaneously the tool, or lens, whichever is undermost, rotates on a vertical spindle, the uppermost element being allowed to rotate also. The pitch (or other base for the polishing material) is not a solid, but a liquid which, though rigidly resisting distortion in passing over any small inequality of surface, yet, by a slow accommodation to the surface (spherical in the main) over which it passes, retains a spherical shape whose radius of curvature is always that of the surface it is polishing.

The Trueing Tools are usually made of cast iron, turned on the working surface to the desired radius of curvature. There are always two tools of the same radius, convex and concave, and after turning they are ground together with fine emery of the grade known as "trueing" until they fit exactly. The polisher holders (convex and concave) are similar to the trueing tools, but should be of radius of curvature greater or less than that of the trueing tool (according as the latter is convex or concave) by such an amount that the polisher is of a uniform thickness. If a number of lenses are to be polished together they are held on a similar tool by blobs of cement known as mallets.

Polishers are usually of pitch, although felt is sometimes used for the commoner work and various wax mixtures are also used. For pitch polishers wood pitch (*e.g.*, Swedish) may be filtered when hot through gauze and then boiled until, at the temperature at which it is to be used, it can be indented readily but not deeply by pressure of the thumbnail. Although this rough test is often the only one applied, it is the better practice to use a mechanical device, *e.g.*, a weighted cone or ball, applied for a definite time and to measure the indentation produced by it. Since the viscosity of pitch is halved for each $1\frac{1}{4}$° C rise of temperature, it is necessary to vary the pitch according to the temperature of the workshop, for if the pitch is too hard it causes scratches, while if too soft it soon loses its truly spherical shape, and the lenses get a bad figure. A typical mixture for *mallets* consists of two parts of pitch to three of red ochre; instead of the red ochre, wood ash may be used.

Grinding and Polishing Materials.—For roughing, the fastest material is carborundum; for trueing and smoothing various forms of aluminium oxide (Al_2O_3) are used. The impure forms known as emery have been used for grinding from time immemorial, and up till the end of the 19th century the emery from the Isle of Naxos had formed the principal source of supply for the optical industry. Purer and better natural forms known as corundum are found in the United States, Canada, Madagascar and elsewhere, while the artificial forms sold under various names (aloxite, alundum, etc.), are better still. All those mentioned require grinding and grading by elutriation; a very fine and uniformly graded material being of the highest importance if speedy polishing is to be accomplished. The following table shows the average sizes of grain suitable for optical work:

Trueing	Average size of grain				0·01	mm.	diameter
Fine trueing	,,	,,	,,	,,	0·005	,,	,,
Smoothing	,,	,,	,,	,,	0·0025	,,	,,
Fine smoothing	,,	,,	,,	,,	0·0012	,,	,,

The finest of these materials are very expensive to produce. In 1923 a further form of Al_2O_3 (Sira abrasive) of great purity, hardness and uniformity of grading became available. Owing to its sharp crystal edges, and to the fact that they maintain their quick-cutting properties, grinding with Sira abrasive is a rapid process. This abrasive is not so fine in grain as some of the grades of emery mentioned, but on account of its uniformity and because of the shape of its grains, it gives a ground surface with shallow pits of even depth which can be more quickly polished than the ground surface obtained with the usual series of progressively finer emeries. There are two materials in general use for polishing lenses. The first, jeweller's rouge, is a fine red iron oxide prepared by calcination of ferrous sulphate. The second is putty powder (tin oxide), which is often used with polishers of the wax class, and particularly for polishing soft materials. Other substances are of occasional use for special purposes, such as diamantine and chromium oxide. All these are used wet.

Mass Production.—In the mass production of lenses polishing processes have developed in two directions. The first aims at increasing the number of polishing spindles which can be attended to by a single workman. In other factories, particularly in some making large numbers of lenses (such as camera lenses) of good quality, carefully designed machines are used to secure that the best conditions for good polishing are automatically maintained. For instance in Taylor's polishing machines (*U.S. Pat. Sp. 1,562,068*, 1925) the rising and falling motion of the member which actuates the polisher is eliminated, and reactions, due to inertia, which are cause of the polisher becoming deformed, are thus abolished. At the same time the liquid is automatically applied to the polisher when the adhesion between the work and the polisher increases owing to the drying of the latter (*Brit. Pat. Sp.* 126,489/18). Similar machines are used for the lens smoothing. In the roughing of glass to shape a departure from the traditional processes has been made by Carl Zeiss Ltd., by the use of copper cylinders charged on the circumference with diamond dust (C. Zeiss, *Brit. Pat. Sp.* 14,126/07). With laps of this kind rotating at high speed (1,500 revolutions or more per min.) and with an ample supply of lubricant (*e.g.*, a sodium oleate solution in that strength which gives the minimum surface tension), cuts of a half inch deep and three or four inches wide can be milled off. A similar process is carried out by a slightly different form of machine (W. Taylor, *U.S. Pat. Sp. 1,432,093*, 1922), which, built on the turret principle, has three lens-holding spindles and two

abrasive wheels operating simultaneously on two lenses at once, one roughing, the other trueing; with this machine it is claimed that, owing to the principle of grinding adopted, spherical surfaces may be ground indefinitely.

The principal subsidiary processes are the centring and edging of the lenses, and the cementing of achromatic lenses. The process of centring and edging has been briefly described in the introduction. Machines are now made where the process becomes semi-automatic. For instance, one lens is mounted and adjusted on one spindle while a second lens is being ground by a diamond lap or corundum wheel, on the second spindle, the two spindles being mounted so that they can be interchanged by swinging about a common centre. For the cementing of achromatic objectives, liquid Canada balsam is still generally used, and is hardened around the rim of the objective by prolonged baking in a warm oven.

THE TESTING OF LENSES

A lens should be well polished, and free from bubbles and other defects in the glass. These faults are easily seen in a good light against a dark background if the examiner's eyes are screened. Defects of definition are more important, and not so simply dealt with. Among the tests applied to a lens should never be omitted its trial in actual use, but there should be added tests more severe than any to which it will be subjected in use and such as to indicate the degree and cause of any faults present. It must suffice to deal here with telescope and microscope objectives. Spectacle lenses, condensers and lenses for magnifiers and eye-pieces are made in large quantities and sold without any test at all being made except to reveal such faults as might be readily perceived by a purchaser; where manufacture is carefully controlled it is rare that any such lens that is not amply good enough for the unexacting requirements is put on the market.

A good test-object for telescope objectives is a star, or an artificial star produced by a distant ball of black glass, or a bulb of mercury, in which the sun is reflected. Actually, if the wave theory of light be taken into account, calculation shows that the image formed by a telescope lens is not a point, but a disc of finite diameter surrounded by rings of rapidly decreasing intensity (G. Airy, "Diffraction at a Circular Object Glass," *Trans. Camb. Phil. Soc.* 5, 1835, *see* also LIGHT). Examination of the image with a lens of high enough power confirms the result of calculation. William Halley in 1720 knew that the image of a star had a size greater than was attributable to the star alone, and Herschel knew of the rings referred to long before any explanation of them was given (J. F. W. Herschel, "Light," *Encyc. Metropolitana,* 1849). Examination of these rings, particularly as they appear a little within and without focus, can yield with experience most valuable information concerning any faults that may be present; and this method of test has been applied with excellent results by Dennis Taylor (*The Adjustment and Testing of Telescope Objectives,* York, 1896).

Another test which is highly informative is that of Foucault (*Comptes Rendus,* 1858, "Memories," *Ann. de l'Observatoire de Paris,* 1859) adopted later for other purposes by Toepler (*Pogg. Ann.* 1866–68). The eye placed in the focus of a star (or artificial star) sees the object glass uniformly illuminated. In the Foucault test a knife edge passed slowly across the focus from right to left makes the illumination disappear over the whole area of the object glass simultaneously if, and only if, the rays all pass accurately through the focus; this affords direct evidence of the course of the rays from different parts of the object glass. Still fuller knowledge of the course of the rays is to be had from Hartmann's method ("Objectivuntersuchungen," *Zeits. f. Instrumentenk.,* 1904). In this, a diaphragm pierced with holes is placed close to the object glass, and the image of a star photographed within and without focus. Such photographs consist of dots, each of which corresponds to one of the apertures in the diaphragm; and from the distances apart of the dots in the two photographs the course taken by the rays from the corresponding parts of the object glass can be found. Highly accurate results have been obtained by this method but it is very laborious. Methods which are of value in special cases have been developed by Waetzmann, founded on the Jamin Refractometer (E. Bratke, Über die Waetzmannsche Interferenzmethode zur Untersuchung optischen Systeme, *Zeitschr. f. Phys.* 1924), Ronchi (Vasco Ronchi, Über die Schattenstreifen zum Studien der Lichtwellen *Zeistchr. für Instrumentenkunde,* 1926) and Lenouvel (M. L. Lenouvel, *Revue d'Optique* 3 (1924), pp. 211 and 315. These last two derived from Foucault's test.

In quite a different category from the above are the methods of examination founded by Twyman and Green (F. Twyman and A. Green, *Brit. Pat.* 103,832/16, and 213,274/23, F. Twyman, *Brit. Pat.* 130,224/18) on the interferometer of Michelson. The method is applicable to object glasses of every size—including microscope objectives and even complete lens systems—and the information is given in terms of aberrations of wave-front produced by the lens, or if desired, by simple transformations (J. W. Perry, "The Determination of Aberrations, etc." *Trans. Opt. Soc.* 1924) in terms of the geometric convention in which almost all practical lens computations are carried out; the test is of high accuracy, can be carried out very rapidly and can be recorded in a photograph in which the errors due to each area of the lens aperture are represented. Those who have adopted it as a means of controlling their lens production have found it to yield readily information more complete and useful than that obtainable in any other way.

MICROSCOPE LENSES

The manufacture and testing of microscope lenses involves peculiar difficulties, arising from the smallness of the lenses and their short radii of curvature. The front lens of a high-powered microscope is always either hemispherical or more than hemispherical in shape, and often less than $\frac{1}{10}$ in. diameter. When it is borne in mind that the radius of curvature of these small lenses requires to be made to the calculated radius to within $\frac{1}{10,000}$ in. the necessity of special means to ensure these conditions will be realized.

Although pitch is employed as a polisher it is more customary to use a mixture such as shellac and putty powder, and the methods of grinding and polishing already described are then applicable with such modifications as are implied by the above mentioned characteristics of the deeper lenses used for microscope objectives. Very accurate means of measuring the radius of curvature have to be employed. One method in use employs two microscopes fixed so that their axes make a given angle with one another. The lens surface to be tested is placed on a traversing table in such a way that it can reflect the light back into one microscope or the other alternatively, according to the position occupied by the traversing table. The distance traversed taken together with the angular separation of the axes of the microscopes enables the radius of curvature of the lens surface to be calculated.

As already stated nearly all the front lenses of high power objectives are hemispherical or more than hemispherical, and to determine the departure from sphericity of such a lens is one of the outstanding difficulties of the microscope manufacturer. The method of centring does not differ in principle from that adopted in the case of larger lenses. The successful setting and edging of the lens is, however, an operation of considerable skill. The mechanical accuracy of the mount also requires special care, as does the process of mounting and cementing the front lens, the spherical surface of which bears against a shoulder, the lens being centred and cemented in position with shellac.

Testing Microscope Lenses.—A usual test of microscope objectives is to examine a familiar object, such as a Podura scale or one of certain diatoms such as *Amphipleura pellucida.* The utility of these objects usually depends on the presence of regular markings of more or less constant separation which thus furnish a test of the resolving power of objectives. A better test of resolving power is to be found in the Grayson rulings, consisting of ten fine diamond lines ruled on realgar surfaces and separated by distances down to $\frac{1}{120,000}$ in. The manufacturer, however, requires to assist him in achieving perfection in his lenses an indication not only that the lens is imperfect, but of the nature of its imperfection. The reflection of light from a very small mercury globule gives him a small point of light which will serve a purpose

similar to that of the star in the observation of the diffraction rings in the testing of telescope lenses. In place of the mercury globule, the light transmitted through a selected accidental perforation in a piece of silvered glass can be used with advantage. The observation of the ring system inside and outside focus with either of these kinds of object affords in either case an indication of the accuracy of the aberration correction or of the manufacture of the lens. Here again, however, a special difficulty arises in the case of the microscope, for the aberrations which in the case of a telescope are simple (involving in the calculations terms of the second order only), in the case of the microscope are much more complex; this complexity is reflected in the appearance of the rings, not only the brightness but their disposition also being strongly affected by the aberrations of the various zones. Thus judgment of the correction required is very difficult. Information of a more direct character is obtained from observing the appearance within and without focus on the exposure one by one of narrow zones of the objective, but here again considerable experience is needed before a right judgment can be come to. It should here be noted that even in the repetition manufacture of an approved type of objective the maker requires to make a final correction of aberration, which may be effected by slightly altering the position of one of the lenses. The means that appears likely to afford the most direct information on this subject is provided by the microscope objective interferometer, the application of which to this problem of the aberrations of microscope lenses seems likely to afford valuable information. (For aberration in optical systems, see Optics.) (F. T.)

LENT, in the Christian Church, the period of fasting preparatory to the festival of Easter. As this fast falls in the early part of the year, it became confused with the season, and gradually the word Lent, which originally meant spring, was confined to this use.

The length of this fast and the rigour with which it has been observed have varied greatly at different times and in different countries (*see* Fasting). In the time of Irenaeus the fast before Easter was very short, but very severe; thus some ate nothing for forty hours between the afternoon of Good Friday and the morning of Easter. This was the only authoritatively prescribed fast known to Tertullian (*De jejunio,* 2, 13, 14; *De oratione,* 18). In Alexandria about the middle of the 3rd century it was already customary to fast during Holy Week; and earlier still the Montanists boasted that they observed a two weeks' fast instead of one. Of the Lenten fast or Quadragesima, the first mention is in the fifth canon of the council of Nicaea (325), and from this time it is frequently referred to, but chiefly as a season of preparation for baptism, of absolution of penitents or of retreat and recollection. In this season fasting played a part, but it was not universally nor rigorously enforced. At Rome, for instance, the whole period of fasting was but three weeks, according to the historian Socrates (*Hist. eccl.* v. 22), these three weeks, in Mgr. Duchesne's opinion, being not continuous but, following the primitive Roman custom, broken by intervals. Gradually, however, the fast as observed in East and West became more rigorously defined. In the East, where after the example of the Church of Antioch the Quadragesima fast had been kept distinct from that of Holy Week, the whole fast came to last for seven weeks, both Saturdays and Sundays (except Holy Saturday) being, however, excluded. Early in the 7th century the fast was made to last 40 days and the cycle of paschal solemnities was extended to the ninth week before Easter by the institution of stational masses for Septuagesima, Sexagesima and Quinquagesima Sundays. The Greek Lent begins on the Monday of Sexagesima, with a week of preparatory fasting, known as τυροφάγια, or the "butter-week"; the actual fast, however, starts on the Monday of Quinquagesima (Esto mihi), this week being known as "the first week of the fast" (ἑβδομὰς τῶν νηστειῶν). The period of Lent is still described as "the six weeks of the fast" (ἓξ ἑβδομάδες τῶν νηστειῶν), Holy Week (ἡ ἁγία καὶ μεγάλη ἑβδομάς) not being reckoned in. The Lenten fast was retained at the Reformation in some of the reformed Churches, and is still observed in the Anglican and Lutheran communions. In England a Lenten fast was first ordered to be observed by Earconberht, king of Kent (640–664). In the middle ages, meat, eggs and milk were forbidden in Lent not only by ecclesiastical but by statute law; and this rule was enforced until the reign of William III.

During the religious confusion of the Reformation, the practice of fasting was generally relaxed and it was found necessary to reassert the obligation of keeping Lent and the other periods and days of abstinence by a series of proclamations and statutes. After the Revolution the Lenten laws fell obsolete, though they remained on the statute-book till repealed by the Statute Law Revision Act 1863. But during the 18th century, though the strict observance of the Lenten fast was generally abandoned, it was still observed and inculcated by the more earnest of the clergy, such as William Law and John Wesley; and the custom of women wearing mourning in Lent, which had been followed by Queen Elizabeth and her court, survived until well into the 19th century. With the growth of the Oxford Movement in the English Church, the practice of observing Lent was revived; and, though no rules for fasting are authoritatively laid down, the duty of abstinence is now very generally inculcated by bishops and clergy, either as a discipline or as an exercise in self-denial. For the more "advanced" Churches, Lenten practice tends to conform to that of the pre-Reformation Church.

Mid-Lent, or the fourth Sunday in Lent, was long known as *Mothering Sunday,* in allusion to the custom for girls in service to be allowed a holiday on that day to visit their parents. They usually took as a present for their mother a small cake known as a *simnel.* In shape it resembled a pork-pie but in materials it was a rich plum-pudding. The word is derived through M. Lat. *simenellus, simella,* from Lat. *simila,* wheat flour. In Gloucestershire simnel cakes are still common; and at Usk, Monmouth, the custom of mothering is still scrupulously observed. *See* article "Lent" in *Catholic Encyclopaedia.*

LENTHALL, WILLIAM (1591–1662), English parliamentarian, speaker of the House of Commons, second son of William Lenthall, of Lachford, Oxfordshire, was born at Henley-on-Thames in June 1591. He left Oxford without taking a degree in 1609, and was called to the bar at Lincoln's Inn in 1616, becoming a bencher in 1633. He represented Woodstock in the Short Parliament (April 1640), and was chosen (1640) by Charles I. to be speaker of the Long Parliament. On Jan. 4, 1642, however, when the king entered the House of Commons to seize the five members, Lenthall behaved with great prudence and dignity. Having taken the speaker's chair and looked round in vain to discover the offending members, Charles turned to Lenthall standing below, and demanded of him "whether any of those persons were in the House, whether he saw any of them and where they were." Lenthall fell on his knees and replied: "May it please your Majesty, I have neither eyes to see nor tongue to speak in this place but as the House is pleased to direct me, whose servant I am here." On the outbreak of the great rebellion, Lenthall threw in his lot with the parliament.

He carried on his duties as speaker without interruption till 1647, when the power of the parliament had been transferred to the army. On July 26, a mob invaded the House of Commons and obliged it to rescind the ordinance re-establishing the old parliamentary committee of militia; Lenthall was held in the chair by main force and compelled to put to the vote a resolution inviting the king to London. Threats of worse things came to Lenthall's ears, and, taking the mace with him, he left London on the 29th to join the army and Fairfax. Returning to London with the army, he was installed again by Fairfax in the chair (Aug. 6), and all votes passed during his absence were annulled. He adhered henceforth to the army party, but with a constant bias in favour of the king. His speakership continued till April 20, 1653, when the Long Parliament was summarily expelled. Cromwell directed Colonel Harrison, on the refusal of Lenthall to quit the chair, to pull him out—and Lenthall submitted to the show of force. He was speaker in the parliament of 1654, but was not re-elected to the chair in the parliament of 1656.

After Cromwell's death, the officers, having determined to recall the "Rump" parliament, assembled at Lenthall's house at

the Rolls (May 6, 1659), to desire him to send out the writs. Lenthall made various excuses for not complying. Nevertheless, upon the officers threatening to summon the parliament without his aid, he led the procession to the parliament house. Lenthall was now restored to the speakership. He was temporarily made keeper of the new great seal (May 14). On Oct. 13 Lambert placed soldiers round the House and prevented the members from assembling. Lenthall's coach was stopped as he was entering Palace Yard, the mace was seized, and he was obliged to return. The army, however, soon returned to their allegiance to the parliament. On Dec. 24, they marched to Lenthall's house, and expressed their sorrow. On the 29th the speaker received the thanks of the reassembled parliament.

Lenthall now turned his attention to bringing about the Restoration. He had been in communication with Monk for some time, and when Monk entered London with his army Lenthall met him in front of Somerset House. Nevertheless he was included (June 11) by the House of Commons, among the 20 persons excepted from the act of indemnity and subject to penalties not extending to life. Monk's testimony and intercession saved him, though he was declared incapable of holding for the future any public office. His last public act was a disgraceful one. Unmindful now of the privileges of parliament, he consented to appear as a witness against the regicide Thomas Scot, for words spoken in the House of Commons while Lenthall was in the chair. It was probably after this that he was allowed to present himself at court. Lenthall died on Sept. 3, 1662.

See C. H. Firth in the *Dict. Nat. Biog.*; Wood (ed. Bliss), *Ath. Oxon.* iii. 603, who gives a list of his printed speeches and letters; Foss, *Lives of the Judges*, vi. 447; and J. A. Manning, *Lives of the Speakers of the House of Commons*.

LENTICEL, a special organ, which appears as an elongated scar on the surface of the cells of trees, and which makes provision for gaseous interchange between the internal tissues and the external air after the formation of cork. A lenticel is formed by the phellogen dividing and giving rise to a loose tissue of rounded cells through which air can pass to the tissue below. The lenticels of the stem are usually found below the stomata whose function they take up after the latter have been cast off with the epidermis. *See* PLANTS.

LENTIL, the seed of *Lens esculenta* (also known as *Ervum Lens*), a small annual of the vetch tribe. The plant varies from 6 to 18 in. in height, and has many long ascending branches. The leaves are alternate, with six pairs of oblong-linear, obtuse, mucronate leaflets. The flowers, two to four in number, are of a pale blue colour, and are borne in the axils of the leaves, on a slender footstalk nearly equalling the leaves in length; they are produced in June or early in July. The pods are about ½ in. long, broadly oblong, slightly inflated, and contain two seeds, which are of the shape of a doubly convex lens, and about ¼ in. in diameter. There are several cultivated varieties of the plant, differing in size, hairiness and colour of the leaves, flowers and seeds. The last may be more or less compressed in shape, and in colour may vary from yellow or grey to dark brown; they are also sometimes mottled or speckled. In English commerce two kinds of lentils are principally met with, French and Egyptian. The former are usually sold entire, and are of an ash-grey colour externally and of a yellow tint within; the latter are usually sold like split peas, without the seed coat, and consist of the reddish-yellow cotyledons, which are smaller and rounder than those of the French lentil; the seed coat when present is of a dark brown colour. Considerable quantities of lentils are also imported into the United States.

The native country of the lentil is not known. It was probably one of the first plants brought under cultivation by mankind. Lentils have been found in the lake dwellings of St. Peter's island, Lake of Bienne, which are of the Bronze age. The red pottage of lentils for which Esau sold his birthright (Gen. xxv. 34) was apparently made from the red Egyptian lentil. This lentil is cultivated in one or other variety in India, Persia, Syria, Egypt, Nubia and North Africa, and in Europe, along the coast of the Mediterranean, and as far north as Germany, Holland and France. In Egypt, Syria and other Eastern countries the parched seeds are exposed for sale in shops, and esteemed the best food to carry on long journeys.

The reddish variety of the lentil (*lentillon d'hiver*) is the kind most esteemed in France on account of the superior flavour of its smaller seeds. It is sown in autumn either with a cereal crop or alone, and is cultivated chiefly in the north and east of France. The large or common variety, *lentille large blonde*, cultivated in Lorraine and at Gallardon (Eure-et-Loir), and largely in Germany, is the most productive, but is less esteemed. This kind has very small whitish flowers, two or rarely three on a footstalk, and the pods are generally one-seeded, the seeds being of a whitish or cream colour, about ⅜ of an inch broad and ⅛ in. thick. A single plant produces from 100 to 150 pods, which are flattened, about ¾ in. long and ½ in. broad. Another variety, with seeds similar in form and colour to the last, but of much smaller size, is known as the *lentillon de Mars*. It is sown in spring. This variety and the *lentille large* are both sometimes called the *lentille à la reine*. A small variety, *lentille verte du Puy*, cultivated chiefly in the departments of Haute Loire and Cantal, is also grown as a vegetable and for forage. The Egyptian lentil was introduced into Britain in 1820. It has blue flowers. Another species of lentil, *Ervum monanthos*, is grown in France about Orleans and elsewhere under the name of *jarosse* and *jarande*. It is, according to Vilmorin, one of the best kinds of green food to grow on a poor dry sandy soil; on calcareous soil it does not succeed so well. It is usually sown in autumn with a little rye or winter oats, at the rate of a hectolitre to a hectare.

Lentils are more especially the food of the poor in all countries where they are grown, and have often been spurned when better food could be obtained. The herbage is highly esteemed as green food for suckling ewes and all kinds of cattle (being said to increase the yield of milk), also for calves and lambs.

Sea-lentil is a name sometimes applied to the gulfweed *Sargassum vulgare*.

LENTO (It., slow), a musical term indicating a tempo between largo (*q.v.*) and andante (*q.v.*).

LENTULUS, the name of a Roman patrician family of the Cornelian gens. The word *Lentulitas* is coined by Cicero (*Ad Fam.* iii. 7, 5) to express the attributes of a pronounced aristocrat. The following members of the family deserve mention:

PUBLIUS CORNELIUS LENTULUS, nicknamed SURA, one of the chief figures in the Catilinian conspiracy. When accused by Sulla (to whom he had been quaestor in 81 B.C.) of having squandered the public money, he refused to render any account, but insolently held out the calf of his leg (*sura*), on which boys were punished when they made mistakes in playing ball. He was praetor in 75, governor of Sicily 74, consul 71. In 70, being expelled from the senate with a number of others for immorality, he joined Catiline. When Catiline left Rome after Cicero's first speech *In Catilinam*, Lentulus took his place as chief of the conspirators in the city. In conjunction with C. Cornelius Cethegus, he undertook to murder Cicero and set fire to Rome, but the plot failed owing to his indiscretion in communicating it to the ambassadors to the Allobroges, then in Rome, in the hope of securing armed assistance. They betrayed him, and the conspirators were arrested and forced to confess. Lentulus was executed on Dec. 5, 63 B.C.

See Dio Cassius xxxvii. 30, xlvi. 20; Plutarch, *Cicero*, 17; Sallust, *Catilina*; Cicero, *In Catilinam*, iii., iv.; *Pro Sulla*, 25; also CATILINE.

PUBLIUS CORNELIUS LENTULUS, called SPINTHER from his likeness to an actor of that name, supporter of Pompey. In 63 B.C., as curule aedile, he assisted Cicero in the suppression of the Catilinarian conspiracy. He was praetor in 60, and with Caesar's support got the province of Hispania Citerior in 59 and was consul in 57. He took a leading part in recalling Cicero from exile. From 56–53 Lentulus was governor of the province of Cilicia (with Cyprus) and during that time was commissioned by the senate to restore Ptolemy XI. Auletes to his kingdom (*see* PTOLEMIES). In spite of his indebtedness to Caesar, Lentulus joined the Pompeians on the outbreak of civil war (49). The generosity with which he was treated by Caesar after the capitulation of Corfinium made him hesitate, but he finally decided in favour of Pompey. After Pharsalus, Lentulus escaped to Rhodes.

According to Aurelius Victor (*De vir. ill.* lxxviii., 9, if the reading be correct), he subsequently fell into Caesar's hands and was put to death.

See Caesar, *Bell. Civ.* i. 15–23, iii. 102; Plutarch, *Pomp.* 49; Valerius Maximus ix. 14, 4; many letters of Cicero, especially *Ad Fam.* i. 1–9.

LUCIUS CORNELIUS LENTULUS, surnamed CRUS or CRUSCELLO, member of the anti-Caesarian party. In 61 B.C. he was the chief accuser of P. Clodius (*q.v.*) in the affair of the festival of Bona Dea. When consul (49) he advised the rejection of all peace terms offered by Caesar, and declared that, if the senate did not at once decide upon opposing him by force of arms, he would act upon his own responsibility. He fled from Rome as soon as he heard of Caesar's advance, and crossed over to Greece. After Pharsalus, he made his way to Rhodes (but was refused admission), thence, by way of Cyprus, to Egypt. He landed at Pelusium the day after the murder of Pompey, and was seized and put to death by Ptolemy.

See Caesar, *Bell. Civ.* i. 4, iii. 104; Plutarch, *Pompey*, 80.

A full account of the different Cornelii Lentuli, with genealogical table, will be found in Pauly-Wissowa's *Realencyclopädie*, iv. pt. 1, p. 1355 (1900) (*s.v.* "Cornelius"); *see* also V. de Vit, *Onomasticon*, ii. 433.

LENZ, JACOB MICHAEL REINHOLD (1751–1792), German poet, was born in Sesswegen, Livonia, the son of the village pastor, on Jan. 12, 1751, and brought up at Dorpat. In 1771 he went to Strasbourg as tutor to two young German noblemen. He fell in love with Friederike Brion, daughter of the pastor of Sesenheim, famous for her attachment to Goethe, and the lyrics (the best of his poems) which he wrote to her, *Die Liebe auf dem Lande*, were long attributed to Goethe, as was for a time his first play, *Der Hofmeister, oder Vorteile der Privaterziehung* (1774). Lenz had undoubted genius, but a nervous temperament, which brought on him repeated attacks of insanity at different times. His bad and vicious manners drove him from Weimar, where he had at first been well received by the reigning duke in 1776. He led a wandering life from that time onwards, though he found at last a small teaching post near Moscow, where he died insane on May 24, 1792.

Lenz's *Gesammelte Schriften* were published by L. Tieck in three volumes (1828); supplementary to these are E. Dorer-Egloff, *J. M. R. Lenz und seine Schriften* (1857); modern critical editions of his *Gesammelte Schriften* by F. Blei (1909–13, 5 vols.) and E. Lewy (4 vols., 1917). *See* Kindermann, *Lenz und die deutsche Romantik* (1924).

LEO I., who alone of Roman pontiffs shares with Gregory I. the surname of THE GREAT, pope from 440 to 461, was a native of Rome, or, according to a less probable account, of Volterra in Tuscany. In 429, when the first unmistakable reference to Pope Leo occurs, he was still only a deacon, but already a man of commanding influence; it was at his suggestion that the *De incarnatione* of the aged Cassianus, having reference to the Nestorian heresy, was composed in that year, and about 431 Cyril of Alexandria wrote to him to prevent the Roman Church from lending any support to the ambitious schemes of Juvenal of Jerusalem. In 440, while Leo was in Gaul, whither he had been sent to compose some differences between Aetius and another general named Albinus, Pope Sixtus III. died. The absent archdeacon was unanimously chosen to succeed him, and was consecrated on Sept. 29. In 443 he began to take stern measures against the Manichaeans (who since the capture of Carthage by Genseric in 439 had become very numerous at Rome), and in 444 he was able to report to the Italian bishops that some of the heretics had returned to Catholicism, while many had been sentenced to perpetual banishment "in accordance with the constitutions of the Christian emperors," and others had fled; in seeking these out the help of the provincial clergy was sought. During the earlier years of Leo's pontificate Hilarius of Arles was compelled to return to his obedience to the Roman See. The edict of Valentinian III. (445) denounced the contumacy of the Gallic bishop, and enacted "that nothing should be done in Gaul, contrary to ancient usage, without the authority of the bishop of Rome, and that the decree of the apostolic see should henceforth be law."

In 448 he received with commendation a letter from Eutyches, the Constantinopolitan monk, complaining of the revival of the Nestorian heresy there; and in 449 Eutyches asked for Leo's support at the oecumenical council at that time under summons to meet at Ephesus. Leo then by his legates sent to Flavian the epistle setting forth in detail the doctrine ever since recognized as orthodox regarding the union of the two natures in the one person of Jesus Christ. Leo's letter, though submitted, was not read by the assembled fathers at the Synod of Ephesus and the papal legates were in danger of their lives from the violence of the theologians who, not content with deposing Flavian and Eusebius, shouted for the dividing of those who divided Christ. When the news of the result of this council reached Rome, Leo wrote to Theodosius requesting the emperor to sanction another council, to be held this time, however, in Italy.

Among the reasons urged by Leo for holding this council in Italy had been the threatening attitude of the Huns; their irruption took place in the following year (452). After Aquileia had succumbed to Attila's long siege, the conqueror set out for Rome. Near the confluence of the Mincio and the Po he was met by Leo, whose eloquence persuaded him to turn back. Legend has sought to enhance the impressiveness of the occurrence by an unnecessarily imagined miracle. The pope was less successful with Genseric when the Vandal chief arrived under the walls of Rome in 455, but he secured a promise that there should be no incendiarism or murder, and that three of the oldest basilicas should be exempt from plunder—a promise which seems to have been faithfully observed. Leo died on Nov. 10, 461, the liturgical anniversary being April 11. His successor was Hilarius or Hilarus, who had been one of the papal legates at the "robber" synod in 449.

The title of *doctor ecclesiae* was given to Leo by Benedict XIV. Leo was a great preacher. From his short and pithy *Sermones* many of the lessons now to be found in the Roman breviary have been taken.

The works of Leo I. were first collectively edited by Quesnel (Lyons, 1700), and again, on the basis of this, in what is now the standard edition by Ballerini (Venice, 1753–56). Ninety-three *Sermones* and 173 *Epistolae* occupy the first volume; the second contains the *Liber Sacramentorum*, usually attributed to Leo, and the *De Vocatione Omnium Gentium*, also ascribed, by Quesnel and others, to him, but more probably the production of a certain Prosper, of whom nothing further is known. The works of Hilary of Arles are appended. *See* also P. Batiffol, *Le Siège apostolique (359–451)* (1924).

LEO II., pope from August 682 to July 683, was a Sicilian by birth, and succeeded Agatho I. The only fact of permanent historical interest with regard to Leo is that he wrote once and again in approbation of the decision of the sixth oecumenical council (Constantinople, 681), and in condemnation of the Monothelite heresy and of Honorius, whom he regarded as one who *profana proditione immaculatam fidem subvertere conatus est.* In the Greek text of the letter to the emperor in which the phrase occurs the milder expression παρεχώρησεν (*subverti permisit*) is used for *subvertere conatus est.* This Hefele in his *Conciliengeschichte* (iii. 294) regards as alone expressing the true meaning of Leo. It was during Leo's pontificate that the dependence of the see of Ravenna upon that of Rome was finally settled by imperial edict. Benedict II. succeeded him.

LEO III., whose pontificate (795–816) covered the last eighteen years of the reign of Charlemagne, was a native of Rome, and having been chosen successor of Adrian I on Dec. 26, 795, was consecrated to the office on the 27th day. His first act was to send to Charles as patrician the standard of Rome along with the keys of the sepulchre of St. Peter and of the city. On April 25, 799, Leo was attacked while riding in procession through the city; the object of his assailants, incited by Paschalis and Campulus, nephews of Adrian I., was, by depriving him of his eyes and tongue, to disqualify him for the papal office. This barbarous intention was not executed, but Leo sought the help of Winegis, the Frankish duke of Spoleto. Having vainly requested the presence of Charles in Rome, Leo crossed the Alps to meet the king at Paderborn; he was received with much ceremony and respect, but Charles appointed both the pope and his accusers to appear as parties before him in Rome. Leo returned to his diocese; Charles, who did not arrive until November in the following year, acquitted the pope, who, however, was permitted or rather re-

quired to clear himself by the oath of compurgation. The coronation of Charles followed two days afterwards. His enemies renewed their attacks after Charles's death; the violent repression of a conspiracy led to an open rebellion at Rome; serious charges were once more brought against him, when he died in 816. Under Leo's pontificate Felix of Urgel, the adoptianist, was anathematized (798) by a Roman synod. Leo at another synod held in Rome in 810 admitted the dogmatic correctness of the *filioque*, but deprecated its introduction into the creed. On this point, however, the Frankish Church persevered in the course it had already initiated. Leo's successor was Stephen IV.

LEO IV., pope from 847 to 855, was a Roman by birth, and succeeded Sergius II His pontificate was chiefly distinguished by his efforts to repair the damage done by the Saracens. He built and fortified the suburb on the right bank of the Tiber still known as the Civitas Leonina. A conflagration, which he is said to have extinguished by his prayers, is the subject of Raphael's great work in the Sala dell' Incendio of the Vatican. He held three synods, one of them (in 850) distinguished by the presence of Louis II., who was crowned emperor on the occasion. Leo was succeeded by Benedict III.

LEO V., a native of Ardea, was pope for two months in 903 after the death of Benedict IV. He was overthrown and cast into prison by the priest Christopher, who installed himself in his place.

LEO VI., succeeded John X. in 928, and reigned seven months and a few days. He was succeeded by Stephen VIII.

LEO VII., pope from 936 to 939, was preceded by John XI., and followed by Stephen IX.

LEO VIII., pope from 963 to 965, a Roman by birth, held the lay office of *protoscrinius* when he was elected to the papal chair at the instance of Otto the Great by the Roman synod which deposed John XII. in December 963. In February 964, the emperor having withdrawn from the city, Leo fled, and was deposed by a synod presided over by John XII. On the sudden death of John, the people chose Benedict V. as his successor; but Otto laid siege to the city and compelled their acceptance of Leo. It is usually stated that, at the synod which deposed Benedict, Leo conceded to the emperor and his successors as sovereign of Italy full rights of investiture, but the genuineness of the document is more than doubtful. Leo VIII. was succeeded by John XIII.

LEO IX., saint, pope from 1049 to 1054, a native of Upper Alsace, was born on June 21, 1002. His name was Bruno; through his father he was related to the emperor Conrad II. He was educated at Toul, where he successively became canon and (1026) bishop; he rendered political services to Conrad II., and afterwards to Henry III., and zealously promoted the rule of the order of Cluny. On the death of Damasus II., Bruno was in December 1048, with the concurrence of the emperor and of the Roman delegates, selected pope by an assembly at Worms; he stipulated, however, that he should first proceed to Rome and be canonically elected by the voice of clergy and people. On his way to Rome he met abbot Hugo of Cluny at Besançon, where he was joined by the young monk Hildebrand, afterwards Pope Gregory VII. He arrived in pilgrim garb at Rome, and at his consecration assumed the name of Leo IX. One of his first public acts was to hold the well-known Easter synod of 1049, at which celibacy of the clergy (down to the rank of subdeacon) was anew enjoined, and where he pronounced against every kind of simony. The greater part of 1050 was spent in a progress through Italy, Germany and France. After presiding over a synod at Pavia, he joined the emperor Henry III. in Saxony, and accompanied him to Cologne and Aix-la-Chapelle; at Reims he summoned a meeting of the higher clergy, by which reforming decrees were passed. At Mainz he held a council, at which the Italian, French and German clergy were represented, and ambassadors of the Greek emperor were present; here simony and the marriage of the clergy were the principal matters dealt with. After a fourth Easter synod in 1053 Leo set out against the Normans in the south with an army of Italians and German volunteers, but his forces were defeated at Astagnum near Civitella (June 18, 1053). He died on April 19, 1054. He was succeeded by Victor II.

See E. Martin, *Saint Léon IX.* (1904); J. H. Stein, *Der deutsche Heilige im Petersdom, Papst Leo IX.* (1925).

LEO X. [Giovanni de' Medici] (1475–1521), pope March 11, 1513 to Dec. 1, 1521, was the second son of Lorenzo de' Medici, called the Magnificent, and was born at Florence on Dec. 11, 1475. He received the tonsure at the age of seven and was soon loaded with rich benefices and preferments. Innocent VIII. named him cardinal-deacon of Sta. Maria in Dominica in March 1489. He received a careful education at Lorenzo's court under Angelo Poliziano, Pico della Mirandola, Marsilio Ficino, and Bibbiena. From 1489 to 1491 he studied theology and canon law at Pisa. In 1492 he was formally admitted into the sacred college and settled in Rome. The death of Lorenzo called the seventeen-year-old cardinal to Florence. He participated in the conclave on the death of Innocent VIII. in July 1492, and opposed the election of Cardinal Borgia. He lived with his elder brother Piero at Florence throughout the agitation of Savonarola and the invasion of Charles VIII. of France, until the Medici were expelled in November 1494. Giovanni then travelled in Germany, in the Netherlands and in France. In May 1500 he returned to Rome, where he devoted himself to art and literature. When the death of Piero de' Medici took place in 1503 Giovanni became head of his family. On Oct. 1, 1511, he was appointed papal legate of Bologna and the Romagna, and when the Florentine republic declared in favour of the schismatic Pisans Julius II. sent him against Florence at the head of the papal army. A bloodless revolution permitted the return of the Medici on Sept. 14, 1512. Giovanni's younger brother Giuliano became the nominal head of the republic, but the cardinal was the real ruler. Julius II. died in Feb. 1513, and the conclave, after a stormy seven days' session, united on Cardinal de' Medici as the candidate of the younger cardinals. He was ordained to the priesthood on March 15, consecrated bishop on the 17th, and enthroned with the name Leo X. on the 19th.

Many problems confronted Leo X. on his accession. He had to preserve the papal conquests which he had inherited from Alexander VI. and Julius II., to minimize foreign influence, whether French, Spanish or German, in Italy to put an end to the Pisan schism and to settle the other troubles incident to the French invasion. Other outstanding problems were the restoration of the French Church to Catholic unity, and the settlement of the wranglings of the German humanists. At the time of Leo's accession Louis XII. of France, in alliance with Venice, was attempting to regain the duchy of Milan and the pope, after fruitless endeavours to maintain peace, joined the league of Mechlin on April 5, 1513, with the emperor Maximilian I., Ferdinand I. of Spain and Henry VIII. of England. The French and Venetians were at first successful, but on June 6 they were defeated at Novara. The Venetians continued the struggle until October. On Dec. 19 the fifth Lateran council, reopened by Leo in April, ratified the peace with Louis XII., and registered the conclusion of the Pisan schism. While the council was planning a crusade and considering the reform of the clergy, a new crisis occurred between the pope and the king of France. Francis I., who succeeded Louis XII. on Jan. 1, 1515, was intent on recovering Milan and Naples. Leo formed a new league with the emperor and the king of Spain, and, to ensure English support, made Wolsey a cardinal. Francis entered Italy in August and won the battle of Marignano (Sept. 14).

The pope in October signed an agreement binding him to withdraw his troops from Parma and Piacenza, on condition of French protection at Rome and Florence. He held a secret conference with Francis at Bologna in Dec. 1515. The ostensible subjects under consideration were the establishment of peace between France, Venice and the Empire, with a view to an expedition against the Turks, and the ecclesiastical affairs of France. Precisely what was arranged is unknown.

During these two or three years of incessant intrigue and warfare the Lateran council was seriously hampered. Its three main objects, the peace of Christendom, the crusade and the reform of the church demanded general agreement among the powers which was lacking. Its most important achievements were the registration at its eleventh sitting (Dec. 19, 1516) of the abolition of the

pragmatic sanction, which the popes since Pius II. had unanimously condemned, and the confirmation of the concordat between Leo X. and Francis I., which was to regulate the relations between the French Church and the Holy See until the Revolution. Leo closed the council on March 16, 1517. It had ended the schism, ratified the censorship of books introduced by Alexander VI. and imposed tithes for a war against the Turks. It raised no voice against the primacy of the pope.

Leo had practised nepotism from the beginning. His cousin Giulio (later Clement VII.), was made archbishop of Florence, cardinal and vice-chancellor of the Holy See. Leo had named his younger brother Giuliano and his nephew Lorenzo, Roman patricians; he had placed Lorenzo in charge of Florence; he married Giuliano to Filiberta of Savoy, and intended to carve out a kingdom for him in Central Italy. After the death of Giuliano in March 1516, Leo transferred his ambitions to Lorenzo. At the very time (Dec. 1516) that peace between France, Spain, Venice and the Empire seemed to give some promise of a Christendom united against the Turk, Leo was preparing an enterprise against the duke of Urbino. He obtained 150,000 ducats from Henry VIII. of England, in return for which he entered the imperial league of Spain and England against France. The war lasted from Feb. to Sept. 1517, and ended with the expulsion of the duke and the triumph of Lorenzo; but it increased brigandage and anarchy in the States of the Church, hindered the preparations for a crusade and wrecked the papal finances. Leo now took advantage of a plot of several of the members of the sacred college to poison him, to execute one cardinal, imprison several others, and to make a radical change in the college. On July 3, 1517, he published the names of 31 new cardinals, among whom were such as Lorenzo Campeggio, Giambattista Pallavicini, Adrian of Utrecht, Cajetan, Cristoforo Numai and Egidio Canisio.

Leo meanwhile was planning a crusade to prevent the advance of Selim I. A truce was to be proclaimed throughout Christendom; the pope was to be the arbiter of disputes; the emperor and the king of France were to lead the army; England, Spain and Portugal were to furnish the fleet; and the combined forces were to be directed against Constantinople. Papal diplomacy in the interests of peace failed, however; Cardinal Wolsey made England, not the pope, the arbiter between France and the Empire; and much of the money collected for the crusade from tithes and indulgences was spent in other ways. In 1519 Hungary concluded a three years' truce with Selim I., but the succeeding sultan, Suliman the Magnificent, renewed the war in June 1521, and captured the citadel of Belgrade. Leo treated the Uniate Greeks with great loyalty, and by bull of May 18, 1521, forbade Latin clergy to celebrate mass in Greek churches and Latin bishops to ordain Greek clergy. These provisions were later strengthened by Clement VII. and Paul III. and went far to settle the chronic disputes between the Latins and Uniate Greeks.

Leo was disturbed throughout his pontificate by heresy and schism. The dispute between Reuchlin and Pfefferkorn was referred to the pope in Sept. 1513. He in turn referred it to the bishops of Spires and Worms, who gave decision in March 1514 in favour of Reuchlin. After the appeal of the inquisitor-general, Hochstraten, and the appearance of the *Epistolae obscurorum virorum*, however, Leo annulled the decision (June 1520) and imposed silence on Reuchlin. The pope had authorized the extensive grant of indulgences to secure funds for the crusade and for the rebuilding of St. Peter's at Rome. Against the attendant abuses the Augustinian monk Martin Luther (*q.v.*), posted (Oct. 31, 1517) on the church door at Wittenberg his famous ninety-five theses, which were the signal for widespread revolt against the church. Leo directed (Feb. 3, 1518) the vicar-general of the Augustinians to impose silence on the monks. On Aug. 7 Luther was cited to appear at Rome. The citation was cancelled, however, and Luther betook himself in October 1518 to Augsburg to meet the papal legate, Cardinal Cajetan. Fruitless negotiation followed, during which the pamphlets of the reformer set all Germany on fire.

Leo formally excommunicated Luther by bull of Jan. 3, 1521; and in a brief directed the emperor to take energetic measures against heresy. On May 21, 1521, Henry VIII. of England sent to Leo his book against Luther on the seven sacraments. The pope in return conferred on the king of England the title "Defender of the Faith" by bull of Oct. 11, 1521. Neither the imperial edict nor the work of Henry VIII. stayed the Lutheran movement. It was under Leo X. also that the Protestant movement had its beginning in Scandinavia. The pope had repeatedly used the rich northern benefices to reward members of the Roman curia, and in 1516 he sent the grasping and impolitic Arcimboldi as papal nuncio to Denmark to collect money for St. Peter's. King Christian II. expelled the nuncio and summoned (1520) Lutheran theologians to Copenhagen, and proceeded to abolish the jurisdiction of Rome in Denmark. Leo sent a new nuncio to Copenhagen (1521) in the person of the Minorite Francesco de Potentia, who readily absolved the king and received the rich bishopric of Skara. Neither the pope nor his legate, however, took any steps to remove abuses or otherwise reform the Scandinavian churches.

That Leo did not do more to check the tendency toward heresy and schism in Northern Europe is partly explained by political complications, and by his own preoccupation with schemes of papal and Medicean aggrandizement in Italy. The death of the emperor Maximilian on Jan. 12, 1519, had seriously affected the situation. Leo allowed it to appear at first that he favoured Francis I. while really working for the election of some minor German prince. He finally accepted Charles I. of Spain as inevitable, and the election of Charles (June 28, 1519) revealed Leo's desertion of his French alliance, a step facilitated by the death of Lorenzo de' Medici and his French wife. Leo desired to unite Ferrara, Parma and Piacenza to the States of the Church. An attempt in 1519 to seize Ferrara failed, and in May 1521 a treaty of alliance was signed at Rome between pope and emperor. Milan and Genoa were to be taken from France and restored to the Empire, and Parma and Piacenza were to be given to the Church on the expulsion of the French. The expense of enlisting 10,000 Swiss was to be borne equally by pope and emperor. Charles took Florence and the Medici family under his protection and promised to punish all enemies of the Catholic faith. Leo agreed to invest Charles with Naples, to crown him emperor, and to aid in a war against Venice. Henry VIII. announcd his adherence to the League in August. Francis I. had already begun war with Charles in Navarre, and in Italy, too, the French made the first hostile movement (June 23, 1521). Leo lived to hear of the capture of Milan from the French and of the occupation by papal troops of the long-coveted provinces (November 1521). He died suddenly on Dec. 1, 1521. His successor was Adrian VI.

Leo was friendly with King Emmanuel of Portugal on account of the latter's missionary enterprises in Asia and Africa. His concordat with Florence (1516) guaranteed the free election of the clergy in that city. His constitution of March 1, 1519 condemned the king of Spain's claim to refuse the publication of papal bulls. He maintained close relations with Poland because of the Turkish advance and the Polish contest with the Teutonic Knights. His bull of July 1, 1519, which regulated the discipline of the Polish Church, was later transformed into a concordat by Clement VII. Leo showed special favours to the Jews and permitted them to erect a Hebrew printing-press at Rome. He approved the formation of the Oratory of Divine Love, a group of pious men at Rome which later became the Theatine Order, and he canonized Francesco di Paola.

Leo X. was a patron of learning, and made Rome the centre of European culture. While yet a cardinal, he had restored the church of Sta. Maria in Dominica after Raphael's designs; and as pope he built S. Giovanni on the Via Giulia after designs by Jacopo Sansovino and pressed forward the work on St. Peter's and the Vatican under Raphael and Chigi. His constitution of Nov. 5, 1513 reformed the Roman university, which had been neglected by Julius II.; although it never attained to the importance of Padua or Bologna, it nevertheless possessed in 1514 an excellent faculty of eighty-eight professors. Leo called Theodore Lascaris to Rome to give instruction in Greek, and established a Greek printing-press from which the first Greek book printed at

Rome appeared in 1515. He made Raphael custodian of the classical antiquities of Rome and the vicinity. The distinguished Latinists Pietro Bembo (1470–1547) and Jacopo Sadoleto (1477–1547) were papal secretaries, as well as the famous poet Bernardo Accolti (d. 1534). Poets and literati were bishops, or papal scriptors or abbreviators, or in other papal employ. Leo's lavish expenditure exhausted within two years the hard savings of Julius II. To fill the treasury he created new offices and sold them. He sold cardinals' hats. He sold membership in the "Knights of Peter." He borrowed large sums from bankers, curials, princes and Jews.

In spite of his worldliness, Leo prayed, fasted, and was exact in religious observance. To the virtues of liberality, charity and clemency he added the Machiavellian qualities of falsehood and shrewdness, so highly esteemed by the princes of his time. He failed entirely in his general policy of expelling foreigners from Italy, of restoring peace throughout Europe, and of prosecuting war against the Turks. He failed to recognize the need of reform within the church and the dangers which threatened the papal monarchy; and he neglected the spiritual needs of the time. He was zealous in establishing the political power of the Holy See; he made it unquestionably supreme in Italy; he successfully restored the papal power in France; and he secured a prominent place in the history of culture.

AUTHORITIES.—The life of Leo X. was written shortly after his death by Paolo Giovio, bishop of Nocera, who had known him intimately. Other important contemporary sources are the Italian *History* of the Florentine writer Guicciardini, covering the period 1492–1530 (Milan, 1884); the reports of the Venetian ambassadors, Marino Giorgi (1517), Marco Minio (1520) and Luigi Gradenigo (1523), in vol. iii. of the 2nd series of *Le Relazioni degli ambasciatori Veneti*, edited by Alberi (Florence, 1846); and the *Diarii* of the Venetian Marino Sanuto (58 vols., 1879–1903). Other materials for the biography are to be found in the incomplete *Regesta* edited by Joseph Cardinal Hergenröther (Freiburg-i.-B., 1884 ff.); in the Turin collection of papal bulls (1859, etc.); in *Il Diario di Leone X. dai volumi manoscritti degli archivi Vaticani della S. Sede connote di M. Armellini* (Rome, 1884); and in "Documenti risguardanti Giovanni de' Medici e il pontifice Leone X.," appendix to vol. 1 of the *Archivio storico Italiano* (Florence, 1842).

LEO XI. (Alessandro de' Medici) was elected pope on April 1, 1605, at the age of seventy. He had long been archbishop of Florence and nuncio to Tuscany; and was entirely pro-French in his sympathies. He reigned for 26 days and was succeeded by Paul V.

LEO XII. (Annibale della Genga), pope from 1823 to 1829, was born near Spoleto on Aug. 22, 1760. Educated at the Accademia dei Nobili ecclesiastici at Rome, he was ordained priest in 1783. In 1792 Pius VI. made him his private secretary, in 1793 creating him titular archbishop of Tyre and despatching him to Lucerne as nuncio. In 1794 he was transferred to the nunciature at Cologne, but owing to the war had to make his residence in Augsburg. During the dozen or more years he spent in Germany he was entrusted with missions to the courts of Dresden, Vienna, Munich and Württemberg. After the abolition of the States of the Church, he was treated by the French as a state prisoner, and lived at the abbey of Monticelli, solacing himself with music and with bird-shooting. In 1814 he was chosen to carry the pope's congratulations to Louis XVIII.; in 1816 he was created cardinal-priest of Santa Maria Maggiore, and appointed to the see of Sinigaglia, which he resigned in 1818. In 1820 Pius VII. made him cardinal vicar. In the conclave of 1823, in spite of the active opposition of France, he was elected pope by the *zelanti* on Sept. 28. At the time he was thought to be dying, but he unexpectedly rallied. His foreign policy, entrusted at first to Della Somaglia and then to the more able Bernetti, moved in general along lines laid down by Consalvi; and he negotiated concordats advantageous to the papacy. Personally most frugal, Leo reduced taxes, made justice less costly, and found money for public improvements; yet he left the finances more confused than he had found them, and even the jubilee of 1825 did not mend matters. His domestic policy was one of extreme reaction. He condemned the Bible societies, and under Jesuit influence reorganized the educational system. Severe ghetto laws led many of the Jews to emigrate. He hunted down the *Carbonari* and the Freemasons; he took strong measures against political agitation in theatres. Leo, temperamentally stern, hard-working in spite of bodily infirmity, died at Rome on Feb. 10, 1829. He was succeeded by Pius VIII.

LEO XIII. (Gioacchino Pecci) (1810–1903), pope from 1878 to 1903, reckoned the 257th successor of St. Peter, was born at Carpineto on March 2, 1810. His family was Sienese in origin, and his father, Colonel Domenico Pecci, had served under Napoleon. His mother, Anna Prosperi, is said to have been a descendant of Rienzi, and was a member of the third order of St. Francis. He and his elder brother Giuseppe (known as Cardinal Pecci) were educated by the Jesuits at Viterbo, and at Rome. In 1825 he headed a students' deputation to Pope Leo XII. After graduation as doctor of theology he entered the Accademia dei Nobili ecclesiastici. Two years later Gregory XVI. appointed him a domestic prelate. He was ordained priest on Dec. 31, 1837, and a few weeks later was made apostolic delegate of Benevento. In 1841 he was appointed delegate of Perugia, at that time a centre of anti-papal secret societies. There he obtained a reputation as a social and municipal reformer. In 1843 he was sent as nuncio to Brussels, being first consecrated a bishop (Feb. 19). During his three years' residence at Brussels he was occupied with the education controversy then raging, and he mediated between the Jesuits and the Catholic university of Louvain. In January 1846 he was appointed bishop of Perugia with the rank of archbishop; but before returning to Italy he spent February in London, and March and April in Paris. On Dec. 19, 1853, he received the red hat from Pius IX. Meanwhile, and throughout his long episcopate of thirty-two years, he built and restored many churches, striving to elevate the intellectual as well as the spiritual tone of his clergy, and showing in his pastoral letters an unusual regard for learning and for social reform.

His position in Italy was similar to that of Bishop Dupanloup in France; and, as but a moderate supporter of the policy enunciated in the Syllabus, he was not altogether *persona grata* to Pius IX. He protested against the loss of the pope's temporal power in 1870, against the confiscation of the property of the religious orders, and against the law of civil marriage established by the Italian government, and he refused to welcome Victor Emmanuel in his diocese. In 1877, when the papal office of *camerlengo* became vacant, Pius IX. appointed to it Cardinal Pecci, who thus returned to reside in Rome.

When Pius IX. died (Feb. 7, 1878) Cardinal Pecci was elected pope at the subsequent conclave with comparative unanimity, obtaining at the third scrutiny (Feb. 20) forty-four out of sixty-one votes, or more than the requisite two-thirds majority. Although his long seclusion at Perugia had caused his name to be little known outside Italy, there was a general belief that the conclave

had selected a man who was a prudent statesman as well as a devout churchman.

The second day after his election Pope Leo XIII. crossed the Tiber *incognito* to his former residence in the Falconieri Palace to collect his papers, returning at once to the Vatican, where he continued to regard himself as "imprisoned" so long as the Italian government occupied the city of Rome. He was crowned in the Sistine Chapel on March 3, 1878, and at once began a reform of the papal household on austere and economic lines. He summoned to the Vatican certain Perugian clergy who had been trained under his own eye, and from the first he was less accessible than his predecessor had been, either in public or private audience. The stricter theological training of the Roman Catholic clergy throughout the world on the lines laid down by St. Thomas Aquinas was his first care, and to this end he founded in Rome and endowed an academy bearing the great schoolman's name, further devoting about £12,000 to the publication of a new and splendid edition of his works, the idea being that on this basis the later teaching of Catholic theologians and many of the speculations of modern thinkers could best be harmonized and brought into line.

The study of Church history was encouraged, and in August 1883 the Vatican archives and library were thrown open to qualified historians. His belief was that the Church would not suffer by the publication of documents. A man of literary taste and culture, familiar with the classics, a facile writer of Latin verses[1] as well as of Ciceronian prose, he was anxious that the Roman clergy should unite the humanities with their theological studies. He also established voluntary schools, the competition of which with the State schools ultimately obliged the State to include religious teaching in its curriculum. The numerous encyclicals issued by Leo XIII. were prepared and written by himself, but were submitted to the customary revision. The encyclical *Aeterni Patris* (Aug. 4, 1879) was written in the defence of the philosophy of St. Thomas Aquinas. In later ones, working on the principle that the Christian Church should superintend and direct every form of civil life, he dealt with the Christian constitution of states (*Immortale Dei*, Nov. 1, 1885), with human liberty (*Libertas*, June 20, 1888), and with the condition of the working classes (*Rerum novarum*, May 15, 1891).

This last was described as "the social Magna Carta of Catholicism," and it won for Leo the name of "the workingman's pope." Translated into the chief modern languages, many thousands of copies were circulated among the working classes in Catholic countries. Other encyclicals were on Christian marriage (*Arcanum divinae sapientiae*, Feb. 10, 1880), on the Rosary (*Supremi apostolatus officii*, Sept. 1, 1883, and *Superiore anno*, Sept. 5, 1898), and on Freemasonry (*Humanum genus*, April 20, 1884). Other famous encyclicals were on the study of Holy Scripture (Nov. 18, 1893) and on the reunion of Christendom (June 20, 1894). He showed special anxiety for the return of England to the Roman Catholic fold, and addressed a letter *ad Anglos*, dated April 14, 1895. This he followed up by an encyclical on the unity of the Church (*Satis cognitum*, June 29, 1896); and the question of the validity of Anglican ordinations from the Roman Catholic point of view having been raised in Rome by Viscount Halifax, a commission was appointed to consider the subject, and on Sept. 15, 1896 a condemnation of the Anglican form as theologically insufficient was issued, and was directed to be taken as final.

The establishment of a diocesan hierarchy in Scotland had been decided upon before the death of Pius IX., but the actual announcement of it was made by Leo XIII. On July 25, 1898 he addressed to the Scottish Catholic bishops a letter, in the course of which he said that "many of the Scottish people who do not agree with us in faith sincerely love the name of Christ and strive to ascertain His doctrine and to imitate His most holy example." The Irish and American bishops he summoned to Rome to confer with him on the subjects of Home Rule and of "Americanism," respectively. In India he established a diocesan hierarchy, with seven archbishoprics.

With the government of Italy his general policy was generally conciliatory. In 1879, addressing a congress of Catholic journalists in Rome, he exhorted them to proclaim that the affairs of Italy would never prosper until the temporal power was restored; in 1887 he found it necessary to deprecate the violence with which this doctrine was advocated in certain journals. A similar counsel of moderation was given to the Canadian press in connection with the Manitoba school question in Dec. 1897. The less conciliatory attitude towards the Italian government was resumed in an encyclical addressed to the Italian clergy (Aug. 5, 1898), in which he insisted on the duty of Italian Catholics to abstain from political life while the papacy remained in its "intolerable position." And in Jan. 1902, reversing the policy which had its inception in the encyclical, *Rerum novarum*, of 1891, and had further been developed ten years later in a letter to the Italian bishops entitled *Graves de communi*, the "Sacred Congregation of Extraordinary Ecclesiastical Affairs" issued instructions concerning "Christian Democracy in Italy," directing that the popular Christian movement, which embraced in its programme a number of social reforms, such as factory laws for children, old-age pensions, a minimum wage in agricultural industries, an eight-hour day, the revival of trade gilds, and the encouragement of Sunday rest, should divert its attention from all such things as savoured of novelty and devote its energies to the restoration of the temporal power.

His policy towards all governments outside Italy was to support them wherever they represented social order; and it was with difficulty that he persuaded French Catholics to be united in defence of the republic. The German *Kulturkampf* was ended by his exertions. In 1885 he arbitrated between Germany and Spain in a dispute concerning the Caroline Islands. In Ireland he condemned the "Plan of Campaign" in 1888, but he conciliated the Nationalists by appointing Dr. Walsh archbishop of Dublin. The jubilee of Queen Victoria in 1887 and the pope's priestly jubilee a few months later were the occasion of friendly intercourse between Rome and Windsor. Similar courtesies were exchanged during the jubilee of 1897, and again in March 1902; and the visit of Edward VII. to Leo XIII. in April 1903 was a further proof of friendliness between the English court and the Vatican.

The elevation of Newman to the college of Cardinals in 1879 was taken as evidence that Leo XIII. had a wider horizon than his predecessor; and his similar recognition of two of the most distinguished "inopportunist" members of the Vatican council, Haynald, archbishop of Kalocsa, and Prince Fürstenberg, archbishop of Olmütz, was even more noteworthy. Döllinger the pope attempted to reconcile, but failed. He worked for the reunion of the Oriental Churches with the see of Rome, establishing Catholic educational centres in Athens and in Constantinople with that end in view. He used his influence with the rulers of Russia, of China, Japan and Persia, to secure the free practice of their religion for Roman Catholics in those countries. Among the canonizations and beatifications of his pontificate was that of Sir Thomas More. His encyclical issued at Easter 1902, and described by himself as a kind of will, was mainly a reiteration of earlier condemnations of the Reformation, and of modern philosophical systems, which for their atheism and materialism he makes responsible for all existing moral and political disorders.

Grave and serious in manner, speaking slowly, but with energetic gestures, simple and abstemious in his life—his daily bill of fare being reckoned as hardly costing a couple of francs—Leo XIII. distributed large sums in charity, and at his own charges placed costly astronomical instruments in the Vatican observatory, providing also accommodation and endowment for a staff of officials. He always showed the greatest interest in science and in literature, and he would have taken a position as a statesman of the first rank had he held office in any secular government. Under him the papacy acquired a prestige unknown since the middle ages. On March 3, 1903, he celebrated his jubilee in St. Peter's with more than usual pomp and splendour; he died on July 20 following. His successor was Pius X.

LEO I., variously surnamed Thrax, Magnus and Makelles, emperor of the East, 457–474, was born in Thrace about 400. From his position as military tribune he was raised to the throne by the soldiery and recognized both by senate and clergy; his coronation by the patriarch of Constantinople is said to have been the earliest instance of such a ceremony. Leo owed his elevation mainly to Aspar, the commander of the guards, who was debarred by his Arianism from becoming emperor in his own person, but hoped to exercise a virtual autocracy through his former steward and dependant. But Leo, following the traditions of his predecessor Marcian, set himself to curtail the domination of the great nobles and repeatedly acted in defiance of Aspar. He vigorously suppressed the Eutychian heresy in Egypt, and by exchanging his Germanic bodyguard for Isaurians removed the chief basis of Aspar's power. With the help of his generals Anthemius and Anagastus, he repelled invasions of the Huns into Dacia (466 and 468).

In 467 Leo had Anthemius elected emperor of the West, and in concert with him equipped an armament of more than 1,100 ships and 100,000 men against the pirate empire of the Vandals in Africa. Through the remissness of Leo's brother-in-law Basiliscus, who commanded the expedition, the fleet was surprised by the Vandal king, Genseric, and half of its vessels sunk or burnt (468). This failure was made a pretext by Leo for killing Aspar as a traitor (471), and Aspar's murder served the Goths in turn as an excuse for ravaging Thrace up to the walls of the capital. In 473 the emperor associated with himself his infant grandson, Leo II., who, however, survived him by only a few months. His surnames Magnus (Great) and Makelles (butcher) respectively reflect the attitude of the Orthodox and the Arians towards his religious policy.

See E. Gibbon, *The Decline and Fall of the Roman Empire* (ed. Bury, 1896), iv. 29–37; J. B. Bury, *The Later Roman Empire* (1889), i. 227–233.

LEO III. (*c.* 680–740), called The Isaurian, emperor of the East, 717–740. Born about 680 in the Syrian province of Commagene, he rose to distinction in the military service, and under Anastasius II. was invested with the command of the eastern army. In 717 he revolted against the usurper Theodosius III. and, marching upon Constantinople, was elected emperor in his stead. The first year of Leo's reign saw a memorable siege of his capital by the Saracens, who had taken advantage of the civil discord in the Roman empire to bring up a force of 80,000 men to the Bosporus. By his stubborn defence the new ruler wore out the invaders who, after a twelve months' investment, withdrew their forces. An important factor in the victory of the Romans was their use of Greek fire. Having thus preserved the empire from extinction, Leo proceeded to consolidate its administration, which in the previous years of anarchy had become completely disorganized. He secured its frontiers by inviting Slavonic settlers into the depopulated districts and by restoring the army to efficiency; when the Arabs renewed their invasions in 726 and 739 they were decisively beaten on both occasions by the imperial forces.

His civil reforms include the abolition of the system of prepaying taxes which had weighed heavily upon the wealthier proprietors, the elevation of the serfs into a class of free tenants, the remodelling of family and of maritime law. These measures, which were embodied in a new code published in 740, met with some opposition on the part of the nobles and higher clergy. But Leo's most striking legislative reforms dealt with religious matters. After an apparently successful attempt to enforce the baptism of all Jews and Montanists in his realm (722), he issued a series of edicts against the worship of images (726–729). This prohibition of a custom which had undoubtedly given rise to grave abuses seems to have been inspired by a genuine desire to improve public morality, and received the support of the official aristocracy and a section of the clergy. But a majority of the theologians and all the monks opposed these measures with uncompromising hostility, and in the western parts of the empire the people refused to obey the edict. A revolt which broke out in Greece, mainly on religious grounds, was crushed by the imperial fleet (727), and two years later, by deposing the patriarch of Constantinople, Leo suppressed the overt opposition of the capital.

In Italy the defiant attitude of Popes Gregory II. and III. on behalf of image-worship led to a fierce quarrel with the emperor. The former summoned councils in Rome to anathematize and excommunicate the image-breakers (730, 732); Leo retaliated by transferring southern Italy and Greece from the papal diocese to that of the patriarch. The struggle was accompanied by an armed outbreak in the exarchate of Ravenna (727), which Leo finally endeavoured to subdue by means of a large fleet. But the destruction of the armament by a storm decided the issue against him; his south Italian subjects successfully defied his religious edicts, and the province of Ravenna became detached from the empire. In spite of this partial failure Leo must be reckoned as one of the greatest of the later Roman emperors. By his resolute stand against the Saracens he delivered all eastern Europe from a great danger, and by his thorough-going reforms he not only saved the empire from collapse, but invested it with a stability which enabled it to survive all further shocks for a space of five centuries.

See E. Gibbon, *The Decline and Fall of the Roman Empire* (ed. Bury, 1896), v. 185 *seq.*, 251 *seq.* and appendices, vi. 6–12; J. B. Bury, *The Later Roman Empire* (1889), ii. 401–449; K. Schenk, *Kaiser Leo III.* (Halle, 1880), and in *Byzantinische Zeitschrift* (1896), v. 257–301; T. Hodgkin, *Italy and her Invaders* (1892, etc.), bk. vii., chs. 11, 12. *See* also Iconoclasts.

LEO IV., called Chazar, succeeded his father, Constantine V., as emperor of the East in 775. In 776 he associated his young son, Constantine, with himself in the empire, and suppressed a rising led by his five step-brothers which broke out as a result of this proceeding. Leo was largely under the influence of his wife Irene (*q.v.*), and when he died in 780 he left her as the guardian of his successor, Constantine VI.

LEO V., surnamed The Armenian, emperor of the East, 813–820, was a distinguished general of Nicephorus I. and Michael I. After rendering good service on behalf of the latter in a war with the Arabs (812), he was summoned in 813 to co-operate in a campaign against the Bulgarians. Taking advantage of the disaffection prevalent among the troops, he left Michael in the lurch at the battle of Versinikia and subsequently led a successful revolution against him. Leo justified his usurpation by repeatedly defeating the Bulgarians who had been contemplating the siege of Constantinople (814–817). By his vigorous measures of repression against the Paulicians and image-worshippers he roused considerable opposition, and after a conspiracy under his friend Michael Psellus had been foiled by the imprisonment of its leader, he was assassinated in the palace chapel on Christmas Eve, 820, by his partisans.

See E. Gibbon, *The Decline and Fall of the Roman Empire* (ed. Bury, 1896), v. 193–195; Bury, *Eastern Roman Empire* (1912), p. 43–76; and *English Historical Review,* xxv. (1910) 276 *sqq.*

LEO VI., surnamed The Wise and The Philosopher, Byzantine emperor, 886–911. He was the son of Eudocia, wife of Basil I., but in fact his father was Michael III. The chief event of his reign was the capture of Thessalonica (904) by Mohammedan pirates (described in *The Capture of Thessalonica* by John Cameniata) under the renegade Leo of Tripolis. In Sicily and Lower Italy the imperial arms were unsuccessful, and the Bulgarian Symeon, who assumed the title of "Czar of the Bulgarians and autocrat of the Romaei" secured the independence of his church by the establishment of a patriarchate. But though Gibbon may be right in calling his surname "absurd," he did lasting work

in reforming the civil administration of the empire. His works include seventeen *Oracula,* in iambic verse, on the destinies of future emperors and patriarchs of Constantinople; thirty-three *Orations,* chiefly on theological subjects (such as church festivals); *Basilica,* the completion of the digest of the laws of Justinian, begun by Basil I., the father of Leo; some epigrams in the Greek *Anthology;* an iambic lament on the melancholy condition of the empire; and some palindromic verses, curiously called *καρκίνοι* (crabs). The treatise on military tactics, attributed to him, is possibly by Leo III., the Isaurian.

Complete edition in Migne, *Patrologia Graeca,* cvii.; for the literature of individual works *see* C. Krumbacher, *Geschichte der bysantinischen Literatur* (1897); H. Monnier, *Les Novelles de Léon Le Sage;* A. Vogt, in *Cambridge Medieval History,* vol. iv., pp. 54–59; M. Mittard, *Etudes sur le règne de Lèon VI.* (1903), in *Byzantinische Zeitschrift,* XII. (J. H. F.)

LEO, BROTHER (d. *c.* 1270), the favourite disciple, secretary and confessor of St. Francis of Assisi. He was one of the small group of most trusted companions of the saint during his last years. Leo was the leader in the early stages of the struggle in the order for the maintenance of St. Francis's ideas on strict poverty, and the chief inspirer of the tradition of the Spirituals on St. Francis's life and teaching. The claim that he wrote the so-called *Speculum perfectionis* cannot be allowed, but portions of it no doubt go back to him. A little volume of his writings has been published by Lemmeus (*Scripta Fratris Leonis,* 1901). He died at the Portiuncula in extreme old age.

All that is known concerning him is collected by Paul Sabatier in the "Introduction" to the *Speculum perfectionis* (1898). (*See* St. Francis and Franciscans.)

LEO, HEINRICH (1799–1878), German historian, was born at Rudolstadt on March 19, 1799, his father being chaplain to the garrison there. As a student (1816–20) at the universities of Breslau, Jena and Göttingen, Leo fell under radical influences and at Jena he attached himself to the radical wing of the German *Burschenschaft,* the so-called "Black Band," under the leadership of Karl Follen. The murder of Kotzebue by Karl Sand, however, shocked him out of his extreme revolutionary views, and from this time he tended, under the influence of the writings of Hamann and Herder, more and more in the direction of conservatism and romanticism, until at last he became an extreme reactionary. He was *Privatdocent* at Erlangen, *Docent* (1822–27) at Berlin and for nearly 40 years (1830–68) professor at Halle.

Leo collaborated in the *Jahrbücher für Wissenschaftliche Kritik* (1827–46). His first considerable work was his *Geschichte der italienischen Staaten* (5 vols., 1829–32). As a friend of the Prussian "Camarilla" and of King Frederick William IV. he collaborated especially in the high conservative *Politisches Wochenblatt,* which first appeared in 1831, as well as in the *Evangelische Kirchenzeitung,* the *Kreuzzeitung* and the *Volksblatt für Stadt und Land.* In all this his critics scented an inclination towards Catholicism; and Leo did actually glorify the counter-Reformation, *e.g.,* in his *Zwölf Bücher niederländischer Geschichte* (2 vols., 1832–35). His other historical works, and particularly his *Universalgeschichte* (6 vols., 1835–44) are biassed by his reactionary views.

Leo was by nature highly excitable and almost insanely passionate, though at the same time strictly honourable, unselfish, and in private intercourse even gentle. During the last year of his life his mind suffered rapid decay, of which signs had been apparent as early as 1868. He died at Halle on April 24, 1878. He left an account of his early life (*Meine Jugendzeit,* Gotha, 1880), which is of interest.

See Lord Acton, *English Historical Review,* i. (1886); P. Krägelin, *Heinrich Laube* (1908).

LEO, JOHANNES (*c.* 1494–1552?), in Italian Giovanni Leo or Leone, usually called Leo Africanus, sometimes Eliberitanus (*i.e.,* of Granada), and properly known among the Moors as Al Hassan Ibn Mohammed Al Wezaz Al Fasi, was the author of a *Descrizione dell' Africa,* or *Africae descriptio,* which long ranked as the best authority on Mohammedan Africa. Born probably at Granada of a noble Moorish stock, he received a great part of his education at Fez, and travelled widely in the Barbary States. Before the end of 1513 he seems to have started on his famous Sudan and Sahara journeys (1513–1515) which brought him to Timbuktu, to many other regions of the Great Desert and the Niger basin, and apparently to Bornu and Lake Chad. In 1516–1517 he travelled to Constantinople, probably visiting Egypt on the way; it is more uncertain when he visited the three Arabias (*Deserta, Felix* and *Petraea*), Armenia and "Tartary" (the last term is perhaps satisfied by his stay at Tabriz). His three Egyptian journeys, immediately after the Turkish conquest, all probably fell between 1517 and 1520; on one of these he ascended the Nile from Cairo to Assuan.

As he was returning from Egypt about 1520 he was captured by pirates near the island of Gerba, and was ultimately presented as a slave to Leo X. The pope assigned him a pension and having persuaded him to profess the Christian faith, stood sponsor at his baptism, and bestowed on him (as Ramusio says) his own names, Johannes and Leo. The new convert, having learned Latin and Italian, taught Arabic (among his pupils was Cardinal Egidio Antonini, bishop of Viterbo); he also wrote books in both the Christian tongues he had acquired. His *Description of Africa* was first, apparently, written in Arabic, but the primary text now remaining is that of the Italian version, issued by the author (1526) at Rome, three years after Pope Leo's death. The Moor returned to Africa some time before his death at Tunis, probably in 1552; according to some, he renounced his Christianity and returned to Islam.

The *Descrizione dell' Africa* in its original Arabic ms. is said to have existed for some time in the library of Vincenzo Pinelli (1535–1601); the Italian text, though issued in 1526, was first printed by Giovanni Battista Ramusio in his *Navigationi et Viaggi* (vol. i.) of 1550. A Latin version by Joannes Florianus, *Joannis Leonis Africani de totius Africae descriptione libri i.–ix.* served as the basis of John Pory's Elizabethan English translation, made at the suggestion of Richard Hakluyt (*A Geographical Historie of Africa,* London, 1600). Pory's version was reissued, with notes, maps, etc., by Robert Brown, E. G. Ravenstein, etc. (3 vols., Hakluyt Society, London, 1896). Heinrich Barth's great works on the Sudan are the best elucidation of the *Descrizione dell' Africa.*

Leo also wrote lives of the Arab physicians and philosophers (*De viris quibusdam illustribus apud Arabes; see* J. A. Fabricius, *Bibliotheca Graeca,* Hamburg, 1726, xiii. 259–298); a Spanish-Arabic vocabulary, now lost, but noticed by Ramusio as having been consulted by the famous Hebrew physician, Jacob Mantino; a collection of Arabic epitaphs in and near Fez (the ms. of this Leo presented, it is said, to the brother of the king); and poems, also lost.

LEO, LEONARDO (1694–1744), more correctly Lionardo Oronzo Salvatore de Leo, Italian musical composer, was born on Aug. 5, 1694, at S. Vito dei Normanni, near Brindisi. He became a student at the Conservatorio della Pietà dei Turchini at Naples in 1703, and was a pupil first of Provenzale and later of Nicola Fago. His earliest known work was a sacred drama, *L'Infedeltà abbattuta,* performed by his fellow-students in 1712. In 1714 he produced, at the court theatre, an opera, *Pisistrato,* which was much admired. He held various posts at the royal chapel, and continued to write for the stage, besides teaching at the conservatorio. After adding comic scenes to Gasparini's *Bajazette* in 1722 for performance at Naples, he composed a comic opera, *La Mpeca scoperta,* in Neapolitan dialect, in 1723. His most famous comic opera was *Amor vuol sofferenze* (1739), better known as *La Finta Frascatana,* highly praised by Des Brosses. *L'Olimpiade* (1737) is his most famous serious opera and he wrote also some admirable sacred music. He died on Oct. 31, 1744. Leo was one of the first of the Neapolitan school to obtain a complete mastery over modern harmonic counterpoint. His sacred music is masterly and dignified, logical rather than passionate, and free from sentimentality. His serious operas suffer from a coldness and severity of style, but in his comic operas he shows a keen sense of humour. A fine and characteristic example of his sacred music is the *Dixit Dominus* in C, edited by C. V. Stanford and published by Novello. A number of songs from his operas are accessible in modern editions, and his charming little Arietta, written for the harpsichord, is still played by all pianists.

LEO (The Lion), in astronomy, the fifth sign of the zodiac denoted by the symbol ♌. According to Greek mythology this

constellation is the Nemean lion, which, after being killed by Hercules, was raised to the heavens by Jupiter in honour of Hercules. It contains the first magnitude star Regulus. The Leonids are a swarm of meteors which meet the earth in November. Magnificent showers of Leonids were displayed in 1833 and 1866; a repetition was expected in 1899 but nothing much occurred, and it appears that the main swarm has been diverted by planetary perturbations, so that its orbit no longer intersects the earth's.

LEOBEN, a town in Styria, Austria, situated on the right bank of the Mur. It is the centre of the Upper Styrian lignite workings and has an extensive industry and trade in iron, closely associated with the iron-mining and smelting of Eisenerz and Vordernberg. Surrounded on three sides by the river, it is a well-built, progressive town with a well-known academy of mining and several technical schools. Pop. (1923) 11,900.

LEOBSCHÜTZ (Bohemian *Lubczyce*), a town in the Prussian province of Silesia, on the Zinna, about 20 m. N.W. of Ratibor by rail. Pop. (1925) 12,697. Leobschütz existed in the 10th century, and from 1524 to 1623 was the capital of the principality of Jägerndorf. The principal industries are malting, carriage-building, wool-spinning, machine building and the manufacture of hosiery.

LEOCHARES, a Greek sculptor who worked with Scopas on the Mausoleum about 350 B.C. He executed statues of the family of Philip of Macedon, in gold and ivory, which were set up by that king in the Philippeum at Olympia. He also with Lysippus made a group in bronze at Delphi representing a lion-hunt of Alexander. Of this the base with an inscription was recently found. We hear of other statues by Leochares of Zeus, Apollo and Ares. The statuette in the Vatican, representing Ganymede being carried away by an eagle, so closely corresponds with Pliny's description (*N.H.* 34, 79) of a group by Leochares that we are justified in considering it a copy of that group, especially as the Vatican statue shows all the characteristics of Attic 4th-century art. The attribution of the Belvedere Apollo to Leochares by Furtwängler (*Meister werke*) and Winter is not generally accepted but we may regard the fine statue of Alexander the Great at Munich as a copy of his gold and ivory portrait at Olympia.

See Winter, *Jahrbuch* (1892), p. 164; E. A. Gardner, *Handbook of Greek Sculpture* (1915).

LEOFRIC (d. 1057), earl of Mercia, was a son of Leofwine, earl of Mercia, and became earl at some date previous to 1032. Henceforth, being one of the three great earls of the realm, he took a leading part in public affairs. On the death of King Canute in 1035 he supported the claim of his son Harold to the throne against that of Hardicanute; and during the quarrel between Edward the Confessor and Earl Godwine in 1051 he played the part of a mediator. Through his efforts civil war was averted, and in accordance with his advice the settlement of the dispute was referred to the Witan. When he became earl of Mercia his direct rule seems to have been confined to Cheshire, Staffordshire, Shropshire and the borders of north Wales, but afterwards he extended the area of his earldom. As Chester was his principal residence and the seat of his government, he is sometimes called earl of Chester. Leofric died at Bromley in Staffordshire on Aug. 31, 1057. His wife was Godgifu, famous in legend as Lady Godiva (*q.v.*). Both husband and wife were noted as liberal benefactors to the church, among their foundations being the famous Benedictine monastery at Coventry. Leofric's son, Aelfgar, succeeded him as earl of Mercia.

See E. A. Freeman, *The Norman Conquest,* vols. i. and ii. (1877).

LEOMINSTER, town, municipal borough, in Herefordshire, England, 157 m. N.W. of London and 12 m. N. of Hereford. Pop. (1921) 5,538. It is served by the G.W. and L.M.S. railways. It still retains some old-timbered houses. The parish church of mixed architecture, Norman nave and fine window tracery, was restored in 1866 and enlarged in 1879. The Butter Cross, a beautiful example of timber work of 1633, has been removed and re-erected in the grounds of the Grange. Trade is chiefly in agricultural produce, wool and cider, as the district is rich in orchards. Brewing and the manufacture of agricultural implements are also carried on.

Merewald, king of Mercia, is said to have founded a religious house in Leominster in 660, and a nunnery existed here until the Conquest, when the place became a royal demesne. It was granted by Henry I. to the monks of Reading, who built in it a cell of their abbey, and under whose protection the town grew up. In 1539 it reverted to the crown; and in 1554 was incorporated by a charter. Fairs, which have modern representatives, were granted at various times. A market was held by the abbey by a grant of Henry I.; Friday is now market day. Leominster was famous for wool from the 13th to the 18th century.

LEOMINSTER, city, Worcester county, Massachusetts, U.S.A., on the Nashua river, 45m. N.W. of Boston; served by the New York, New Haven and Hartford railroad. The area is 26·5 sq.m. The population was 19,744 in 1920 (25% foreign-born white) and 22,120 in 1925. It has numerous and diversified manufacturing industries, with an output in 1925 valued at $19,110,417. Combs are the product for which the city is most widely known, but paper, celluloid, reed chairs, pianos, buttons, jewelry, shirts, children's carriages and toys are also manufactured. Leominster was formed from part of Lancaster and incorporated as a town in 1740, and in 1915 was chartered as a city.

LEON, LUIS PONCE DE (1527–1591), Spanish poet and mystic, was born at Belmonte de Cuenca, entered the University of Salamanca at the age of 14, and in 1544 joined the Augustinian order. In 1561 he obtained a theological chair at Salamanca, to which in 1571 was added that of sacred literature. He was denounced to the Inquisition for translating the book of Canticles, and for criticizing the text of the Vulgate. He was consequently imprisoned at Valladolid from March 1572 till Dec. 1576; but he was released with an admonition. He returned to Salamanca as professor of Biblical exegesis, and was again reported to the Inquisition in 1582, but without result. In 1583–85 he published the three books of his mystic treatise, *Los Nombres de Cristo,* written in prison. *La Perfecta Casada* (1583) is a treatise for the use of a lady newly married. Ten days before his death, at Madrigal (Aug. 23, 1591), he was elected vicar general of the Augustinian order. Luis de León is the greatest of Spanish mystics, and is counted among the greatest of Spanish lyrical poets. His poems were not issued till 1631, when Quevedo published them as a counterblast to *culteranismo.*

The best edition of Luis de León's works is that of Merino (6 vols., 1816); the reprint (1885) by C. Muñoz Saenz is incorrect. The text of *La Perfecta Casada* has been well edited by Miss Elizabeth Wallace (Chicago, 1903). See *Coleccion de documentos inéditos para la historia de España,* vols. x.–xi.; F. H. Reusch, *Luis de León und die spanische Inquisition* (Bonn, 1873); M. Gutiérrez, *Fray Luis de León y la filosofía española* (1885); M. Menendez y Pelayo, *Estudios de crítica literaria* (1893), Primera série, pp. 1–72.

LEON, MOSES [BEN SHEM-TOB] **DE** (d. 1305), Jewish scholar, was born in Leon (Spain) in the middle of the 13th century and died at Arevalo. His fame is due to his authorship of the most influential Kabbalist work, the *Zohar* (*see* KABBALAH), which was attributed to Simon b. Yoḥai, a Rabbi of the 2nd century. In modern times the discovery of the modernity of the *Zohar* has led to injustice to the author. Moses de Leon undoubtedly used old materials and out of them constructed a work of genius. He led a wandering life, and was more or less of an adventurer. But as to the greatness of his work, the profundity of his philosophy and the brilliance of his religious idealism, there can be no question.

See Graetz, *History of the Jews,* vol. iv. ch. i.; Geiger, *Leon de Modena.* (I. A.)

LEÓN or **LEÓN DE LAS ALDAMAS,** a city of the State of Guanajuato, Mexico, 259 m. N.W. of the Federal capital and 30 m. W. by N. of the city of Guanajuato. Pop. (1910) 57,722; (1921) 53,639. The Mexican Central gives it railway connection with the national capital and other prominent cities of the republic. León stands in a fertile plain on the banks of the Turbio, a tributary of the Río Grande de Lerma, at an elevation of 6,200 ft. above sea-level and in the midst of very attractive surroundings. The country about León is considered one of the richest cereal-producing districts of Mexico. The city itself is subject to disas-

trous floods, sometimes leading to loss of life as well as considerable damage to all classes of property. It manufactures saddlery and other leather work, gold and silver embroideries, cotton and woollen goods, especially *rebozos* (long shawls), soap and cutlery. There are also tanneries and flour mills. The city has a considerable trade in wheat and flour. The first settlement of León occurred in 1552, but its formal foundation was in 1576, and it did not reach the dignity of a city until 1836.

LEÓN, the largest city of Nicaragua, Central America, capital of the province or department of the same name, one of the oldest and most picturesque Spanish cities of Central America. Pop. (1928) about 47,000. It is 52 m. from Managua, the national capital, and 35 m. from Corinto, the chief port of Nicaragua on the Pacific ocean; the Pacific railway connects León with Corinto, Managua and Granada, beyond. León spreads over a large area; its houses, mostly one-storeyed, are of adobe with red tile roofs, and many have fine gardens. The cathedral, the Dominican church in the old Indian suburb of Subtiaba, the palaces of the bishop, the fortified barracks built originally as a Franciscan monastery, the hospital and the university, are fine old historic buildings. The streets and private houses of the old town are picturesquely Spanish, full of charm to the visitor. León is a prosperous, busy centre of an important agricultural region. The local products are sugar, cotton and cacao; there are a cotton factory and small woollen mills, cigar, shoe and saddlery factories, and cattle, chiefly draught animals, are raised and exported to all Central America. Much merchandise is handled by wholesalers in León for the interior points, particularly in the mining regions.

León has an extensive history, closely interwoven with that of the country. It is the recognized "capital" of the Liberal Party, as Granada (*q.v.*) is the "capital" of the Conservatives, and the struggle between these two cities has led many times to revolution and bloodshed. The town antedates the Spanish conquest, for it is on the site (and the Indian section of the town still bears the old name) of Subtiaba, the residence of the cacique Nagrando, and an important Indian shrine. León was first founded on the edge of Lake Managua by Francisco Hernández de Córdova in 1523, but was moved to the site of the old Indian capital in 1610. It was the capital of the Spanish province and of the Republic of Nicaragua until 1855, although its great commercial rival, Granada, on Lake Nicaragua, 88 m. to the south-west, long disputed the honour, bringing on the bitter feud which resulted in the coming of William Walker (*q.v.*), the American filibuster, and the years of turmoil which followed his landing. Ultimately, Managua (*q.v.*) was established between the two as a compromise capital, and seat of the archbishop, León and Granada each having a bishop. León is the birthplace of Rubén Darío, one of the notable Spanish poets of the late 19th and early 20th centuries, and his remains rest in the cathedral there.

(W. Tho.)

LEON, the name of a modern province and of an ancient kingdom, captaincy-general and province in north-western Spain. The modern province, founded in 1833, is bounded on the north by Oviedo, north-east by Santander, east by Palencia, south by Valladolid and Zamora and west by Orense and Lugo. Pop. (1920) 412,417. Area 5,986 sq.m. Leon belongs partly to the river system of the Miño (*see* Spain), partly to that of the Duero or Douro (*q.v.*), these being separated by the Montañas de Leon, which extend in a continuous wall (with passes at Manzanal and Poncebadon) from north to south-west.

At the time of the Roman conquest, the province was inhabited by the Vettones and Callaici. Among the Christian kingdoms which arose in Spain as the Moorish invasion of the 8th century receded, Leon was one of the oldest. The title of king of Leon was first assumed by Ordoño in 913. Ferdinand I. (the Great) of Castile united the crowns of Castile and Leon in the 11th century; the two were again separated in the 12th, until a final union took place (1230) in the person of St. Ferdinand. The Leonese belong partly to the Castilian section of the Spaniards, partly to the north-western section which includes the Galicians and Asturians. Near Astorga there dwells a curious people, the Maragatos, sometimes considered to be a remnant of the original Celtiberian inhabitants. As a rule the Maragatos earn their living as muleteers or carriers; they wear a distinctive costume, mix as little as possible with their neighbours and do not marry outside their own group.

To the north-west of the Montañas de Leon is the richly wooded pastoral and highland district known as the Vierzo, which in its lower valleys produces grain, fruit and wine in abundance. The Tierra de Campos in the west of the province is fairly productive, but in need of irrigation. The whole province is sparsely peopled. Apart from agriculture, stock-raising and mining, its commerce and industries are unimportant. Cattle, mules, butter, leather, coal and iron are exported. The hills of Leon were worked for gold in the time of the Romans; iron is still obtained, and coal-mining developed considerably towards the close of the 19th century. The only towns with more than 5,000 inhabitants in 1920 were Leon Ponferrada (9,829), Pola de Gordón (6,676), Astorga (6,312) and Cistierna (5,728). The main railway from Madrid to Corumna passes through the province, and there are branches from the city of Leon to Vierzo, Oviedo and the Biscayan port of Gijón.

LEON, an episcopal see and the capital of the Spanish province of Leon, situated on a hill 2,631 ft. above sea-level, in the angle made by the Torio and Bernesga, streams which unite on the south, and form the river Leon, a tributary of the Esla Pop. (1920) 21,399. Leon is on the main railway from Madrid to Oviedo, and is connected with Astorga by a branch line. Leon (Arab. *Liyun*) owes its name to the Legio Septima Gemina of Galba, which, under the later emperors, had its headquarters here. About 540 Leon fell into the hands of the Gothic king Leovigild, and in 717 it capitulated to the Moors. Retaken about 742, it ultimately, in the beginning of the 10th century, became the capital of the kingdom of Leon (*see* Spain: *History*). About 996 it was taken by Almansur, but on his death soon afterwards it reverted to the Spaniards. It was the seat of several ecclesiastical councils between 1012 and 1288.

The cathedral, founded in 1199 and finished only at the close of the 14th century, is built of a warm cream-coloured stone, and is remarkable for simplicity, lightness and strength. It is one of the finest examples of Spanish Gothic, smaller, indeed, than the cathedrals of Burgos and Toledo, but exquisite in design and workmanship. The chapter library contains some valuable manuscripts. The collegiate church of San Isidoro was founded by Ferdinand I. of Castile in 1063 and consecrated in 1149. The church contains some fine plate, including the shrine of St. Isidore of Seville and a silver processional cross dating from the 16th century, which is one of the most beautiful in the country. The convent and church of San Marcos, planned in 1514 by Ferdinand the Catholic, founded by Charles V. in 1537, and consecrated in 1541, are Renaissance in style.

LEONARDO DA VINCI (1452–1519), the great Italian painter, sculptor, architect, musician, mechanician, engineer and natural philosopher, was the natural son of a Florentine lawyer. The place of his birth was Vinci, a *castello* or fortified hill village in the Florentine territory near Empoli, from which his father's family derived its name. To splendid beauty and activity of person Leonardo joined a winning charm of temper and manners, a tact for all societies, and an aptitude for all accomplishments. An inexhaustible intellectual energy and curiosity lay beneath this amiable surface.

Pupil of Verrocchio 1470–77.—Among the multifarious pursuits to which the young Leonardo set his hand, the favourites at first were music, drawing and modelling. His father showed some of his drawings to an acquaintance, Andrea del Verrocchio, who at once recognized the boy's artistic vocation, and was selected to be his master. Verrocchio, although hardly one of the great creative or inventive forces in the art of his age at Florence, was a first-rate craftsman alike as goldsmith, sculptor and painter and particularly distinguished as a teacher. In his studio Leonardo worked for several years (*c.* 1470–1477) in the company of Lorenzo di Credi and other less celebrated pupils He had soon learnt all that Verrocchio had to teach—more than all, if we are

to believe the oft-told tale of the figure, or figures, executed by the pupil in the picture of Christ's Baptism designed by the master for the monks of Vallombrosa. The work in question is now in the Uffizi, at Florence. According to Vasari the angel kneeling on the left was put in by Leonardo. The picture, originally painted in tempera, has suffered much from later repaints in oil, rendering exact judgment difficult. The work was probably done in or about 1470, when Leonardo was 18 years old. By 1472 we find him enrolled in the lists of the painters' guild at Florence. Here he continued to live and work for ten or eleven years longer.

Up till 1477 he is still spoken of as a pupil or apprentice of Verrocchio; but in that year he seems to have been taken into special favour by Lorenzo the Magnificent, and to have worked as an independent artist under his patronage until 1482–83. In 1478 we find him receiving an important commission from the signory, and in 1480 another from the monks of San Donato in Scopeto.

Student of Nature.—Leonardo was not one of those artists of the Renaissance who sought the means of reviving the ancient glories of art mainly in the imitation of ancient models. The antiques of the Medici gardens seem to have had little influence on him beyond that of generally stimulating his passion for perfection. By his own instincts he was an exclusive student of nature. From his earliest days he had flung himself upon that study with an unprecedented ardour of delight and curiosity. In drawing from life he had early found the way to unite precision with freedom and fire—the subtlest accuracy of expressive definition with vital movement and rhythm of line—as no draughtsman had been able to unite them before.

He was the first painter to recognize the play of light and shade as among the most significant and attractive of the world's appearances, the earlier schools having with one consent subordinated light and shade to colour and outline. Nor was he a student of the broad, usual, patent appearances only of the world; its fugitive, fantastic, unaccustomed appearances attracted him most of all. Strange shapes of hills and rocks, rare plants and animals, unusual faces and figures of men, questionable smiles and expressions, whether beautiful or grotesque, far-fetched objects and curiosities, were things he loved to pore upon and keep in memory. Neither did he stop at mere appearances of any kind, but, having stamped the image of things upon his brain, went on indefatigably to probe their hidden laws and causes. The laws of light and shade, the laws of "perspective," including optics and the physiology of the eye, the laws of human and animal anatomy and muscular movement, those of the growth and structure of plants and of the powers and properties of water, all these and much more furnished food to his insatiable spirit of inquiry. Lastly, Leonardo is related to have begun work in sculpture about this time by modelling several heads of smiling women and children.

Early Paintings, 1470–82.—Of certified paintings produced by the young genius, during his apprenticeship or in his independent years at Florence (about 1470–82), very few are extant, and the two most important are incomplete. A small and charming strip of an oblong "Annunciation" at the Louvre is generally accepted as his work, done soon after 1470. This is not very compatible in style with another and larger, much debated "Annunciation" at the Uffizi, which manifestly came from the workshop of Verrocchio about 1473–74, and which many critics claim confidently for the young Leonardo. It may have been joint studio-work of Verrocchio and his pupils including Leonardo, who certainly was concerned in it, since a study for the sleeve of the angel, preserved at Christ Church, Oxford, is unquestionably by his hand. The landscape, with its mysterious spiry mountains and winding waters, is very Leonardesque both in this picture and in another contemporary product of the workshop, or as some think of Leonardo's hand, namely a very highly and coldly finished small "Madonna with a Pink" at Munich. The likeness he is recorded to have painted of Ginevra de' Benci used to be traditionally identified with the fine portrait of a matron at the Pitti absurdly known as *La Monaca*: more lately it has been recognized in a rather dull, expressionless Verrocchiesque portrait of a young woman with a fanciful background of pine-sprays in the Liechtenstein gallery at Vienna. Neither attribution can be counted convincing. Several works of sculpture, including a bas-relief at Pistoia and a small terra-cotta model of a St. John at the Victoria and Albert Museum, have also been claimed, but without general consent, as the young master's handiwork. Of many brilliant early drawings by him, the first that can be dated is a study of landscape done in 1473. A magnificent silver-point head of a Roman warrior at the British Museum was clearly done, from or for a bas-relief, under the immediate influence of Verrocchio. A number of studies of heads in pen or silver-point, with some sketches for Madonnas, including a charming series in the British Museum for a "Madonna with the Cat," may belong to the same years or the first years of his independence. A sheet with two studies of heads bears a ms. note of 1478, saying that in one of the last months of that year he began painting the "Two Maries." One of the two may have been a picture of the Virgin appearing to St. Bernard, which we know he was commissioned to paint in that year for a chapel in the Palace of the Signory, but never finished: the commission was afterwards transferred to Filippino Lippi, whose performance is now in the Badia. One of the two heads on this dated sheet may probably have been a study for the same St. Bernard; it was used afterwards by some follower for a St. Leonard in a stiff and vapid "Ascension of Christ," wrongly attributed to the master himself in the Berlin museum. A pen-drawing representing a ringleader of the Pazzi conspiracy, Bernardo Baroncelli, hung out of a window of the Bargello after his surrender by the sultan at Constantinople to the emissaries of Florence, can be dated from its subject as done in December 1479.

Early Drawings.—A number of his best drawings of the next following years are preparatory pen-studies for an altarpiece of the "Adoration of the Magi," undertaken early in 1481 on the commission of the monks of S. Donato at Scopeto. The preparation in monochrome for this picture, a work of extraordinary power both of design and physiognomical expression, is preserved at the Uffizi, but the painting itself was never carried out, and after Leonardo's failure to fulfil his contract Filippino Lippi had once more to be employed in his place. Of equal or even more intense power, though of narrower scope, is an unfinished monochrome preparation for a St. Jerome, found accidentally at Rome by Cardinal Fesch and now in the Vatican gallery; this also seems to belong to the first Florentine period, but is not mentioned in documents.

Studies in Applied Science.—Leonardo was already ardently feeling his way in the work of experimental study and observation in every branch of theoretical or applied science in which any beginning had been made in his age, as well as in some in which he was himself the first pioneer. He was full of new ideas concerning both the laws and the applications of mechanical forces. His architectural and engineering projects were of a daring which amazed even the fellow-citizens of Alberti and Brunelleschi. History presents few figures more attractive to the mind's eye than that of Leonardo during this period of his all-capable and dazzling youth.

Leonardo would even in youth seclude himself for a season in complete intellectual absorption, forgetful of rest and food. But we have to picture him as anon gathering about him a tatterdemalion company, and jesting with them until they were in fits of laughter, for the sake of observing their burlesque physiognomies; anon as eagerly frequenting the society of men of science and learning of an older generation like the mathematician Benedetto Aritmetico, the physician, geographer and astronomer Paolo Toscanelli, the famous Greek Aristotelian Giovanni Argiropoulo; or as out-rivalling all the youth of the city by charm of recitation, by skill in music and by feats of strength and horsemanship; or again as standing radiant in his rose-coloured cloak and his rich gold hair among the throng of young and old on the piazza, and holding them spellbound while he expatiated on the great projects in art and mechanics that were teeming in his mind.

Ludovico Sforza.—He was ready to leave Florence when the chance was offered him of fixed service at the court of Ludovico Sforza (il Moro) at Milan. Soon after that prince had firmly established his power as nominal guardian and protector of his

nephew Gian Galeazzo but really as usurping ruler of the State, he revived a project previously mooted for the erection of an equestrian monument in honour of the founder of his house's greatness, Francesco Sforza. Ludovico employed the talents of a number of court poets and artists, who in public recitation and pageant, in emblematic picture and banner and device, proclaimed the wisdom and kindness of his guardianship and the wickedness of his assailants. That Leonardo was among the artists thus employed is proved both by notes and projects among his mss. and by allegoric sketches still extant. Several such sketches are at Christ Church, Oxford: one shows a horned hag or she-fiend urging her hounds to an attack on the state of Milan and baffled by the Prudence and Justice of Il Moro (all this made clear by easily recognizable emblems).

Engineering and Architectural Plans.—It must have been the pestilence decimating Milan in 1484–85 which gave occasion to the projects submitted by Leonardo to Ludovico for breaking up the city and reconstructing it on improved sanitary principles. To 1485–86 also appears to belong the inception of his elaborate though unfulfilled architectural plans for beautifying and strengthening the *Castello,* the great stronghold of the ruling power in the state. Very soon afterwards he must have begun work upon his plans and models, undertaken during an acute phase of the competition which the task had called forth between German and Italian architects, for another momentous enterprise, the completion of Milan cathedral. Extant records of payments made to him in connection with these architectural plans extend from Aug. 1487 to May 1490: in the upshot none of them was carried out.

From the beginning of his residence with Ludovico his combination of unprecedented mechanical ingenuity with apt allegoric invention and courtly charm had made him the directing spirit in all court ceremonies and festivities. Meanwhile he was filling his note-books as busily as ever with the results of his studies in statics and dynamics, in human anatomy, geometry and the phenomena of light and shade. It is probable that from the first he had not forgotten his great task of the Sforza monument, with its attendant researches in equine movement and anatomy, and in the science and art of bronze casting on a great scale. The many existing sketches for the work (of which the chief collection is at Windsor) cannot be distinctly dated. In 1490, the seventh year of his residence at Milan, after some expressions of impatience on the part of his patron, he had all but got his model ready for display on the occasion of the marriage of Ludovico with Beatrice d'Este, but at the last moment was dissatisfied with what he had done and determined to begin all over again.

In the same year, 1490, Leonardo enjoyed some months of uninterrupted mathematical and physical research in the libraries and among the learned men of Pavia, whither he had been called to advise on some architectural difficulties concerning the cathedral. Here also the study of an ancient equestrian monument (the so-called *Regisole,* destroyed in 1796) gave him fresh ideas for his Francesco Sforza. The following years the ever-increasing gaiety and splendour of the Milanese court gave him continual employment as a masque and pageant-master and in the composition and recitation of jests, tales, fables and "prophecies" (*i.e.,* moral and social satires and allegories cast in the future tense); among his mss. occur the drafts of many such, some of them both profound and pungent.

Bronze of Francesco Sforza.—Meanwhile he was again at work upon the monument to Francesco Sforza, and this time to practical purpose. When ambassadors from Austria came to Milan towards the close of 1493, the finished colossal model, 26 ft. high, was at last in its place in the courtyard of the Castello. Contemporary accounts attest the magnificence of the work and the enthusiasm it excited, but are not precise enough to enable us to judge to which of the two main groups of extant sketches its design corresponded. One of these groups shows the horse and rider in relatively tranquil march, in the manner of the Gattemalata monument put up 50 years before by Donatello at Padua and the Colleoni monument on which Verocchio was now engaged at Venice. Another group of sketches shows the horse galloping or rearing in violent action, in some instances in the act of trampling a fallen enemy. Neither is it possible to discriminate with certainty the sketches intended for the Sforza monument from others which Leonardo may have done in view of another and later commission for an equestrian statue, namely, that in honour of Ludovico's great enemy, Gian Giacomo Trivulzio.

The year 1494 was one of special importance in the prodigiously versatile activities of Leonardo da Vinci. Documents show him, among other things, planning during an absence of several months from the city vast new engineering works for improving the irrigation and water-ways of the Lomellina and adjacent regions of the Lombard plain; ardently studying phenomena of storm and lightning, of river action and of mountain structure; co-operating with his friend, Donato Bramante, the great architect, in fresh designs for the improvement and embellishment of the Castello at Milan; and petitioning the duke to secure him proper payment for a Madonna lately executed with the help of his pupil, Ambrogio de Predis, for the brotherhood of the Conception of St. Francis at Milan. (This is almost certainly the fine, slightly altered second version of the "Virgin of the Rocks," now in the National Gallery, London. The original and earlier version is one of the glories of the Louvre, and shows far more of a Florentine and less of a Milanese character than the London picture.) In the same year, 1494, or early in the next, Leonardo, if Vasari is to be trusted, paid a visit to Florence to take part in deliberations concerning the projected new council-hall to be constructed in the palace of the Signory.

"Last Supper" (Cenacolo).—Recent research has proved that it was in 1494 that Leonardo got to work in earnest on what was to prove not only by far his greatest but by far his most expeditiously and steadily executed work in painting. This was the "Last Supper" undertaken for the refectory of the convent church of Sta. Maria delle Grazie at Milan on the joint commission (as it would appear) of Ludovico and of the monks themselves. This picture, the world-famous "Cenacolo" of Leonardo, has been the subject of much erroneous legend and much misdirected experiment. The intensity of intellectual and manual application which Leonardo threw into the work is proved by the fact that he finished it within four years.

Medium Employed.—He painted the picture on the wall in tempera, not, according to the legend which sprung up within twenty years of its completion, in oil. The tempera vehicle, perhaps including new experimental ingredients, did not long hold firmly to its plaster ground, nor that to the wall. Flaking and scaling set in; hard crusts of mildew formed, dissolved and reformed with changes of weather over both the loosened parts and those that remained firm. Decade after decade these processes went on, a rain of minute scales and grains falling, according to one witness, continually from the surface, till the picture seemed to be perishing altogether. In the 18th century attempts were first made at restoration. They all proceeded on the false assumption, dating from the early years of the 16th century, that the work had been executed in oil. With oil it was accordingly at one time saturated in hopes of reviving the colours. Other experimenters tried various "secrets," which for the most part meant deleterious glues and varnishes. Fortunately not very much of actual repainting was accomplished except on some parts of the garments. The chief operations were carried on by Bellotti in 1726, by Mazza in 1770, and by Barezzi in 1819 and the following years. None of them arrested, some actually accelerated, the natural agencies of decay.

Yet this mere ghost of a picture, this evocation, half vanished as it was, by a great world-genius of a mighty spiritual world-event, remained a thing indescribably impressive. The ghost has now been brought back to much of true life again by the skill of the most scrupulous of all restorers, Cavaliere Cavenaghi, who, found it possible to secure to the wall the innumerable blistered flakes and scales of the original work that yet remained, to clear the surface thus obtained of much of the obliterating accretions and to bring the whole to unity by touching tenderly in with tempera the spots and spaces actually left bare. A further gain

obtained through these operations has been the uncovering, immediately above the main subject, of a beautiful scheme of painted lunettes and vaultings, the lunettes filled by Leonardo's hand with inscribed scutcheons and interlaced plait or knot ornaments (*intrecciamenti*), the vaultings with stars on a blue ground.

Composition.—Leonardo's "Last Supper," for all its injuries, became from the first for all Christendom the typical representation of the scene. Goethe in his famous criticism has said all that needs to be said of it. The painter has departed from precedent in grouping the disciples, with their Master in the midst, along the far side and the two ends of a long, narrow table, and in leaving the near or service side of the table towards the spectator free. The chamber is seen in a perfectly symmetrical perspective, its rear wall pierced by three plain openings which admit the sense of quiet distance and mystery from the open landscape beyond; by the central of these openings, which is the widest of the three, the head and shoulders of the Saviour are framed in. On His right and left are ranged the disciples in equal numbers. The furniture and accessories of the chamber, very simply conceived, have been rendered with scrupulous exactness and distinctness; yet they leave to the human and dramatic elements the absolute mastery of the scene. The serenity of the holy company has within a moment been broken by the words of their Master, "One of you shall betray Me." In the agitation of their consciences and affections, the disciples have started into groups or clusters along the table, some standing, some still remaining seated. There are four of these groups, of three disciples each, and each group is harmoniously interlinked by some natural connecting action with the next. Leonardo, though no special student of the Greeks, has perfectly carried out the Greek principle of expressive variety in particulars subordinated to general symmetry. He has used all his acquired science of linear and aerial perspective to create an almost complete illusion to the eye, but an illusion that has in it nothing trivial, and in heightening our sense of the material reality of the scene only heightens its profound spiritual impressiveness and gravity. The results of his intensest meditations on the psychology and the human and divine significance of the event (on which he has left some pregnant hints in written words of his own) are perfectly fused with those of his subtlest technical calculations on the rhythmical balancing of groups and arrangement of figures in space.

Preparatory Sketches.—Of authentic preparatory studies for this work there remain but few. There is a sheet at the Louvre of much earlier date than the first idea or commission for this particular picture, containing some nude sketches for the arrangement of the subject; another later and farther advanced, but still probably anterior to the practical commission, at Venice, and a ms. sheet of great interest at the Victoria and Albert museum, on which the painter has noted in writing the dramatic motives appropriate to the several disciples. At Windsor and Milan are a few finished studies in red chalk for the heads. A highly-reputed series of life-sized chalk drawings of the same heads, of which the greater portion is at Weimar, consists of early copies, and is interesting though having no just claim to originality. Scarcely less doubtful is the celebrated unfinished and injured study of the head of Christ at the Brera, Milan.

Interior Decorations.—Leonardo had formed a new and close friendship with Luca Pacioli of Borgo San Sepolcro, the great mathematician, whose *Summa de aritmetica, geometrica,* etc., he had eagerly bought at Pavia on its first appearance, and who arrived at the court of Milan about the moment of the completion of the "Cenacolo." The two begin working together on the materials for Pacioli's next book, *De divina proportione.* But he was soon called away by Ludovico to a different undertaking, the completion of the interior decorations, already begun by another hand and interrupted, of certain chambers of the Castello called the *Saletta Negra* and the *Sala Grande dell' Asse,* or *Sala della Torre.* When, in the last decade of the 19th century, works of thorough architectural investigation and repair were undertaken in that building under the superintendence of Senatore Luca Beltrami, a devoted foreign student, Dr. Paul Müller-Walde, obtained leave to scrape for traces of Leonardo's handiwork beneath the replastered and white-washed walls and ceilings of chambers that might be identified with these. In the great *Sala dell' Asse* (or *della Torre*) abundant traces of Leonardo's own hand were found, in the shape of a decoration of intricate geometrical knot or plait work combined with natural leafage; the abstract puzzle-pattern, of a kind in which Leonardo took peculiar pleasure, intermingling in cunning play and contrast with a pattern of living boughs and leaves exquisitely drawn in free and vital growth. Sufficient portions of this design were found in good preservation to enable the whole to be accurately restored. Leonardo was rewarded in 1498 (ready money being with difficulty forthcoming and his salary being long in arrears) by the gift of a suburban garden outside the Porta Vercelli.

Work as Military Engineer.—He was then called away on duty as chief military engineer (*ingegnere camerale*) with the special charge of inspecting and maintaining all the canals and waterways of the duchy. Dangers were accumulating upon Ludovico and the state of Milan. France had become Ludovico's enemy; and Louis XII., the pope and Venice had formed a league to divide his principality among them. Ludovico travelled to Innsbruck, the better to push his interests (Sept. 1499). In his absence Louis XII. invaded the Milanese, and the officers left in charge of the city surrendered it without striking a blow. The French lieutenant in Milan, Gian Giacomo Trivulzio, the embittered enemy of Ludovico, began exercising a vindictive tyranny over the city which had so long accepted the sway of the usurper. Great artists were usually exempt from the consequences of political revolutions, and Trivulzio, now or later, commissioned Leonardo to design an equestrian monument to himself. Leonardo, having remained unmolested at Milan for two months under the new régime, but knowing that Ludovico was preparing a great stroke for the re-establishment of his power, and that fresh convulsions must ensue, thought it best to provide for his own security. In December he left Milan with his friend Luca Pacioli, having first sent some of his modest savings to Florence for investment. His intention was to watch events. They took a turn which made him a stranger to Milan for the next seven years.

Ludovico, at the head of an army of Swiss mercenaries, returned victoriously in Feb. 1500, and was welcomed by a population disgusted with the oppression of the invaders. But in April he was once more overthrown by the French in a battle fought at Novara. Ludovico was taken prisoner and carried to France; the city, which had been strictly spared on the first entry of Louis XII., was entered and sacked; and the model of Leonardo's great statue made a butt (as eye witnesses tell) for Gascon archers. Two years later we find the duke Ercole of Ferrara begging the French king's lieutenant in Milan to let him have the model, injured as it was, for the adornment of his own city; but nothing came of the petition, and within a short time it seems to have been totally broken up.

Work at Milan (1483–99).—Thus, of Leonardo's sixteen years' work at Milan (1483–99) the results actually remaining are as follows:

"Virgin of the Rocks."—The Louvre "Virgin of the Rocks" possibly, *i.e.,* as to its execution; the conception and style are essentially Florentine, carried out by Leonardo to a point of intense and almost glittering finish, of quintessential, almost overstrained, refinement in design and expression, and invested with a new element of romance by the landscape in which the scene is set—a strange watered country of basaltic caves and arches, with the lights and shadows striking sharply and yet mysteriously among rocks, some upright, some jutting, some pendent, all tufted here and there with exquisite growths of shrub and flower. The National Gallery "Virgin of the Rocks" certainly, with help from Ambrogio de Predis; in this the Florentine character of the original is modified by an admixture of Milanese elements, the tendency to harshness and over-elaboration of detail softened, the strained action of the angel's pointing hand altogether dropped, while in many places pupils' work seems recognizable beside that of the master. The "Last Supper" of Sta. Maria delle Grazie, his masterpiece; as to its history and present condition enough has

been said. The decorations of the ceiling of the Sala della Torre in the Castello. Other paintings done by him at Milan are mentioned, and attempts have been made to identify them with works still existing. He is known to have painted portraits of two of the king's mistresses, Cecilia Gallerani and Lucrezia Crivelli. Cecilia Gallerani used to be identified as a lady with ringlets and a lute, depicted in a portrait at Milan, now rightly assigned to Bartolommeo Veneto. More lately she has by some been conjecturally recognized in a doubtful, though Leonardesque, portrait of a lady with a weasel in the Czartoryski collection at Cracow. Lucrezia Crivelli has, with no better reason, been identified with the famous "Belle Ferronnière" (a mere misnomer, caught from the true name of another portrait which used to hang near it) at the Louvre; this last is fine work of one of his pupils. Mention is made of a "Nativity" painted for and sent to the emperor Maximilian, and also apparently of some picture painted for Matthias Corvinus, king of Hungary; both are lost or at least unidentified.

Milan Pupils.—The painters especially recorded as Leonardo's immediate pupils during this part of his life at Milan are the two before mentioned, Giovanni Antonio Boltraffio and Ambrogio Preda or de Predis, with Marco d'Oggionno and Andrea Salai, the last apparently less a fully-trained painter than a studio assistant and personal attendant, devotedly attached and faithful in both capacities. Leonardo's own native Florentine manner had at first been not a little modified by that of the Milanese school as he found it represented in the works of such men as Bramantino, Borgognone and Zenale; but his genius had in its turn reacted far more strongly upon the younger members of the school, and exercised, now or later, a transforming and dominating influence not only upon his immediate pupils, but upon men like Luini, Giampetrino, Bazzi, Cesare da Sesto and indeed the whole Lombard school in the early 15th century. Of sculpture done by him during this period we have no remains, only the tragically tantalizing history of the Sforza monument. Of drawings there are very many, including few only for the "Last Supper," many for the Sforza monument, as well as the multitude of sketches, scientific and other, which we find intermingled among the vast body of his miscellaneous mss., notes and records. In mechanical, scientific and theoretical studies of all kinds it was a period, as these mss. attest, of extraordinary activity and self-development.

The occurrence of the words "Achademia Leonardi Vinci" on certain engravings, done after his drawings, of geometric "knots" or puzzle-patterns (things for which we have already learned his partiality), does not prove the existence of an Academy at Milan in the sense now attached to the word. His many-sided and far-reaching studies in experimental science were mainly his own, conceived and carried out long in advance of his time, and in communion with only such more or less isolated spirits as were advancing along one or another of the same paths of knowledge.

Venice and Florence, 1499.—When Leonardo and Luca Pacioli left Milan in Dec. 1499, their destination was Venice. They made a brief stay at Mantua, where Leonardo was graciously received by the duchess Isabella Gonzaga, the most cultured of the many cultured great ladies of her time, whose portrait he promised to paint on a future day; meantime he made the fine chalk drawing of her now at the Louvre. Arrived at Venice, he seems to have occupied himself chiefly with studies in mathematics and cosmography. In April the friends heard of the second and final overthrow of Ludovico il Moro, and at that news, giving up all idea of a return to Milan, moved on to Florence, which they found depressed both by internal troubles and by the protraction of the indecisive and inglorious war with Pisa. Here Leonardo undertook to paint an altar-piece for the Church of the Annunziata, Filippino Lippi, who had already received the commission, courteously retiring from it in his favour. A year passed by, and no progress had been made with the painting.

Questions of physical geography and engineering engrossed him as much as ever. He writes to correspondents making enquiries about the tides in the Euxine and Caspian Seas. He reports for the information of the *Arte de' Mercanti* on the precautions to be taken against a threatening landslip on the hill of S. Salvatore dell' Osservanza. He submits drawings and models for the canalization and control of the waters of the Arno, and propounds, with compulsive eloquence and conviction, a scheme for transporting the Baptistery of St. John, the "bel San Giovanni" of Dante, to another part of the city, and elevating it on a stately basement of marble.

Annunziata Cartoons.—The Servite brothers of the Annunziata were growing impatient for the completion of their altar-piece. In April 1501 Leonardo had only finished the cartoon, and this all Florence flocked to see and admire. Isabella Gonzaga, who cherished the hope that he might be induced permanently to attach himself to the court of Mantua, wrote about this time to ask news of him, and to beg for a painting from him for her study, already adorned with masterpieces by the first hands of Italy, or at least for a "small Madonna, devout and sweet as is natural to him." In reply her correspondent says that the master is wholly taken up with geometry and very impatient of the brush, but at the same time tells her all about his just completed cartoon for the Annunziata. The subject was the Virgin seated in the lap of St. Anne, bending forward to hold her child who had half escaped from her embrace to play with a lamb upon the ground. The description answers exactly to the composition of the celebrated picture of the Virgin and St. Anne at the Louvre. A cartoon of this composition in the Esterhazy collection at Vienna is held to be only a copy, and the original cartoon must be regarded as lost.

But another of kindred though not identical motive has come down to us and is preserved in the Diploma gallery at the Royal Academy. In this work St. Anne, pointing upward with her left hand, smiles with an intense look of wondering questioning, inward sweetness into the face of the Virgin, who in her turn smiles down upon her child as He leans from her lap to give the blessing to the little St. John standing beside her. Evidently two different though nearly related designs had been maturing in Leonardo's mind. A rough first sketch for the motive of the Academy cartoon is in the British Museum; one for the motive of the lost cartoon and of the Louvre picture is at Venice. No painting by Leonardo from the Academy cartoon exists, but in the Ambrosiana at Milan there is one by Luini, with the figure of St. Joseph added. It remains a matter of debate whether the Academy cartoon or that shown by Leonardo at the Annunziata in 1501 was the earlier. The probabilities seem in favour of the Academy cartoon. This, whether done at Milan or at Florence, is in any case a typically perfect and harmonious example of the master's Milanese manner; while in the other composition with the lamb the action and attitude of the Virgin are somewhat strained, and the original relation between her head and her mother's, lovely both in design and expression, is lost.

In spite of the universal praise of his cartoon, Leonardo did not persevere with the picture, and the monks of the Annunziata had to give back the commission to Filippino Lippi, at whose death the task was completed by Perugino. It remains uncertain whether a small Madonna with distaff and spindle, which the correspondent of Isabella Gonzaga reports Leonardo as having begun for one Robertet, a favourite of the king of France, was ever finished. He painted one portrait, it is said, at this time, that of Ginevra Benci, a kinswoman, perhaps sister, of a youth Giovanni di Amerigo Benci, who shared his passion for cosmographical studies; and probably began another, the famous "La Gioconda," which was only finished four years afterwards. The gonfalionere Soderini offered him in vain, to do with it what he would, the huge half-spoiled block of marble out of which Michelangelo three years later wrought his "David."

Cesare Borgia (1502).—In the spring of 1502 he took service with Cesare Borgia, duke of Valentinois, occupied in consolidating his recent conquests in the Romagna. Between May 1502 and March 1503 Leonardo travelled as chief engineer to Duke Caesar over a great part of central Italy. Starting with a visit to Piombino, on the coast opposite Elba, he went by way of Siena to Urbino, where he made drawings and began works; was thence hastily summoned by way of Pesaro and Rimini to Cesena; spent two months between there and Cesenatico, projecting and direct-

ing canal and harbour works, and planning the restoration of the palace of Frederic II.; thence hurriedly joined his master, momentarily besieged by enemies at Imola; followed him probably to Sinigaglia and Perugia, through the whirl of storms and surprises, vengeances and treasons, which marked his course that winter, and finally, by way of Chiusi and Acquapendente, as far as Orvieto and probably to Rome, where Caesar arrived on the 14th of February 1503. The pope's death and Caesar's own downfall were not destined to be long delayed. But Leonardo apparently had already had enough of that service, and was back at Florence in March. He has left dated notes and drawings made at most of the stations we have named, besides a set of six large-scale maps drawn minutely with his own hand, and including nearly the whole territory of the Maremma, Tuscany and Umbria between the Apennines and the Tyrrhene sea.

Battle-piece for Florence.—At Florence he was at last persuaded, on the initiative of Piero Soderini, to undertake for his native city a work of painting as great as that with which he had adorned Milan. This was a battle-piece to decorate one of the walls of the new council-hall in the palace of the signory. He chose an episode in the victory won by the generals of the republic in 1440 over Niccolo Piccinino near a bridge at Anghiari, in the upper valley of the Tiber. To the young Michelangelo was presently entrusted a rival battle-piece to be painted on another wall of the same apartment; he chose, as is well known, a surprise of the Florentine forces in the act of bathing near Pisa.

In one of the sections of his projected *Treatise on Painting*, Leonardo has detailed at length, and obviously from his own observation, the pictorial aspects of a battle. In his mss. there occur almost as many trenchant sayings on life and human affairs as on art and natural law; and of war he has disposed in two words as a "bestial frenzy" (*pazzia bestialissima*). In his design for the Hall of Council he set himself to depict this frenzy at its fiercest. He chose the moment of a terrific struggle for the colours between the opposing sides; hence the work became commonly known as the "Battle of the Standard." Judging by the accounts of those who saw it, and the fragmentary evidences which remain, the tumultuous medley of men and horses, and the expressions of martial fury and despair, must have been conceived and rendered with a mastery not less commanding than had been the looks and gestures of bodeful sorrow and soul's perplexity among the quiet company on the convent wall at Milan. The place assigned to Leonardo for the preparation of his cartoon was the Sala del Papa at Santa Maria Novella. He for once worked steadily and unremittingly at his task. His accounts with the signory enable us to follow its progress step by step.

Influence on Contemporaries.—He had finished the cartoon in less than two years (1504–05), and when it was exhibited along with that of Michelangelo, the two rival works seemed to all men a new revelation of the powers of art, and served as a model and example of the students of that generation, as the frescoes of Masaccio in the Carmine had served to those of two generations earlier. The young Raphael, whose incomparable instinct for rhythmical design had been trained hitherto on subjects of holy quietude and rapt contemplation according to the traditions of Umbrian art, learnt from Leonardo's example to apply the same instinct to themes of violent action and strife. From the same example Fra Bartolommeo and a crowd of other Florentine painters of the rising or risen generation took in like manner a new impulse. The master lost no time in proceeding to the execution of his design upon the mural surface; this time he had devised a technical method of which, after a preliminary trial in the Sala del Papa, he regarded the success as certain; the colours, whether tempera or other remains in doubt, were to be laid on a specially prepared ground, and then both colours and ground made secure upon the wall by the application of heat. When the central group was done the heat was applied, but it was found to take effect unequally; the colours in the upper part ran or scaled from the wall, and the result was a failure more or less complete. The unfinished and decayed painting remained for some 50 years on the wall, but after 1560 was covered over with new frescoes by Vasari.

The cartoon did not last so long. After doing its work as the most inspiring of all examples for students it seems to have been cut up. When Leonardo left Italy for good in 1516 he is recorded to have left "the greater part of it" in deposit at the hospital of S. Maria Nuova, where he was accustomed also to deposit his moneys, and whence it seems before long to have disappeared. Our only existing memorials of the great work are a number of small pen-studies of fighting men and horses, three splendid studies in red chalk at Budapest for heads in the principal group, one head at Oxford copied by a contemporary of the size of the original cartoon (above life); a tiny sketch, also at Oxford, by Raphael after the principal group; an engraving done by Zacchia of Lucca in 1558 not after the original but after a copy; a 16th-century Flemish drawing of the principal group, and another, splendidly spirited, by Rubens, both copies of copies; with Edelinck's fine engraving after the Rubens drawing.

Mona Lisa (La Gioconda).—During these years, 1503–06, Leonardo also finished the portrait of Madonna Lisa, the Neapolitan wife of Zanobi del Giocondo. In this lady he had found a sitter whose face and smile possessed in a singular degree the haunting, enigmatic charm in which he delighted. He worked, it is said, at her portrait during some portion of four successive years, causing music to be played during the sittings that the rapt expression might not fade from off her countenance. The picture was bought afterwards by Francis I. for 4,000 gold florins, and is now one of the glories of the Louvre. The portrait casts an irresistible spell alike by subtlety of expression, by refinement and precision of drawing, and by the romantic invention of its background. It has been the theme of endless critical rhapsodies, among which that of Pater is perhaps the most imaginative as it is the best known.

Louis XII.—In the spring of 1506 Leonardo, moved perhaps by chagrin at the failure of his work in the Hall of Council, accepted a pressing invitation to Milan, from Charles d'Amboise, Maréchal de Chaumont, the lieutenant of the French king in Lombardy. The leave of absence granted to him by the signory on the request of the French viceroy was for three months only. The period was several times extended, at first grudgingly, Soderini complaining that Leonardo had treated the republic ill in the matter of the battle picture; whereupon the painter honourably offered to refund the money paid, an offer which the signory as honourably refused. Louis XII. sent messages urgently desiring that Leonardo should await his own arrival in Milan, having seen a small Madonna by him in France (probably that painted for Robertet) and hoping to obtain from him works of the same class and perhaps a portrait. The king arrived in May 1507, and soon afterwards Leonardo's services were formally and amicably transferred from the signory of Florence to Louis, who gave him the title of painter and engineer-in-ordinary. In September of the same year troublesome private affairs called him to Florence. His father had died in 1504, apparently intestate.

There are traces of work done during his residence at Florence. A sheet of sketches drawn there in 1508 shows the beginning of a Madonna now lost except in the form of copies, one of which (known as the "Madonna Litta") is at St. Petersburg (Leningrad), another in the Poldi-Pezzoli museum at Milan. A letter from Leonardo to Charles d'Amboise in 1511, announcing the end of his law troubles, speaks of two Madonnas of different sizes that he means to bring with him to Milan. Meantime the master's main home and business were at Milan. He had attached to himself a new and devoted young friend and pupil of noble birth, Francesco Melzi and was a frequent visitor at the villa of the Melzi family at Vaprio.

Rome.—In 1512 the ageing master uprooted himself from Milan, and moved with his chattels and retinue of pupils to Rome, into the service of the house that first befriended him, the Medici. The vast enterprises of Pope Julius II. had already made Rome the chief seat and centre of Italian art. The accession of Giulio de' Medici in 1513 under the title of Leo X. raised on all hands hopes of still ampler and more sympathetic patronage. Leonardo's special friend at the papal court was the pope's youngest brother, Giuliano de' Medici, a youth who combined dissipated

habits with thoughtful culture and a genuine interest in arts and sciences. But the conditions of the time and place proved adverse. The young generation held the field. Michelangelo and Raphael were fresh from the glory of their great achievements in the Sistine Chapel and the Stanze. After a stay of less than two years, Leonardo left Rome. On meeting Francis I., young and brilliant successor to Louis XII., an immediate and strong sympathy sprang up, and Leonardo determined to accept the royal invitation to France, where a new home was offered him with every assurance of honour and regard.

Amboise.—The remaining two and a half years of Leonardo's life were spent at the Castle of Cloux near Amboise, which was assigned, with a handsome pension, to his use. In the spring of 1518 Leonardo had occasion to exercise his old talents as a festival-master when the dauphin was christened and a Medici-Bourbon marriage celebrated. He drew the designs for a new palace at Amboise and was much engaged with the project of a great canal to connect the Loire and Saône. An ingenious attempt has been made to prove, in the absence of records, that the famous spiral staircase at Blois was also of his designing.

Among his visitors was a fellow-countryman, Cardinal Louis of Aragon, whose secretary has left an account of the day. Leonardo, it seems, was suffering from some form of slight paralysis which impaired his power of hand. But he showed the cardinal three pictures, the portrait of a Florentine lady done for Giuliano de' Medici (the Gioconda?), the Virgin in the lap of St. Anne (the Louvre picture; finished at Florence or Milan 1507–1513?), and a youthful John the Baptist. The last, which may have been done since he settled in France, is the darkened and partly repainted, half-length figure in the Louvre. Of the "Pomona" mentioned by Lomazzo as a work of the Amboise time his visitor says nothing. Besides pictures, the master seems also to have shown and explained to his visitors some of his vast store of notes and observations on anatomy and physics. He kept hoping to get some order among his papers, the accumulation of more than forty years, and perhaps to give the world some portion of the studies they contained. But his strength was nearly exhausted. On Easter Eve 1519, feeling that the end was near, he made his will. It made provision for masses to be said and candles to be offered in three different churches of Amboise, first among them that of St. Florentin, where he desired to be buried, as well as for 60 poor men to serve as torch-bearers at his funeral. He received the sacraments of the Church and died on May 2, 1519.

King Francis, then at his court of St. Germain-en-Laye, is said to have wept for the loss of such a servant; that he was present beside the death-bed and held the dying painter in his arms is a familiar but an untrue tale. After a temporary sepulture elsewhere his remains were transported on Aug. 12 to the cloister of St. Florentin according to his wish. He left all his mss. and apparently all the contents of his studio, with other gifts, to Melzi, whom he named executor; to Salai and to his servant Battista Villani a half each of his vineyard outside Milan; gifts of money and clothes to his maid Maturina; one of money to the poor of the hospital in Amboise; and to his half-brothers a sum of 400 ducats lying to his credit at Florence.

Achievements.—History tells of no man gifted in the same degree as Leonardo was at once for art and science. In art he was an inheritor and perfecter, born in a day of great and many-sided endeavours on which he put the crown, surpassing both predecessors and contemporaries. In science, on the other hand, he was a pioneer, working wholly for the future, and in great part alone. That the two stupendous gifts should in some degree neutralize each other was inevitable. The mere attempt to conquer the kingdom of light and shade for the art of painting was destined to tax the skill of generations. Leonardo sought to achieve that conquest and at the same time to carry the old Florentine excellences of linear drawing and psychological expression to a perfection of which other men had not dreamed. The thirst for knowledge had first been aroused in him by the desire of perfecting the images of beauty and power which it was his business to create.

Thence there grew upon him the passion of knowledge for its own sake. In the splendid balance of his nature the Virgilian longing, *rerum cognoscere causas*, could never indeed wholly silence the call to exercise his active powers. But the powers he cared most to exercise ceased by degree to be those of imaginative creation, and came to be those of turning to practical human use the mastery which his studies had taught him over the forces of nature. In science he was the first among modern men to set himself most of those problems which unnumbered searchers of later generations have laboured severally or in concert to solve. A hundred years before Bacon, say those who can judge best, he showed a firmer grasp of the principles of experimental science than Bacon showed, fortified by a far wider range of actual experiment and observation. Galileo, Bacon, Newton, Harvey—he knew what each of them would one day discover. He was Watt's precursor; only he meant steam to project a missile from a cannon; experts aver that, had he at his disposal some power like petrol, he would have completed his mechanic of aviation; he knew a method of remaining a long time under water, but he refused to tell of it because of "the evil nature of man." Had Leonardo left behind him any one with zeal and knowledge enough to extract from the mass of his mss. some portion of his labours in those sciences and give them to the world, an incalculable impulse would have been given to all those enquiries by which mankind has since been striving to understand the laws of its being and control the conditions of its environment. As it was, these studies of Leonardo—"studies intense of strong and stern delight"—seemed to his trivial followers and biographers merely his whims and fancies, *ghiribizzi*, things to be spoken of slightingly and with apology. The mss., with the single exception of some of those relating to painting, lay unheeded and undivulged until the present generation.

So much for the intellectual side of Leonardo's character. As a moral being we are less able to discern what he was like. The man who carried in his brain so many images of subtle beauty, as well as so much of the hidden science of the future, must have lived spiritually, in the main, alone. Of things communicable he was at the same time, as we have said, communicative—a genial companion, a generous and loyal friend, impressing all with whom he was brought in contact by the power and the charm of genius, and inspiring fervent devotion and attachment in friends and pupils. We see him full of tenderness to animals; open-handed in giving, not eager in getting—"poor," he says, "is the man of many wants"; not prone to resentment—"the best shield against injustice is to double the cloak of long-suffering"; zealous in labour above all men—"as a day well spent gives joyful sleep, so does a life well spent give joyful death."

With these instincts and maxims, and with his strength, spent ever tunnelling in abstruse mines of knowledge, his moral experience is not likely to have been deeply troubled. In religion, he regarded the faith of his age and country at least with imaginative sympathy and intellectual acquiescence, if no more. On the political storms which shook his country and drove him from one employment to another, he seems to have looked not with the passionate participation of a Dante or a Michelangelo but rather with the serene detachment of a Goethe. In matters of the heart, if any consoling or any disturbing passion played a great part in his life, we do not know it; we know only (apart from a few passing shadows cast by calumny and envy) of affectionate and dignified relations with friends, patrons and pupils, of public and private regard mixed in the days of his youth with dazzled admiration, and in those of his age with something of reverential awe.

The Drawings of Leonardo.—These are among the greatest treasures ever given to the world by the human spirit expressing itself in pen and pencil. Apart from the many hundreds of illustrative pen-sketches scattered through his autobiographic and scientific mss., the principal collection is at Windsor castle (partly derived from the Arundel collection); others of importance are in the British Museum; at Christ Church, Oxford; in the Louvre, in the Uffizi, the Venice academy, the Royal library at Turin, the museum of Budapest, in the Bayonne museum and in the collection of Lord Melchett Leonardo's chief implements were pen, silverpoint, and red and black chalk (red chalk especially). In silverpoint there are many beautiful drawings of his

earlier time, and some of his later; but of the charming heads of women and young men in this material attributed to him in various collections, comparatively few are his own work, the majority being drawings in his spirit by his pupils Ambrogio Preda or Boltraffio. Leonardo appears to have been left-handed; a contemporary and intimate friend, Luca Pacioli, speaks of his "ineffable left hand"; all the best of his drawings are shaded downward from left to right, which would be the readiest way for a left-handed man; and his habitual eccentric practice of writing from right to left is much more likely to have been due to natural left-handedness than to any desire for mystery or concealment. A full critical discussion and catalogue of the extant drawings of Leonardo are to be found in Berenson's *Drawings of the Florentine Painters.*

The Writings of Leonardo.—The only printed book bearing Leonardo's name until the recent issues of transcripts from his mss. was the celebrated *Treatise on Painting* (*Trattato della pittura, Traité de la peinture*). This consists of brief didactic chapters, or more properly paragraphs, of practical direction or critical remark on all the branches and conditions of a painter's practice. The original ms. draft of Leonardo has been lost, though a great number of notes for it are scattered through the various extant volumes of his mss. The work has been printed in two different forms; one of these is an abridged version consisting of 365 sections; the first edition of it was published in Paris in 1551, by Raphael Dufresne, from a ms. which he found in the Barberini library; the last, translated into English by J. F. Rigaud, in London, 1877. The other is a more extended version, in 912 sections, divided into eight books; this was printed in 1817 by Guglielmo Manzi at Rome, from two mss. which he had discovered in the Vatican library; a German translation from the same ms. has been edited by G. H. Ludwig in Eitelberger's series of *Quellenschriften für Kunstgeschichte* (Vienna, 1882; Stuttgart, 1885). More recent publications of the *Treatise on Painting* are:—*Leonardo da Vinci, Traktat von der Malerei* (Jena, 1909); and *Leonardo da Vinci, Traité de la peinture* (1910). On the history of the book in general *see* Max Jordan, *Das Malerbuch des Leonardo da Vinci* (Leipzig, 1873). The unknown compilers of the Vatican mss. must have had before them much more of Leonardo's original text than is now extant. Only about a quarter of the total number of paragraphs are identical with passages to be found in the master's existing autograph notebooks. It is indeed doubtful whether Leonardo himself ever completed the ms. treatise (or treatises) on painting and kindred subjects mentioned by Fra Luca Pacioli and by Vasari, and probable that the form and order, and perhaps some of the substance, of the *Trattato* as we have it was due to compilers and not to the master himself.

In recent years a whole body of scholars and editors have been engaged in giving to the world the texts of Leonardo's existing mss. The history of these is too complicated to be told here in any detail. Francesco Melzi (d. 1570) kept the greater part of his master's bequest together as a sacred trust as long as he lived, though even in his time some mss. on the art of painting seem to have passed into other hands. But his descendants suffered the treasure to be recklessly dispersed. The chief agents in their dispersal were the Doctor Orazio Melzi who possessed them in the last quarter of the 16th century; the members of a Milanese family called Mazzenta, into whose hands they passed in Orazio Melzi's lifetime; and the sculptor Pompeo Leoni, who at one time entertained the design of procuring their presentation to Philip II. of Spain, and who cut up a number of the note-books to form the great miscellaneous single volume called the *Codice Atlantico*, now at Milan. This volume, with a large proportion of the total number of other Leonardo mss. then existing, passed into the hands of a Count Arconati, who presented them to the Ambrosian library at Milan in 1636. In the meantime the earl of Arundel had made a vain attempt to purchase one of these volumes (the *Codice Atlantico?*) at a great price for the king of England. Some stray parts of the collection, including the mss. now at Windsor, did evidently come into Lord Arundel's possession, and the history of some other parts can be followed; while much, it is evident, was lost for good. In 1796 Napoleon swept away to Paris, along with the other art treasures of Italy, the whole of the Leonardo mss. at the Ambrosiana: only the *Codice Atlantico* was afterwards restored, the other volumes remaining the property of the Institut de France. These also have had their adventures, two of them having been stolen by Count Libri and passed temporarily into the collection of Lord Ashburnham, whence they were in recent years made over again to the Institut. The first important step towards a better knowledge of the mss. was made by the beginning, in 1880, of the great series of publications from the mss. of the Institut de France undertaken by C. Ravaisson-Mollien; the next by the publication in 1883 of Dr. J. P. Richter's *Literary Works of Leonardo da Vinci* (*see* Bibliography): this work included, besides a history and analytical index of the mss., facsimiles of a number of selected pages containing matter of autobiographical, artistic, or literary interest, with transcripts and translations of their ms. contexts. Since then much progress has been made in the publication of the complete mss., scientific and other, whether with adequate critical apparatus or in the form of mere facsimile without transliteration or comment.

A brief statement follows of the present distribution of the several mss. and of the form in which they are severally published:—

England.—*Windsor:* Nine mss., chiefly on anatomy, published entire in simple facsimile by Rouveyre (Paris, 1901); partially, with transliterations and introduction by Piumati and Sabachnikoff (Paris, 1898, foll.); *British Museum:* one ms., miscellaneous, unpublished; *Victoria and Albert Museum:* ten note-books bound in 3 vols.; facsimile by Rouveyre, *Holkham* (collection of Lord Leicester), 1 vol., on hydraulics and the action of water; published in facsimile with transliteration and notes by Gerolamo Calvi. France.—*Institut de France:* 17 mss., all published with transliteration and notes by C. Ravaisson-Mollien (6 vols., Paris, 1880–91). Italy.—*Milan, Ambrosiana:* the *Codice Atlantico*, the huge miscellany, of vital importance for the study of the master, put together by Pompeo Leoni; published in facsimile, with transliteration, by the Accademia dei Lincei (1894, foll.); *Milan:* collection of Count Trivulzio; 1 vol., miscellaneous; published and edited by L. Beltrami (1892); *Rome:* collection of Count Marszolini; *Treatise on the Flight of Birds*, published and edited by Piumati and Sabachnikoff (Paris, 1892). *Quaderni d'Anatomia* published by Ove Vagensten, A. Fonahn, H. Hopstok with English and German translations (Christiania [Oslo], 1911–17).

Preussischen Kunstsammlungen* (1897–99), the first immature and incomplete, the second of high value; E. Müntz, *L. da V. sa vie, son génie, son oeuvre* (1898; English translation 1898); G. Gronau, *L. da V.* (1902); Bernhard Berenson, *The Drawings of the Florentine Painters* (1903); Edmondo Solmi, *Studi sulla filosofia naturale di L. da V.* (Modena, 1898); *Id., Leonardo* (Florence, 1st ed. 1900, 2nd ed. 1907); A. Rosenberg, *L. da V.*, in Knackfuss's series of art biographies (Leipzig, 1898); Gabriel Séailles, *L. da V., l'artiste et le savant* (1st ed. 1892, 2nd ed. 1906), a lucid and careful general estimate of great value, especially in reference to Leonardo's relations to modern science: Edward McCurdy, *L. da V.*, in Bell's "Great Masters" series (1904 and 1907), *Id., L. da V.'s Note-Books* (1908), a selection from the passages of chief general interest in the master's mss., with a history of the mss. prefixed, *Le Vicende del Cenacolo di L. da V. nel secolo XIX.* (Milan, 1906), an official account of the later history and vicissitudes of the "Last Supper" previous to its final repair; Luca Beltrami, *Il Castello di Milano* (1894); *Id., L. da V. et la Sala dell' Asse* (1902); *Id.*, "Il Cenacolo di Leonardo," in *Raccolta Vinciana* (Milan, 1908), the official account of the successful work of repair carried out by Signor Cavenaghi in the preceding years; Woldemar von Seidlitz, *Leonardo da Vinci, der Wendepunkt der Renaissance* (2 vols., 1909); Jens Thüs, *L. da V. The Florentine Years of L. da V. and Verrocchio* (Christiania, 1909. English translation 1913); F. Malaguzzi Valeri, *La Corte di Lodovico il Moro II.* (Milan, 1915); *Raccolta Vinciana presso l'Archivio storico del Comune di Milano*, important periodical publication begun in 1905; G. Calvi, *I Manoscritti di Leonardo da Vinci del punto di vista cronologico, storico, e biografico* (Bologna 1925). It seems needless to give references to the discussion in newspapers and periodicals concerning the authenticity of a wax bust of Flora acquired in 1909 for the Berlin museum and unfortunately ascribed to Leonardo da Vinci, its real author having been proved by external and internal evidence to be the Englishman Richard Cockle Lucas, and its date 1846. (S. C.; X.)

LEONARDO OF PISA (LEONARDUS PISANUS or FIBONACCI), Italian mathematician of the 13th century. He was educated at Bugia and then travelled extensively around the Mediterranean, during which time he gathered knowledge of mathematics. He returned to Pisa in 1202 and published his famous *Liber abaci.* His work was widely read and secured the introduction of Arabic notation into Europe and provided the basis of works on algebra and arithmetic in the following centuries. In 1220 he published a work on geometry *Practica Geometria.* His fame spread and in 1225 he was presented to the emperor Frederick II., the presentation being accompanied by a mathematical tournament in which

Leonardo solved difficult problems proposed by John of Palermo.

His works were edited by Count B. Boncompagni, *Scritti di Leonardo Pisano* (2 vols., Rome, 1857, 1862).

LEONCAVALLO, RUGGIERO (1858–1919), Italian operatic composer, was born at Naples. He received his musical education at the conservatoire, and for many years led a wandering life, supporting himself by playing at café concerts, while he attempted to obtain the production of more than one opera. His *Pagliacci* was at length performed at Milan in 1892 with immediate success, but neither his *Medici* (produced at Milan 1892) nor *Chatterton* (1896), the libretto of which was adapted from de Vigny's tragedy, obtained any favour. *La Bohème*, performed in 1897 at Venice, was well received, though it suffered by comparison with the more famous work on the same subject by Puccini. *Zaza* was produced in 1900 and *Der Roland* in 1904. In all these operas he was his own librettist. None of the more ambitious works were very successful. Leoncavallo is undoubtedly seen at his best in *Pagliacci* and in *Zaza*, shorter works, in which his gift for the theatre stood him well. He died at Montecatini on Aug. 9, 1919.

LEONIDAS, king of Sparta, the 17th of the Agiad line. He succeeded, probably in 489 or 488 B.C., his half-brother Cleomenes, whose daughter Gorgo he married. In 480 he was sent with about 7,000 men to hold the pass of Thermopylae against the army of Xerxes. It seems that the ephors supported the scheme half-heartedly, their policy being to concentrate the Greek forces at the Isthmus. Leonidas repulsed the frontal attacks of the Persians, but when the Malian Ephialtes led the Persian general Hydarnes by a mountain track to the rear of the Greeks he divided his army, himself remaining in the pass with 300 Spartiates, 700 Thespians and 400 Thebans. Perhaps he hoped to surround Hydarnes' force: if so, the movement failed, and the little Greek army, attacked from both sides, was cut down to a man save the Thebans, who are said to have surrendered. Leonidas fell in the thickest of the fight; his head was afterwards cut off by Xerxes' order and his body crucified. Our knowledge of the circumstances is too slight to enable us to judge of Leonidas's strategy, but his heroism and devotion secured him an almost unique place in the imagination not only of his own but also of succeeding times.

Leocr.* 110, 111; Strabo i. 10, ix. 429; Aelian, *Var. hist.* iii. 25; Cicero, *Tusc. disput.* i. 42, 49; *de Finibus*, ii. 30; Cornelius Nepos, *Themistocles*, 3; Valerius Maximus iii. 2; Justin ii. 11. *See* THERMOPYLAE. (M. N. T.; X.)

LEONINE VERSE, the name given to a mediaeval form of hexameter and pentameter verses in which the syllables preceding the middle of the line rhymed with the final syllables. It was employed during the period of transition from the ancient to the modern form of verse and may be traced to the Roman poets, examples of leonine verse appearing in the *Epistles* of Ovid. *See* VERSE.

LEON OF MODENA (1571–1648), Jewish scholar, was born in Venice, of a French family which had migrated to Italy after the expulsion of the Jews from France. One of Leon's most effective works was his attack on the Kabbala (*'Ari Nohem*, first published in 1840), for in it he demonstrated that the "Bible of the Kabbalists" (the *Zohar*) was a modern composition. (*See* LEON, MOSES DE.) His *Riti Ebraici* (1637) was widely read by Christians; it was rendered into various languages, and in 1650 was translated into English by Edward Chilmead. He died at Venice.

See Graetz, *History of the Jews* (Eng. trans.), vol. v. ch. iii.; *Jewish Encyclopedia*, viii. 6; Geiger, *Leon de Modena.*

LEONTIASIS OSSEA, a rare disease characterized by an overgrowth of the facial and cranial bones. The common form is that in which one or other maxilla is affected, its size progressively increasing both regularly and irregularly, and thus encroaching on the cavities of the orbit, the mouth, the nose and its accessory sinuses. Exophthalmos gradually develops, going on later to a complete loss of sight due to compression of the optic nerve by the overgrowth of bone. There may also be interference with the nasal respiration and with the taking of food. In the somewhat less common form of this rare disease the overgrowth of bone affects all the cranial bones as well as those of the face, the senses being lost one by one and death finally resulting from cerebral pressure. There is no treatment other than exposing the overgrown bone, and chipping away pieces, or excising entirely where possible. The cause of the condition is unknown, but the association of the allied disease acromegaly with changes in the pituitary body suggests that it may be of endocrine origin.

LEONTINI, ancient town, south-east Sicily (mod. *Lentini*), 22 m. north-north-west of Syracuse direct, founded by Chalcidians from Naxos in 729 B.C. The site, originally held by the Sicels, was seized by the Greeks owing to its command of the fertile plain on the north. It was reduced to subjection in 498 B.C. by Hippocrates of Gela, and in 476 Hieron of Syracuse established here the inhabitants of Catana and Naxos. Later on Leontini regained its independence. It was mainly the eloquence of Gorgias (*q.v.*) of Leontini which led to the abortive Athenian expedition of 427. In 422 Syracuse supported the oligarchs against the people and received them as citizens, Leontini itself being forsaken. The exiles of Leontini then joined the envoys of Segesta in persuading Athens to undertake the great expedition of 415. After its failure, Leontini became subject to Syracuse once more It was finally stormed by M. Claudius Marcellus in 214 B.C. It was destroyed by the Saracens A.D. 848, and almost totally ruined by the earthquake of 1698. The ancient city is described by Polybius as lying in a bottom between two hills, and facing north. On the west side of this bottom ran a river with a row of houses on its west bank under the hill. At each end was a gate, the northern leading to the plain, the southern, at the upper end, to Syracuse. There was an acropolis on each side of the valley, lying between precipitous hills with flat tops, over which buildings had extended. The eastern hill still has considerable remains of a strongly fortified mediaeval castle (the Castellaccio).

LEONTIUS (*fl.* 6th cent.), theological writer, is variously styled BYZANTINUS, HIEROSOLYMITANUS (as an inmate of the monastery of St. Saba near Jerusalem) and SCHOLASTICUS (the first "schoolman," as the introducer of the Aristotelian definitions into theology; according to others, he had been an advocate, a special meaning of the word *scholasticus*). He himself states that in his early years he belonged to a Nestorian community. Nothing else is known of his life. Most scholars regard as genuine the polemical treatises *Contra Nestorianos et Eutychianos, Contra Nestorianos, Contra Monophysitas, Contra Severum* (patriarch of Antioch); and the Σχόλια, generally called *De Sectis*. An essay *Adversus fraudes Apollinaristarum* and two homilies are referred to other hands, the homilies to a Leontius, presbyter of Constantinople.

Collected works in J. P. Migne, *Patrologia Graeca* lxxxvi.; for the various questions connected with Leontius *see* C. Krumbacher, *Geschichte der byzantinischen Literatur* (1897); J. P. Junglas, *Leontius von Byzanz* (1908). For other persons of the name *see* Fabricius, *Bibliotheca Graeca* (ed. Harles), viii. 323.

LEOPARD, PARD or PANTHER (*Felis pardus*), the largest spotted cat of the Old World, except, perhaps, the snow-leopard (*q.v.*). Leopards are characterized by the rosette-like form of the black spots on the body, and by the absence of a central spot from each rosette. They vary considerably in size, but the usual length is from 6-7½ft. inclusive of the tail. The ground colour of the fur may be any shade between pale fawn and rufous buff; perfectly black (*melanistic*) mutants are not uncommon. In habit the leopard is ferocious, bloodthirsty and cunning Its movements are quick and graceful. It obtains its prey either by springing upon it from an ambush (frequently the bough of a tree), or by a stealthy stalk. It will eat any animal it can overcome, being especially fond of dogs. The geographical range of this animal embraces practically all Africa, and Asia from Palestine to China, Manchuria and Java. In the Pleistocene epoch it inhabited Europe. (*See* CARNIVORA.)

The CLOUDED LEOPARD (*Felis nebulose*) is a large arboreal cat from south-east Asia, Sumatra, Java, Borneo and Formosa. This cat, often called the clouded tiger, is beautifully marked, and has an elongated head and body, long tail and rather short limbs. The canine teeth are proportionately longer than in any other

living cat. It preys on small mammals and birds. The species is related to the small Indian marbled cat (*F. marmorata*), and Fontaniers cat (*F. tristis*) of central Asia.

LEOPARDI, GIACOMO, COUNT (1798–1837), Italian poet, was born at Recanati in the March of Ancona, on June 29, 1798. All the circumstances of his parentage and education conspired to foster his precocious and sensitive genius at the expense of his physical and mental health. His mother was absorbed in mending the family fortunes, having taken over the whole administration from her husband. His father, Count Monaldo Leopardi, secluded himself in his extensive library, to which his nervous, sickly and deformed son had free access, and which absorbed him exclusively in the absence of an intelligent sympathy from his parents, of any companionship except that of his brothers and sister, or of any recreation in the dullest of Italian towns. The lad spent his days over grammars and dictionaries, learning Latin with little assistance, and Greek and the principal modern languages with none at all.

Erudition.—Any ordinarily clever boy would have emerged from this discipline a mere pedant and bookworm. Leopardi came forth a Hellene, not merely a consummate Greek scholar, but penetrated with the classical conception of life, and a master of antique form and style. At 16 he composed a Latin treatise on the Roman rhetoricians of the second century, a commentary on Porphyry's life of Plotinus and a history of astronomy; at 17 he wrote on the popular errors of the ancients, citing more than 400 authors. A little later he imposed upon the first scholars of Italy by two odes in the manner of Anacreon. At 18 he produced the *Appressamento alla Morte,* a vision of the omnipotence of death, modelled upon Petrarch, but more truly inspired by Dante, and in its conception, machinery and general tone, offering a remarkable resemblance to Shelley's *Triumph of Life* (1822). At 19 he experienced his first serious passion for his cousin, Geltrude Cassi, already married and a mother. In 1819 came the great lyrical odes, the ode to Italy, and that on the monument to Dante erected at Florence. They are chaste in diction, close and nervous in style, sparing in fancy and almost destitute of simile and metaphor, antique in spirit, yet pervaded by modern ideas. A third ode, on Cardinal Mai's discoveries of ancient mss., lamented the decadence of Italian literature.

Pessimism.—He found intellectual sympathy in the eminent scholar and patriot Pietro Giordani, to whom he wrote letters of bitter complaint and lamentation. His condition was rendered the more unhappy by bad eyesight which for months made even reading impossible. At length (1822) his father allowed him to spend the winter in Rome, where, though he received literary encouragement from C. C. J. Bunsen and Niebuhr, he found little satisfaction. Dispirited and with exhausted means, he returned to Recanati, where he spent three miserable years, brightened only by the publication of his *Versi* (Bologna, 1824). The most remarkable of these is perhaps the *Bruto Minore,* the epitome of his philosophy of despair.

In 1827 appeared the *Operette Morali,* written some years before and consisting principally of dialogues and his imaginary biography of Filippo Ottonieri, which brought Leopardi fame as a prose writer. Modern literature has few productions so eminently classical in form and spirit, so symmetrical in construction and faultless in style. Lucian is evidently the model; but the wit and irony which were playthings to Lucian are terribly earnest with Leopardi. Leopardi's invention is equal to Lucian's and his only drawback in comparison with his exemplar is that, while the latter's campaign against pretence and imposture commands hearty sympathy, Leopardi's philosophical creed is a repulsive hedonism in the disguise of austere stoicism. *Filippo Ottonieri* is a portrait of an imaginary philosopher, imitated from the biography of a real sage in Lucian's *Demonax.* Lucian has shown us the philosopher he wished to copy, Leopardi has truly depicted the philosopher he was.

On leaving Florence in the autumn of 1827 he went to Pisa, and there wrote some of his finest poems, among them *Il Risorgimento* and *A Silvia.* Want of means drove Leopardi back, in Nov. 1828, to Recanati, where, deaf, half-blind, sleepless, tortured by incessant pain, at war with himself and every one around him except his sister, he spent the two most unhappy years of his unhappy life. In May 1830 he escaped to Florence, where he formed the acquaintance of a young Swiss philologist, de Sinner. To him he confided his unpublished philological writings, with a view to their appearance in Germany. A selection appeared under the title *Excerpta ex schedis criticis J. Leopardi* (Bonn, 1834). The remaining mss. were purchased, after de Sinner's death, by the Italian Government, and, together with Leopardi's correspondence with the Swiss philologist, were partially edited by Aulard.

His Last Years.—In 1831 Leopardi's friends subscribed for the publication of all his poems previously printed, with some additions, *Canti* (Florence, 1831). This volume placed him at once among the greatest lyric poets of the century, and made him famous throughout Europe. Leopardi was now driven from Florence to Rome by an unhappy attachment for Fanny Tozzetti Targioni. He had made acquaintance with a young Neapolitan, Antonio Ranieri, who went with him to Rome, and befriended him thenceforth. Unfortunately, in his old age Ranieri wrote a spiteful account of Leopardi's life in Naples. But at the time he was a good friend. Leopardi accompanied Ranieri and his sister to Naples, and under their care enjoyed four years of comparative tranquillity. He made the acquaintance of the German poet Platen, his sole contemporary rival in the classical perfection of form, and composed *La Ginestra,* the most consummate of all his lyrical masterpieces. He also wrote at Naples *I paralipomeni della Batracomiomachia, The Sequel to the Battle of the Frogs and Mice,* a satire in *ottava rima* on the abortive Neapolitan revolution of 1820, clever and humorous, but obscure because of the local nature of the allusions. He died on June 15, 1837.

Leopardi's lyrics have been studied and re-studied since his death. His genius is incommunicable, but his technique has influenced all his successors.

BIBLIOGRAPHY.—The principal editions of Leopardi's works are those of A. Ranieri (2 vols., Florence, 1845); the diamante edition of the poems by G. Mestica (Florence, 1886); an edition of the poems with notes by R. Fornaciari (Florence, 1889 and frequently reprinted). Among editions of the prose works may be mentioned: *Giacomo Leopardi, operette morali con proemio e note,* ed. G. Gentile (Bologna, 1918); and *Pensieri di varia filosofia e di bella letteratura di Giovanni Leopardi,* ed. G. Carducci (7 vols., Florence). His correspondence was first published in 1849; the standard edition is *G. Leopardi, Epistolario raccolto e ordinato,* ed. P. Viani (3 vols., Florence, 1892).

English translations of the poems are those by F. H. Cliffe (1893); J. M. Morrison (1900); L. de'Lucchi (1922), and G. L. Bickersteth (Cambridge, 1923). Bickersteth's book contains a life, critical appreciation and full bibliography. There are admirable translations of the essays and dialogues by James Thomson, ed. B. Dobell (1905); by G. C. Edwardes (1882) in vol. xvii. of the *English and Foreign Philosophical Library;* and by P. Maxwell (1905) in the Scots collection of Great Writers series.

Italian studies of Leopardi are very numerous. *See* especially G. Chiarini, *Vita di Giacomo Leopardi* (Florence, 1921); G. Carducci, *Degli spiriti e delle forme nella poesia di Giacomo Leopardi Considerazioni,* in vol. xvi. of G. Carducci's *Opere* (1898); F. de Sanctis, *Studio sul Giacomo Leopardi* (7th ed., 1921). In English *see* the editions referred to above; also W. E. Gladstone, "Giacomo Leopardi" in *Gleanings of Past Years,* vol. ii. (1879); and C. H. Herford in *Shakespeare's Treatment of Love and other Essays* (1921).

LEOPARDO, ALESSANDRO (d. *c.* 1512), Italian sculptor, was born and died at Venice. His first known work is the imposing mausoleum of the doge Andrea Vendramini, now in the church of San Giovanni e Paolo; in this he had the cooperation of Tullio Lombardo, but the finest parts are Leopardo's. Some of the figures have been taken away, and two in the Berlin museum are considered to be certainly his work. He was exiled on a charge of fraud in 1487, and recalled in 1490 by the senate to finish Verrocchio's colossal statue of Bartolommeo Colleoni. He worked between 1503 and 1505 on the tomb of Cardinal Zeno at St. Mark's, which was finished in 1515 by Pietro Lombardo; and in 1505 he designed and cast the bronze sockets for the three flagstaffs in the square of St. Mark's, the antique character of the decorations suggesting some Greek model. (*See* VENICE.)

LEOPOLD I. (1640–1705), Roman emperor, second son of the emperor Ferdinand III. and his first wife Maria Anna, daughter of Philip III. of Spain, was born on June 9, 1640. Leopold was intended for the church, but the death of his elder brother,

the German king Ferdinand IV., in July 1654, made him his father's heir. In 1655 he was chosen king of Hungary and in 1656 king of Bohemia, and in July 1658, more than a year after his father's death, he was elected emperor at Frankfort. For nearly the whole 47 years of his reign Leopold was pitted against Louis XIV. of France. The emperor was a man of peace, and never directed his armies in person, but the empire was at war for the greater part of his reign. (*See* EUROPE: *History*.) He was the ally of Poland against Charles X. of Sweden until the peace of Oliva (1660). A war against Turkey was brought to a close by the victory of the imperialist general Montecuccoli at St. Gotthard, followed by a twenty years' truce with the sultan. The first war with France (1672–78) was concluded by the treaty of Nijmwegen (1679). The empire was again in a state of war with France in 1682–84, and in 1689 Leopold joined the Grand Alliance against Louis XIV. (*See* GRAND ALLIANCE, WAR OF THE.) Peace was concluded at Ryswick in 1697, though Leopold did not come to terms until some months later. After four years of peace the empire was involved in the war of the Spanish Succession (*q.v.*). The early course of the war was not favourable to the imperialists, but the tide turned with the great victory of Blenheim before Leopold died on May 5, 1705.

During this reign some important changes were made in the constitution of the Empire. In 1663 the imperial diet entered upon the last stage of its existence, and became a body permanently in session at Regensburg; in 1692 the duke of Hanover was raised to the rank of an elector, becoming the ninth member of the electoral college; and in 1700 Leopold greatly in need of help for the impending war with France, granted the title of king of Prussia to the elector of Brandenburg. The net result of these and similar changes was to weaken the authority of the emperor over the members of the Empire, and to compel him to rely more and more upon his position as ruler of the Austrian archduchies and of Hungary and Bohemia, and Leopold was the first who really appears to have realized this altered state of affairs and to have acted in accordance therewith.

Leopold's letters to Marco d'Aviano from 1680 to 1699 were edited by O. Klopp and published at Graz in 1888. Other letters are found in the *Fontes rerum Austriacarum*, Bände 56 and 57 (Vienna, 1903–04). *See* also F. Krones, *Handbuch der Geschichte Österreichs* (1876–79); R. Baumstark, *Kaiser Leopold I.* (1873); A. F. Pribram, *Zur Wahl Leopolds I.* (Vienna, 1888); K. T. von Heigel, *Neue Beiträge zur Charakteristik Leopolds I.* (1890).

LEOPOLD II. (1747–1792), Roman emperor and grand-duke of Tuscany, son of the empress Maria Theresa and her husband, Francis I., was born in Vienna on May 5, 1747. He was a third son, and was at first educated for the priesthood. On the death of his elder brother Charles in 1761 it was decided that he should succeed to his father's grand duchy of Tuscany. This settlement was the condition of his marriage on Aug. 5, 1764 with Maria Louisa, daughter of Charles III. of Spain, and on the death of his father Francis I. in 1765 he succeeded to the grand duchy.

When he succeeded, on the death of his brother Joseph II., to the Austrian lands he made large concessions to the interests offended by his brother's innovations. He recognized the Estates of his different dominions as "the pillars of the monarchy," and pacified the Hungarians, and divided the Belgian insurgents by concessions. When these failed to restore order, he marched troops into the country, and re-established at the same time his own authority, and the historic franchises of the Flemings

Leopold's reign lasted barely two years (1790–92) and during that period he was hard pressed by peril from west and east alike. Revolution endangered the life of his sister Marie Antoinette, and also threatened his own dominions with the spread of a subversive agitation. From the east he was threatened by the aggressive ambition of Catherine II. of Russia, and by the unscrupulous policy of Prussia. To his sister he gave good advice and promises of help if she and her husband could escape from Paris. The French émigrés were refused audience. Within six weeks of his accession he opened negotiations with England to impose a check on Russia and Prussia. He put pressure on England by threatening to cede his part of the Low Countries to France, and then, when secure of English support, he was in a position to baffle the intrigues of Prussia. A personal appeal to Frederick William II. led to a conference between them at Reichenbach in July 1790, and to an arrangement which was in fact a defeat for Prussia. Leopold's coronation as king of Hungary on Nov. 15, 1790, was preceded by a settlement with the diet in which he recognized the dominant position of the Magyars.

In January Leopold dismissed the count of Artois, afterwards Charles X., king of France, to avoid being entangled in the affairs of France. The insults inflicted on Louis XVI. and Marie Antoinette, however, at the time of their attempted flight to Varennes in June, led him to make a general appeal to the sovereigns of Europe to take common measures in view of events which "immediately compromised the honour of all sovereigns, and the security of all governments." On Aug. 25 he met the king of Prussia at Pillnitz, near Dresden, and they drew up a declaration of their readiness to intervene in France if and when their assistance was called for by the other powers. When Louis XVI. swore to observe the constitution of September 1791, the emperor professed to think that a settlement had been reached in France, and hoped to avoid war. He died suddenly on March 1, 1792.

Several volumes containing the emperor's correspondence have been published. Among these are; *Joseph II. und Leopold von Toskana. Ihr Briefwechsel 1781–1790* (Vienna, 1872), and *Marie Antoinette, Joseph II. und Leopold II. Ihr Briefwechsel* (Vienna, 1866), both edited by A. Ritter von Arneth; *Joseph II., Leopold II. und Kaunitz. Ihr Briefwechsel* (Vienna, 1873); and *Leopold II., Franz II. und Catharina. Ihre Correspondenz nebst einer Einleitung: Zur Geschichte der Politik Leopolds II.* (Leipzig, 1874), both edited by A. Beer; and *Leopold II. und Marie Christine. Ihr Briefwechsel 1781–1792*, edited by A. Wolf (Vienna, 1867). *See* also H. von Sybel, *Über die Regierung Kaiser Leopolds II.* (Munich, 1860); A. Schultze, *Kaiser Leopold II. und die franzosische Revolution* (Leipzig, 1890); and A. Wolf and H. von Zwiedeneck-Südenhorst, *Österreich unter Maria Theresa, Joseph II. und Leopold II.* (1882–84); K. T. von Heigel, *Deutsche Gesch. vom Tode Friedrichs d. Gr. bis zur Auflösung des alten Reiches* (1899–1911, 2 vols.).

LEOPOLD I. (1790–1865), king of the Belgians, fourth son of Francis, duke of Saxe-Coburg-Saalfeld, and uncle of Queen Victoria of England, was born at Coburg on Dec. 18, 1790. At the age of 18 he entered the military service of Russia, and accompanied the emperor Alexander to Erfurt as a member of his staff. He was required by Napoleon to quit the Russian army, and spent some years in travelling. But in 1813 he took part in the whole of the campaign of that and the following year, distinguishing himself in the battles of Leipzig, Lützen and Bautzen. He entered Paris with the allied sovereigns, and accompanied them to England. He married in May 1816 Charlotte, only child of George, prince regent, afterwards George IV., heiress-presumptive to the British throne. After the death of the princess in 1817 he continued to reside in England In 1830 he declined the crown of Greece, but was in the following year elected king of the Belgians (June 4, 1831). He accepted, after assuring himself of the support of the great powers. On July 12, he made his entry into Brussels and took the oath to observe the constitution. During the first eight years of his reign he was confronted with the resolute hostility of King William I. of Holland, and it was not until 1839 that the differences between the two States, which until 1830 had formed the kingdom of the Netherlands, were finally settled at the conference of London by the treaty of the 24 Articles. (*See* BELGIUM.)

From this date until his death, King Leopold spent all his energies in the wise administration of the affairs of the newly formed kingdom. In 1848 the throne of Belgium stood unshaken amidst the revolutions which marked that year in almost every European country. On Aug. 8, 1832, Leopold married, as his second wife, Louise of Orleans, daughter of Louis Philippe, king of the French. This union produced two sons and one daughter—(1) Leopold, afterwards king of the Belgians; (2) Philip, count of Flanders; (3) Marie Charlotte, who married Maximilian of Austria, the unfortunate emperor of Mexico. Leopold I. died at Laeken on Dec. 10, 1865. He was a cultured man, who encouraged art, science and education. His judgment was universally respected by contemporary sovereigns and statesmen, and he was frequently spoken of as "the Nestor of Europe." For his influ-

ence over his niece, Queen Victoria, *see* VICTORIA.

Thonissen, *La Belgique sous le règne de Léopold Ier* (Louvain, 1862); Hymans, *Histoire populaire du règne de Léopold I.* (1882); and *Lettres de Léopold I. à Thiers, 1836–1864*, ed. Lanzac de Laborie (1918). *See* also the *Letters* of Queen Victoria (1907).

LEOPOLD II. (LEOPOLD LOUIS PHILIPPE MARIE VICTOR) (1835–1909), king of the Belgians, son of the preceding, was born at Brussels on April 9, 1835. In 1846 he was created duke of Brabant, and entered the army. On Aug. 22, 1853, Leopold married Marie Henriette (1836–1902), daughter of the archduke Joseph of Austria, whose beauty gained for her the sobriquet of "The Rose of Brabant." Between the years 1854 and 1865 Leopold travelled much abroad, visiting India and China as well as Egypt and the countries on the Mediterranean coast of Africa. On Dec. 10, 1865, he succeeded his father. On Jan. 28, 1869, he lost his only son, Leopold (b. 1859), duke of Hainaut. The king's brother Philip, count of Flanders (1837–1905), then became heir to the throne; and on his death his son Albert (b. 1875) (*see* ALBERT I.) became heir-presumptive. During the Franco-Prussian War (1870–1871) the king of the Belgians preserved neutrality in a period of unusual difficulty and danger. The most notable event in Leopold's career was the foundation of the Congo Free State (*q.v.*). He gave the first impulse towards the development of this idea by founding in 1876 the *Association Internationale Africaine*. He enlisted the services of H. M. Stanley (*q.v.*).

Leopold's exploitation of this vast territory, which he administered autocratically, and in which he associated himself personally with various financial schemes, brought him an enormous fortune; it was the subject of acutely hostile criticism (*see* CONGO FREE STATE), and in 1908 the territory was annexed to Belgium. On Nov 15, 1902, King Leopold's life was attempted in Brussels by an Italian anarchist named Rubino.

Queen Marie Henriette died at Spa on Sept. 19, 1902; the king died at Laeken on Dec. 17, 1909. King Leopold was a notoriously dissolute monarch. The wealth he amassed from the Congo he spent, no doubt, royally on public improvements in Belgium, as well as on his pleasures; but he had a hard heart towards the natives of his distant possession.

LEOPOLD II. (1797–1870), of Habsburg-Lorraine, grand-duke of Tuscany, was born on Oct 3, 1797, the son of the grand-duke Ferdinand III., whom he succeeded in 1824. During the first 20 years of his reign he devoted himself to the internal development of the State. His was the mildest and least reactionary of all the Italian despots of the day; he refused to adopt the Austrian methods of government, allowed liberty to the press, and permitted political exiles from other states to dwell in Tuscany undisturbed. In 1845–46 riots broke out and Leopold granted a number of administrative reforms.

The election of Pope Pius IX, gave fresh impulse to the Liberal movement, and on Sept. 4, 1847 Leopold instituted the National Guard—a first step towards the constitution; shortly afterwards Cosimo Ridolfi was appointed prime minister. The granting of the Neapolitan and Piedmontese constitutions was followed (Feb. 17, 1848) by that of Tuscany, drawn up by Gino Capponi. The revolution in Milan and Vienna aroused a fever of patriotic enthusiasm in Tuscany, where war against Austria was demanded; Leopold, giving way to popular pressure, sent a force to co-operate with Piedmont in the Lombard campaign. His speech on their departure was uncompromisingly Italian and Liberal. "Soldiers," he said, "the holy cause of Italian freedom is being decided to-day on the fields of Lombardy. Already the citizens of Milan have purchased their liberty with their blood and with a heroism of which history offers few examples. . . . Honour to the arms of Italy! Long live Italian independence!" The Tuscan contingent fought bravely, if unsuccessfully, at Curtatone and Montanara. On June 26 the first Tuscan parliament assembled, but the failure of the campaign in Lombardy led to the resignation of the Ridolfi ministry, which was succeeded by that of Gino Capponi. Disorder continued, there was actual civil war in Leghorn, and the democratic party became more influential. Capponi resigned, and Leopold reluctantly agreed to a Montanelli-Guerrazzi ministry.

New elections in 1848 returned a constitutional majority, but it ended by voting in favour of a constituent assembly. There was talk of instituting a central Italian kingdom with Leopold as king, to form part of a larger Italian federation, but the grand-duke, alarmed at the revolutionary and republican agitations in Tuscany and encouraged by the success of the Austrian arms, was, according to Montanelli, negotiating with Field-Marshal Radetzky and with Pius IX., who had now abandoned his Liberal tendencies, and fled to Gaeta. Leopold had left Florence for Siena, and eventually for Porto S. Stefano, leaving a letter to Guerrazzi in which, on account of a protest from the pope, he declared that he could not agree to the proposed constituent assembly. The utmost confusion followed. On Feb. 9, 1849 the republic was proclaimed, and on the 18th Leopold sailed for Gaeta. A third parliament was elected and Guerrazzi appointed dictator. But the defeat of Charles Albert at Novara caused consternation. The majority, while fearing an Austrian invasion, desired the return of the grand-duke, and in April 1849 the municipal council usurped the powers of the assembly and invited him to return. Leopold accepted. The Austrians occupied Lucca and Leghorn, and although Leopold simulated surprise at their action, it has since been proved that Austrian intervention was due to the request of the grand-duke. On May 24 the latter appointed G. Baldasseroni prime minister, on the 25th the Austrians entered Florence, and on July 28, Leopold himself returned. In 1850 he concluded a treaty with Austria sanctioning the continuation for an indefinite period of the Austrian occupation with 10,000 men; in September he dismissed parliament, and the following year established a concordat with the Church of a very clerical character.

He feebly asked Austria if he might maintain the constitution, and the Austrian premier, Prince Schwarzenberg, advised him to consult the pope, the king of Naples and the dukes of Parma and Modena. On their advice he formally revoked the constitution (1852). Political trials were held, Guerrazzi and many others being condemned to long terms of imprisonment, and although in 1855 the Austrian troops left Tuscany, Leopold's popularity was gone. The popular party headed by F. Bartolommei and G. Dolfi realized that only by the expulsion of Leopold could the national aspirations be realized. When in 1859 France and Piedmont made war on Austria, numbers of Tuscan volunteers joined the Franco-Piedmontese forces. Finally the grand-duke's participation in the war was formally demanded. On April 27 the grand-duke and his family departed for Bologna undisturbed. Thus a bloodless revolution was accomplished, and after an interregnum Tuscany was incorporated in the kingdom of Italy. On July 21, Leopold abdicated in favour of his son Ferdinand IV., who never reigned, but issued a protest from Dresden (March 26, 1860). He died in Rome on Jan. 29, 1870.

(Turin, 1895). *See* also RICASOLI; BARTOLOMMEI; CAPPONI, GINO; etc.

LEOPOLD II., LAKE, a Central African lake in the Belgian Congo It is very irregular in shape, its greatest length being 70 m. (north to south) and it is widest (30 m.) at its north end. It is shallow, its banks low, liable to be flooded, marshy and in places densely wooded, and it is simply the remnant of a vast lake which was practically drained when the river Kasai (*q.v.*) broke through, at Kwa mouth, to the Congo. Its chief affluents are Lokoro and Lukenye and its effluent to the Kasai, the Mfini. The chief places on it are Inongo and Kutu. It was discovered in 1882 by Stanley.

LEOTYCHIDES, Spartan king, of the Eurypontid family, in 491 B.C. succeeded Demaratus (*q.v.*), whose title to the throne he had with Cleomenes' aid successfully challenged. He took part in Cleomenes' second expedition to Aegina, on which ten hostages

were seized and handed over to the Athenians for safe custody: for this he narrowly escaped being surrendered to the Aeginetans after Cleomenes' death. In the spring of 479 he commanded the Greek fleet of 110 ships, first at Aegina and afterwards at Delos. In August he attacked the Persian position at Mycale on the coast of Asia Minor opposite Samos, defeated the army, and annihilated the fleet which was drawn up on the shore. Soon afterwards he sailed home with the Peloponnesians, leaving the Athenians to prosecute the siege of Sestos. In 476 he led an army to Thessaly to punish the Aleuadae for helping the Persians and to strengthen Spartan influence in northern Greece, but was bribed to withdraw. For this he was tried at Sparta, and fled to the temple of Athena Alea at Tegea. Sentence of exile was passed, his house was razed and his grandson Archidamus II. ascended the throne (Herod. vi. 65–87, ix. 90–114; Thucydides i. 89; Pausanias iii. 9–10; Plutarch, *De malignitate Herodoti*, 21, p. 859 D; Diodorus xi. 34–37) The chronology of his reign and death is somewhat obscure. He died probably in 469.

See G. Busolt, *Griech. Geschichte*, iii. 83, note; J. B. Bury, *History of Greece*, p. 326; G. Grote, *History of Greece*, new edition 1888, iv. 349, note; also abridged edition 1907, p. 273, note 3.

LEOVIGILD or **LÖWENHELD** (d. 586), restorer of the Visigothic kingdom, king in 568, ruled until 572 over the part of this kingdom which lay to the south of the Pyrenees when his brother Luiva, or Leova, who governed the small part to the north, died and he became sole king. Menaced externally by the Byzantines and Suevi, and internally by the dissensions between the orthodox Christians and Arians, Leovigild began by attacking the Byzantines, whom he defeated; he chastised the Suevi, and took Cordova, capturing before the end of his reign their whole kingdom. Having given peace to his people, he made Toledo his capital, and associated in his rule his two sons, Recared and Hermenegild. Leovigild was an Arian, the last of the Visigothic kings to hold that creed. Hermenegild, however, had been converted to the orthodox faith and he headed a formidable insurrection of the Byzantines and orthodox Christians; defeated and captured, he refused to give up his faith and was executed in 585. He was canonized, at the request of Philip II. of Spain, by Pope Sixtus V. Leovigild died at Toledo on April 21, 586

LEPANTO, THE BATTLE OF. The battle of Lepanto was fought on Oct. 7, 1571, between the forces of the Christian League and Turkey. The League had been formed mainly by the efforts of Pope Pius V. to whom Venice had appealed against the constant depredations of the Turk, culminating in their seizure of Cyprus; and its naval forces were supplied mainly by Venice and Spain—the former having Barbarigo and Veniero as their principal admirals, the latter the marquis of Santa Cruz; there was also a small squadron from the Papal States, commanded by Colonna, and a Genoese squadron under Andrea Doria. The total Christian force numbered over 300 ships, including eight galleasses and some 208 galleys. The supreme command was given to Don John of Austria. The allies concentrated at Messina, the Turk making no attempt to intercept a Venetian squadron which had to join them from the eastern Mediterranean. Thence they proceeded to the Gulf of Lepanto where the Turkish force from the Aegean awaited them.

The Turks, 300 strong, including over 250 galleys, were drawn up just inside the gulf, stretching nearly from shore to shore. The commander-in-chief, Ali Pasha, was in the centre, and the right and left were commanded by Mahomet Sirocco and Uluch Ali, respectively. The allies had to deploy round the headland on the northern side of the gulf and then, the galleasses leading, descended in line abreast on the Turk. On the two flanks they were not immediately successful. Barbarigo, on the left, came under the full fire of the Turks as he deployed, while Uluch Ali completely outmanoeuvred the Christian right. Pretending to outflank his foe, he induced Andrea Doria to part company with his centre and broke through the gap so created, the situation only being saved by the foresight of Santa Cruz with the reserve squadron. In the centre, however, the Christians achieved great success. Ali Pasha's galley was captured and his squadron utterly beaten. Panic spread to the other Turkish squadrons, and the greater part of their fleet was taken or destroyed, Uluch Ali alone escaping with some of his ships.

The battle is remarkable in two ways. First, as the last great battle in which both sides used oar-propelled vessels; secondly, for its enormous casualties, reckoned at various figures. The Christians had some 8,000 men killed and double that number wounded, while the Turks had about 25,000 killed and an unknown number wounded. Further, some 15,000 Christians in the Turkish galleys were liberated from slavery.

See Sir W. Stirling Maxwell, *Don John of Austria* (1883); Jurien de la Gravière, *La Guerre de Chypre et la bataille de Lepanto* (1888); J. R. Hale, *Famous Sea Fights* (1919). (G. A. R. C.; J. G. B)

LEPCHA, the name of the aboriginal inhabitants of Sikkim (*q.v.*). They practice polyandry and are polygamous. The father transmits bone to his offspring, while the flesh and blood come from the mother. Marriage is by service coupled with a small payment. A man may cohabit with the younger sisters of his wife. The eldest brother's wife is common to all the brothers, only the youngest having his wife to himself. Unions with blood relatives are punished with banishment. Animistic beliefs colour the numerous folk-tales, while Tibetan Lamaism is the official religion. Ancestral spirits are the Rimi who often die, descend in the shape of a hailstone which impregnates the woman who swallows it. A peculiar part is played by a supernatural "Binthing"—an exorciser. A special alphabet was invented in the 18th century based on a form of Tibetan. The language is of Tibetan affinity.

See *Journal of the Asiatic Society of Bengal*, vol. xxi., 1925, No. 4.

LE PELETIER (or LEPELLETIER), **DE SAINT-FARGEAU, LOUIS MICHEL** (1760–1793), French politician, was born on May 29, 1760, at Paris. He became president of the parlement of Paris and in 1789 he was a deputy of the *noblesse* to the States General. On July 13, 1789 he demanded the recall of Necker. In the Constituent Assembly he won popularity by moving the abolition of the penalty of death, of the galleys and of branding, and the substitution of beheading for hanging. On June 21, 1790 he was made president of the Constituent Assembly. He represented the department of Yonne in the Legislative and in the Convention. His vote for the king's death resulted in his assassination by a member of the king's body-guard on the eve of the king's execution (Jan. 20, 1793)

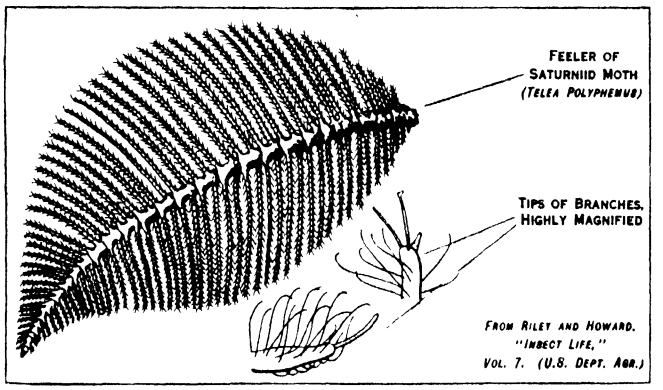
See *Oeuvres de M. de le Peletier de Saint-Fargeau* (Brussels, 1826) with a life by his brother Félix.

LEPIDOLITE or **LITHIA-MICA,** a mineral of the mica group (*see* MICA). It is a basic aluminium, potassium and lithium fluo-silicate, with the approximate formula $KLi[Al(OH,F)_2]Al(SiO_3)_2$. Lithia and fluorine are each present to the extent of about 5%; rubidium and caesium are sometimes present in small amounts Distinctly developed monoclinic crystals or cleavage sheets of large size are of rare occurrence, the mineral being usually found as scaly aggregates, and on this account it was named lepidolite (from Gr. λεπίς, scale). It is usually of a lilac or peach-blossom colour, but is sometimes greyish-white, and has a pearly lustre on the cleavage surfaces. The hardness is 2½–3 and the sp.gr. 2·8–2·9, the optic axial angle measures 50°–70°. It is found in pegmatite-veins, often in association with pink tourmaline (rubellite). Scaly masses of considerable extent are found at Rozena near Bystritz in Moravia, also at Pala in San Diego county, Calif., where it has been extensively mined for the extraction of lithium and rubidium salts. The mineral occurs in the island of Utö in Sweden and the Oiseau River district in Manitoba. At Alabashka near Mursinka in the Urals large isolated crystals have been found, and from Central Australia transparent cleavage sheets of a fine lilac colour are known

The lithium-iron mica *zinnwaldite* or *lithionite* is closely allied to lepidolite, differing from it in containing some ferrous iron in addition to the constituents mentioned above It occurs as greyish silvery scales with hexagonal outlines in the tin-bearing granites of Zinnwald in Bohemia and of Cornwall.

LEPIDOPTERA, the name used in zoological classification for that order of insects which comprises the butterflies and moths. The term (Gr. λεπίς, a scale, and πτερόν, a wing) was first used by Linnaeus (1735) and has been retained by all naturalists

after him. Lepidoptera are among the most familiar and easily recognizable of insects and have long been popular objects for study and collecting, largely on account of the great beauty of coloration exhibited by so many of the species, together with the interest that is afforded by following their transformations. Their most easily observable characteristic is the scaly covering of the wings, body and appendages, which comes off on the



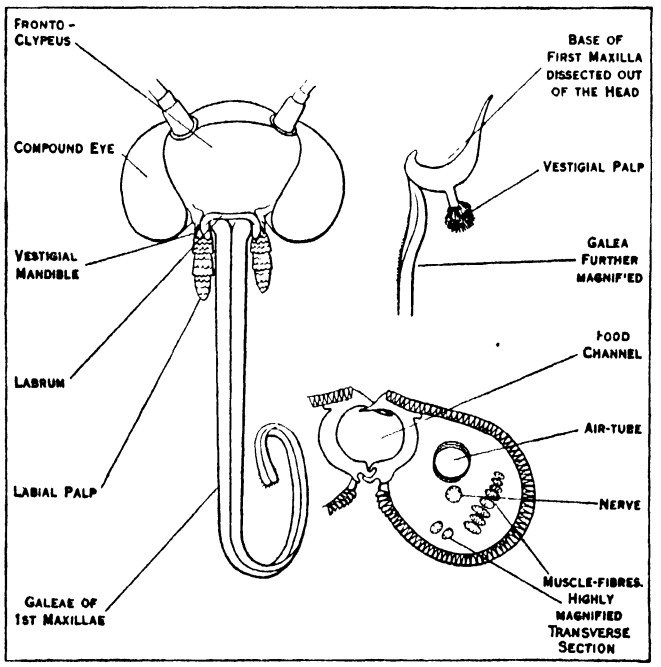


FIG. 1.—ANTENNA OF A MALE SATURNIID MOTH, SHOWING THE COMB-LIKE BRANCHES, WHICH ARE MUCH LESS DEVELOPED IN THE FEMALE

fingers as a dust when these insects are handled, and, if examined under a microscope, this "dust" is seen to be composed of minute scales of definite forms. Most Lepidoptera also possess a coiled "tongue" or haustellum in front of the head Metamorphosis is complete and the larvae are caterpillars which carry up to a maximum of eight pairs of feet; the pupae generally have their appendages more or less glued down to the body and are said to be obtected and are usually enclosed in a silken cocoon or in an earthen cell. At least 80,000 species have been described and of

BY COURTESY OF THE EDITOR OF THE "AMERICAN NATURALIST"

FIG. 2.—DIAGRAMMATIC REPRESENTATION OF THE ARRANGEMENT OF THE MOUTH-PARTS IN A TYPICAL MOTH

these over 2,000 inhabit the British isles and more than 9,000 occur in America, north of Mexico.

GENERAL STRUCTURE

The Head.—The head is small and sub-globular in shape with the compound eyes exceedingly well developed and a pair of simple eyes or ocelli often present on the vertex (fig. 3). The antennae are many-jointed: in numerous moths they are thread-like, in others they bear comb-like processes and are said to be pectinate (fig. 1), a development that is most pronounced in the males; among butterflies the antennae terminate in a club or knob. The mouth-parts (fig. 2) are nearly always adapted for sucking, with the mandibles reduced to vestiges or entirely wanting. The maxillae have their two galeae greatly elongated and interlocked to form a sucking tube, through which the food is imbibed; it is coiled up in a watch-spring-like manner when at rest, but extended straight out when sucking nectar from flowers. Maxillary palpi are generally reduced or wanting and the labium is represented by a small plate generally bearing prominent three-jointed palpi. In some Lepidoptera the mouth-parts are aborted and no food is taken in the adult stage, while at the other extreme in certain hawk-moths the haustellum is over 6in. long and adapted for probing the deeply-seated nectaries of tubular flowers. In a few cases the haustellum bears toothed spines at its apex, and those moths which possess this feature are able to lacerate the rind of fruits and suck the juices within.

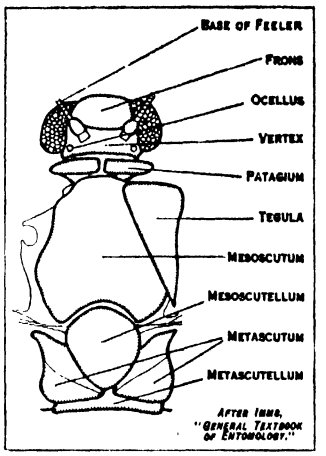

FIG. 3.—DORSAL VIEW OF HEAD AND THORAX OF A YELLOW UNDERWING MOTH (AGROTIS PRONUBA) WITH HAIR AND SCALES REMOVED

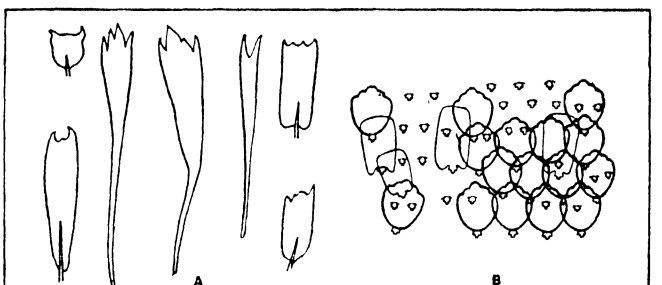
The Thorax.—The thorax (fig 3) has its first segment small and usually collar-like, but often bearing lateral processes or *patagia* that are very characteristic of the order. The mesothorax is very large and carries a pair of well-developed plates or *tegulae*, which often overlap the bases of the wings; in almost all species the metathorax is small and inconspicuous. The wings are membranous and clothed with modified hairs termed scales; in many species almost every transition between flattened hairs and broad scales can be detected under a microscope. Most scales are longitudinally striated and there are often tiny cross strioles or connecting bars between the striae. Each scale is provided with a minute pedicel which fits into a tiny socket in the wing-membrane, and in many butterflies they are arranged in regular rows, as shown in fig. 4. Peculiar scales known as *androconia* are found in the wings of the males of certain Lepidoptera; in some cases they



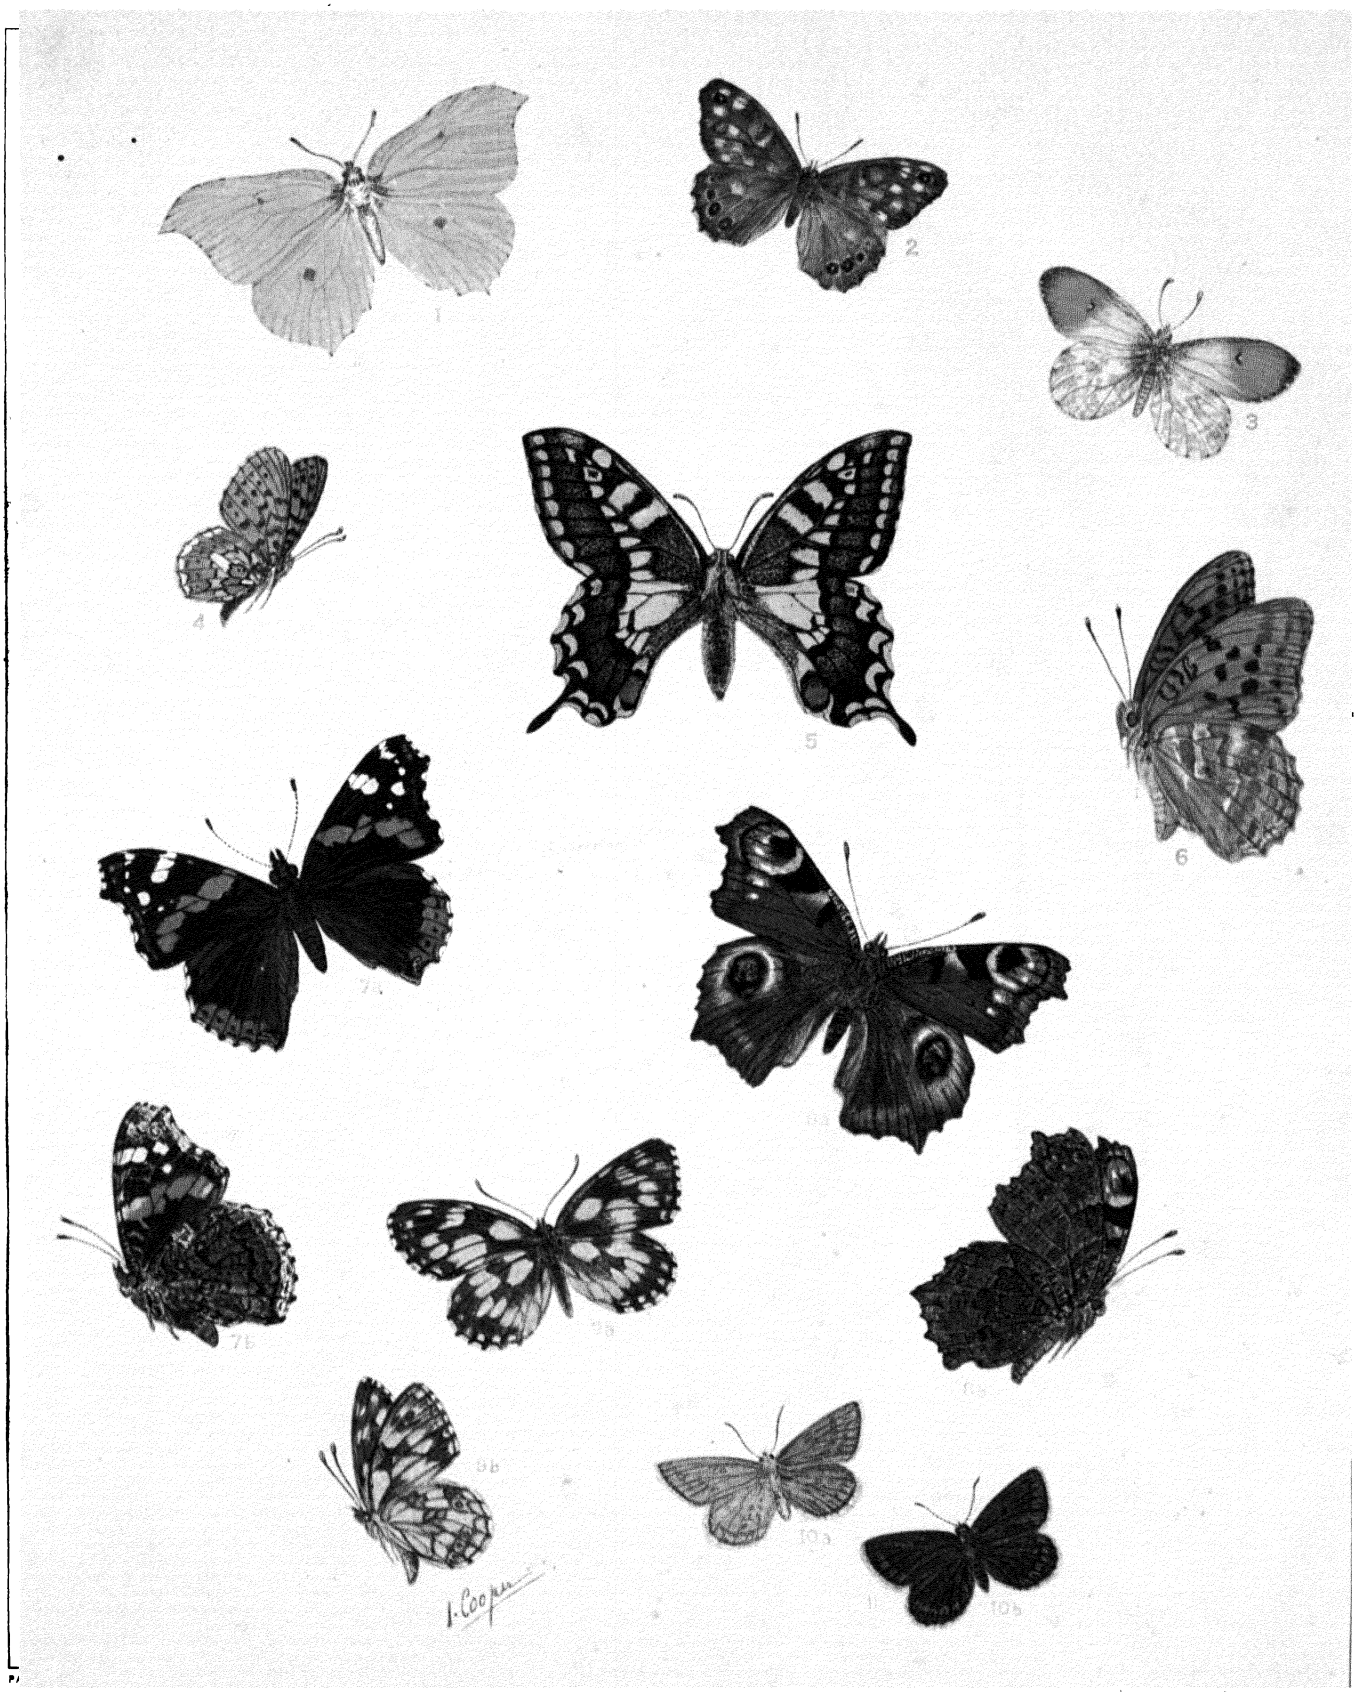


FIG. 4.—(A) VARIOUS SCALES FROM THE WING OF A MOTH OF THE FAMILY URANIIDAE. (B) PORTION OF THE WING OF A FRITILLARY BUTTERFLY (ARGYNNIS) SHOWING ARRANGEMENT OF THE SCALES AND EMPTY SOCKETS WHERE SCALES HAVE BEEN REMOVED

occur in "brands" or patches and physiologically they are glandular structures that secrete an odour often very characteristic for particular species. The wings of a side are linked together by a coupling apparatus which exists in several forms (fig. 5). In the primitive swift moths a finger-like process or *jugum* of the fore-wing grips and overlaps the base of the hind wing when the insect is in flight. In most moths a group of stiff setae, forming the *frenulum*, arises from the base of the hind wing and passes beneath the fore wing where it is retained in position by a catch or *retinaculum;* in the male the setae of the frenulum are usually fused into a single stout bristle, but in the female they remain separate. Among some moths and in butterflies there is no frenulum, and the humeral lobe at the base of the hind wing is greatly developed and projects some distance beneath the fore

BUTTERFLIES OF THE OLD WORLD

1. *Gonepteryx rhamni*, brimstone butterfly of Europe and Asia. 2. *Parage aegeria*, speckled wood butterfly, of central Europe. 3. *Anthocharis cardamines*, orange tip butterfly, found in British Isles. 4. *Argynnis euphrosyne*, pearl bordered fritillary, common in Europe. 5. *Papilio machaon*, swallow tail butterfly. Widely distributed. 6. *Argynnis paphia*, silver-washed fritillary, found in Europe and Asia. 7a. *Vanessa atalanta*, red admiral of Europe and Africa 7b. Underwing view of the red admiral (*Vanessa atalanta*). 8a *Vanessa io*, peacock butterfly, common in Europe and Asia. 8b. Underwing view of peacock butterfly (*Vanessa io*). 9a. *Melanargia galathea*, marbled white butterfly of Europe. 9b. Underwing view of marbled white butterfly (*Melanargia galathea*). 10a *Lycaena icarus* (male), common blue butterfly of Europe, Asia and Africa. 10b. *Lycaena icarus* (female)

wing, where it is held in position.

The Wing-veins.[1]—The wing-veins are of great importance in classification. There are but few cross-veins, and in all except the most primitive forms there is a large *basal cell* which is partly formed by the elimination of the main stem of the median vein *M:* the radial sector (*Rs*) is typically four-branched in the fore-wing and reduced to a single stem in the hind wing, while the median vein has generally three free branches (fig. 6). The majority of Lepidoptera carry a tympanal organ on either side close to the junction of the thorax and abdomen. In geometrid moths, for example, it takes the form of a bladder-like vesicle closely associated with the first abdominal spiracle of its side and certain of the neighbouring air-sacs. It is innervated from the last thoracic ganglion and from its general structure is believed to be an auditory organ. The reason for its existence is difficult to account for unless it be able to appreciate the notes produced by the vibrating wings of other members of the same species, since sound-producing organs are rare in Lepidoptera.

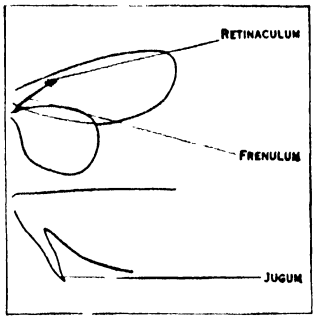

FIG. 5.—ABOVE, DIAGRAM OF THE UNDER SURFACE OF LEFT WING OF A PSYCHID MOTH. BELOW, BASE OF FOREWING OF A SWIFT MOTH

The Legs.—The legs are usually slender, covered with hairs or scales, and with five-jointed tarsi; among butterflies the fore pair is often so reduced as to be useless for walking.

Abdominal Segments.—Ten abdominal segments are present in Lepidoptera, but the first sternum is always reduced or atrophied and the terminal segments are modified to form external

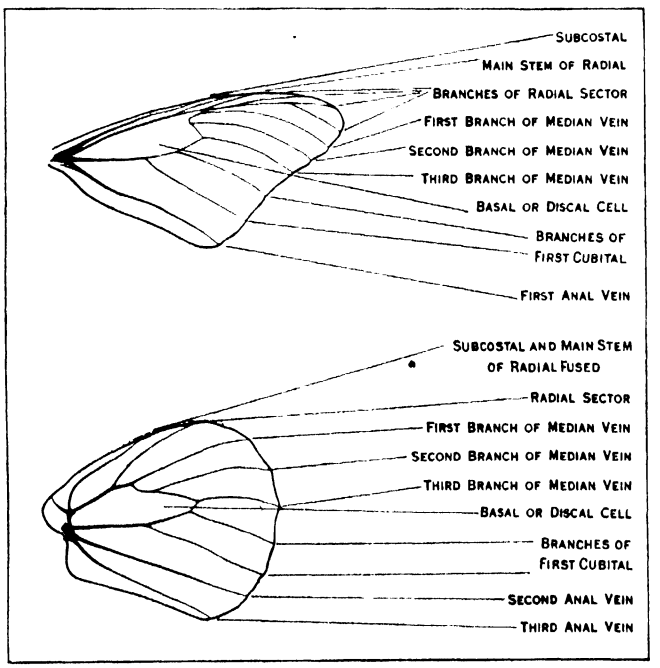

FIG. 6.—VENATION OF A MONARCH BUTTERFLY

organs of reproduction. In the male (fig. 7) the latter consist of a pair of prominent *claspers* borne by the 9th segment, which are often beset inside with groups of stiff hairs forming the *harpes*. The 9th tergum bears a prominent median process or *uncus* above the anus, while the intromittent organ or *aedeagus* arises between the bases of the claspers. In the female the terminal segments in some cases are produced into a telescopic ovipositor, a true valvular ovipositor being undeveloped. In the most primitive moths there is a single female genital aperture on the 9th abdominal sternum, but in most Lepidoptera two openings are present. One, situated on the 8th sternum, is that of the copulatory pouch and the other, situated on the 9th sternum, is the opening of the vagina. During mating the male cells are discharged into the copulatory pouch, whence they travel along a seminal canal which connects that organ with the oviduct, where fertilization of the eggs takes place.

[1]Throughout this article, the wing-veins (figs. 6, 8, 11, 18, 18a, 22) are denominated as follows—Costal, C; Subcostal, Sc; Radial, R; Radial sector, Rs; Cubital, Cu; Subcostal and main stem of radial fused Sc+R; Median, M.

CLASSIFICATION

The classification of butterflies and moths into major groups presents difficulties, mainly owing to the absence of markedly different characters among great numbers of species. The old grouping of the order into two suborders, viz., Heterocera or moths, and Rhopalocera or butterflies, is open to the objection that the butterflies are raised to a rank equivalent to the whole of the moths, whereas their true status is that of a superfamily. Among the several systems of classification that have been proposed the recent one of Turner and Tillyard[1] has been partially incorporated in the present article.

SUBORDER I. HOMONEURA

Venation of fore and hind wings closely similar; vein Rs with several branches in both pairs of wings (fig 8).

Two main families and several smaller groups belong here and they are of great interest on account of their primitive structure, not found in any other Lepidoptera.

The *Micropterygidae* are all very small moths with well-developed mouth-parts (fig. 9), functional mandibles being present in some forms, and the galeae of the maxillae are either unmodified or elongated to form an imperfect haustellum; tibial spines or spurs are present and the wing coupling apparatus consists of a small jugum. The caterpillars in some cases (*Micropteryx*) bear eight pairs of abdominal feet, a number never attained in any other Lepidoptera; in others the feet are reduced or wanting. They either feed on mosses or liverworts (*Micropteryx, Sabatinca*) or live as leaf-miners on birch, hazel and other trees (*Eriocrania*). The pupae have their appendages free,

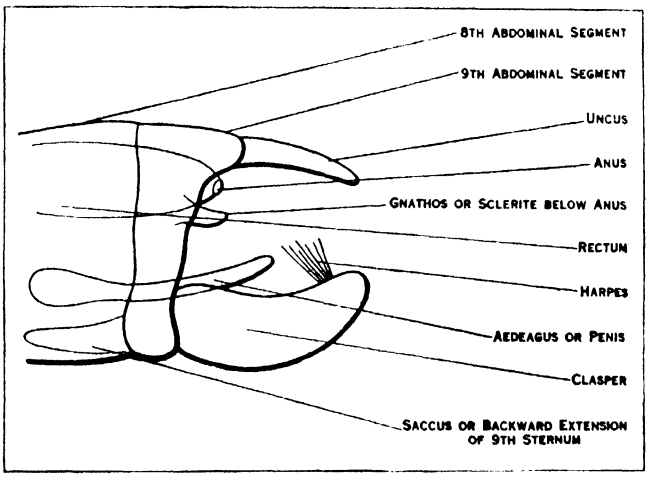

FIG. 7.—DIAGRAM OF THE APEX OF THE ABDOMEN OF A MALE MOTH

the abdominal segments movable, and large mandibles are present with which they bite their way to the exterior to allow of the emergence of the perfect insects. *Micropteryx* and *Eriocrania* occur not uncommonly in Great Britain; *Epimartyria* and *Nemonica* are North American; while *Sabatinca* belongs to New Zealand.

The *Hepialidae*, or swift moths, have very short antennae, only vestiges of mouth-parts, and no tibial spurs; the wing coupling apparatus consists of a well developed jugum. They are a widely distributed family, best represented in Australia, where the species attain a gigantic size and exhibit remarkable coloration. The caterpillars feed at the roots of grasses and other herbage or of trees, and some species are very destructive. The ghost moth (*Hepialus humuli*) is the most familiar British species.

[1]In R. J. Tillyard, *Insects of Australia and New Zealand* (Sydney, 1926).

SUB-ORDER II. HETERONEURA

Venation of fore and hind wings markedly different; vein Rs reduced to a single branch in hind wings (fig. 6).

Superfamily I. Cossoidea

Basal cell in both pairs of wings divided by vein M and its two main branches; radial cell present (fig. 11). *Mouth-parts vestigial, antennae pectinated, rarely simple but not clubbed.*

The *Cossidae* are the only family included here and are medium

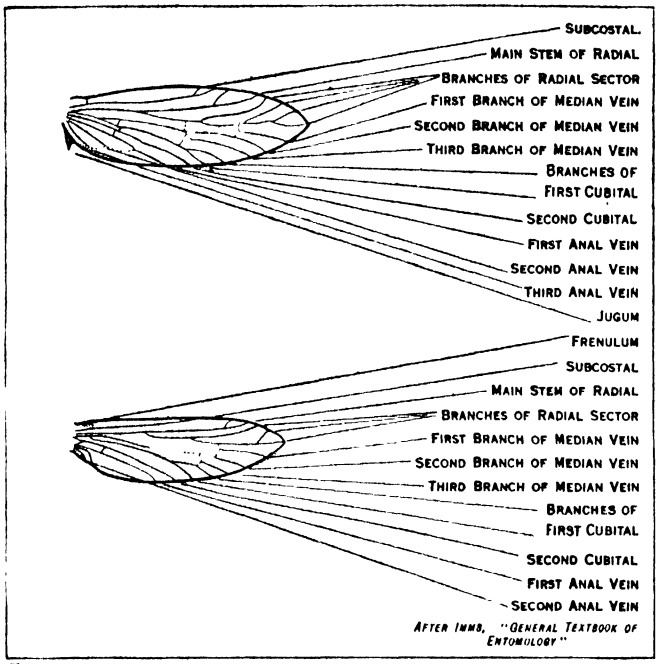

FIG. 8.—RIGHT WINGS OF MENMONICA SUBPURPURELLA (HOMONEURA, FAMILY MICROPTERYGIDAE)

to large-sized archaic moths (fig. 10), found in most parts of the world. Their caterpillars (fig. 35) are borers and often tunnel in the solid wood of trees; some require more than a year to complete their transformations. The leopard moth (*Zeuzera pyrina*) is common to Europe and North America and this species, along with the goat moth (*Cossus cossus*), are well known in Great Britain.

Superfamily II. Castnioidea

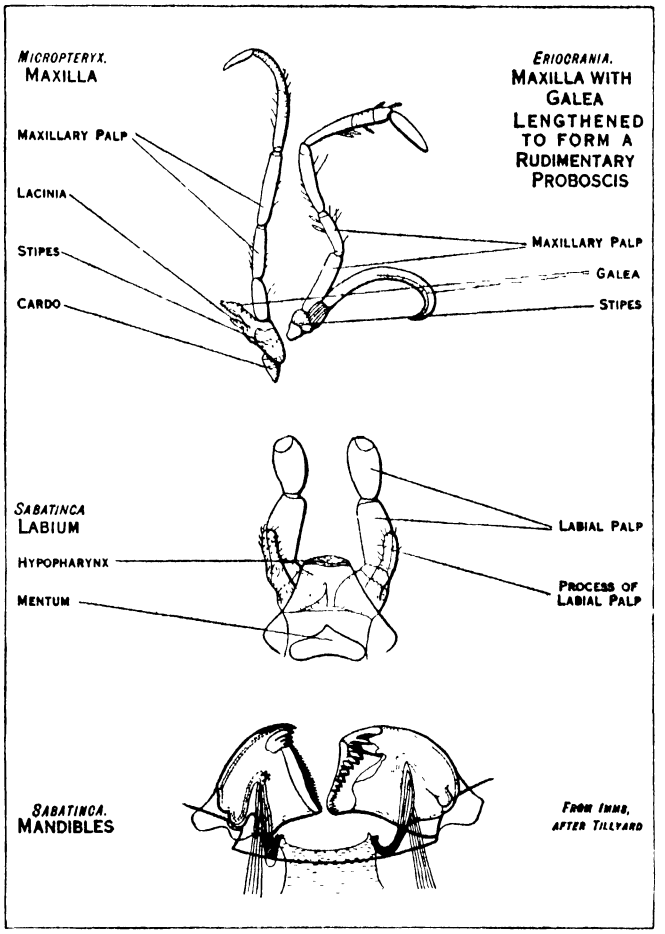
Basal cell in both pairs of wings divided by vein M and its branch M_{3+4}; radial cell usually absent. Antennae clubbed and not pectinated.

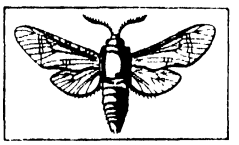
The single family *Castniidae* includes a small number of brightly coloured day-flying moths bearing a general resemblance to certain butterflies. They are confined to tropical America, Indo-Malaysia and Australia; their larvae, so far as known, feed in the stems of plants or at the roots of grasses.

Superfamily III. Tineoidea

Small moths with vein M absent or little developed in the basal cell; wings often very narrow with long fringes and degraded venation or with vein Rs in the hind wings not approximated to Sc+R, beyond the cell.

Included in the Tineoidea are an immense number of species which are variously classified into numerous families by different authorities, and the characters upon which these groups are based are often slight and difficult to determine. It is only possible in these columns to mention briefly certain of the more important groups. The *Tineidae* (fig. 12) are an extensive family with the venation well developed in many species and much degraded in others. The cosmopolitan clothes moths (*Tinea*), whose larvae construct portable cases in which they live, are well known; in *Lyonetia* and *Lithocolletis* the larvae are leaf-miners, while those of *Adela* and *Nematois* live in flattened cases composed of leaf-fragments. The moths of the two latter genera fly by day, and in the males of *Adela* the antennae are often extremely long and threadlike (fig. 14). The *Nepticulidae* have a greatly reduced venation and, in some species, a small jugum is present which suggests their affinity with the Homoneura. Their larvae are leaf-miners and the moths are the smallest of all Lepidoptera, in some cases with a wing-expanse of only 3mm. The *Plutellidae* have the head smooth instead of rough-haired as in most *Tineidae;*





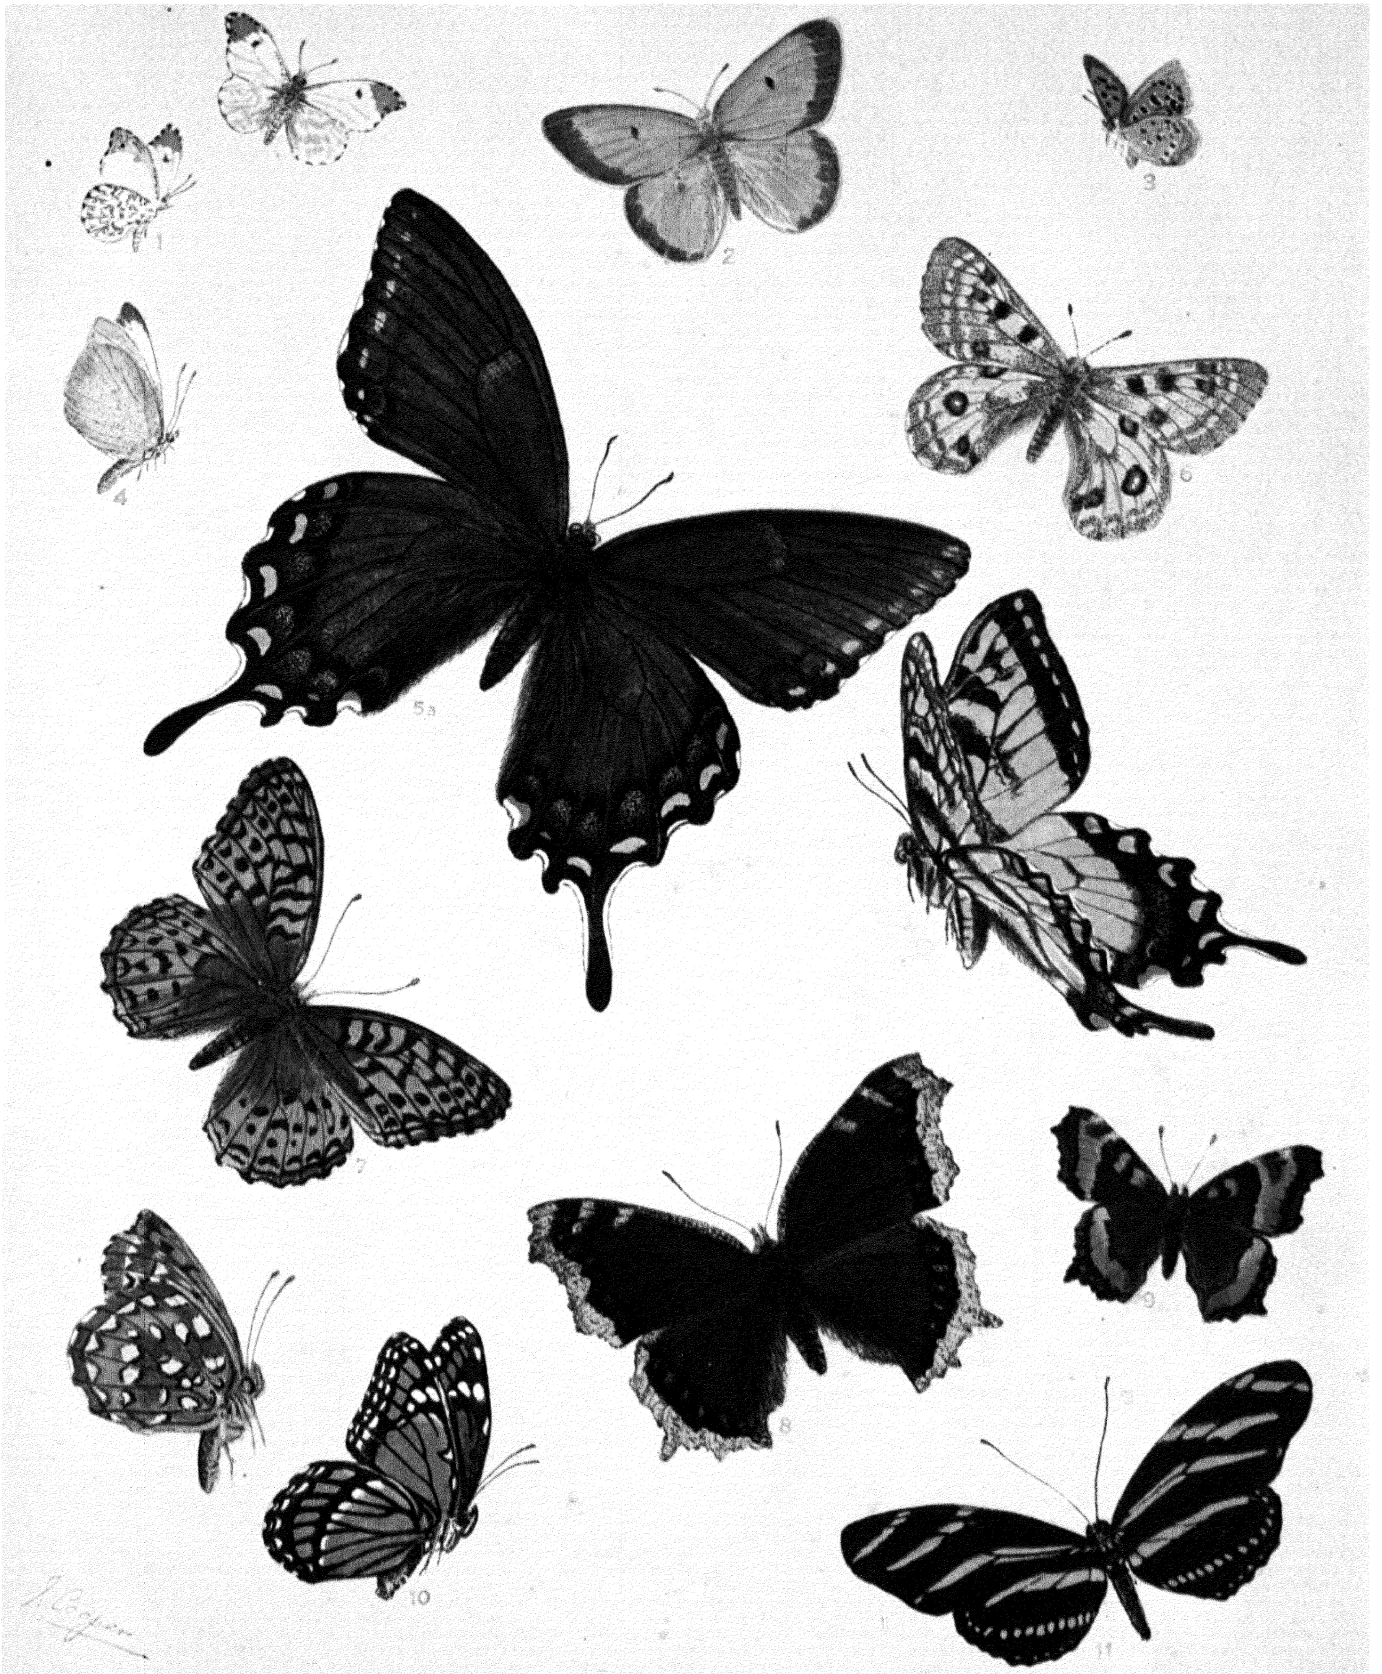


FIG. 9.—MOUTH-PARTS OF MICROPTERYGIDAE

their larvae are leaf-feeders and the best known species is the widely-spread diamond-back moth (*Plutella maculipennis*). The *Hyponomeutidae* include, among others, the small ermine moths (*Hyponomeuta*), whose larvae live gregariously in dense webs, and the moths have white fore wings dotted with black. The *Sesiidae* or *Aegeriidae* comprise the clearwing moths which are characterized by the absence of scales over the greater part of the wings (fig. 13); many bear a remarkable resemblance to wasps, bees, or ichneumon flies and are often brightly coloured insects, flying in sunshine. Their larvae are stem or wood borers and one of the best known species is the currant borer (*Trochilium tipuliforme*). The two large families *Oecophoridae* (fig. 15) and *Xyloryctidae* attain their maximum development in Australia; the last mentioned family is almost confined to that region and includes some of the largest of the Tineidae. The *Gelechiidae* are an extensive and widely distributed family distinguished by the sinuous or emarginate outer border of the hind wings which have vein Sc+R, connected with, or approximated to, the basal cell. Their larvae mostly live among leaves, shoots, etc., and several are major pests, one of the most important being the pink bollworm (*Pectinophora gossypiella*) of the cotton plant. The *Elachistidae* are often divided into several families and have extremely narrow wings. One of the best known genera is *Coleophora*, whose

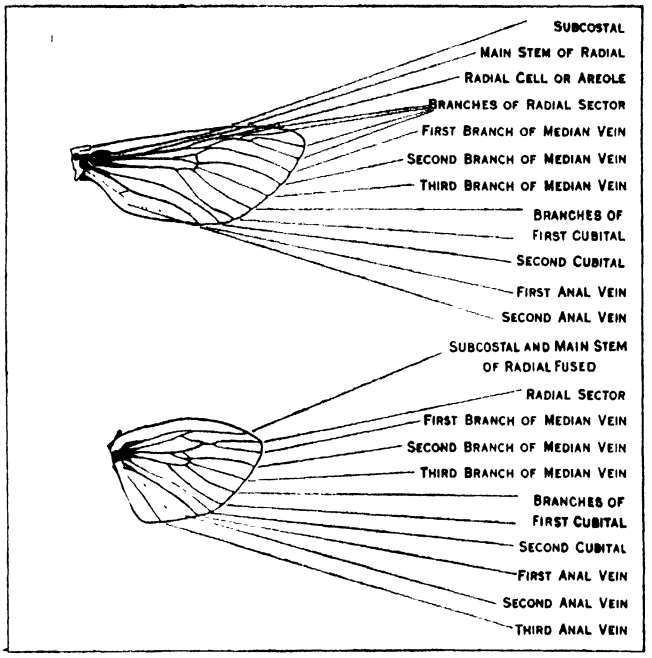
BUTTERFLIES OF NORTH AMERICA

1. The Falcate Orange-tip (*Anthocharis genutia*)
2. The Common Sulphur (*Eurymus philodice*)
3. The American Copper (*Heodes hypophlaeas*)
4. The Cabbage Butterfly (*Pieris rapae*)
5. The Tiger Swallow-tail (*Papilio glaucus*): (a) black female, (b) male
6. The Colorado Parnassian (*Parnassius smintheus*)
7. The Great Spangled Fritillary (*Argynnis cybele*)
8. The Mourning Cloak (*Aglais antiopa*)
9. Milbert's Tortoise-shell (*Aglais milberti*)
10. The Viceroy (*Basilarchia archippus*)
11. The Zebra (*Heliconius charithonia*)

larvae are at first leaf-miners and subsequently live in portable cases. The Tortrices are often regarded as a distinct superfamily and are characterized by the terminal joint of the labial palpi, being short and obtuse. They include five families, the *Eucosmidae* being one of the most important; this family is recognized by the presence of a fringe of long hairs on the margin of the cell



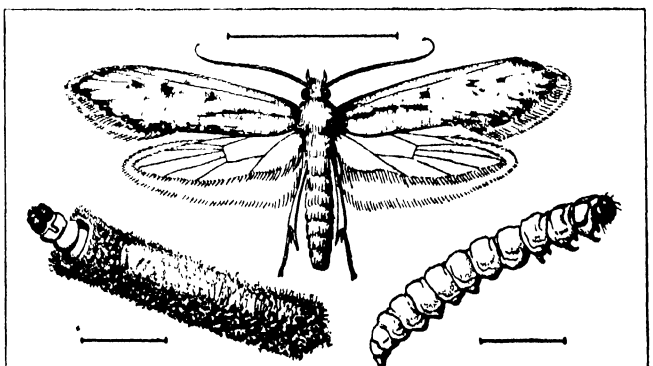


FIG. 11.—VENATION OF PRIONOXYSTUS ROBINIAE (FROM COMSTOCK)

in the hind wings and includes the codling moth (*Cydia pomonella*), the oriental peach moth (*Laspeyresia molesta*) and many others. The *Tortricidae* lack the hair-fringe or pecten to the hind wings: their larvae are leaf-rollers and the genus *Tortrix* is world-wide.

SUPERFAMILY IV. PTEROPHOROIDEA

Wings usually cleft into a series of separate plumes; legs elongate and slender with long tibial spurs.

Only two families are included here: the *Pterophoridae*, or plume moths (fig. 15), have the fore-wings never more than four-cleft; the larvae feed either openly, or less frequently, in stems

AFTER MARLATT, IN BULLETIN, DIV. ENT., UNITED STATES DEPT. OF AGRICULTURE

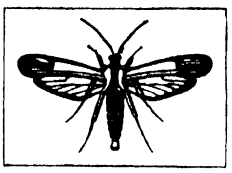

FIG. 12.—CLOTHES MOTH (TINEA PELLIONELLA) WITH LARVA IN AND OUT OF ITS CASE. MAGNIFIED

or seed-vessels and the pupae are markedly spiny. The *Orneodidae* or many-plume moths (fig. 16) are a very small family with the wings cleft into six or more plume-like divisions. The family is widely distributed and represented in Great Britain by *Orneodes hexadactyla*, whose larvae feed on the flower-buds of honeysuckle.

SUPERFAMILY V. PYRALOIDEA

Hind wings with vein Sc+R, partially fused with or approximated to R_5 beyond the basal cells and with Cu_2 present.

This superfamily includes several thousand species of small to medium-sized moths of slender build with relatively long legs. The fore-wings are usually elongate-triangular, sometimes very narrow, while the hind wings are relatively broad. The chief families are the following: The *Pyraustidae* form an extensive and widely distributed group characterized by vein R_5 in the fore-wings arising separately from the cell. They are particularly numerous in the tropics and one of the largest genera is *Scoparia*,

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)

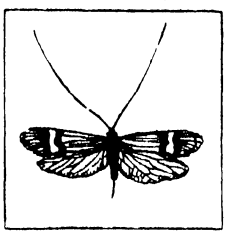

FIG. 13.—THE YELLOW-LEGGED CLEARWING MOTH. EUROPE

whose larvae mainly feed upon mosses and lichens, among which they construct silken galleries. *Nymphula* and several allied genera are interesting in that their larvae are aquatic or subaquatic, and in some species possess tracheal gills. The grape leaf-folder *Desmia funeralis* is common in the United States and its larvae form retreats by folding portions of the leaves into tunnels. The *Pyralidae* differ from the foregoing in having vein R_5 of the fore-wings basally fused with the stem of R_{3+4}. They are a small family many of whose larvae feed upon dry or decaying substances. Several species are found among meal, grain, or chaff, and the meal moth (*Pyralis farinalis*) has become widely distributed through commerce. The *Crambidae*, or grass moths, are small insects with narrow, elongate fore-wings, extremely abundant among grass, where they rest on the stems during daytime with their wings closed folded. The *Phycitidae* lack vein R_5 in the fore-wings, and the hind-wings have a group of hairs forming a pecten near the base of the cell. Their larvae are very variable in habit and those of the Mediterranean flour moth (*Ephestia kuehniella*) (fig. 17) are pests in flour mills throughout the world; in the North American *Laetilia coccidivora* the larvae prey on scale insects and in the oriental toon moth (*Hypsipyla robusta*) they are shoot-borers. The small family *Galleridae* includes the bee moth (*Galleria mellonella*), which infests the combs of hives, while the tropical *Thyrididae* often have translucent spots on both pairs of wings and in the hind pair vein Cu_2 is wanting.

SUPERFAMILY VI. PSYCHOIDEA

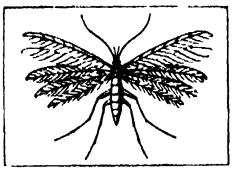
M present as a simple vein within the cell or, more rarely, branched in one or both pairs of wings: Cu_2 present in both pairs of wings.

This superfamily exhibits the above primitive features in the venation, but the radial cell or areole is never developed as in the Cossoidea. The most interesting family is the *Psychidae*, or bagworm moths, in which the males have the wings thinly clothed with scales and hairs, but almost devoid of colour pattern, while the females are wingless, and in some forms are so degenerate that the mouth-parts and legs are also wanting. Their larvae inhabit cases or bags formed of silk covered with vegetable fragments, and carry these cases with them as they crawl over their

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)

FIG. 14.—ADELA DEGEERELLA. EUROPE

food-plants. In many species the females do not leave these cases after emergence from the pupa, laying their eggs and dying in this same habitation. The family is mainly tropical; very few species are British and only about 20 inhabit North America. The *Zygaenidae* include the burnets and foresters; they are often metallic green or bluish insects frequently spotted with crimson. They fly slowly by day in grassy places and their caterpillars feed upon low plants. Ten species inhabit the British isles, but in the tropics the family is more considerably developed, and in *Himanopterus* the hind wings are drawn out into long filaments. The *Eucleidae*, or *Limacodidae*, are a small family with vestigial mouth-parts and mainly interesting on account of their curious slug-like larvae. The latter are flattened below and move by means of secondarily developed sucker discs, of which there are eight pairs; some of these larvae are smooth above and others are armed with spine-like processes. They construct dense egg-like cocoons, each provided with a lid to allow of the emergence of the moth. Among other families the *Megalopygidae* or flannel moths are more



especially American, and *Lagoa crispata* is well known on account of its larvae possessing poisonous spines.

In the following superfamilies vein C_2 is absent from both pairs of wings and the basal cell is not divided by the main stem of M.

Superfamily VII. Lasiocampoidea

Fore wings with base of vein M_2 near to that of M_3; hind wings without a frenulum or rarely with vein Sc+R, approximated to Rs beyond the cell and a frenulum present (fig. 18).

The principal family is the *Lasiocampidae,* which include moderate to large-sized insects densely scaled, with no functional mouth-parts and the antennae pectinated, especially in the males. The frenulum is replaced by a projecting humeral lobe at the base of the hind wing which underlies the fore wing. The caterpillars are densely clothed with soft hairs, often arranged partly in tufts and lateral flanges; pupation takes place in compact egg-like cocoons Well-known examples include the lappet moths of Europe and America; the lackey moth (*Malacosoma neustria*) and its allies, whose young larvae construct dense communal webs and are known as tent-caterpillars; and the eggar moths (*Lasiocampa*) of Europe. The *Drepanidae* or hook tips have a frenulum present and the fore wings in many species are falcate.

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)

FIG. 15.—PLUME MOTH (PTEROPHORUS SPILODACTYLUS). EUROPE

Superfamily VIII. Noctuoidea

Fore wings with bases of veins M_2 M_3 near together; hind wings with a frenulum and vein Sc+R, remote from Rs beyond the cell (fig. 18a).

Included in this group are a very large number of species, and at least 10,000 are comprised in the single family *Noctuidae,* or owlet moths. In the latter the areole or radial cell is usually present in the fore wings and vein Sc+R of the hind wings is fused with the cell near its base. They are mostly moths of dull coloration, flying at dusk or by night and are greatly attracted by the collector's sugar mixture. In *Catocala* and certain other genera the hind wings are often brightly coloured, but are concealed by the fore wings when at rest (fig. 19). The larvae are rarely hairy and mostly pupate in earthen cells; many are exceedingly destructive to crops, especially those known as "cut-worms" and "army worms" (fig. 20). The *Lymantriidae* or tussock-moths are very closely allied to the Noctuidae, but are separable by the pectinated antennae in the males, and the haustellum is usually absent. Their larvae are densely hairy (fig. 33), the hair often being arranged in brushes or tufts, and in some species is very irritating to the skin. The pupae are provided with setae and are enclosed in cocoons often formed of the larval hairs incorporated with the silk. Among the best known species are the brown tail moth (*Euproctis chrysorrhoea*), gypsy moth (*Lymantria dispar*) and the "nun" (*L. monacha*). The *Arctiidae* include the tiger moths and the ermine moths (fig. 21), and are very widely distributed. They differ from the *Noctuidae* in that vein Sc+R is fused with the cell to near or beyond the middle. Many of them are brightly coloured moths with conspicuously spotted or otherwise ornamental wings. Their larvae or "woolly bears" feed on herbaceous plants and are densely clothed with long hairs, which they utilize along with silk in spinning their cocoons. The footmen (subfamily Lithosiinae) are exceptional in being small, narrow-winged, sombre-coloured insects, whose larvae feed upon lichens. The *Syntomidae* are mainly tropical, and number about 2,000 species; in this family vein Sc+R is aborted or fused up with Rs. They are mostly brightly coloured day-flying moths, some of them bearing a striking resemblance to Hymenoptera; none are British and only a few species occur in Europe and North America.

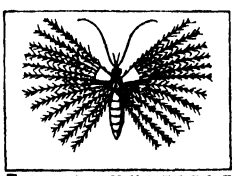


FIG. 16.—MULTIPLE PLUME MOTH. EUROPE

Superfamily IX. Notodontoidea

Fore wings with vein M_3 parallel to M_2 or approximated to M_1; R_4 and R_5 joined to R_3. Hind wings with Sc+R_1 running close to or connected with the cell; frenulum present (fig. 22).

The largest group in this superfamily is the *Geometrina* (fig. 23), which are divided into several families; they are characterized

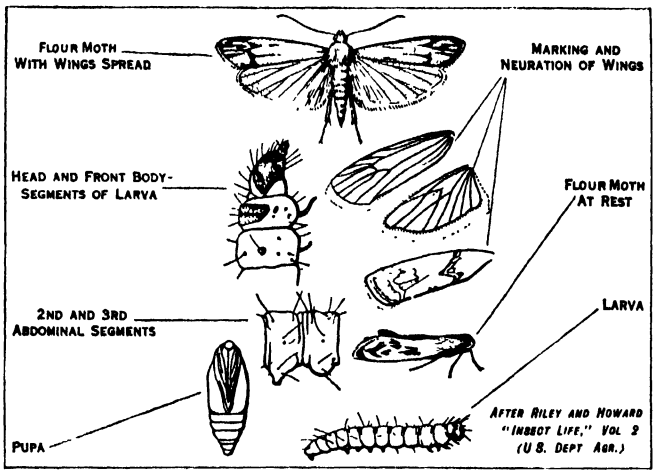

FIG. 17.—STRUCTURE OF PUPA, LARVA AND ADULT OF MEDITERRANEAN FLOUR MOTH (EPHESTIA KÜHNIELLA)

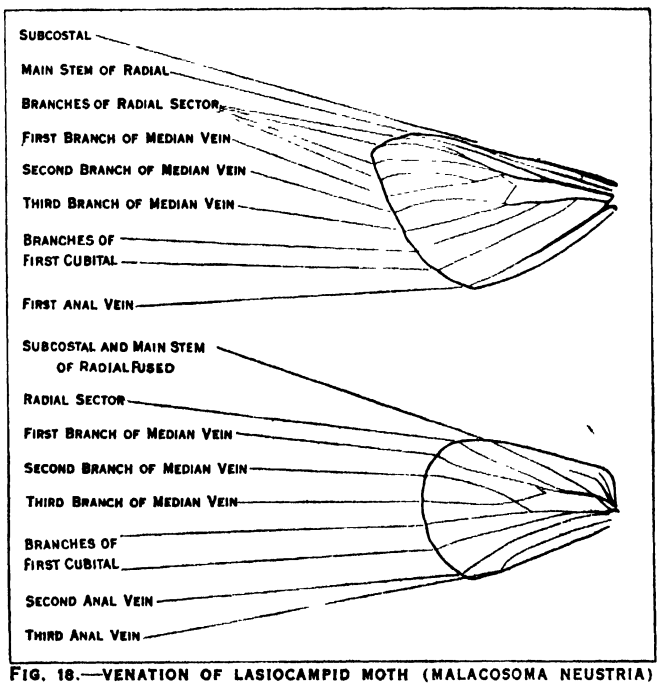
by their larvae having abdominal feet usually only present on the 6th and 10th segments, and they consequently progress in a series of loops (hence the name geometers or loopers). They are mostly thin-bodied moths of slender build with relatively large wings, and structurally they are separable from other Notodontoidea by Sc being strongly bent and separate from R_1 for a short distance at the base of the fore wing. The *Notodontidae,*



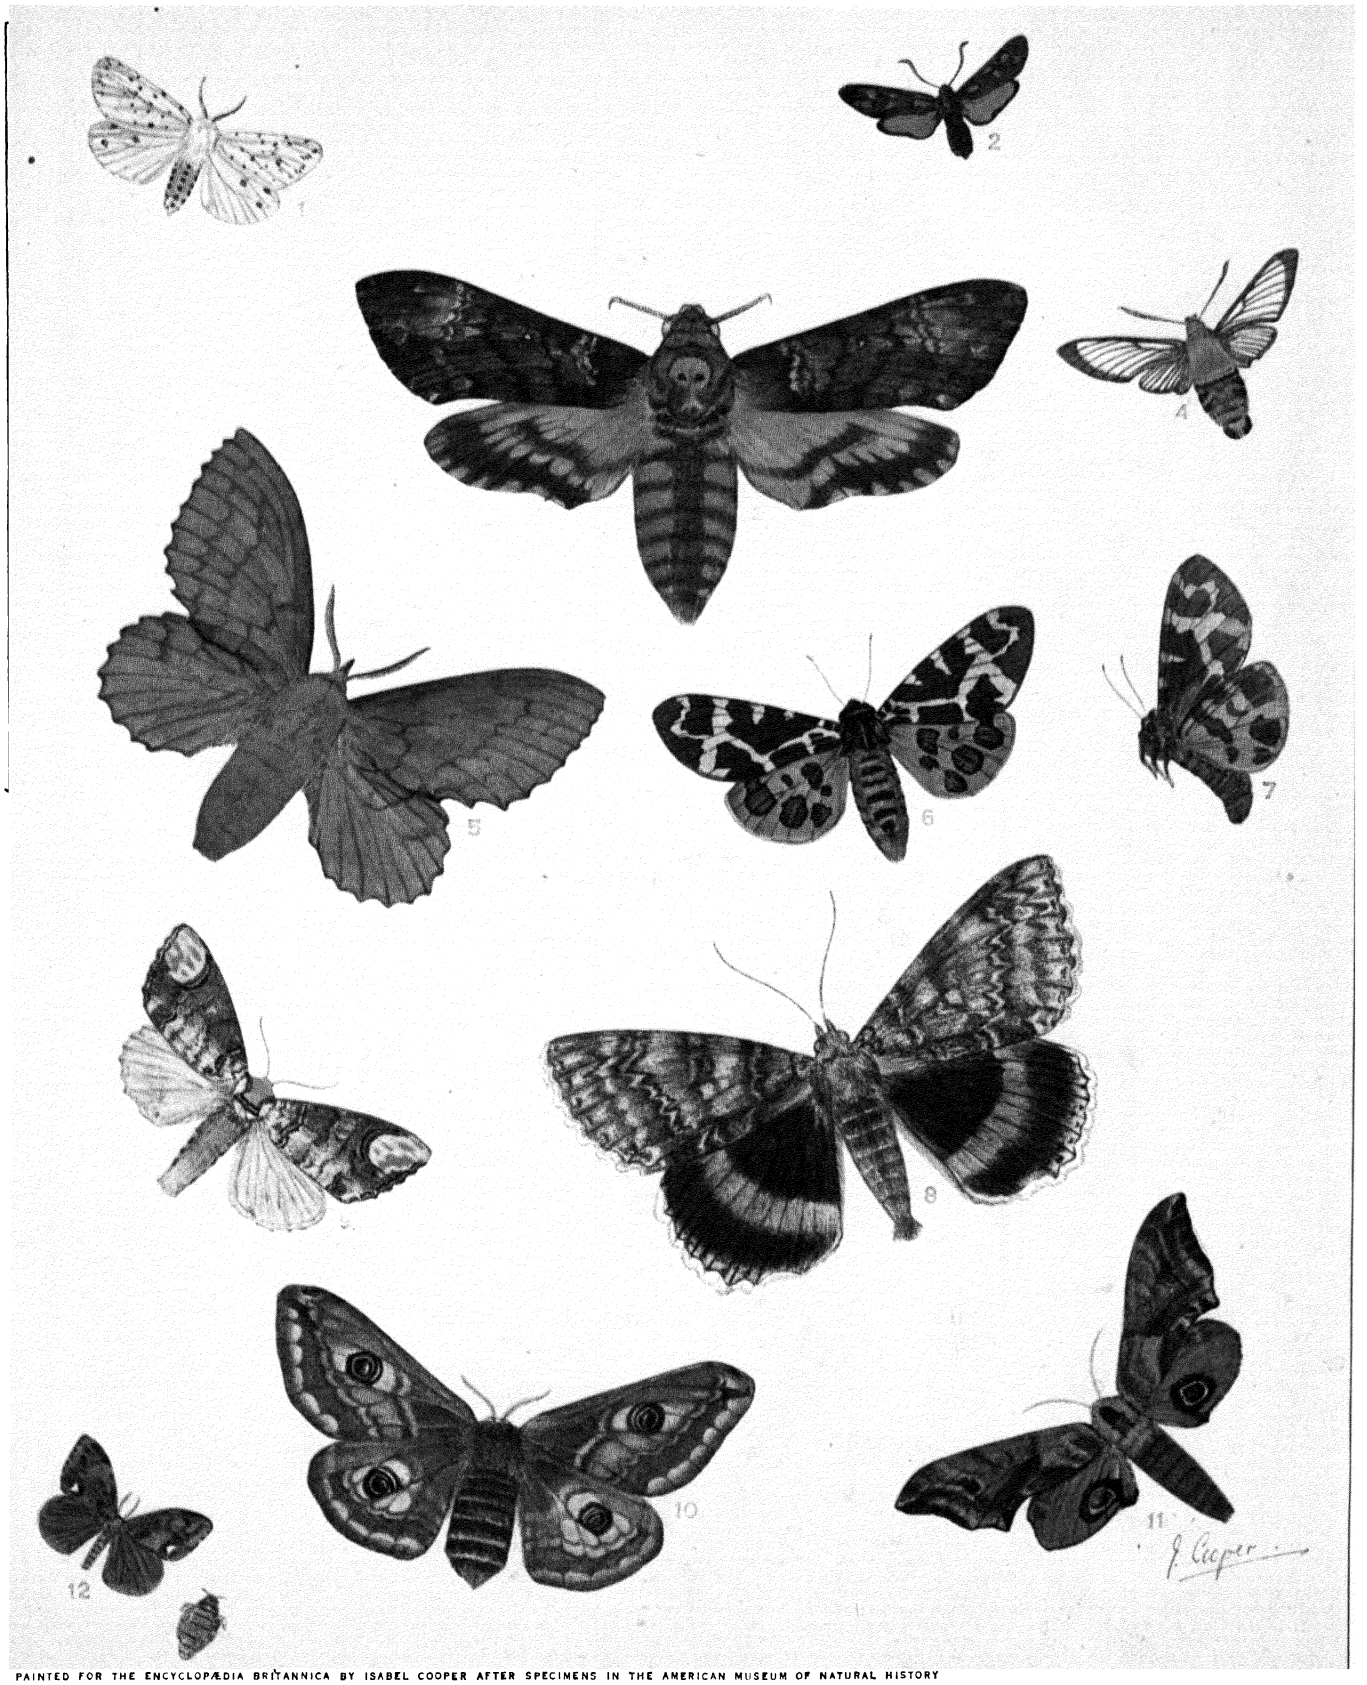


FIG. 18.—VENATION OF LASIOCAMPID MOTH (MALACOSOMA NEUSTRIA)

or prominents, have vein Sc+R_1 running close to or joining the cell, and are stout hairy moths, whose larvae sometimes have the anal claspers modified into slender processes, well exhibited in the puss moth (*Dicranura vinula*) (fig. 24). The *Sphingidae,* or hawk moths, are swiftly flying, powerful insects with narrow wings, and the antennae are thickened, but taper to a point which is generally hooked; in the hind wings Sc+R_1 is connected with the cell by a bar. Familiar examples are the death's head moths (*Acherontia*) and the widely-spread convolvulus hawk moth (*Protoparce convolvuli*).

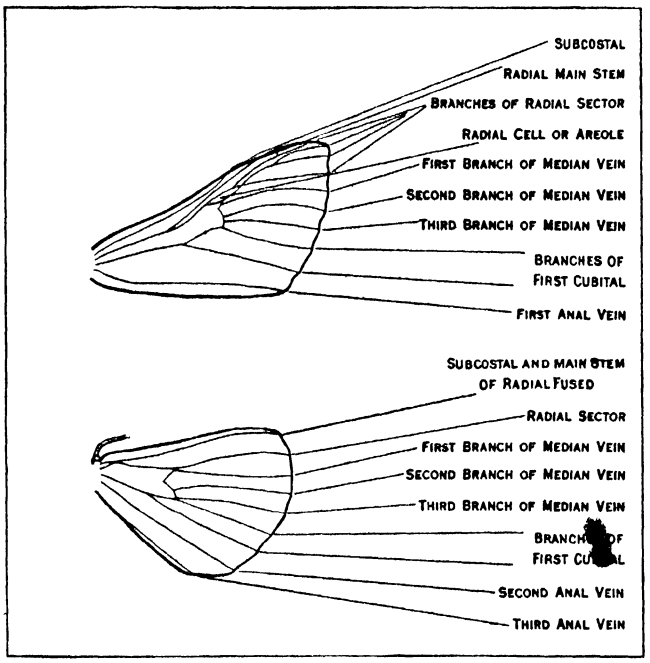
1. ***Arctia mendhastria***, the white ermine. **2.** *Zygaena filipendulae*, six-spotted burnet, very common in Europe and Asia. **3.** *Acherontia atropos*, the death's-head hawk moth, usually scarce in Europe. **4.** *Macroglossa bombyliformis*, the beehawk moth, common in southern England. **5.** *Gastropacha quercifolia*, *gastropacha lappet* of Europe and southern England. **6.** *Arctia caja*, common tiger moth, found in Europe, Asia and North America. **7.** Side view of *Arctia caja*, the common tiger moth. **8.** *Catocala*, a very rare species, probably migrated to England from the Continent. **9.** *Pygaera bucephala*, buff-tipped moth, plentiful throughout most of Europe. **10.** *Eudia pavonia*, the emperor, found in Portugal and central and southern Europe. **11.** *Smerinthus ocellatus*, the eyed hawk moth, found in England, Europe and Asia. **12.** *Orygia antiqua*, the vapourer moth, showing the male and wingless female

Superfamily X. Uranoidea.

Fore wings with vein M_1 usually joining R_5. Hind wings with $Sc+R_1$ diverging from cell at the base and remote from Rs; frenulum present or absent; haustellum present.

This small tropical group comprises only two families. The most important are the *Uraniidae*, which include large moths generally with tailed wings and the costal region of the hind wings



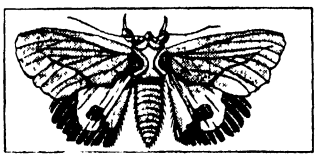


FIG. 18A.—VENATION OF A NOCTUID MOTH (PLUSIA GAMMA)

greatly expanded and no frenulum. They are often day-flying insects, closely resembling butterflies in general appearance, and are among the most exquisitely coloured of all Lepidoptera (fig. 25).

Superfamily XI. Bombycoidea

Differ from the Uranoidea in having R_5 joined to R_4; haustellum absent.

These insects are essentially tropical with but few representatives in temperate lands; the antennae are strongly pectinated, especially so in the males, and the haustellum and frenulum are generally absent. The *Bombycidae* include the well-known silkworm moth (*Bombyx mori*) (fig. 26) and have two anal veins to the hind wings. The *Saturniidae*, or emperor moths (fig. 27), have a single anal vein to the hind wings and comprise some of the largest of all Lepidoptera, the atlas moths of the Orient having a wing-expanse up to ten inches. Their larvae construct dense silken cocoons, and in some species the silk is used commercially.

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)

FIG. 19.—OPHIDERES IMPERATOR FOUND IN MADAGASCAR

Superfamily XII. Papilionoidea

Antennae clubbed or swollen at their apices and a frenulum wanting.

The Papilionoidea, or butterflies, can be readily separated from the moths, or remainder of the Lepidoptera, by the above-mentioned characters and it is noteworthy that clubbed antennae are also found in certain moths, but in such cases the frenulum is present. The most primitive family of butterflies are the *Hesperiidae*, or "skippers," which have all the veins in the fore wings arising separately from the cell. They derive their popular name from their erratic darting flight which is different from the more sustained movements of other butterflies. Their affinities are by no means clear, but they are probably related either to Pyralid moths or to the Castniidae. They are divided into three subfamilies which are sometimes regarded as of family rank. The *Hesperiinae*, or true skippers, are a very large group, occurring in most parts of the world, while the giant skippers or *Megathymiinae* belong to the tropics of America, and the *Euschemoninae* are Australian. It is noteworthy that the male of *Euschemon* is the only butterfly possessing a frenulum and at one time this genus was placed among moths of the family *Castniidae*.

In the remainder of the butterflies certain of the veins of the fore wings are coincident and do not arise separately from the cell.

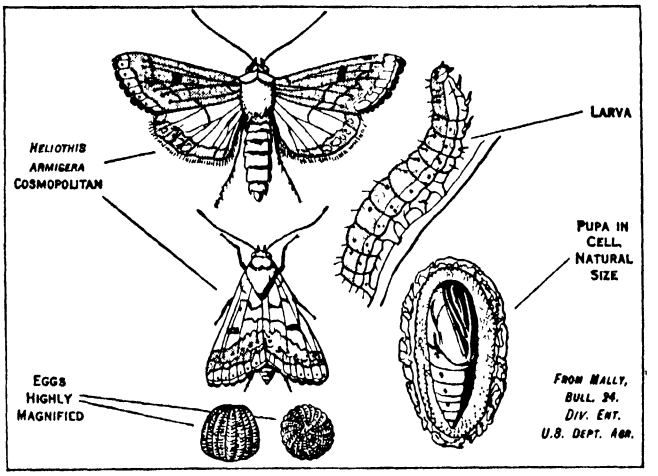

FIG. 20.—LIFE HISTORY OF HELIOTHIS ARMIGERA, A NOCTUID

The *Papilionidae* or swallow-tails are large insects, mainly tropical; the majority have tails to the hind wings and they are among the most magnificent of all insects. The fore legs are fully developed in both sexes and the hind wings have only a single anal vein. The larvae are smooth or provided with fleshy tubercles, and there is a dorsal retractile scent organ or osmeterium on the prothorax; the pupae are attached head upwards, by means of a girdle of silk and a cremaster. The genus *Papilio* is world-wide and the species *P. machaon* (fig. 28) is the sole English member of the family. The Apollo butterflies (*Parnassius*) are alpine, with translucent wings, and their pupae are exceptional in being enclosed in a loose web among leaves.

The *Nymphalidae* (figs. 29, 30) are the largest family of butterflies, and number over 5,000 species, which have the fore legs in both sexes reduced and useless for walking. Among the various subfamilies, the *Nymphalinae* include the peacock, tortoiseshells, admirals, fritillaries and emperors; as a rule they have spiny caterpillars (fig. 34) and the pupae hang head downwards, only supported by a cremaster (fig. 38). The *Satyrinae* include

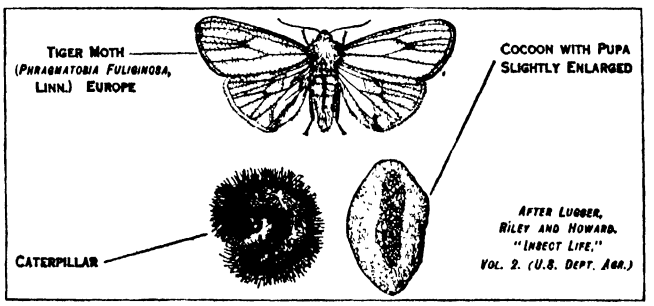

FIG. 21.—TIGER MOTH. EUROPE

the heaths, graylings, meadow browns; they are mostly sombre coloured and their larvae are smooth, feeding usually upon grasses. The *Danainae* are only numerous in warm countries, but one of the best known species is the monarch (*Danais archippus*) of North America. Several of the other subfamilies are mainly found in South America, including the splendid metallic blue *Morphinae*.

The *Pieridae* include the whites, yellows and orange tips; the fore legs are fully developed in both sexes and these insects differ from the *Papilionidae* in having two anal veins to the hind wings. The cabbage white (*Pieris rapae*), common in many parts

of the world, is one of the few injurious butterflies, its larvae being destructive to various *Brassica* vegetables. The larvae in this family are hairy and the pupae have a single "horn" to the head and are suspended upright by a girdle of silk and a cremaster.

The *Lycaenidae* comprise the blues, coppers and hair-streaks, which have the fore legs normal in the female but the tarsi are shortened in the male, with one or both the claws absent; the

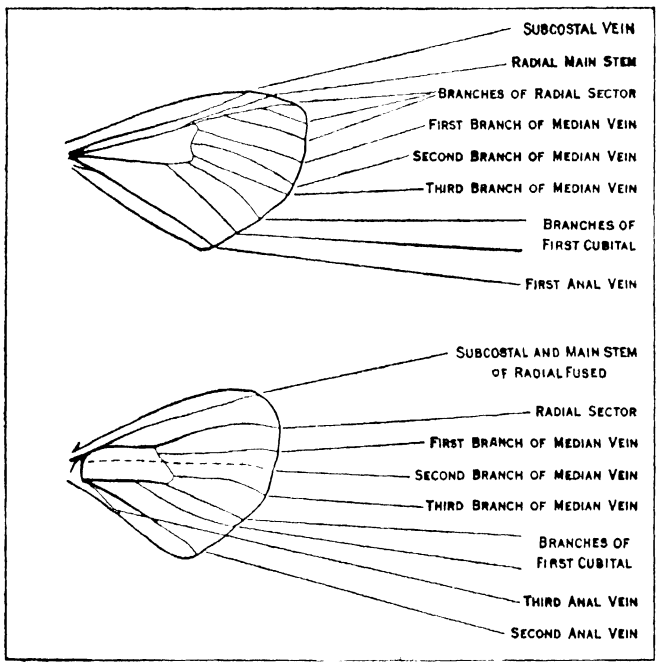

FIG. 22.—VENATION OF NOTODONTINA (GEOMETRINA)

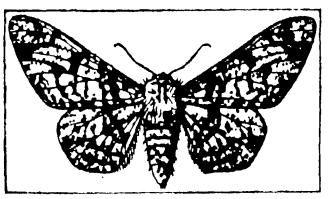
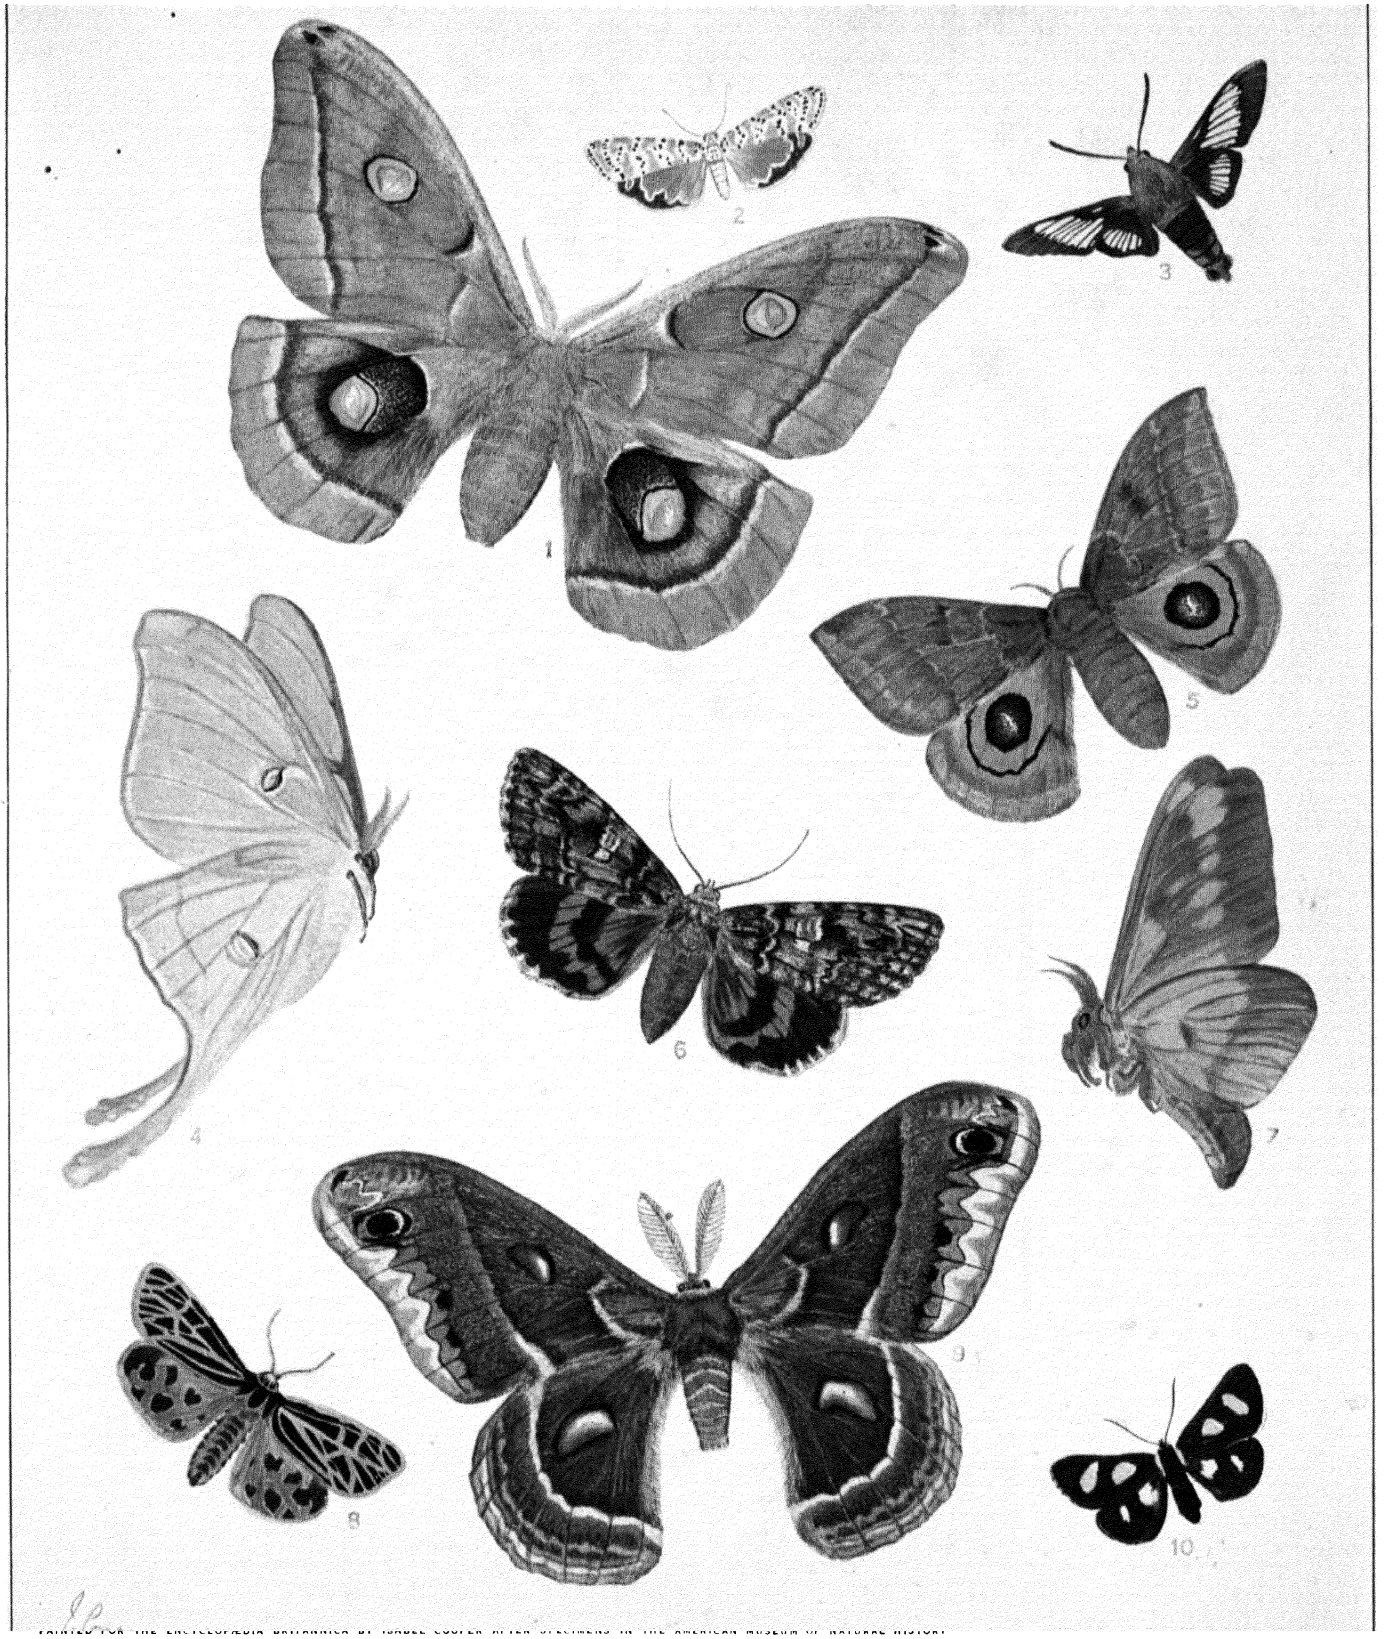
antennae are nearly always ringed with white and a white rim encircles each eye. They are mostly rather small butterflies, often with metallic colours above and spotted beneath. Their larvae are very short and almost slug-like and the pupae are devoid of spiny processes. The *Nemeobiidae*, or *Lemoniidae*, are closely related to the *Lycaenidae* and have the fore legs in the male useless for walking, but they are normally developed in the female. The family is essentially a South American one: only a few species occur in the United States, while the Duke of Burgundy fritillary (*Nemeobius lucina*) is the sole European representative.



DEVELOPMENT

The Egg.—The eggs of Lepidoptera are generally of one of two types. They may be ovoid or flattened with the long axis horizontal; or upright, spherical, or hemispherical with the axes either equal or the vertical axis longest. Both types may have the shell or chorion sculptured in various ways, and in the upright eggs of many butterflies the shell exhibits a beautiful cell-like structure divided by longitudinal ribs (fig. 31). The number of eggs laid is variable and a single female may deposit up to a thousand or more. Some of the swift moths and the antler moth (*Charaeas graminis*) merely drop their eggs at random among the herbage upon which the future caterpillars feed. The lackey moth (*Malacosoma neustria*) lays its eggs in necklace-like rings around twigs, while the garden white butterflies (*Pieris*) place them singly or in small groups on the undersides of leaves, and the brown tail (*Euproctis chrysorrhaea*) lays them in masses covered with hair derived from the anal tuft at the extremity of the body.

Caterpillars.—The larvae are known as caterpillars, which are characterized by the presence of three pairs of jointed, clawed legs on the thorax and a variable number of abdominal feet, which are short, fleshy outgrowths provided with a series of hooks or crochets on their grasping surface. These abdominal feet consist typically of five pairs, but in the geometer (fig. 23) or looper caterpillars they are only present on the 6th and 10th segments. The head in caterpillars is a firmly chitinized capsule which carries six simple eyes on either side and a pair of very short antennae. The mandibles are large and strong, while the maxillae are small and inconspicuous; the labium bears a median tube or *spinneret* which receives the ducts of the spinning glands (fig. 32). The latter are the modified salivary glands and they produce the silk used in forming the cocoon; in many cases these glands are very long and, in the silkworm about five times as long as the whole caterpillar. Along the sides of the body nine pairs of spiracles are found and they appear as small dots, often easily seen (fig. 24). Caterpillars are armed or protected in various ways either in virtue of their structure or of their behaviour. Some, such as those of tiger moths, are densely hairy, and in the vapourer moths (*Orgyia*) these hairs are grouped into conspicuous tufts and brushes (fig. 33). Certain caterpillars are efficiently protected by so-called urticating hairs which are very fragile and bristle with needle-like lateral points. Whether their irritating properties are due to mechanical action alone or to a poisonous secretion is uncertain, but most people who have handled hairy caterpillars of various types have experienced the effects of such hairs on the skin. In North America and also in the tropics there are caterpillars armed with true poison spines, which are tubes fed with the secretion of special glands in the skin. Such spines are capable of inflicting nasty "stings" and evidently secure for their possessors considerable immunity from attack.



Among butterflies, the caterpillars of the tortoiseshells and other species of *Vanessa* and of fritillaries (fig. 34) are armed with spiny non-poisonous outgrowths of the body and very much the same sort of armature is found in those of the great emperor moths (*Saturniidae*). In hawk-moth larvae there is usually a single horn near the extremity, while many other caterpillars are entirely smooth (figs. 35 and 36) or only slightly hairy. A very large number of caterpillars protect themselves by feeding only at night; others form cases, webs, or mine into the tissues of leaves, while numerous Tortrices roll leaves into tubular retreats. There are, again, others which obtain a measure of protection by close resemblance to their surroundings. Thus, many geometrid or looper caterpillars bear such a very close resemblance to a mid-rib of a leaf or to a small twig as to render detection a matter of great difficulty. The larvae of some of the hawk-moths bear a resemblance to portions of foliage, their diagonal lateral stripes being believed to simulate the effects of light and shade. The caterpillars of the moth *Anarta myrtilli*, with their intricate green pattern, are hardly discernible among the heather upon which they live. At times the experiments of E. B. Poulton show that the reflection of light from the immediate surroundings produces a nervous response on the part of the caterpillar which results in a physiological change in the accumulation of the pigment. Thus larvae of the red underwing moth, when subjected to green surroundings, become bluish-green and in a darkly-coloured environment become bluish-grey. Similarly looper caterpillars, if so placed when young, become dark brown among dark twigs and green if placed among leaves.

The Food of Caterpillars.—Caterpillars, it may be added, feed almost entirely upon the higher plants and there is probably not a single family of the latter which does not serve as food for one or more species. Very few are carnivorous and among them are those of some of the Lycaenid butterflies. The caterpillars of the large blue (*Lycaena arion*), after feeding upon wild thyme, finally enter ants' nests and prey upon the grubs; while those of the North American *Feniseca tarquinius* feed upon aphides. In the Mediterranean region the larvae of the moth *Erastria scitula* devour scale insects upon various fruit-trees and are therefore to be looked upon as being beneficial. Certain other caterpillars are cannibalistic, notably those of the common European moth *Calymnia trapezina*, but this habit is by no means exclusive and such larvae are also regular devourers of foliage. Some additional instances of unusual feeding habits are given in the section devoted to the economic importance of Lepidoptera.

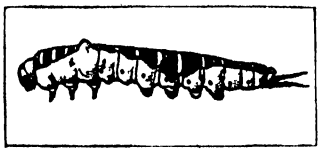
FIG. 23.—GEOMETRID MOTH (AMPHIDASYS BETULARIA), FEMALE, EUROPE



PRINTED FOR THE ENCYCLOPÆDIA BRITANNICA BY ISABEL COOPER AFTER SPECIMENS IN THE AMERICAN MUSEUM OF NATURAL HISTORY

MOTHS OF THE NEW WORLD

1. *Telea polyphemus*, ochre coloured wings, found all over the North American continent. It feeds on oak, birch and other trees. 2. *Utheisa bella*, the beautiful uthesia, ranging from Quebec to Mexico and through the Antilles. It feeds on chz elm and other plants. 3. *Haemorrhagia thysbe*, one of the humming-bird sphinx moths, in eastern North America. It has the unmoth-like habit of flying in bright sunlight. 4. *Actias luna*, the luna moth, considered the most beautiful North American insect. It is about 3 inches long when arrived at maturity. 5. *Automeris io*, known as the Io; this insect spins a silken path for the guidance of the young in seeking food. 6. *Catocala ilia*, known as the ilia underwing, distributed generally throughout the United States and most of Canada. 7. *Citheronia regalis*, the royal walnut moth, found in the northern part of the continent. It feeds on walnut, hickory, ash and similar trees. 8. *Apantesis virgo*, the virgin tiger moth, distributed throughout the north Atlantic states and Canada. 9. *Samia cecropia*, the cecropia moth, ranging along the Atlantic seaboard westward to the margin of the great plains. 10. *Alypia octomaculata*, the eight-spotted forester, found in the northern Atlantic states and westward beyond the Mississippi river.

Silk Production.—The production of silk by caterpillars has already been alluded to; it is used for several purposes and the best known is for the formation of the cocoon. The latter attains its greatest perfection in those families which include the silk-worm moth (*Bombycidae*) and the emperor moths (*Saturniidae*): in other cases, as in the tiger moths and tussock moths, the cocoon is much less dense and the silk often intermixed with hairs derived from the larva that formed it. Sometimes foreign material largely replaces a cocoon and the silk is utilized to draw together leaves to form a pupal shelter (fig. 37) or to cement soil particles into a compact earthen cell (fig. 20), as in many hawk moths (*Sphingidae*) and owlet moths (*Noctuidae*). Among many butterflies the cocoon is reduced to a slight pad, to which the cremaster is hooked, and to a mere thread encircling the body of the pupa; in such cases these exposed pupae are protected by their close colour resemblance to their surroundings (fig. 38). Silk is also used by caterpillars as a "life-line" which is run out through the spinneret as quickly as it is secreted, and by means of this device such creatures elude their enemies or save themselves when blown off or shaken from their food-plants, by remaining suspended by the thread until the danger has passed. Other caterpillars, when young, are gregarious and secrete guiding threads over their food-plant, which enable them to maintain their foothold; others go a stage further and construct communal webs, within which they feed, gradually dispersing and becoming solitary as they grow older.

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)

FIG. 24.—LARVA OF THE PUSS MOTH (CERURA VINULA)

The Chrysalis.—The pupa or chrysalis in the majority of Lepidoptera is of the *obtected* type with the appendages glued down to the body, which presents a hard compact appearance in consequence (fig. 36). Such pupae have little or no power of movement of the abdominal segments and remain in a fixed position, being attached by the *cremaster* (fig. 36) to the cocoon, or to a silken pad in the case of many butterflies. The cremaster consists of a group of hooks or a prominent spine at the caudal extremity of the body and is formed from the last dorsal shield, overlying the vent in the larva. Obtected pupae are found in all the higher groups, from the Lasiocampoidea to the butterflies. Among the lower groups, the pupae are termed *incomplete;* they have the appendages partially free from the body, instead of being soldered down, and the abdomen has several of the segments freely movable. The latter feature, aided by girdles of spines, enables such pupae to work their way out of the cocoons or burrows and come to the surface to allow of the exit of the perfect insect. Except in the Pterophoroidea the cremaster is absent or but little developed. In the *Micropterygidae* the pupae closely resemble those of the caddis flies (*Trichoptera*) and are of the *free type,* with all the abdominal segments movable and the appendages entirely free from any secondary attachment to the body. Functional mandibles are present which enable these pupae to bite their way through the cocoons when the time for eclosion of the moths approaches. In some cases special devices are present in order to enable the moths to effect their emergence. In the puss moth (*Dicranura vinula*) the insect secretes potassium hydroxide as a solvent which softens the hard woody walls of the cocoon; in the emperor moth (*Saturnia pavonia-minor*), the arrangement of the silk at the front end of the cocoon expressly allows of the free egress of the insect; while certain other moths are provided with temporary spines or plates which function as cocoon cutters in the same way as the girdle of spines mentioned above.

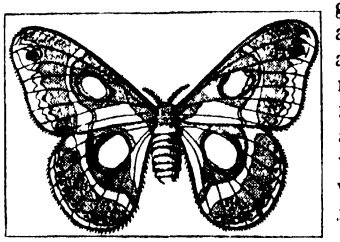
NATURAL HISTORY



In the perfect state Lepidoptera feed principally upon nectar which they derive from flowers and, among other sources of food, honey dew and over-ripe fruit are also resorted to. Decaying fruit, for example, is attractive to the red admiral (*Vanessa atalanta*) and certain other butterflies, while the purple emperor (*Apatura iris*) is well known to visit carrion. Certain flowers are more attractive to Lepidoptera than others, and in Europe the flowers of jasmine, honeysuckle, valerian, heather, ivy, sallow, syringa, privet, petunia and ragwort are much visited by moths, while butterflies are especially partial to bramble, thistle and *Buddleia.* Butterflies and certain moths are diurnal insects, but the majority of the members of the order are crepuscular or nocturnal. Some moths fly both by day and at night, while others are seldom known on the wing before midnight, and after dark almost the whole of the Noctuidae are attracted to the moth collectors' sugar mixture. During the winter, in cold and temperate lands, most Lepidoptera hibernate either as larvae or pupae; some, such as the hairstreak butterflies, overwinter as eggs, while certain of the *Vanessae* and other butterflies, along with a number of moths, pass the dormant season as perfect insects. Many Lepidoptera are double-brooded in that two complete life-cycles are passed through in the year; others, given a sufficiently high temperature, may pass through four or five generations in that period, particularly species infesting stored grain, meal, etc.

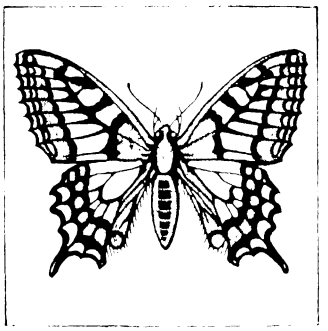
FIG. 26.—THE COMMON SILK-WORM (BOMBYX MORI), CHINA



Sexual Difference.—The sexual differences in Lepidoptera are often well marked; in some families the antennae are pectinated in the males and simple in the females, or these organs may be pectinated in both sexes, but much more pronounced in the males (fig. 1). The special sensory organs located on the antennae are greatly developed where those appendages are highly pectinated, and give to the males their remarkable power of finding their mates. The phenomenon known as "assembling" is especially prevalent in the Lasiocampoidea as well as in some other moths, and is believed to be of the nature of an olfactory response. The females apparently emit an odour attractive to the opposite sex, and under favourable conditions a freshly emerged example will attract many males, which fly up to her against the wind. In many Lepidoptera the sexes differ greatly in size and coloration, as for example in the gipsy moth; among the *Lycaenidae* the males of numerous species are brilliant blue and the females of a brownish hue. In the tropical *Papilionidae* the sexes are often totally different in coloration as well as exhibiting differences in form. Other examples of sexual dimorphism are afforded by those moths whose females are either wingless or have the wings reduced to useless vestiges, the males being fully winged. This peculiarity occurs in distantly related families and has consequently been independently evolved. Notable examples are found in the bag-worm moths (*Psychidae*), vapourer moths (*Orgyia*), and in about half a dozen genera of geometrid moths.

FIG. 27.—SILK SPINNING MOTH (EPIPHORA BOUHINIAE). WEST AFRICA

Seasonal Forms.—Another interesting feature is the occurrence of different seasonal forms among certain butterflies: these are so different in coloration that they were regarded as separate species until their relationships were worked out. One of the best known examples is afforded by the European *Araschnia levana,* whose spring form is known as *levana* and its summer form, *prorsa* was first described under that name as a different butterfly. In the tropics certain species occur in definite wet season and dry season forms, and the North American swallow tail *Iphiclides marcellus* has three distinct seasonal forms. Those which emerge from over-wintered pupae in the early spring are of the form *marcellus* and those that appear somewhat later are of the form *telamonides;* the summer butterflies, produced from eggs laid the same season, are different from either of the spring forms and are of the type named *lecontei.* There are, again, other butterflies, such as the African *Papilio dardanus,* which have several and quite different forms in the female which closely mimic other species of Lepidoptera. For a discussion of this and other cases of polymorphism *see* MIMICRY. Extensive experiments have been conducted by Weismann, Merrifield, Standfuss, Fischer and others upon the effects of temperature on seasonal and other types of coloration. Thus A. Weismann showed that when pupae destined to produce the summer form *prorsa* of *Araschnia levana* were kept at a low temperature they gave rise to the form *levana* or to a form intermediate between it and *prorsa.* By raising the temperature it proved exceedingly difficult to change the form *levana* into *prorsa* and in most cases it was a failure. Weismann concluded, therefore, that the species was a northern one and that the form *levana* was the older and more constant, and that *prorsa* was a later acquired form, and consequently more readily influenced. By the application of cold, individuals of *Vanessa urticae* indistinguishable from the northern variety *polaris* have been produced; also, pupae of the summer form of *Pieris napi* when placed on ice gave rise to the winter form of that butterfly. By raising temperature to the requisite extent and applying it at the susceptible period it has been possible to change the female coloration of two butterflies, *Parnassius apollo* and *Gonepteryx rhamni* into that of their respective males.

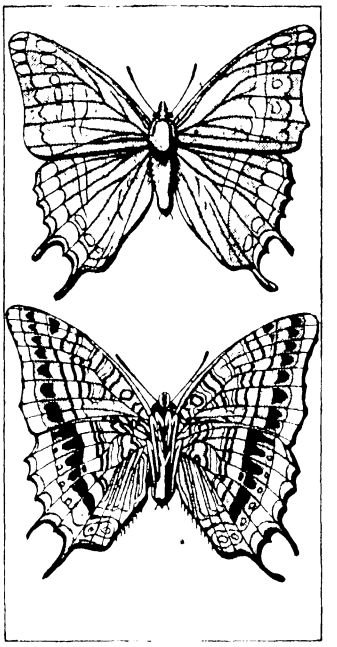

FIG. 28.—SWALLOW-TAIL BUTTERFLY (PAPILIO MACHAON). EUROPE

Departure from Usual Life-history.—Among the most remarkable departures from the usual life-history prevalent in Lepidoptera is that afforded by the Indo-Australian Lycaenid butterfly, *Liphyra brassolis,* whose larva is flattened and covered by a hard cuticle, devoid of evident segmentation. It is found in association with the ant *Oecophylla smaragdina* and is believed to prey upon the brood of the latter, its hard covering serving as a protection against the ants. Pupation occurs in the old larval skin which forms a puparium loosely enclosing the chrysalis within. The newly emerged butterfly is covered with loosely attached white scales, over its orange and brown ordinary scales, which serve as protection against the ants, since they fall off readily and cause those insects evident discomfort if they adhere to them. Another very interesting species is the North American yucca moth *Tegeticula alba,* the females of which have the maxillae provided with a long tentacle specially adapted for collecting the pollen of yucca flowers. After collecting a large mass of pollen she inserts her eggs deep into the ovary of a flower, usually other than that from which the pollen was gathered. After egg-laying she then thrusts the pollen into the stigmatic opening of the flower. By means of this provision the development of the seeds upon which the larvae feed is ensured and any not so devoured secure the perpetuation of the yucca. A third example is afforded by aquatic moths of the genus *Acentropus.* The young larvae live submerged in mines which they excavate in the leaves of water plants; as they grow older they form tunnels of spun leaves and the submerged pupa is enclosed in a similar shelter. The female moths are dimorphic: the long-winged forms are aerial, while those with reduced wings are aquatic, using their alary organs for swimming.

FIG. 29.—PEACOCK BUTTERFLY (VANESSA IO)

Sound Production.—A few Lepidoptera possess a capacity for sound-production. The death's head moths (*Acherontia*) have long been known to emit a shrill chirping note. The method of its production has been much discussed and it is believed to be caused by the forcing of air through the haustellum. The caterpillar also has been noted to produce sharp cracking notes resembling those emitted during the discharge of successive electric sparks; in this case the sound is brought about by bringing the mandibles forcibly together. Several moths are able to stridulate, and in certain *Agaristidae* the male has a corrugated area beneath the costa of the fore wings, and the membrane in that area is distended to form a resonator. It is suggested that the clicking sound observed is caused by the ridged area on the fore wings rubbing against spines on the legs during flight.

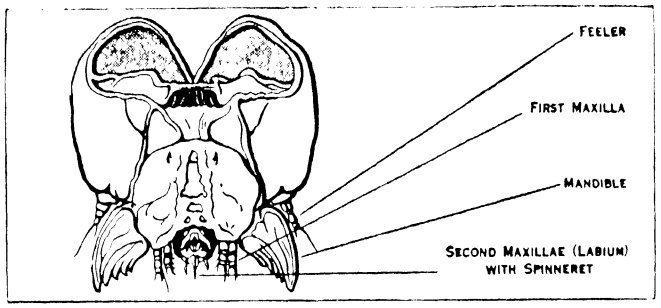
FIG 30.—UPPER AND LOWER SURFACES OF NYMPHALIS JASON, FOUND IN WEST AFRICA

DISTRIBUTION AND MIGRATION



Geographical Distribution.—Lepidoptera have a range practically co-extensive with that of flowering plants and are only absent from the remote and inhospitable regions around the poles Among butterflies it is interesting to note that at least 46 species extend within the Arctic Circle and some range as far north as 80° lat.; but, on the other hand, no resident butterfly is known from Iceland. In the Antarctic, 50° lat. is about their most southerly limit, which is reached by a species of fritillary found on an island near Cape Horn. Some species of Lepidoptera are almost world-wide and exhibit migratory tendencies, notable examples being the hawk moth *Celerio lineata* and the butterfly *Pyrameis cardui,* the latter being found in all the continents excepting South America. Several Noctuid moths, notably *Agrotis ypsilon* and *Chloridea obsoleta,* are now cosmopolitan. The blue butterfly *Lampides boeticus* occurs over all the warmer parts of the old world to Australia as well as reaching remote islands in the Atlantic,

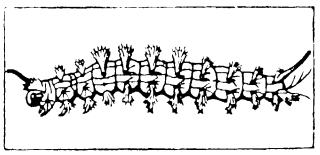
FIG. 31.—ABOVE, EGG OF ORANGE TIP BUTTERFLY (ANTHOCARIS CARDAMINES); BELOW, EGG OF WHITE ADMIRAL BUTTERFLY (LIMNETIS SIBYLLA). MAGNIFIED



Pacific and Indian oceans. In some cases human agencies have possibly been partially responsible for the wide range enjoyed by such insects by the introduction of suitable food-plants in regions where they did not previously exist. While many of the largest families of Lepidoptera are cosmopolitan, certain

FROM MIALL AND DENNY, AFTER LYONNET

FIG. 32.—HEAD OF GOAT MOTH CATERPILLAR (COSSA) FROM BEHIND

others are limited to definite areas of the globe. Among moths the *Xyloryctidae* are almost limited to Australia, the *Lacosomidae* are confined to the western hemisphere and the *Megalopygidae* have few species elsewhere. Among butterflies, the subfamilies *Ithomiinae, Brassolinae* and *Heliconiinae* of the *Nymphalidae* are confined to South America, and *Acraeinae* are mainly centred in Africa. The richest fauna of Lepidoptera, as in most orders of insects, is found in the tropics, and Brazil probably yields more species of butterflies than any other part of the world, over 600 species having been stated to have been taken within an hour's journey of the city of Para alone. Some idea of this wealth of species will be gathered when it is mentioned that only 70 species are recorded from the British Isles

BY COURTESY OF THE TRUSTEES OF THE BRITISH MUSEUM (NATURAL HISTORY)

FIG. 33.—LARVA OF ORGYIA GONOSTIGMA EUROPE

Migration.—Some species of Lepidoptera have a marked capacity for migrating from one region to another, either individually or in swarms. In North America great companies of the monarch butterfly (*Danais archippus*) form in parts of Canada and the northern United States and fly southwards in early autumn, apparently reaching the Gulf states; in June and July this butterfly appears in the northern states and the individuals then seen are believed to be re-migrants from the south. In Ceylon C. B. Williams mentions that about 69, out of a total of 234 species of butterflies known in Ceylon, have been recorded as taking part in migratory flights. The latter occur at the beginning and at the end of the north-east monsoon and proceed in various directions. At times these flights seem to bear some correlation with seasonal changes and it has been suggested that they originate owing to the drying up of the food-plants, but the data is at present insufficient for drawing reliable conclusions. The painted lady (*Pyrameis cardui*) moves northward in spring in north Africa and south Europe, invading most of central and northern Europe as far as Iceland; individuals found in countries such as England and Germany are entirely emigrants from the south and, in some years, they fail to appear. Migratory swarms of Lepidoptera have often been recorded from far out in the ocean. In one case a swarm of the weak-flying moth *Deiopeia pulchella* was observed at sea nearly 1,000 miles from its nearest known habitat. Solitary individuals of various species often fly on board ship at a great distance from land, and are chiefly those of wide geographical range.

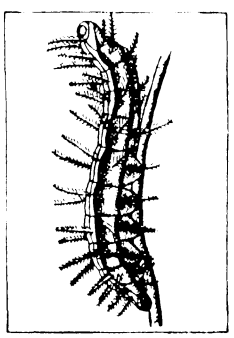


FIG. 34.—LARVA OF SILVER-WASHED FRITILLARY. EUROPE

Geological Distribution.—No undoubted fossil Lepidoptera are known before the commencement of the Tertiary period, although it is probable that the primitive Homoneura existed at an earlier epoch. Butterfly remains are known from the Eocene and Oligocene of North America and a few moths have been described from Baltic amber. As a whole, knowledge of the fossil history of Lepidoptera is very scanty, which perhaps is scarcely surprising considering the delicacy of structure exhibited in so many of the species.

Economic Importance.—In the caterpillar stages a large number of species of the order are injurious to crops and forest trees. Among the *Hepialidae* the subterranean larvae are destructive to grass roots and in Australia those of *Leto* and *Charagia* bore into the solid wood of trees. Other wood-borers are found in the families *Cossidae,* including the goat and leopard moths, *Xyloryctidae* and *Sesiidae*. The *Tineidae* include the cosmopolitan clothes moths, *Tinea pellionella* and *biselliella* and *Trichophaga tapetiella,* which are destructive in houses, their larvae attacking wool, hair, carpets, feathers and dried skins. Among the *Gelechiidae* are the Angoumois grain moth (*Sitotroga cerealella*) which attacks wheat, maize, etc.; *Pectinophora gossypiella,* the most serious lepidopterous enemy of the cotton plant, found in many lands; and *Hypatinia pulverea* which is destructive to lac cultivation in India. In the *Plutellidae* the diamond-back moth (*Plutella maculipennis*) is one of the widest distributed of all moths and very destructive to cruciferous vegetables. The great group known commonly as the *Tortrices* include many species harmful to fruit trees, and its most notable representative is the codling moth (*Cydia pomonella*) of the apple; *Tortrix viridana* is a serious defoliator of the oak in Europe, and species of *Evetria* are very injurious to conifers. Mention needs also to be made of the oriental peach moth (*Laspeyresia molesta*) which, since 1916, has become a dangerous enemy of plum, cherry, peach and apple in the United States, where it is believed to have been introduced from Japan. Of the *Pyralidae* the cosmopolitan *Pyralis farinalis* forms silken galleries among stored corn and flour; while the most injurious of the *Pyraustidae* is the European corn-borer (*Pyrausta nubilalis*) which, since its entry into North America, has become a most dangerous enemy to maize both in the United States and Canada. In the *Crambidae* the borer moth (*Diatraea saccharalis*) is one of the chief pests of sugar-cane in the Gulf states and Central America. Among the *Phycitidae* are two moths infesting stored foods, viz., the cosmopolitan Mediterranean flour moth (*Ephestia kuhniella*), which is troublesome in flour mills, and the Indian meal moth (*Plodia interpunctella*), which is a pest of almonds, groceries and other stored goods; both species have become practically world-wide through commerce. Among the *Noctuidae,* larvae of *Agrotis, Noctua* and other genera are known as cut-worms which feed at night, cutting off crop plants before

FIG. 37.—PUPA OF GYPSY MOTH SHELTERED IN LEAVES JOINED BY SILKEN THREADS. BELOW IS THE CAST LARVAL CUTICLE

they are very far grown. The army-worm (*Cirphis unipuncta*), found throughout the United States east of the Rocky mountains and also in other countries, appears in some years in vast numbers in the caterpillar stage. The name is given from the fact that when these larvae have destroyed the vegetation in the area where the eggs were laid they advance in army-like swarms to other fields. In Europe the antler moth (*Charaeas graminis*) behaves in a similar fashion, and the last serious outbreak in Great Britain took place in 1917. The *Lymantriidae* include several well-known defoliators of forest and shade trees, as has been previously mentioned; while among the *Geometrina* group the looper caterpillars of many species are injurious to fruit trees and bushes.

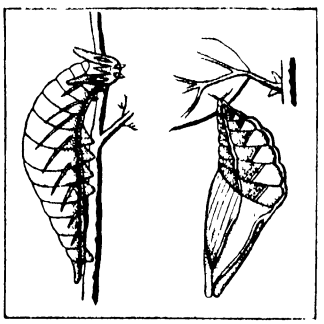

FIG. 38.—LARVA AND EMPTY PUPA CASE OF APATURA ILIA

As an offset to the injurious propensities of so many species, certain members of the families *Bombycidae* and *Saturniidae* are commercially valuable in yielding silk. The common silk-worm moth (*Bombyx mori*), which belongs to the first mentioned family, is native to China and has been introduced into many countries. The usual food of its caterpillars is the leaves of the mulberry and the silk produced is of the highest quality. Among the *Saturniidae* several eastern species yield lower grades of commercial silk, and the varieties of the latter, known as Shantung, Tussore, Eri and Muga silks, are produced by species of *Antheraea* and *Philosamia*. (*See* SILK.) Very few other Lepidoptera are in any sense useful to man, excepting the showy coloured species which are utilized for ornamentation or mounted for purposes of display. Mention needs also to be made of the caterpillars of a few species which prey upon aphides or scale insects, and thereby confer benefit by destroying noxious and pestiferous forms of insect life.

BIBLIOGRAPHY.—The beginner and collector of British Lepidoptera will find no better handbooks than R. South, *Butterflies of the British Isles*, and the same author's *Moths of the British Isles*, which are well illustrated and deal with all the higher groups; the caterpillars are well figured in W. Buckler, *Larvae of British Butterflies and Moths* (1885–99). For more comprehensive works E. Meyrick, *Revised Handbook of British Lepidoptera* (1928); and the treatise by C. G. Barrett, *The Lepidoptera of the British Isles* (1893–1907) should be consulted. A great deal of interesting information will be found in J. W. Tutt, *British Lepidoptera* (1899–1909) and in F. W. Frowhawk's finely illustrated work on *British Butterflies* (1926).

For the European species an elementary guide is provided in W. F. Kirby, *Butterflies and Moths of Europe* (1903); among other works H. Berge, *Schmetterlingsbuch* (Stuttgart, 1910); K. Lampert, *Grossschmetterlinge u. Raupen Mitteleuropas* (1907); and A. Spuler, *Die Schmetterlinge Europas und Raupen* (Stuttgart, 1908–10), are important. The North American species are described in the popular works of W. J. Holland, viz., *The Butterfly Book* (1898), and *The Moth Book* (1903). For further information consult W. H. Edwards, *Butterflies of North America* (three series, 1868–97); S. H. Scudder, *Butterflies of the Eastern United States and Canada* (Cambridge [Mass.] 1889); A. S. Packard, *Monograph of the Bombycine Moths of North America* (Mem. Nat. Acad. Sciences, vols. vii., ix. and xii., 1895–1914); and W. T. M. Forbes, *Lepidoptera of New York and Neighbouring States* (Mem. 68 Cornell Univ. Exp. Sta., 1923). The great work of A. Seitz, *Macrolepidoptera of the World* (Stuttgart and Berlin, 1910–28) is indispensable to all who desire a wider acquaintance with the order, and is now nearing completion. For the biology and habits of Lepidoptera M. Hering, *Biologie der Schmetterlinge* (1926), is replete with interesting information. The literature on different aspects of coloration and its significance is extensive. *See* M. Standfuss, *Handbuch der paläarktischen Gross-schmetterlinge* (Jena, 1896); F. Merrifield, *Trans. Entom. Soc. London* (1890, 1893, 1905); E. B. Poulton, *The Colours of Animals* (1890), and *Trans. Entom. Soc. London* (1892, 1903, 1908); F. E. Beddard, *Animal Coloration* (1892); H. Onslow, *Phil. Trans. Royal Soc.* vol. cxi. (1921); and A. G. Mayer, *Bull. Mus. Comp. Zool. Harvard*, 29 (1896), and *Proc. Boston Soc. Nat. Hist. U.S.A.*, 27 (1897). For further references on this subject *see* MIMICRY.

For migration and geographical distribution *see* C. B. Williams, *Proc. Internat. Ent. Congress, Zürich*, vol. ii. (1925), and *Trans. Ent. Soc. London* (1923, 1927): J. J. Walker, *Proc. Ent. Soc. Lond.* (1920). Other literature on the order is mentioned in A. D. Imms, *General Textbook of Entomology* (1925). (A. D. I.)

LEPIDUS, the name of a Roman patrician family in the Aemilian gens.

1. MARCUS AEMILIUS LEPIDUS, one of the three ambassadors sent to Egypt in 201 B.C. as guardians of Ptolemy V. He was consul in 187 and 175, censor 179, *pontifex maximus* from 180 onwards, and was six times *princeps senatus*. He died in 152. He distinguished himself in the war with Antiochus III. of Syria, and against the Ligurians. He made the Via Aemiliá from Arîminum to Placentia, and led colonies to Mutina and Parma.

Livy xl. 42–46, *epit.* 48; Polybius xvi. 34.

2. MARCUS AEMILIUS LEPIDUS, father of the triumvir. In 81 B.C. he was praetor of Sicily. In the civil wars he sided with Sulla. Afterwards he became leader of the popular party, and with the help of Pompey was elected consul for 78, in spite of the opposition of Sulla. On Sulla's death, Lepidus tried to upset the Sullan constitution. His colleague defeated his measures by the use of the tribunician veto, and the situation nearly led to civil war. Lepidus was then ordered by the senate to go to his province, Transalpine Gaul; but he stopped in Etruria on his way from the city and began to levy an army. He was declared a public enemy early in 77, and forthwith marched against Rome. He was defeated in the Campus Martius by Pompey and Catulus. He sailed to Sardinia, to join Sertorius in Spain, and died shortly afterwards.

Plutarch, *Sulla*, 34, 38, *Pompey*, 15; Appian, *B.C.* i. 105, 107; Livy, *epit.* 90; Florus iii. 23; Cicero, *Balbus*, 15.

3. MARCUS AEMILIUS LEPIDUS, the triumvir. He joined the party of Julius Caesar in the civil wars, was consul in 46 B.C. In the beginning of 44 B.C. he was sent to Gallia Narbonensis, but before he had left the city with his army Caesar was murdered. Lepidus, as commander of the only army near Rome, became a man of great importance in the troubles which followed. He sided with Antonius when civil war broke out. Antony, after his defeat at Mutina, joined Lepidus in Gaul, and in August 43 Octavian, who had forced the senate to make him consul, effected an arrangement with Antony and Lepidus, and their triumvirate was organized at Bononia Antony and Octavian soon reduced Lepidus to an inferior position. His province of Gaul and Spain was taken from him; and his inclusion in the renewed triumvirate in 37 was only formal. In 36 he attempted to raise Sicily against Octavian, but his soldiers betrayed him. He was allowed to retain his fortune and the office of *pontifex maximus* but had to retire into private life. According to Suetonius (*Augustus*, 16), he died at Circeii in the year AD 13

See ROME: *History* ii., "The Republic," Period C., *ad fin.*; Appian *Bell. Civ.* ii.–v.; Dio Cassius xli.–xlix; Vell. Pat. ii. 64, 80; Orelli's *Onomasticon* to Cicero.

LE PLAY, PIERRE GUILLAUME FRÉDÉRIC (1806–1882), French engineer and economist, was born at La Rivière Saint-Sauveur (Calvados), on April 11, 1806, the son of a custom-house official. He was educated at the École Polytechnique at Paris, and from there he passed into the State Department of Mines, where his powers of observation won him rapid promotion. In 1832, he became co-editor of the *Annales des Mines*, two years later he was appointed head of the permanent committee of mining statistics and in 1840 engineer-in-chief and professor of metallurgy at the School of mines, where he became inspector in 1848. As a representative of the French Government, he reported on the steel and cutlery exhibited in London at the great exhibition of 1851, and at the Paris exhibitions of 1855 and 1862 he was placed in charge of the arrangement and classification of the products. On being created a senator in 1867, he made a brief entry into politics, but after the fall of the senate in 1870, he made no further attempt to re-enter parliament. During his long vacations, which he had systematically spent in travelling in Europe and Asia, Le Play had closely observed the social and economic conditions of the people, and on his retirement in 1870, he devoted himself to the study of similar questions in France. After investigating minutely the economic circumstances of about 300 families, he tabulated the facts with a view to discovering the bases of the welfare of the family, and in 1855 published a selection of 36 of these monographs in *"Les Ouvriers Européens"* (6 vols.). Technically his work in

classifying and tabulating family budgets is excellent. The conclusions at which Le Play arrived relate mainly to the morals of industry, and are of greater value to the statesman than the economist.

For his work in this sphere Le Play was awarded the Monthyon prize of statistics, by the Académie des Sciences. In 1856, Le Play founded the *Socieété internationale des études pratiques d'Economie sociale,* which has devoted its energies to forwarding social studies on lines laid down by its founder. The two basic contributions of Le Play and his continuators, are their insistence on, and treatment of, primary occupations, and their elaboration of the formula "place, work and folk." In opposition to the school of Comte, they approach sociological questions from physical science and industry, and depend on direct observation of representative families and of communities. In *La Science Sociale,* the main organ of the society, have been published a series of social monographs, which are invaluable both to the economist and sociologist. (*See* SOCIOLOGY.) By his work, therefore, Le Play has become the originator of one of the main schools of sociology. He died in Paris on April 5, 1882.

BIBLIOGRAPHY —Other works of Le Play are *La Réforme sociale* (2 vols., 1864; 7th ed., 3 vols., 1887); *L'Organization de la famille* (1871); *La Constitution de l'Angleterre* (in collaboration with M. Delaire, 1875). *See* article 5 in *Harvard Quarterly Journal of Economics* (June, 1890), by H. Higgs; *Bulletin de l'Institut International de Statistique* (1893), by Cheysson and Tocqué; *Journal of the Royal Stat. Soc.* (1894); by H. Higgs; also, Ch. de Ribbe, *Le Play d'après sa correspondance* (1883); and P. de Rousier, *Le Play and Social Science* (1894).

LEPONTINE ALPS, that portion of the central Alps which extends from the Simplon to the Spülgen, and south to the Furka and Oberalp passes. The eastern portion of this range from the St. Gothard pass to the Spülgen is sometimes named the Adula Alps. The highest peak is Mt Leone (11,684 ft.). (*See* ALPS.)

LEPROSY (*Lepra Arabum, Elephantiasis Graecorum*), the greatest disease of mediaeval Christendom, identified, on the one hand, with a disease endemic from the earliest historical times (1500 B.C.) in the delta and valley of the Nile, and, on the other hand, with a disease now common in Asia, Africa, South America, the West Indies and certain isolated localities of Europe.

Leprosy is a bacterial disease the cause being *B. leprae.* There are many resemblances between the lesions of leprosy and of tuberculosis and many leprous patients contract tubercle. The essential character of leprosy is the replacement of normal tissue by nodular foci of inflammatory cells (including giant cells) similar to those found in syphilis and tuberculosis. The bacilli are found in these cells, sometimes in small numbers, sometimes in masses. The structures most affected are the skin, nerves, mucous membranes and lymphatic glands.

Symptoms and Effects.—The symptoms vary according to the parts attacked. Three types of disease are usually described—(1) nodular, (2) smooth or anaesthetic, (3) mixed. In the first the skin is chiefly affected, in the second the nerves; the third combines the features of both. This classification is purely a matter of convenience, and is based on the relative prominence of symptoms, which may be combined in all degrees. The incubation period of leprosy may be many years. The invasion is usually slow and intermittent. There are occasional feverish attacks, with the usual constitutional disturbance and other slight premonitory signs, such as changes in the colour of the skin and in its sensibility. Sometimes, but rarely, the onset is acute and the characteristic symptoms develop rapidly. These begin with an eruption which differs markedly according to the type of disease. In the nodular form dark red or coppery patches appear on the face, backs of the hands and feet or on the body; they are generally symmetrical, and vary from the size of a shilling upwards. They come with one of the feverish attacks and fade away when it has gone, but only to return. After a time infiltration and thickening of the skin become noticeable, and the nodules appear. They are lumpy excrescences, at first pink but changing to brown. Thickening of the skin of the face produces a highly characteristic appearance. The tissues of the eye undergo degenerative changes; the mucous membrane of the nose and throat is thickened, impairing the breathing and the voice; the eyebrows fall off; the ears and nose become thickened and enlarged. As the disease progresses the nodules tend to break down and ulcerate, leaving open sores. The patient, whose condition is extremely wretched, gradually becomes weaker, and eventually succumbs to exhaustion or is carried off by some intercurrent disease, usually inflammation of the kidneys or tuberculosis. A severe case may end fatally in two years, but, as a rule, when patients are well cared for, the illness lasts several years. The smooth type is less severe and more chronic. The eruption consists of patches of dry, slightly discoloured skin, not elevated above the surface. These patches are the result of morbid changes affecting the cutaneous nerves, and are accompanied by diminished sensibility over the areas of skin affected. At the same time certain nerve trunks in the arm and leg, and particularly the ulnar nerve, are found to be thickened. In the further stages the symptoms are those of increasing degeneration of the nerves. Bullae form on the skin, and the discoloured patches become enlarged; sensation is lost, muscular power diminished, with wasting, contraction of tendons, and all the signs of impaired nutrition. The nails become hard and clawed; perforating ulcers of the feet are common; portions of the extremities, including whole fingers and toes, die and drop off. Later, paralysis becomes more marked, affecting the muscles of the face and limbs. This form of the disease runs a very chronic course, and may last 20 or 30 years. Recovery occasionally occurs. In the mixed form, which is probably the most common, the symptoms described are combined in varying degrees.

Incidence of the Disease.—Since 1910 a new and more hopeful era in the 3,000-year-old leprosy problem has been opened up by the discovery of an improved treatment of at least the earlier stages of the disease. It still remains a great scourge, recent estimates placing the world's lepers, including early little recognized cases, at two to three millions, the great majority being in tropical and subtropical Asia and Africa, the last having the highest numbers in proportion to population.

Leprosy is most prevalent in hot damp climates, and least in very dry areas, humidity being apparently favourable to the survival of the lepra bacillus and its transmission to others, usually through long and close contact, 40% of traced infections being due to living in the same house and 30% more to sleeping in the same bed with a leper. Children and young adults are most susceptible. The disease is less infectious than tuberculosis, and many advanced crippled nerve cases lose their infectivity. One-third of the isolated lepers in South African institutions were recently released on this account, with great reduction in expenditure. This policy is in opposition to segregation, which is only necessary in infective stages, and has resulted in the reduction of the lepers in Norway to only 5% of the numbers known in 1856, when it was introduced there. Sweden and Iceland show similar results. Under the more difficult conditions in poor tropical countries such as Hawaii and the Philippines, and in the absence of an effective treatment, the effects of segregation have not been so good and it has led to hiding of the earlier and more amenable cases, from whom infections may arise before they are discovered and isolated.

Treatment.—Numerous suggested remedies, including nastin, having failed to fulfil their early promise, only the old Indian drug, chaulmoogra oil, was known to have some power of retarding the progress of the disease by such doses as could be taken orally on account of its nauseating properties. But slightly better results were obtained by Victor G. Heiser in the Philippines by prolonged painful courses of intramuscular injections of the oil, which few patients would submit to. Real advance was made in 1916–17 when L. Rogers injected the soluble sodium salts of the fatty acids of chaulmoogra and other oils intramuscularly, and still better intravenously. This produced febrile and local reactions, accompanied by extensive destruction of the lepra bacilli in the diseased tissues, with subsequent absorption and eventually complete disappearance of the nodules and the organisms in a considerable proportion of not very advanced cases.

Dean and Hollmann at Honolulu soon after introduced the practically important modification of using intramuscular injections of ethyl esters in place of the more troublesome intravenous ones of

the sodium salts, enabling a larger number of cases to be treated. The result was that in the last four recorded years the number of cases discharged as recovered by a board of medical experts has numbered 53% of the 399 admissions during the same period, and the total lepers, including advanced incurable cases among whom the mortality is high, are being reduced at a rate which will nearly solve the problem in Hawaii within about 25 years. In India Dr. Muir adopted a new substance, sodium hydrocarpate, as part of the routine treatment, and found it cheap, easy to administer and very effective. The British Empire Leprosy Relief Association distributes very large quantities of the drug and had supplied hydrocarpus seed for cultivation so that in a few years most of the British possessions affected would have their own supplies.

Further, at the great Culion leper settlement of the Philippines, of 4,000 cases in all stages recently treated 645 have already cleared up and are bacteriologically negative. Good progress is also being made in many other countries. Many early cases are now coming forward, for the first time in the age-long history of leprosy, in the early amenable stages and asking for admission to the leper institutions in order to obtain the new treatment. They consequently recover before they have reached the more infective stages, cutting short numerous foci of infection in the houses. Active research work, still further to improve the treatment, is going forward in several important centres. The disheartening old asylums for hopelessly advanced and often quite harmless uninfective lepers are giving place to agricultural colonies, much on the lines of tuberculosis sanatoria for the infective cases amenable to treatment.

Hospital clinics are being established to enable the early uninfective cases to be treated as out-patients without the cost and disadvantages of separation from friends and relatives, and only sufficient funds and organization are required to reduce this loathsome disease to negligible proportions in many parts of the world within a few decades.

LEPSIUS, KARL RICHARD (1810–1884), German Egyptologist, was born at Naumburg-am-Saale on Dec. 23, 1810. He studied at Leipzig, and at Göttingen, where, under the influence of Otfried Müller, he finally decided to devote himself to the archaeological side of philology. After graduating doctor in Berlin in 1833, he went to Paris, where he was commissioned by the duc de Luynes to collect material from the Greek and Latin writers for his work on the weapons of the ancients. In 1834 he took the Volney prize with his *Paläographie als Mittel der Sprachforschung*. Befriended by Bunsen and Humboldt, Lepsius took up Egyptological studies, which, since the death of Champollion in 1832, had attracted no scholar of eminence and weight. After four years spent in studying the Egyptian collections of Italy, Holland and England, he returned to Germany, where Humboldt and Bunsen secured for his projected visit to Egypt the status of a scientific expedition with royal support. For three years Lepsius and his party explored the region from the Sudan above Khartum to the Syrian coast. At the end of 1845 they returned home, bringing with them casts, drawings and squeezes of inscriptions and scenes, maps and plans collected with the utmost thoroughness, as well as antiquities and papyri.

In 1846 Lepsius received a chair in Berlin University. In 1859 the 12 volumes of his vast *Denkmäler aus Ägypten und Äthiopien* were finished, supplemented later by a *text* prepared from the note-books of the expedition; they comprise its entire archaeological, palaeographical and historical results. In 1866 Lepsius again went to Egypt, and discovered the famous Decree of Tanis or Table of Canopus, an inscription of the same character as the Rosetta Stone, in hieroglyphic, demotic and Greek. In 1873 he was appointed keeper of the Royal Library, Berlin, which, like the Berlin Museum, owes much to his care. He died at Berlin on July 10, 1884. Besides the colossal *Denkmäler* and other publications of texts such as the *Todtenbuch der Ägypter* (*Book of the Dead*, 1842) his other works, amongst which may be specially named his *Königsbuch der Ägypter* (1858) and *Chronologie der Ägypter* (1849), retain permanent value.

LEPTIS, the name of two towns in ancient Africa. The first, Leptis Magna (Λεπτίμαγνα), the modern Lebda, was in Tripolitana between Tripolis and Mesrata, at the mouth of the Cinyps; the second, Leptis Parva (Λέπτις ἡ μικρά), known also as Leptiminus or Leptis minor, the modern Lamta, was a small harbour of Byzacena between Ruspina (Monastir) and Thapsus (Dimas).

1. LEPTIS MAGNA was one of the oldest and most flourishing of the Phoenician emporia established on the coasts of the greater Syrtis, the chief commercial entrepôt for the interior of the African continent. It was founded by the Sidonians who were joined later by the people of Tyre. Herodotus enlarges on the fertility of its territory. It was tributary to Carthage to which it paid a contribution of a talent a day. After the Second Punic War Massinissa made himself master of it. During the Jugurthine War it appealed for protection to Rome Though captured and plundered by Juba, it maintained its allegiance to Rome, supported the senatorial cause, received Cato the younger with the remains of the Pompeian forces after Pharsalus in 48 B.C. After his victory Julius Caesar imposed upon it an annual contribution of 300,000 measures of oil Nevertheless, it preserved its position as a free city governed by its own magistrates. It received the title of *municipium*, and was subsequently made a *colonia* by Trajan while under Nerva the coast-road from Tacape (Gabes) to Leptis was constructed. Septimius Severus, who was born there, beautified the place and conferred upon it the *Ius Italicum* and the place as it stands is his creation. The ruins of Leptis are among the most imposing Roman remains in North Africa, and have been excavated in part by the Italians since 1911. The city walls have only been traced in a few places on the west, where what is visible is comparatively late; while on the north, towards the sea, there were no walls at all, so that the fresh breezes could, as at Oea (Tripoli) have access to the town. The ancient harbour, with its quays (well preserved and of several types) round a large basin, lay at the mouth of the small stream known as Wady Lebda; on the western promontory a breakwater supported a lighthouse; on the eastern stood a tower and a temple

Before the recent excavations, the most prominent ruins in the town were attributed to the Imperial palace, but they have turned out to be the forum, surrounded by a peristyle with an inscription of Septimius Severus: on the east of the open space is a large basilica, some 300 ft. long and 125 wide, with an apse at each end with finely carved pilasters. To the south-west three arches faced the entrance to a monumental street running north-east, past the forum, to the coast, and to the south is a large mass of concrete with niches, perhaps a *nymphaeum* or monumental fountain.

To the north are streets on a more or less regular plan, and a theatre, another *nymphaeum* of the period of Severus, and a church of the Byzantine period. The *thermae* (baths), which lie to the south of the forum, were completed in A.D. 127. They are

extremely well preserved, and their plan is interesting and well thought out: a large number of statues were found in them. To the south of them again is a large group of cisterns: while a road led from the north-west angle of the baths to a four-way arch, or Janus, which is of the time of Severus and probably belonged to the city walls of the imperial period. Some way off to the east, along the shore, is a large circus, and the site of the amphitheatre is close by.

The coins of Leptis Magna, like the majority of the emporia in the neighbourhood, present a series from the Punic period. They are of bronze with the legend לפקי (*Lepqi*).

See J. Toutain, "Le Limes Tripolitanus en Tripolitaine," in *Bulletin archéologique du comité des travaux historiques* (1905); P. Romanelli, *Leptis Magna* (Rome, 1926); R. Bartoccini, *Guida di Lepcis* (Rome, 1927).

2. LEPTIS PARVA (Lamta), 10 m. from Monastir, which is often confused by modern writers with Leptis Magna in their interpretations of ancient texts, and 24 m. S.W. of Hadrumetum (Sousse). A French engineer, A. Daux, has discovered a probable line of ramparts. Like Hadrumetum, Leptis Parva declared for Rome after the last Punic War. Also after the fall of Carthage in 146 it preserved its autonomy. Julius Caesar made it the base of his operations before the battle of Thapsus in 46. Under the empire Leptis Parva became extremely prosperous; its bishops appeared in the African councils from 258 onwards. In Justinian's reorganization of Africa Leptis Parva was with Capsa one of the two residences of the *Dux Byzacenae*. The ruins extend along the sea-coast to the north-west of Lamta; the remains of docks, the amphitheatre, cisterns and a Byzantine fort can be distinguished; a Christian cemetery has furnished tombs adorned with curious mosaics.

See *Bulletin de la Soc. archéol. de Sousse* (1905; plan of the ruins of Lamta) and refs.

LE PUY or LE PUY EN VELAY, a town of south-eastern France, capital of the department of Haute-Loire, 90 m. S.W. of Lyons on the Paris-Lyon railway. Pop. (1926) 16,432. Towards the end of the 4th or beginning of the 5th century Le Puy became the capital of the Vellavi, at which period the bishopric, originally at Revession, now St. Paulien, was transferred hither. Gregory of Tours speaks of it by the name of Anicium, because a chapel "ad Deum" had been built on the mountain, whence the name of Mt. Adidon or Anis, which it still retains. In the 10th century it was called Podium Sanctae Mariae, whence Le Puy. The city rises in the form of an amphitheatre from a height of 2,050 ft. above sea-level upon Mont Anis. Narrow steep streets ascend from the new town in the valley of the Dolézon to the old feudal and ecclesiastical town. Mt. Corneille, 433 ft. above the Place de Breuil (in the lower town), is a steep rock of volcanic breccia, from which a good view is obtained of the town and of the adjacent volcanic mountains. The Romanesque cathedral of Notre-Dame (early 12th cent.) has a particoloured façade of white sandstone and black volcanic breccia.

Le Puy possesses remains of its old line of fortifications, among them a machicolated tower and a few mediaeval houses. In front of the hospital there is a fine mediaeval porch under which a street passes. The museum, named after Charles Crozatier, contains antiquities, engravings, a collection of lace, and ethnographical and natural history collections. The church of St. Michel d'Aiguilhe, beside the gate of the town, stands on an isolated rock and is reached by a staircase of 271 steps; it dates from the end of the 10th century and its chancel is still older. The steeple is of the same type as that of the cathedral. Three miles from Le Puy are the ruins of the Château de Polignac, one of the most important feudal strongholds of France. Le Puy is the seat of a bishopric under the archbishop of Bourges, a prefect and a court of assizes, and has tribunals of first instance and of commerce, a board of trade arbitrators and a chamber of commerce. The principal manufacture is that of lace and guipure.

LE QUEUX, WILLIAM TUFNELL (1864–1927), English novelist and traveller, was born on July 2, 1864, in London. He was educated privately, and after studying art in Paris went on a walking tour through France and Germany. From 1891 to 1893 he was foreign editor of the *Globe*, but then gave up journalistic work for novel writing. During the following years he travelled widely in Algeria, the Balkans, the Arctic and the Sudan. During the Balkan war he again took up journalism and became correspondent of the *Daily Mail*. He has made a valuable collection of mediaeval manuscripts. His wide knowledge of secret service methods both in England and on the continent gives additional interest to his many novels. He died Oct. 14, 1927.

His works include: *Secrets of Monte Carlo* (1899); *An Observer in the Near East* (1907); *German Spies in England* (1915); *Rasputin, the Rascal Monk* (1920); *Landru* (1921); *Things I Know* (1923); *Hidden Hands* (1925); *The Fatal Face* (1926); *Blackmailed* (1927), and many others.

LERDO DE TEJADA, SEBASTIAN (1825–1889), president of Mexico, was born at Jalapa on April 25, 1825. He was educated as a lawyer and became a member of the supreme court He became known as a liberal leader and a supporter of President Juarez. He was minister of foreign affairs for three months in 1857, and became president of the chamber of deputies in 1861. During the French intervention and the reign of the emperor Maximilian, he continued loyal to the liberal party, and had an active share in conducting the national resistance. As minister of foreign affairs to President Juarez, he showed an implacable resolution in carrying out the execution of Maximilian at Querétaro. When Juarez died in 1872, Lerdo succeeded him in office in the midst of a confused civil war. He achieved some success in pacifying the country, and began the construction of railways. He was re-elected on July 24, 1876, but was expelled in January of the following year by Porfirio Diaz He had made himself unpopular by the means he took to secure his re-election and by his disposition to limit State rights in favour of a strongly centralized Government. He fled to the United States and died in obscurity at New York in 1889.

See H. H. Bancroft, *Pacific States*, vol. ix. (San Francisco, 1882–90).

LERICI, a village of Liguria, Italy, on the N E. side of the Gulf of Spezia, about 12 m. E S E of Spezia, and 4 m. W S.W. of Sarzana by road, 17 ft. above sea-level. Pop (1921) 10,221. Its small harbour is guarded by an old castle, said to have been built by Tancred; in the middle ages it was the chief place on the gulf. S. Terenzo, a hamlet belonging to Lerici, was the residence of Shelley during his last days. Farther north-west the bay of Pertusola has lead-smelting works

LÉRIDA, a province of northern Spain, formed in 1833 of districts previously included in the ancient province of Catalonia, and bounded on the north by France and Andorra, east by Gerona and Barcelona, south by Tarragona and west by Saragossa and Huesca. Pop. (1920) 314,670; area 4,690 square miles. The northern half of Lérida belongs entirely to the Mediterranean or eastern section of the Pyrenees, and comprises some of the finest scenery in the whole chain, including the valleys of Aran and La Cerdaña, and large tracts of forest. It is watered by many rivers, the largest of which is the Segre, a left-hand tributary of the Ebro. Lérida is traversed by the main railway from Barcelona to Saragossa, and by a line from Tarragona to the city of Lérida. In 1904 the Spanish government agreed with France to carry another line to the mouth of an international tunnel through the Pyrenees, and this was inaugurated in 1928. There is a thriving trade in wine, oil, wool, timber, cattle, mules, horses and sheep, but agriculture is far less prosperous than in the maritime provinces of Catalonia Lérida (*q.v.*) is the capital and the only town besides Tarrega (5,438) and Balaguer (5,325) with more than 5,000 inhabitants. Seo de Urgel, near the headwaters of the Segre, is a fortified city which has been an episcopal see since 840, with a close historical connection with Andorra (*q.v.*).

LÉRIDA, the capital of the Spanish province of Lérida, on the river Segre and the Barcelona-Saragossa and Lérida-Tarragona railways. Pop. (1920) 38,165. Lérida is the *Ilerda* of the Romans, and was the capital of the people whom they called *Ilerdenses* (Pliny) or *Ilergetes* (Ptolemy). By situation the key of Catalonia and Aragon, it was from a very early period an important military station. In the Punic Wars it sided with the Carthaginians and suffered much from the Romans. Here Hanno was defeated by

Scipio in 216 B.C., and here Caesar struggled with Pompey's generals Afranius and Petreius in the first year of the civil war (49 B.C.). It was already a *municipium* in the time of Augustus, and enjoyed great prosperity under later emperors. Under the Visigoths it became an episcopal see. Under the Moors *Lareda* became one of the principal cities of the province of Saragossa; it became tributary to the Franks in 793, but was reconquered in 797. In 1149 it fell into the hands of Ramon Berenguer IV. In modern times it has come through numerous sieges, having been taken by the French in 1707 and again in 1810. The older parts of the city, on the right bank of the river, are a maze of narrow and crooked streets, surrounded by ruined walls and a moat, and commanded by the ancient citadel. On the left bank, connected with the older quarters by a fine stone bridge and an iron railway bridge, are the suburbs, laid out after 1880 in broad and regular avenues of modern houses. The old cathedral, last used for public worship in 1707, is a very interesting late Romanesque building, with Gothic and Mauresque additions. The Romanesque town hall, founded in the 13th century has been several times restored. Leather, paper, glass, silk, linen and cloth are manufactured.

LÉRINS, ÎLES DE: *see* CANNES.

LERMONTOV, MIKHAIL YUREVICH (1814–1841), Russian poet and novelist, often styled the poet of the Caucasus, was born in Moscow on Oct. 3, 1814, of Scottish descent, but belonged to a respectable family of the Tula government, and was brought up in the village of Tarkhanui (in the Penza government). From the academic gymnasium in Moscow Lermontov passed in 1830 to the university, but there his career was cut short for insubordination. From 1832 to 1834 he attended the school of cadets at St. Petersburg, and became an officer in the Guards. To his own and the nation's anger at the loss of Pushkin (1837) the young soldier gave vent in a passionate poem (*On the Death of the Poet*), addressed to the tsar. Lermontov was forthwith arrested, court-martialled, expelled from the Guards, and sent off to the Caucasus to a line regiment. He had been in the Caucasus with his grandmother as a boy of ten, and he found himself at home by reason of yet deeper sympathies than those of childish recollection. His exile lasted only a year, however. He was in St. Petersburg in 1838 and 1839, and in the latter year wrote the work, *A Hero of Our Times* (Eng. trans. by R. I. Lipmann, 1886, and by J. S. Phillimore, *A Hero of Nowadays*, 1920). He had fought more than one duel, and in 1841 quarrelled over a lady with his old school-fellow, Mastinov. The rivals met near Piatigorsk, on July 15 (O.S.) and Lermontov was killed.

Lermontov published only one small collection of poems in 1840. Three volumes, much mutilated by the censor, were issued in 1842 by Glazunov; and full editions of his works were published in 1860 and 1863. To Bodenstedt's German translation of his poems (*Michail Lermontov's poetischer Nachlass*, 1842, 2 vols.) which indeed was the first satisfactory collection, he is indebted for a wide reputation outside Russia as one of the greatest Russian romantic poets. English translations of some of his poems are to be found in C. T. Wilson's *Russian Lyrics* (1887) and in J. Pollen's *Rhymes from the Russian* (1891). Among his best-known poems are "Ismail-Bey," "Hadji Abrek," "Valerik," "The Novice" and, remarkable as an imitation of the old Russian ballad, "The song of the tsar Ivan Vasilivitch, his young body-guard, and the bold merchant Kalashnikov."

See Taillandier, "Le Poète du Caucase," in *Revue des deux Mondes* (Feb. 1855), reprinted in *Allemagne et Russie* (1856); Duduishkin's "Materials for the Biography of Lermontov," prefixed to the 1863 edition of his works; E. Duchesne, *Michel Iouriévitch Lermontov, sa vie et ses oeuvres* (1910); *The Demon*, translated by A. C. Stephen (1875) and by E. Richter (1910).

LEROUX, PIERRE (1798–1871), French philosopher and economist, was born at Bercy near Paris, the son of an artisan. His education was interrupted by the death of his father, which compelled him to support his mother and family. Having worked first as a mason and then as a compositor, he joined P. Dubois in the foundation of *Le Globe* which became in 1831 the official organ of the Saint-Simonian community, of which he became a prominent member. In November of the same year, when Enfantin preached the enfranchisement of women and the functions of the *couple-prêtre*, Leroux with Bazard and J. Regnaud separated himself from the sect. In 1838, with J. Regnaud, he founded the *Encyclopédie nouvelle* of which only 8 volumes appeared (1838–41). Amongst the articles which he inserted in it were *De l'égalité* and *Réfutation de l'éclectisme*, which afterwards appeared as separate works. In 1840 he published his treatise *De l'humanité* (2nd ed. 1845), which contains the fullest exposition of his system, and was regarded as the philosophical manifesto of the Humanitarians. In 1841 he established the *Revue indépendante*, with the aid of George Sand, over whom he had great influence. Her *Spiridion*, which was dedicated to him, *Sept cordes de la lyre*, *Consuelo*, and *La Comtesse de Rudolstadt*, were written under the Humanitarian inspiration. In 1843 he established at Boussac (Creuse) a printing association organized according to his systematic ideas, and founded the *Revue sociale*. After the outbreak of the revolution of 1848 he was elected to the Constituent Assembly, and in 1849 to the Legislative Assembly, where his speeches on behalf of the extreme socialist wing were of an abstract and mystical character. After the *coup d'état* of 1851 he settled with his family in Jersey, where he pursued agricultural experiments and wrote his socialist poem *La Grève de Samarez*. On the definitive amnesty of 1869 he returned to Paris, where he died in April 1871, during the Commune.

The system of Leroux was a singular medley of doctrines borrowed, not only from Saint-Simonian, but from Pythagorean and Buddhistic sources. In philosophy his fundamental principle is what he denominates the "triad"—a triplicity which he finds to pervade all things, which in God is "power, intelligence and love," in man "sensation, sentiment and knowledge." In social economy he would preserve the family, country and property, but finds in all three, as they now are, a despotism which must be eliminated.

See Raillard, *Pierre Leroux et ses oeuvres* (1899); Thomas, *Pierre Leroux: sa vie, son oeuvre, sa doctrine* (1904); L. Reybaud, *Études sur les réformateurs et socialistes modernes;* article in R. H. Inglis Palgrave's *Dictionary of Pol. Econ.*

LE ROY, a village of Genesee county, N.Y., U.S.A., 24m. S.W. of Rochester, on Oatka creek. It is served by the Buffalo, Rochester and Pittsburgh, the Erie and the New York Central railways. The population in 1925 was 4,384. It has limestone quarries, cold-storage warehouses and fruit canneries; and its manufactures include patent medicines, salt, "jello," agricultural implements and cotton yarn. The village was incorporated in 1834.

LEROY-BEAULIEU, ANATOLE (1842–1912), French publicist, was born at Lisieux, on Feb. 12, 1842. He visited Russia in order to collect documents on the political and economic organization of the Slav nations, and on his return published in the *Revue des deux mondes* a series of articles, which were the foundation of his great work on Russia, *L'Empire des tsars et les Russes* (1881–82, 4th ed., revised in 3 vols., 1897–1898). *Un homme d'état russe* (1884) gave the history of the emancipation of the serfs by Alexander II. Other works are *Les Catholiques libéraux, l'église et le libéralisme* (1890), *La Papauté, le socialisme et la démocracie* (1892), *Les Juifs et l'antisémitisme; Israël chez les nations* (1893), *Les Arméniens et la question arménienne* (1896), *L'Antisémitisme* (1897), *Études russes et européennes* (1897). In 1881 Leroy-Beaulieu was elected professor of contemporary history and eastern affairs at the École Libre des Sciences Politiques, becoming director of this institution on the death of Albert Sorel in 1906, and in 1887 he became a member of the Académie des Sciences Morales et Politiques. He died in Paris on June 15, 1912.

Two of Leroy-Beaulieu's works have been translated into English: one as the *Empire of the Tsars and the Russians*, by Z. A. Regozin (New York, 1893–1896), and another as *Papacy, Socialism, Democracy*, by B. L. O'Donnell (1892). *See* W. E. H. Lecky, *Historical and Political Essays* (1908).

LEROY-BEAULIEU, PIERRE PAUL (1843–1916), French economist, brother of the preceding, was born at Saumur on Dec. 9, 1843. He studied at Paris, Bonn and Berlin, and on his return to Paris began to write for *Le Temps*, *Revue nationale* and *Revue contemporaine*. In 1867 he won a prize for an essay entitled "L'Influence de l'état moral et intellectuel des populations

ouvrières sur le taux des salaires," and in 1870 gained three prizes for essays on "La Colonization chez les peuples modernes," "L'Administration en France et en Angleterre," and "L'Impôt foncier et ses conséquences économiques." In 1872 Leroy-Beaulieu became professor of finance at the École Libre des Sciences Politiques, and in 1880 he was elected to the chair of political economy in the Collège de France.

His principal works are:—*Recherches économiques, historiques et statistiques sur les guerres contemporaines* (1863–69); *La Question monnaie au dix-neuvième siècle* (1861); *Le Travail des femmes au dix-neuvième siècle* (1873), *Traité de la science des finances* (1877); *Essai sur la répartition des richesses* (1882), *L'Algérie et la Tunisie* (1888), *Précis d'économie politique* (1888); *L'État moderne et ses fonctions* (1889); *Le Collectivisme* (1884); *La Question de la population* (1913); *La Guerre de 1914* (2 vols., 1915–16).

LERWICK, police burgh and burgh of barony, Shetland, Scotland, the most northerly town in the British Isles. Pop. (1921) 4,792. It is situated on Brassay Sound, a fine natural harbour, on the east coast of the island called Mainland, 115 m. N E. of Kirkwall, in Orkney, and 340 m. from Leith by steamer. The town dates from the beginning of the 17th century, and the older part consists of a flagged causeway called Commercial Street, running for 1 m. parallel with the sea (in which the gable ends of several of the quaint-looking houses stand), and so narrow in places as not to allow of two vehicles passing each other. At right angles to this street lanes ascend the hill-side to Hillhead, where the more modern houses and buildings stand. At the north end stands Fort Charlotte, erected by Cromwell, repaired by Charles II and altered by George III., after whose queen it was named. It is now used as a depôt for the Naval Reserve. The Anderson Institute, at the south end, was constructed as a secondary school in 1862 by Arthur Anderson, a native, who also presented the Widows' Asylum in the same quarter. The town-hall, built in 1881, contains several stained-glass windows. Lerwick's main industries are connected with the fisheries, of which it is an important centre. There are docks, wharves, piers, curing stations, warehouses and an esplanade, along the front. The town is also the chief distributing centre for the islands, and carries on some business in knitted woollen goods. The Uphellya mumming festival, still held in January, is of ancient origin. One mile west of Lerwick is Clickimin Loch, separated from the sea by a narrow strip of land. On an islet in the lake stands a ruined "broch" or round tower.

LE SAGE, ALAIN RENÉ (1668–1747), French novelist and dramatist, was born at Sarzeau in Brittany, on May 8, 1668. He went to school with the Jesuits at Vannes and was called to the bar in Paris in 1692. In 1694 he turned to literature. He found a valuable patron in the abbé de Lyonne, who gave him an annuity of 600 livres, and recommended him to exchange the classics for Spanish literature, of which he was himself a student and collector.

Le Sage began by translating plays chiefly from Rojas and Lope de Vega. He was nearly forty before he obtained anything like decided success. But in 1707 his admirable farce of *Crispin rival de son maître* was acted with great applause; and *Le Diable boiteux* was published. Notwithstanding the success of *Crispin,* the actors did not like Le Sage, and refused a small piece of his called *Les Étrennes* (1707). He thereupon altered it into *Turcaret,* his theatrical masterpiece, and one of the best comedies in French literature. This appeared in 1709.

The first two parts of *Gil Blas de Santillane* appeared in 1715. Strange to say, it was not so popular as *Le Diable boiteux.* Le Sage did not bring out the third part till 1724, nor the fourth till 1735. Notwithstanding the great merit and success of *Turcaret* and *Crispin,* the Théâtre Français did not welcome him, and in the year of the publication of *Gil Blas* he began to write for the Théâtre de la Foire—the comic opera held in booths at festival time. According to one computation he produced, either alone or with others, about a hundred pieces, varying from strings of songs with no regular dialogues, to comediettas only distinguished from regular plays by the introduction of music. He was also industrious in prose fiction.

Besides finishing *Gil Blas* he translated the *Orlando innamorato* (1721), rearranged *Guzman d'Alfarache* (1732), published two more or less original novels, *Le Bachelier de Salamanque* and *Estévanille Gonzales,* and in 1733 produced the *Vie et aventures de M. de Beauchesne,* which resembles certain works of Defoe. Le Sage was also the author of *La Valise trouvée,* a collection of imaginary letters, and of some minor pieces, of which *Une journée des parques* is the most remarkable. This laborious life he continued until 1740. At Boulogne Le Sage spent the last seven years of his life, dying on Nov. 17, 1747. His last work, *Mélange amusant de saillies d'esprit et de traits historiques les plus frappants,* had appeared in 1743.

HIS PLACE IN LITERATURE

Le Sage is an important figure in European literature. His work may be divided into three parts. The first contains his Théâtre de la Foire and his few miscellaneous writings, the second his two remarkable plays *Crispin* and *Turcaret,* the third his prose fictions. In the first two he swims within the general literary current in France; he can and must be compared with others of his own nation. But in the third he emerges altogether from merely national comparison. He formed no school in France; he followed no French models. His work is a parenthesis in the general development of the French novel. His literary ancestors are Spaniards, his literary contemporaries and successors are Englishmen.

In mere form Le Sage is not original. He does little more than adopt that of the Spanish picaroon romance of the 16th and 17th century. Often, too, he prefers merely to rearrange and adapt existing work, and still oftener to give himself a kind of start by adopting the work of a preceding writer as a basis. But he never, in any work that pretends to originality at all, is guilty of anything that can fairly be called plagiarism. He is, on the contrary, fond of suggesting indebtedness when he is really dealing with his own funds Thus the *Diable boiteux* borrows the title, and for a chapter or two the plan and almost the words, of the *Diablo Cojuelo* of Luis Velez de Guevara. But after a few pages Le Sage leaves his predecessor alone. Even the plan of the Spanish original is entirely discarded, and the incidents, the episodes, the style, are as independent as if such a book as the *Diablo Cojuelo* had never existed. The case of *Gil Blas* is still more remarkable. It was at first alleged that Le Sage had borrowed it from the *Marcos de Obregon* of Vincent Espinel; but though this book furnished Le Sage with separate incidents and hints for more than one of his books, *Gil Blas* as a whole is not in the least indebted to it. Afterwards Father Isla asserted that *Gil Blas* was a mere translation from an actual Spanish book—an assertion at once incapable of proof and disproof, inasmuch as there is no trace whatever of any such book.

Le Sage has not only the characteristic, which Homer and Shakespeare have, of absolute truth to human nature as distinguished from truth to this or that national character, but he has also what has been called the quality of detachment. He never takes sides with his characters as Fielding (whose master, with Cervantes, he certainly was) sometimes does. Asmodeus and Don Cleofas, Gil Blas and the Archbishop and Doctor Sangrado, are produced by him with exactly the same impartiality of attitude. Except that he brought into novel writing this highest quality of artistic truth, it perhaps cannot be said that Le Sage did much to advance prose fiction in itself. But in individual excellence his works have few rivals. Nor should it be forgotten, as it sometimes is, that Le Sage was a great master of French style, the greatest unquestionably between the classics of the 17th century and the classics of the 18th.

See Barbaret, *Lesage et le Théâtre de la Foire* (1888); L. Claretier, *Lesage romancier* (1890); E. Lintilhac, *Le Sage* (1893) in the series of *Grands Ecrivains français;* Galli, *Le réalisme pittoresque chez Lesage* (1910).

LES ANDELYS, a town of France, capital of an arrondissement in the department of Eure about 30 m. S.E. of Rouen by rail. Pop. (1926) 3,947. Les Andelys is formed by the union of Le Grand Andely and Le Petit Andely. Grand Andely has a church

(13th, 14th and 15th centuries) partly Gothic and partly Renaissance. Petit Andely sprang up at the foot of château Gaillard, now in ruins, but formerly one of the strongest fortresses in France built by Richard Coeur de Lion at the end of the 12th century to protect the Norman frontier. It was captured by the French in 1204. It manufactures organs, tiles, wool and has tanyards and glass-works. It has trade in cattle, grain and flour.

LES BAUX, a village of France, in the department of Bouches-du-Rhône, 11 m. N.E. of Arles. Pop. (1926) 80. In the middle ages Les Baux was the seat of a powerful family which owned the Terre Baussenques, extensive domains in Provence and Dauphiné. The influence of the seigneurs de Baux in Provence declined before the power of the house of Anjou, to which they abandoned many of their possessions. In 1632 the château and the ramparts were dismantled. Les Baux, which in the middle ages was a flourishing town, is now almost deserted. The remains exist of a huge château, once the seat of a celebrated "court of love."

LESBONAX, of Mytilene, Greek sophist and rhetorician, flourished in the time of Augustus. According to Photius (*cod.* 74) he was the author of 16 political speeches, of which two are extant, a hortatory speech after the style of Thucydides, and a speech on the Corinthian War (edition by F. Kiehr, *Lesbonactis quae supersunt,* Leipzig, 1907). Some erotic letters are also attributed to him.

The Lesbonax described in Suidas as the author of philosophical works is probably much earlier; the author of a small treatise Περὶ Σχημάτων (ed. Rudolf Müller, Leipzig, 1900), is probably later.

LESBOS, an island in the Aegean sea, 7–10 m from the coast of Mysia, north of the Gulf of Smyrna, formerly a sanjak in the archipelago vilayet of Turkey, but annexed since 1912 to Greece. Pop. (1920 and 1923 estimate) 205,602. The island is roughly triangular; the three points are Argennum on the north-east, Sigrium (Sigri) on the west, and Malea (Maria) on the south-east. It is divided into three districts, Mytilene or Kastro in the east, Molyvo in the north, and Calloni in the west. The Euripus Pyrrhaeus (Calloni) is a deep gulf on the S.W. between Sigrium and Malea with a small port at Sigri; the gulf of Hiera (Yero) or Olivieri (from its surroundings) lies behind Mytilene town: both have difficult entrances (Yero, however, is of naval value), and commerce is concentrated at the small safe harbour of Mytilene. The surface is rugged, the highest point, Mount Olympus (Hagios Elias) being 3,080 ft. The country is however very fertile in wine, oil and grain. Its chief produce now and principal export is olives. Soap, skins and valonea are also prepared, mules and cattle are bred, the sardine fishery is important, and antimony, marble and coal are found. The island has suffered from periodical earthquakes. There is a telegraph on the island, and a cable to the mainland and to Greece.

The chief town, Mytilene, pop. (1923 estimate) 39,733, was originally built on an island close to the eastern coast: afterwards it was joined to Lesbos by a causeway, and the city spread along the coast. There was a harbour on each side of the island; the southern forms the mediaeval and modern port. The island is now occupied only by the ruined mediaeval fortress. There are now 14 mosques and 7 churches, including a cathedral. Besides the five cities which gave the island the name of Pentapolis (Mytilene, Methymna, Antissa, Eresus, Pyrrha), there was a town called Arisba, perhaps Palaikastro, north-east of Calloni, destroyed by an earthquake in the time of Herodotus. Pyrrha (also Palaikastro) lay south-east of Calloni. Antissa on the north coast near Sigri, was destroyed by the Romans in 168 B.C. Eresus was on the south coast near Sigri. Methymna on the north, on the site of Molyvo, is still the second city of the island. Town walls and other buildings are on all these sites.

History.—The position of Lesbos near the old trade-route to the Hellespont marks it as an important site at all times. Greek tradition represented it as inhabited by aboriginal Pelasgi and immigrant Ionians. In historic times it was peopled by Aeolians who claimed to have migrated about 1050 B.C. from Boeotia; its nobles traced their pedigree to Agamemnon who conquered it in the Trojan War. Lesbos was the most prominent Aeolian settlement. Its commercial activity is attested by colonies in Thrace and the Troad, and by participation in the settlement of Naucratis in Egypt; it was by its good harbour that Mytilene became the political capital. The climax of its prosperity was about 600 B.C., when Pittacus, appointed as *aesymnetes* (dictator), by his wise administration and legislation won a place among the Seven Sages of Greece. The lyric poetry of Greece owed much to Lesbians of the 7th century, the musician Terpander and the dithyrambist Arion, and culminated under Pittacus' contemporaries Alcaeus and Sappho (*qq.v.*). Other distinguished Lesbians were the cyclic poet Lesches, the historian Hellanicus and the philosophers Theophrastus and Cratippus. In the 6th century the island declined, through protracted struggle with Athens for Sigeum on the Hellespont, and a naval defeat by Polycrates of Samos. The Lesbians readily submitted to Persia after the fall of Croesus of Lydia, and although hatred of their tyrant Coës, a Persian protégé, drove them into the Ionic revolt (499–493), they displayed poor spirit at the decisive battle of Lade. In the 5th century Lesbos long remained a privileged member of the Delian League (*q.v.*), with full self-administration, and the sole obligation of assisting Athens with a naval contingent. Nevertheless, early in the Peloponnesian War the oligarchy of Mytilene forced on a revolt, which was ended after a two years' siege of that town (429–427). The Athenians recalled their hasty resolve on a wholesale execution, but killed the ringleaders, confiscated the land and established a garrison. Thereafter Lesbos was repeatedly attacked by the Peloponnesians, and in 405 Mytilene witnessed a naval battle between Callicratidas and Conon. In 389 most of the island was recovered for the Athenians by Thrasybulus; in 377 it joined the Second Delian League, and remained throughout a loyal member, although its democracy was for a while supplanted by a tyranny. In 334 Lesbos served as a base for the Persian admiral Memnon against Alexander the Great; for Perseus against Rome in the Third Macedonian War; and for Mithradates VI. of Pontus in 88 B.C. Mytilene, nevertheless, was raised by Pompey to the status of a free city, thanks no doubt to his confidant Theophanes, a native of it.

Antissa, Eresus and Pyrrha possess no separate history. Methymna in the 5th and 4th centuries sometimes was a rival of Mytilene. During the Byzantine age the island flourished. In 1091 it fell to the Seljuks; in the next century repeatedly to the Venetians; in 1224 it was recovered by the Byzantine emperors, who in 1354 gave it to the Genoese family Gattilusio. Prospering under them Mytilene passed in 1462 under Turkish control, and had an uneventful history till its annexation to Greece, in 1912.

LESCHES (Lescheos in Pausanias x. 25. 5), the reputed author of the *Little Iliad* (Ἰλιὰς μικρά), one of the "cyclic" poems. According to tradition, he was a native of Pyrrha in Lesbos, and flourished about 660 B.C. The *Little Iliad* took up the story of the *Iliad,* and carried it down to the fall of Troy (Aristotle, *Poetics,* 23), or the admission of the wooden horse.

See F. G. Welcker, *Der epische Cyclus* (1865–82); Müller and Donaldson, *Hist. of Greek Literature,* i. ch. 6.

LESCHETIZSKY, THEODOR (1830–1915), Polish pianist and teacher, was born at Lancut, then in Austrian Poland, on June 22, 1830. He was a pupil of Czerny, and had a wide reputation as a pianist. He taught for some years (1864–78) at the St. Petersburg Conservatorium. His fame, however, chiefly rests upon his establishment of the Leschetizsky school of pianoforte playing at Vienna which earned a world-wide reputation for the soundness of its methods and the number of eminent artists whom it produced. Among his pupils may be mentioned Paderewski, Mark Hambourg and Moiseiwitsch. Leschetizsky died at Vienna on Nov. 17, 1915. His second wife Annette Essipoff (1880–92) was one of his most distinguished pupils.

See A. Hullah, *Theodor Leschetizsky* (1906), and E. Newcombe.

Leschetizky as I knew him (New York and London, 1921).

LESCURE, LOUIS MARIE JOSEPH, MARQUIS DE (1766–1793), French soldier and anti-revolutionary, took part in the defence of the Tuileries (Aug. 10, 1792). He was arrested and imprisoned with all his family, as one of the promoters of the rising in La Vendée. He was set at liberty by the Royalists, and became one of their leaders, fighting at Thouars, taking Fontenay and Saumur (May–June 1793), and, after an unsuccessful attack on Nantes, joining la Rochejaquelein, another famous Vendean leader. Their peasant troops finally gained a victory between Tiffauges and Cholet on Sept. 19, 1793. The struggle was then concentrated round Chatillon, which was time after time taken and lost by the Republicans. Lescure was killed on Oct. 15, 1793 near the château of La Tremblaye between Einée and Fougères.

See Marquise de la Rochejaquelein (Lescure's widow, who afterwards married La Rochejaquelein), *Mémoires* (1817); Jullien de Courcelles, *Dictionnaire des généraux français,* tome vii. (1823); T. Muret, *Histoire des guerres de l'ouest* (1848); and J. A. M. Crétineau-Joly, *Guerres de Vendée* (1834).

LESDIGUIÈRES, FRANÇOIS DE BONNE, DUC DE (1543–1626), constable of France, was born at Saint-Bonnet de Champsaur, on April 1, 1543. He was educated at Avignon under a Protestant tutor, and had begun the study of law in Paris when he enlisted as an archer. He joined the Huguenot troops in Dauphiné, and distinguished himself in mountain warfare. In 1575 he became the acknowledged leader of the Huguenot resistance in the district with the title of commandant general, confirmed in 1577 by Marshal Damville, by Condé in 1580, and by Henry of Navarre in 1582. He seized Gap by a lucky night attack on Jan. 3, 1577, re-established the reformed religion there, and fortified the town. He refused to acquiesce in the treaty of Poitiers (1578) which involved the surrender of Gap, and after two years of fighting secured better terms for the province. Nevertheless in 1580 he was compelled to hand the place over to Mayenne and to see the fortifications dismantled.

He took up arms for Henry IV. in 1585, capturing Chorges, Embrun, Châteauroux and other places, and after the truce of 1588–1589 secured the complete submission of Dauphiné. In 1590 he beat down the resistance of Grenoble, and was now able to threaten the leaguers and to support the governor of Provence against the raids of Charles Emmanuel I. of Savoy. He defeated the Savoyards at Esparron in April 1591, and in 1592 began the reconquest of the marquessate of Saluzzo which had been seized by Charles Emmanuel. After his defeat of the Spanish allies of Savoy at Salebertrano in June 1593 there was a truce, during which Lesdiguières was occupied in maintaining the royal authority against Éperon in Provence. The war with Savoy proceeded intermittently until 1601. Henry IV. made him a marshal of France in 1609.

Lesdiguieres took no part in the intrigues which disturbed the minority of Louis XIII., and he moderated the political claims made by his co-religionists under the terms of the Edict of Nantes. In 1622 he formally abjured the Protestant faith; he now became constable of France, and received the order of the Saint Esprit. He had long since lost the confidence of the Huguenots, but he nevertheless helped the Vaudois against the duke of Savoy. His last campaign, fought in alliance with Savoy to drive the Spaniards from the Valtelline, was the least successful of his enterprises. He died of fever at Valence on Sept. 21, 1626.

The life of the Huguenot captain has been written in detail by Ch. Dufuyard, *Le Connétable de Lesdiguières* (Paris, 1892). His first biographer was his secretary Louis Videl, *Histoire de la vie du connestable de Lesdiguières* (Paris, 1638). Much of his official correspondence, with an admirable sketch of his life, is contained in *Actes et correspondance du connétable de Lesdiguières,* edited by Comte Douglas and J. Roman in *Documents historiques inédits pour servir à l'histoire de Dauphiné* (Grenoble, 1878). Other letters are in the *Lettres et mémoires* (Paris, 1647) of Duplessis-Mornay.

LESGHIANS or **LESGHIS,** the collective name for a number of tribes who, with their kinsfolk the Chechenzes, have inhabited Daghestan from time immemorial. They spread southward into the Transcaucasian circles Kuba, Shemakha, Nukha, and Sakatali. They are mentioned as Lēchai by Strabo and Plutarch along with the Gēlai (perhaps the modern Galgai, a Chechenzian tribe), and their name occurs frequently in the chronicles of the Georgians, whose territory was exposed to their raids for centuries, until, on the surrender (1859) to Russia of the Chechenzian chieftain Shamil, they became Russian subjects. The most important of the Lesghian tribes are the Avars (*q.v.*), the Kasimukhians or Lakians, the Darghis and the Kurins or Lesghians proper. Komarov (ethnological map of Daghestan) gives the total number of the tribes as 27, all speaking distinct dialects. The Lesghians are tall, powerfully built, and their hybrid descent is suggested by the range of colouring, some of the tribes exhibiting quite fair, others quite dark individuals In some there is an obvious mongoloid strain. They live a semi-savage life on their mountain slopes, mainly by hunting and stock-breeding. They are for the most part fanatical Mohammedans.

LESION, an injury, hurt, damage. In Scots law the term enorm lesion is used of damage suffered by a party, in entering into a contract, sufficient to enable him to bring an action for setting it aside. It is pleadable as a ground of reduction only in conjunction with the party's minority or other partial incapacity at the time of making the contract.

In pathology, the chief use, the word is applied to any morbid change in the structure of an organ, whether shown by visible changes or by disturbance of function

LESKOV, NIKOLAI SEMENOVICH (1831–1895), Russian novelist, was born at Orel on Feb. 16, 1831, became estate-agent to an Englishman who managed the estates of the Counts Perovsky, and in this way learned to know Russian village life. About 1862 he settled in St. Petersburg, where he spent most of the rest of his life. His first important novel, issued in 1864, under the pseudonym of Stebnitski, *The Blind Alley,* was fiercely criticized by the radicals, as was his *Ostrovityane* (The Islanders). In a long series of tales and novels, he shows, says Prince Mirsky, "a greater and fuller knowledge of the Russian character and an infinitely wider range of observation than any other Russian novelist; he knows all classes, from the very highest to the very outcasts—vagabonds, convicts, tramps." Some of his shorter tales, tragic or humorous, are masterpieces of narrative. Leskov is best known in Western Europe by translations of his *Soboryane* (1872; Eng trans. by I. Hapgood, *Cathedral Folk,* 1924), which contains some excellent types, but is hardly characteristic of the bulk of his work. The directness and simplicity of Leskov's stories and their orthodox and anti-revolutionary tendency account for the delay in the appreciation of them from the purely literary point of view in spite of the wide circulation of his novels during his life-time. He was for a short time a civil servant, but in spite of the accusation of reactionary views by his contemporaries, did not find himself in agreement with the government, and resigned. He died in St. Petersburg, on March 5, 1895.

Leskov's works appeared in a collected edition (12 vols., 1897). Other works of his are a novel: *The Enchanted Wanderer* (1873), Eng. trans. A. G. Paschkoff, 1926; and a collection of short stories, *The Sentry* (Eng. trans., 1922).

LESKOVAC, a town in Serbia, Yugoslavia. Pop. (1921) 13,721. It is the headquarters of the Serbian hemp industry, the extensive plain in which the town lies growing the best flax and hemp in all the Balkan peninsula, and excellent tobacco. Five valleys converge on the plain, and the inhabitants of the villages in them are all occupied in growing flax and hemp. Leskovac is a prosperous town with 14 textile factories. It was captured by the Serbs in the Russo-Turkish war of 1877–8 and assigned to Serbia by the treaty of Berlin (1878).

LESLEY, JOHN (1527–1596), Scottish bishop and historian, natural son of Gavin Lesley, rector of Kingussie, was educated at the University of Aberdeen. In June 1546 he was made an acolyte in the cathedral church of Aberdeen, of which he was afterwards appointed a canon and prebendary. He also studied at Poitiers, at Toulouse and at Paris, where he was made doctor of laws in 1553. In 1558 he took orders and was appointed Official of Aberdeen, and inducted into the parsonage and prebend of Oyne. At the Reformation Lesley became a champion of Catholicism. He was present at the disputation held in Edinburgh in 1561, when Knox and Willox were his antagonists. He was one of the commissioners sent the same year to bring over

the young Queen Mary to take the government of Scotland. He returned in her train, and received the bishopric of Ross and other preferments. He was one of the 16 commissioners appointed to revise the laws of Scotland.

The bishop was one of the most steadfast friends of Queen Mary. He was one of the commissioners at the conference at York in 1568, and he appeared as her ambassador at the court of Elizabeth. He projected a marriage for her with the duke of Norfolk, which ended in the execution of that nobleman. For this he was imprisoned in the Tower of London. During his confinement he collected materials for his history of Scotland, by which his name is now chiefly known.

In 1573 he was liberated from prison, but was banished from England. For two years he attempted unsuccessfully to obtain the assistance of Continental princes in favour of Queen Mary. While at Rome in 1578 he published his Latin history *De Origine, Moribus, et Rebus Gestis Scotorum*. In 1579 he went to France, and was made suffragan and vicar-general of the archbishopric of Rouen. In 1593 he was made bishop of Coutances in Normandy, and had licence to hold the bishopric of Ross till he should obtain peaceable possession of the former see. He retired to an Augustinian monastery near Brussels, where he died on May 31, 1596.

The chief works of Lesley are as follows: *A Defence of the Honour of . . . Marie, Queene of Scotland, by Eusebius Dicaeophile* (1569), reprinted, with alterations, at Liége in 1571, under the title, *A Treatise concerning the Defence of the Honour of Marie, Queene of Scotland, made by Morgan Philippes, Bachelar of Divinitie; Piae afflicti animi consolationes, ad Mariam Scot. Reg.* (Paris, 1574); *De origine, moribus et rebus gestis Scotorum libri decem* (Rome, 1578; reissued 1675); *De illustrium feminarum in republica administranda authoritate libellus* (Reims, 1580; a Latin version of a tract on "The Lawfulness of the Regiment of Women:" *cf.* Knox's pamphlet); *De titulo et iure Mariae Scot. Reg., quo regni Angliae successionem sibi iuste vindicat* (Reims, 1580; translated in 1584). The history of Scotland from 1436 to 1561 owes much, in its earlier chapters, to the accounts of Hector Boece (*q.v.*) and John Major (*q.v.*). In the later sections he gives an independent account (from the Catholic point of view) which is a valuable supplement and a corrective in many details, to the works of Buchanan and Knox.

A Scots version of the history was written in 1596 by James Dalrymple of the Scottish Cloister at Regensburg. It has been printed for the Scottish Text Society (2 vols., 1888–95). A slight sketch by Lesley of Scottish history from 1562 to 1571 has been translated by Forbes-Leith in his *Narrative of Scottish Catholics* (1885), from the original ms. now in the Vatican.

LESLEY, J. PETER (1819–1903), American geologist, was born in Philadelphia Sept. 17, 1819. He was educated for the ministry at the University of Pennsylvania, where he graduated in 1838. Sub-assistant on the first geological survey of Pennsylvania under Professor H. D. Rogers, he was afterwards engaged in a special examination of the coal regions. On the termination of the survey in 1841, he renewed his theological studies at Princeton seminary, at the same time giving his leisure to assisting Professor Rogers in preparing the final report and map of Pennsylvania. He was licensed to preach in 1844; paid a visit to Europe, and entered on a short course of study at the University of Halle. Returning to America, he worked two years for the American Tract Society. At the close of 1847 he again joined Professor Rogers in preparing geological maps and sections at Boston. In 1851 he left the ministry and entered into practice as a consulting geologist. In the course of his work he made elaborate surveys of the Cape Breton coal-field, and other coal and iron regions. From 1855 to 1859 he was secretary of the American Iron Association; for 27 years (1858–85) he was secretary and librarian of the American Philosophical Society; from 1872–78 he was professor of geology and dean of the faculty of science in the University of Pennsylvania, and from 1874–93 he was in charge of the second geological survey of the State. He then retired to Milton, Mass., where he died June 1, 1903. He published *Manual of Coal and its Topography* (1856); *The Iron Manufacturer's Guide to the Furnaces, Forges and Rolling Mills of the United States* (1859).

See memoir by Sir A. Geikie in *Quart. Journ. Geol. Soc.* (May 1904); and memoir (with portrait) by B. S. Lyman, printed in advance with portrait, and afterwards in abstract only in *Trans. Amer. Inst. Mining Engineers*, xxxiv. (1904), p. 726.

LESLIE, CHARLES (1650–1722), Anglican nonjuring divine, son of John Leslie (1571–1671), bishop of Raphoe and afterwards of Clogher, was born in July 1650 in Dublin, and was educated at Enniskillen school and Trinity college, Dublin. He firmly supported the Stuart dynasty, and, having declined at the Revolution to take the oath, was deprived of his benefice. In 1689 he withdrew to England, where he engaged in numerous polemics against the Quakers, Jews, Socinians and Roman Catholics, and especially against the Deists. A warrant having been issued against him in 1710 for his pamphlet *The Good Old Cause or Lying in Truth*, he left England and joined the Pretender at Bar-le-Duc. After the failure of the Stuart cause in 1715, Leslie accompanied his patron to Italy, where he remained until 1721, when he obtained permission to return to his native country. He died at Glaslough, Monaghan, on April 13, 1722.

His best-known work is *A Short and Easy Method with the Deists, wherein the certainty of the Christian Religion is Demonstrated by Infallible Proof from Four Rules* (1697). Others are *The Snake in the Grass* (1696), against the Quakers; *Gallienus Redivivus* (an attack on William III., 1695); *The Socinian Controversy Discussed* (1697); *The True Notion of the Catholic Church* (1703); and *The Case Stated between the Church of Rome and the Church of England* (1713).

His *Theological Works* were published in 2 vols. in 1721; a later edition, slightly enlarged, appeared at Oxford in 1832 (7 vols.).

LESLIE, CHARLES ROBERT (1794–1859), English subject painter, was born in London on October 19, 1794. His parents were American, and when he was five years of age he returned with them to their native country. They settled in Philadelphia, where their son was educated and afterwards apprenticed to a bookseller. Desiring however to study art he left for London in 1811, and was admitted as a student of the Royal Academy, where he carried off two silver medals. His earliest important subject depicted Saul and the Witch of Endor; but he soon discovered his true aptitude and became a painter of cabinet-pictures, dealing with scenes from the great masters of fiction, from Shakespeare, Cervantes, Addison, Molière, Swift, Sterne, Fielding and Smollett. In 1821 Leslie was elected A.R.A., and in 1826 R.A. In 1833 he left for America to teach drawing at West Point, but after some six months he returned to England. He died on May 5, 1859.

Leslie also wrote a *Life* of his friend Constable (1843) and *Handbook for Young Painters*, a volume embodying the substance of his lectures as professor of painting to the Royal Academy, in 1855. In 1860 Tom Taylor edited his *Autobiography and Letters*.

LESLIE, DAVID: *see* NEWARK, DAVID LESLIE, LORD.

LESLIE, SIR JOHN (1766–1832), Scottish mathematician and physicist, was born of humble parentage at Largo, Fifeshire, on April 10, 1766, and was educated at the university of St. Andrews. In 1805 he was elected to succeed John Playfair in the chair of mathematics at Edinburgh, and in 1819 succeeded to that of natural philosophy. Leslie's main contributions to physics were on radiation. He wrote *An Experimental Enquiry into the Nature and Properties of Heat* (1804). He compared the emissive, absorptive and reflecting powers of various substances to radiant heat. This work was carried out with the help of his "differential thermometer" and a "Leslie cube." The substances tested were made to cover a face of the cube or the bulb of a differential thermometer. He used the latter instrument in a great variety of investigations, connected especially with photometry, hygroscopy and the temperature of space. In 1820 he was elected a corresponding member of the Institute of France, and was knighted in 1832. He died at Coates, near Largo, on Nov. 3, 1832.

LESLIE, THOMAS EDWARD CLIFFE (1825?–1882), English economist, was born in Co. Wexford, Ireland, probably in 1825. He had a brilliant university career at Trinity college, Dublin, was called to the bar in 1848, and in 1853 became professor of political economy and jurisprudence in Queen's college, Belfast. From this time he devoted himself to the study of economic and social questions, pursuing his investigations both on the Continent, where he became acquainted with L. de Lavergne and E. de Lave-

leye, and in London. He was one of the founders of the English historical school of political economy. He died at Belfast on Jan. 27, 1882. His most important works are:—*Land systems and Industrial economy of Ireland, England and Continental Countries* (1870); *The Land system of France* (1870); *Financial Reform* (1871); *Essays in Political and Moral Philosophy* (1879).

LESLIE, burgh of barony, police burgh and parish, Fifeshire, Scotland. Pop. (1921) 2,339. It lies on the Leven, the vale of which is overlooked by the town, 4 m. W. of Markinch by the L.N.E. railway. The industries include paper-making, flax-spinning and bleaching. The old church claims to be the "Christ's Kirk on the Green" of the ancient ballads of that name. A stone on the Green, called the Bull Stone, is said to have been used for bull-baiting. Leslie House, the seat of the earl of Rothes, rivalled Holyrood in magnificence, and was noted for its tapestry and pictures. It was damaged by fire in 1763. Norman Leslie, master of Rothes, was concerned in the killing of Cardinal Beaton (1546).

Markinch (pop. 1,610), a police burgh situated between Conland Burn and the Leven, 7¼ m. N. by E. of Kirkcaldy by the L.N.E. railway, is a place of great antiquity, believed to have been a residence of the earlier kings. A cell of the Culdees was established here by one of the last of the Celtic bishops, the site of which may possibly be marked by the ancient cross of Balgonie. Its industries comprise bleaching, wool and flax-spinning, paper-making and coal-mining. Balgonie castle, close by, was a residence of Alexander Leslie, first earl of Leven, and at Balfour castle were born Cardinal Beaton and his uncle and nephew, the archbishops of Glasgow.

LESPINASSE, JULIE DE (1732–1776), French author, was born at Lyons. A natural child of the comtesse d'Albon, she was brought up as the daughter of Claude Lespinasse of Lyons. On leaving her convent school she became governess in the house of her mother's legitimate daughter, Mme. de Vichy, who had married the brother of the marquise du Deffand. Here Mme. du Deffand made her acquaintance, and, recognizing her extraordinary gifts, persuaded her to come to Paris as her companion. The alliance lasted ten years (1754–64), until Mme. du Deffand became jealous of the younger woman's increasing influence, when a violent quarrel ensued. Mlle. de Lespinasse set up a salon of her own which was joined by many of the most brilliant members of Mme. du Deffand's circle. D'Alembert was one of the most assiduous of her friends and eventually came to live under the same roof. There was no scandal attached to this arrangement, which ensured d'Alembert's comfort and lent influence to Mlle. de Lespinasse's salon. Although she had neither beauty nor rank, her ability as a hostess made her reunions the most popular in Paris. She owes her lasting fame, however, not to her social success, but to circumstances which remained a secret during her lifetime from her closest friends. Two volumes of *Lettres* published in 1809 displayed her as the victim of a passion of rare intensity. In virtue of this ardent, intense quality Sainte-Beuve and other of her critics place her letters in the limited category to which belong the Latin letters of Héloïse and those of the Portuguese Nun. Her first passion, a reasonable and serious one, was for the marquis de Mora, son of the Spanish ambassador in Paris. De Mora had come to Paris in 1765, and with some intervals remained there until 1772 when he was ordered to Spain for his health. On the way to Paris in 1774 to fulfil promises exchanged with Mlle. de Lespinasse, he died at Bordeaux. But her letters to the comte de Guibert, the worthless object of her fatal infatuation, begin from 1773. From the struggle between her affection for de Mora and her blind passion for her new lover they go on to describe her partial disenchantment on Guibert's marriage and her final despair. Mlle. de Lespinasse died on May 23, 1776, her death being apparently hastened by the agitation and misery to which she had been a prey for the last three years of her life. In addition to the *Lettres* she was the author of two chapters intended as a kind of sequel to Sterne's *Sentimental Journey*.

Her *Lettres* . . . were published by Mme. de Guibert in 1809 (modern ed. by J. Janin 1847; new ed. 1877); a spurious additional collection appeared in 1820. *See* also *Lettres inédites de Mademoiselle de Lespinasse à Condorcet, à D'Alembert, à Guibert, au comte de Crillon,* ed. Charles Henry (1887); *Letters of Mlle. de Lespinasse* with notes on her life and character by D'Alembert, Marmontel, de Guibert, etc. and an introduction by C. A. Sainte-Beuve, trans. by K. P. Wormeley (1902); *Correspondence entre Mademoiselle de Lespinasse et le comte de Guibert* ed. comte de Villeneuve-Guibert (1906); Marquis de Ségur, *Julie de Lespinasse* (1905; Eng. trans. 1907); Mrs. Humphrey Ward's novel, *Lady Rose's Daughter,* owes something to the character of Mlle. de Lespinasse.

LES SABLES D'OLONNE, a seaport of western France, capital of an arrondissement of the department of Vendée, on an inlet of the Atlantic seaboard, 23 m. S.W. of La Roche-sur-Yon by rail Pop. (1926) 13,251.

Sables was founded by Basque or Spanish sailors and invaded by the Normans in 817. Louis XI. in 1472 granted the inhabitants various privileges, improved the harbour, and fortified the entrance. The town was captured and recaptured during the Wars of Religion and became a nursery of hardy sailors and privateers In 1696 Sables was bombarded by the combined English and Dutch fleets.

The town stands between the sea on the south and the port on the north, while on the west it is separated by a channel from the suburb of La Chaume. There is a fine beach. To the north of Sables extend salt-marshes and oyster-parks, yielding 6,000,000 to 8,000,000 oysters per annum. Sables has a 17th century church. The port, consisting of a tidal basin and a wet-dock, is accessible to vessels drawing 16 ft. at neap tides, but is dangerous when the winds are from the south-west. The lighthouse of Barges stands a mile out at sea to the west. The inhabitants are employed largely in sardine and tunny fishing; there are imports of coal, wood and petroleum. Boat-building and sardine-preserving are carried on. The town has a sub-prefecture.

LES SAINTES-MARIES, coast village of France in the department of Boûches-du-Rhône, 24 m. S.W. of Arles by rail. Pop. (1926) 514. It is the object of an ancient pilgrimage due to the tradition that Mary, sister of the Virgin, and Mary, mother of James and John, together with their black servant Sara, Lazarus, Martha, Mary Magdalen and St. Maximin fled thither to escape persecution in Judaea. The relics of the two Maries, said to have been buried at Saintes-Maries, are in the apse of the fortress-church, a 12th century building. Two festivals are held, one in October, the other in May, unique for its gathering of gipsies who come to do honour to the tomb of their patroness Sara.

LESSE, a river rising at Ochamps in the Ardenne, and flowing in a north-westerly course, reaches the Meuse at Anseremme, a few miles above Dinant. The river is only 49 m. long, but meanders very much. In the 12 m. from Houyet to Anseremme the river is confined between opposing walls of cliff ranging from 300 to 500 ft. above the river. Here were discovered in 1864 in the caves of Furfooz, near Walzin, the bones of prehistoric men. Another curious natural feature of the Lesse is that at Han the river disappears through fissures in the rock into the sub-soil and reappears 1 km. below the village. By its underground course the Lesse has created the celebrated Grottos of Han, renowned for the beauty of their stalactites and stalagmites and marvellous draperies. One of the grotto chambers is 154 metres long and 136 metres wide. There are several superimposed galleries. The Lesse receives in its short course the water of no fewer than 13 tributaries.

LESSEPS, FERDINAND DE (1805–1894), French diplomatist and maker of the Suez canal, was born at Versailles on Nov. 19, 1805. Descended from a family who had long distinguished themselves in the service of the State, he followed the tradition by entering the consular service in 1825, when he became assistant vice consul at Lisbon. Two years later he occupied a similar post in Tunis, and in 1832 he was sent to Alexandria. Here the reading of Lapère's memoir on the Suez canal, written in accordance with Bonaparte's instructions, fired his imagination, and his friendship with Mehemet Ali, and with his son, Said Pasha, led him to hope that he might one day finish what Lapère had begun. For the time, however, nothing was accomplished From 1833 to 1837, Lesseps was consul at Cairo, where he gained distinction by his courage and energy in combating an outbreak of plague. Two years later he was transferred to Rotterdam. Subse-

quently he served at Malaga and Barcelona, where he was promoted to the grade of consul-general, and from 1848 to 1849 he was minister of France at Madrid. In the latter year he was sent by the Government of the French republic to negotiate with the existing Government in Rome, but the French elections, which occurred shortly after his departure, led to a change in foreign policy, and Lesseps was recalled in disgrace. He was given no opportunity to justify his actions, and therefore retired from the service. An invitation from Said Pasha, now viceroy of Egypt, revived in him his early ambitions. On Nov. 30, 1854 Said Pasha signed the concession authorizing M. de Lesseps to pierce the isthmus of the Suez.

A first scheme, indicated by him, was immediately drawn out by M. Linant Bey and Mougel Bey, providing for direct communication between the Mediterranean and the Red sea; and, after being slightly modified, it was adopted by an international commission of engineers in 1856. Encouraged by this approval, Lesseps allowed no obstacles to retard the work, and he succeeded in rousing the French people to subscribe more than half the capital needed to form the company, which was organized in 1858. The first blow of the pickaxe was given by Lesseps at Port Said on April 25, 1859, and on Nov. 17, 1869, the canal was officially opened by the khedive, Ismail Pasha. (*See* SUEZ CANAL.) On the acquisition of the Suez shares by Lord Beaconsfield, Lesseps co-operated loyally with the British, and facilitated the consolidation of interests thus formed.

Although desirous of keeping out of politics, Lesseps became a candidate at Marseille in 1869, but was defeated by Gambetta, and he afterwards declined the candidatures for the senate (1876) and the Chamber (1877). He maintained his interest in current affairs, however, and in 1879, when the Geographical Society at Paris, under the presidency of Admiral de la Roncière de Noury, voted in favour of the construction of the Panama canal, public opinion designated Ferdinand de Lesseps as the head of the enterprise. (*See* PANAMA CANAL and FRANCE: *History.*) Although 74 years of age, he undertook to carry out the project, but his despotic temper and absoluteness of thought made him fail to realize the difficulties of the task. Determined to construct the canal without locks, he refused to be dissuaded when confronted with the Cukbra and the Chagres, the mountain and stream which barred the route. For eight years he struggled against them, but in 1888, when the Panama company was wound up, he was obliged to acknowledge defeat. Seeking to discredit the Government, the enemies of the French republic attacked the directors of the company, and the Government were obliged to take proceedings against them, but Charles de Lesseps (b. 1849) the son of Ferdinand, succeeded in diverting the storm to his own head, to prevent it reaching his father, who died at La Chenaie on Dec. 7, 1894.

Lesseps was a member of the French Academy, of the Academy of Sciences and of numerous scientific societies. He was also decorated with the Grand Cross of the Legion of Honour and the Star of India, and received the freedom of the City of London. His great gifts, coupled with his supreme unselfishness and social charm, made him everywhere respected, and the "scandal" which clouded the last years of his life, has done nothing to tarnish his reputation. He remains for all time one of the most powerful embodiments of the creative genius of the 19th century.

See G. Barnett Smith, *The Life and Enterprises of Ferdinand de Lesseps* (London, 1893); *Souvenirs de quarante ans,* by Ferdinand de Lesseps (trans. by C. B. Pitman Bridier, *Les de Lesseps*) (1900); Birk, *Der Suezkanal* (1925).

LESSING, GOTTHOLD EPHRAIM (1729–1781), German critic and dramatist, was born at Kamenz in Upper Lusatia (Oberlausitz), Saxony, on Jan. 22, 1729. His father, Johann Gottfried Lessing, was *pastor primarius* or chief pastor of Kamenz. After attending the Latin school of his native town, Gotthold was sent in 1741 to the famous school of St. Afra at Meissen. In 1746 he entered the University of Leipzig, nominally as a theological student. He was most interested, however, in the philological lectures of Johann Friedrich Christ (1700–56) and Johann August Ernesti (1707–81), and in the philosophical disputations presided over by his friend A. G. Kästner. Among Lessing's chief friends in Leipzig were C. F. Weisse (1726–1804) the dramatist, and Christlob Mylius (1722–54), who had made some name for himself as a journalist. He was particularly attracted by the theatre then directed by the talented actress Karoline Neuber (1697–1760), who even accepted for performance Lessing's first comedy, *Der junge Gelehrte* (1748), which he had begun at school. His father disapproved of these activities and summoned him home. He was allowed to return to Leipzig only on condition that he devote himself to the study of medicine. Some medical lectures he did attend, but as long as Frau Neuber's company kept together the theatre had an irresistible fascination for him.

In 1748, however, the company broke up, and Lessing, who had allowed himself to become surety for some of the actors' debts, was obliged to leave Leipzig too, in order to escape their creditors. He went to Wittenberg, and afterwards, towards the end of the year, to Berlin, where his friend Mylius was already established. In Berlin Lessing now spent three years, during which he developed his lucid prose style, and his admirable critical faculty. He translated three volumes of Charles Rollin's *Histoire ancienne,* wrote several plays—*Der Misogyn, Der Freigeist, Die Juden*—and in association with Mylius, began the *Beiträge zur Historie und Aufnahme des Theaters* (1750), a periodical—which soon came to an end—for the discussion of matters connected with the drama. Early in 1751 he became literary critic to the *Vossische Zeitung.* At the end of 1751 he was in Wittenberg again, where he spent about a year engaged in unremitting study and research and took his master's degree. He then returned to Berlin, and the next three years were among the busiest of his life. Besides translating for the booksellers, he issued several numbers of the *Theatralische Bibliothek,* and continued his work as critic to the *Vossische Zeitung.*

In 1753 Lessing issued an edition of his collected writings (*Schriften,* 6 vols., 1753–55). They included his lyrics and epigrams, most of which had already appeared during his first residence in Berlin in a volume of *Kleinigkeiten,* published anonymously. Much more important were the papers entitled *Rettungen,* in which he vindicated writers of the Reformation period, such as Cochlaeus and Cardanus—who had been misunderstood or falsely judged by preceding generations. The *Schriften* also contained Lessing's early plays, and one new one, *Miss Sara Sampson* (1755), a landmark in the history of the German drama, which was at that time imitative of contemporary French drama. This play, based more or less on Lillo's *Merchant of London,* and influenced in its character-drawing by the novels of Richardson, is the first *bürgerliches Trauerspiel,* or "tragedy of common life" in German. It was performed for the first time at Frankfort-on-Oder in the summer of 1755, and received with great favour. Among Lessing's chief friends during his second residence in Berlin was the philosopher Moses Mendelssohn, with whom he wrote in 1755 an admirable treatise. *Pope ein Metaphysiker!* tracing sharply the lines which separate the poet from the philosopher. He was also on intimate terms with C. F. Nicolai (1733–1811), a Berlin bookseller and rationalistic writer, and with the "German Horace" K. W. Ramler (1725–98); he had also made the acquaintance of J. W. L. Gleim (1719–1803), the Halberstadt poet, and E. C. von Kleist, a Prussian officer, whose fine poem, *Der Frühling,* had won for him Lessing's warm esteem.

In Oct. 1755 Lessing settled in Leipzig with a view to playwriting. He then started on a foreign tour as companion to Gottfried Winkler, a wealthy young merchant, but the travellers turned back at Amsterdam at the outbreak of the Seven Years' War. At this time Lessing began the study of mediaeval literature to which attention had been drawn by the Swiss critics, Bodmer and Breitinger, and wrote occasional criticisms for Nicolai's *Bibliothek der schönen Wissenschaften.* In Leipzig Lessing saw much of Kleist, whose regiment was stationed there, and a warm affection sprang up between them. In 1758 Kleist's regiment being ordered to new quarters, Lessing returned to Berlin. Kleist was mortally wounded in 1759 at the battle of Kunersdorf.

In Berlin Lessing contributed to the *Briefe, die neueste Literatur*

betreffend (1759–65), a series of critical essays—written in the form of letters to a wounded officer—on contemporary literature. He insisted especially on the necessity of truth to nature in the imaginative presentation of the facts of life, and in one letter he courageously asserted the superiority of Shakespeare to Corneille, Racine and Voltaire; other notable essays were on Wieland and Klopstock, and he edited with Ramler a selection from the writings of F. von Logau, an epigrammatist of the 17th century, and introduced to the German public the *Lieder eines preussischen Grenadiers,* by J. W. L. Gleim. In 1759 he published *Philotas,* a prose tragedy in one act, and also a complete collection of his fables, preceded by an essay on the nature of the fable. The latter is one of his best essays on criticism, defining with perfect lucidity what is meant by "action" in works of the imagination, and distinguishing the action of the fable from that of the epic and the drama.

In 1760 Lessing went to Breslau, as secretary to General Tauentzien, governor of Breslau, and director of the mint. During the four years which Lessing spent in Breslau, he collected a large library, and, after the conclusion of the Seven Years' War, in 1763, he resumed more enthusiastically than ever his partially interrupted studies. He investigated the early history of Christianity and penetrated more deeply than any contemporary thinker into the significance of Spinoza's philosophy He also found time for the studies which were ultimately to appear in the volume entitled *Laokoon,* and in fresh spring mornings he sketched in a garden the plan of *Minna von Barnhelm.*

Laokoon.—In 1765 he returned to Berlin, but could gain no public appointment because Frederick had not forgotten his criticism of Voltaire. Lessing was restless and unhappy during the two years (1765–67) in Berlin, yet it was during this period that he published two of his greatest works, *Laokoon, oder uber die Grenzen der Malerei und Poesie* (1766) and *Minna von Barnhelm* (1767). *Laokoon* is a European classic. It aimed at defining by analysis the limitations of poetry and the plastic arts His conclusions have not all been maintained by later writers on aesthetics; indeed they have often been fiercely contradicted. But Lessing was a pioneer; he indicated more decisively than any of his predecessors the fruitful principle that each art is subject to definite conditions, and that it can accomplish great results only by limiting itself to its special function. The most valuable parts of the work are those which relate to poetry, of which he had a much more intimate knowledge than of sculpture and painting. His exposition of the methods of Homer and Sophocles is especially suggestive, and he may be said to have marked an epoch in the appreciation of these writers, and of Greek literature generally. The power of *Minna von Barnhelm,* Lessing's greatest drama, was also immediately recognized. Tellheim, the hero of the comedy, is an admirable study of a manly and sensitive soldier, with somewhat exaggerated ideas of conventional honour; and Minna, the heroine, is one of the brightest and most attractive figures in German classic comedy.

In 1767 Lessing settled in Hamburg, where he had been invited to take part in the establishment of a national theatre. At the same time he joined J. C. Bode (1730–93), in starting a printing establishment. The theatre, however, was soon closed, and the printing establishment failed, leaving behind it a heavy burden of debt. In despair, Lessing determined towards the end of his residence in Hamburg to quit Germany, believing that in Italy he might find congenial labour that would suffice for his wants. The *Hamburgische Dramaturgie* (1767–68), Lessing's commentary on the performances of the National Theatre, is the first modern handbook of the dramatist's art. By his original interpretation of Aristotle's theory of tragedy, he delivered German dramatists from the yoke of the classic tragedy of France, and directed them to the Greek dramatists and to Shakespeare. Another result of Lessing's labours in Hamburg was the *Antiquarische Briefe* (1768), a series of masterly letters in answer to Christian Adolf Klotz (1738–71), a professor of the University of Halle, who, after flattering Lessing, had attacked him, and sought to establish a kind of intellectual despotism by means of critical journals which he directly or indirectly controlled. In connection with this controversy Lessing wrote his brilliant little treatise, *Wie die Alten den Tod gebildet* (1769), contrasting the mediaeval representation of death as a skeleton with the Greek conception of death as the twin-brother of sleep.

Instead of settling in Italy, as he intended, Lessing accepted in 1770 the office of librarian at Wolfenbüttel, offered to him by the hereditary prince of Brunswick. The debts which he had contracted in Hamburg weighed heavily on him, and he missed his friends; his health, too, which had hitherto been excellent, gradually gave way. In 1775 he travelled for nine months in Italy with Prince Leopold of Brunswick, and in the following year he married Eva König, the widow of a Hamburg merchant, with whom he had been on terms of intimate friendship. But their happiness lasted only for a brief period; in 1778 she died in childbed.

Soon after settling in Wolfenbüttel, Lessing found in the library the manuscript of a treatise by Berengarius of Tours on transubstantiation in reply to Lanfranc. This was the occasion of Lessing's powerful essay on Berengarius, in which he vindicated the latter's character as a serious and consistent thinker. In 1771 he published his *Zerstreute Anmerkungen über das Epigramm, und einige der vornehmsten Epigrammatisten.* No other critic has offered so many pregnant hints as to the laws of epigrammatic verse, or defended with so much force and ingenuity the character of Martial. In 1772 he published *Emilia Galotti,* a tragedy handling a subject suggested by the Roman legend of Virginia, but conceived in the spirit of the "tragedy of common life." Lessing then occupied himself for some years almost exclusively with the treasures of the Wolfenbüttel library. The results of these researches he embodied in a series of volumes, *Zur Geschichte und Literatur,* the first being issued in 1773, the last in the year of his death.

Theological Works.—The last period of Lessing's life was devoted chiefly to theological controversy. He published extracts from the *Apologie oder Schutzschrift fur die vernunftigen Verehrer Gottes* of H. S. Reimarus, a book written from the deistic standpoint, in his *Zur Geschichte und Literatur* in 1774–78. These extracts, the authorship of which was not publicly avowed, were known as the *Wolfenbütteler Fragmente.* They created great excitement among orthodox theologians, and Lessing was bitterly condemned for having published them. His most formidable and unscrupulous assailant was Johann Melchior Goeze (1717–86), the chief pastor of Hamburg. To him, therefore, Lessing addressed in 1778 his most elaborate answers—*Eine Parabel, Axiomata,* 11 letters with the title *Anti-Goeze,* and two pamphlets in reply to an inquiry by Goeze as to what Lessing meant by Christianity. These papers are full of thought and learning; they are written with a grace, vivacity and energy that give them permanent value.

The Brunswick Government having, in deference to the consistory, confiscated the *Fragments* and ordered Lessing to discontinue the controversy, he resolved, as he wrote to Elise Reimarus, the author's daughter, to try "whether they would let him preach undisturbed from his old pulpit, the stage." In *Nathan der Weise,* written in the winter of 1778–79, he gave poetic form to the ideas which he had already developed in prose. Its governing conception is that noble character may be associated with the most diverse creeds, and that there can, therefore, be no good reason why the holders of one sect of religious principles should not tolerate those who maintain wholly different doctrines. The play, which is written in blank verse, is too obviously a continuation of Lessing's theological controversy to rank high as poetry, but the representatives of the three religions—the Mohammedan Saladin, the Jew Nathan and the Christian Knight Templar—are finely conceived, and show that Lessing's dramatic instinct had, in spite of other interests, not deserted him. In 1780 appeared *Die Erziehung des Menschengeschlechts,* the first half of which he had published in 1777 with one of the *Fragments.* This work, composed of 100 brief paragraphs, was the last, and is one of the most suggestive of Lessing's writings. The doctrine on which its argument is based is that no dogmatic creed can be regarded as final, but that every historical religion had its share in the development of the spiritual life of mankind. Lessing also

maintains that history reveals a definite law of progress, and that occasional retrogression may be necessary for the advance of the world towards its ultimate goal.

These ideas formed a striking contrast to the principles both of orthodox and of sceptical writers in Lessing's day, and gave a wholly new direction to religious philosophy. Another work of Lessing's last years, *Ernst und Falk* (a series of five dialogues, of which the first three were published in 1777, the last two in 1780), also sets forth many new points of view. Its nominal subject is freemasonry, but its real aim is to plead for a humane and charitable spirit in opposition to a narrow patriotism, an extravagant respect for rank and exclusive devotion to any particular church.

Lessing's theological opinions exposed him to much petty persecution, and he was in almost constant straits for money. His health had been undermined by excessive work and anxiety, and after a short illness he died at Brunswick on Feb. 15, 1781. "We lose much in him," wrote Goethe after Lessing's death, "more than we think." It may be questioned whether there is any other writer to whom the Germans owe a deeper debt of gratitude. He was succeeded by poets and philosophers who gave Germany for a time the first place in the intellectual life of the world, and it was Lessing, as they themselves acknowledged, who prepared the way for their achievements. Without attaching himself to any particular system of philosophical doctrine, he fought error incessantly, and in regard to art, poetry and the drama and religion, suggested ideas which kindled the enthusiasm of aspiring minds, and stimulated their highest energies.

BIBLIOGRAPHY.—The first edition of Lessing's collected works, edited by his brother Karl Gotthelf Lessing (1740–1812), J. J. Eschenburg and F. Nicolai, appeared in 26 vols. between 1791 and 1794, as a continuation of the *Vermischte Schriften*, edited by Lessing himself in 4 vols. (1771–85); the *Samtliche Schriften*, edited by Karl Lachmann, were published in 13 vols. (1825–28), this edition being subsequently re-edited by W. von Maltzahn (1853–57), by F. Muncker (21 vols., 1886 ff.) and by J. Petersen and W. von Olshausen (25 vols., 1925). The more important biographies of Lessing are by K. G. Lessing (his brother) (1793–95, a reprint in Reclam's *Universal-bibliothek*); J. Sime, *Lessing, his Life and Works* (2 vols., 1877); E. Schmidt, *Lessing, Geschichte seines Lebens und seiner Schriften* (2 vols., 1884–92, 4th ed., revised by F. Schultz, 1923)—this is the most complete biography; T. W. Rolleston, *Lessing* (in "Great Writers," 1889); R. M. Werner, *Lessing* (1917). *See* also K. Fischer, *Lessing als Reformator der deutschen Literatur dargestellt* (2 vols., 1881, 2nd ed., 1888); B. A. Wagner, *Lessing-Forschungen* (1881); J. W. Braun, *Lessing im Urteile seiner Zeitgenossen* (2 vols., 1884); G. Kettner, *Lessings Dramen im Lichte ihrer und unserer Zeit* (1904); C. Pitollet, *Contribution à l'état de l'Hispanisme de G. E. Lessing* (1909); G. Fittbogen, *Die Religion Lessings* (Leipzig, 1923). Translations of Lessing's *Dramatic Works* (2 vols, 1878) edited by E. Bell, and of *Laokoon, Dramatic Notes and the Representation of Death by the Ancients*, by E. C. Beasley and H. Zimmern (1 vol., 1879), will be found in Bohn's "Standard Library."

LESSON, part of a book appointed to be read aloud, or learnt for repetition, hence anything learnt or studied (Lat. *lectio*, reading). Selections from the Bible or other religious writings appointed to be read at divine service are called lessons. In the Church of England most of the Old Testament is read through during the year as the First Lesson at Morning and Evening Prayer, and as the Second Lesson the whole of the New Testament, with the exception of parts of Revelation. (*See* LECTION and LECTIONARY.)

LESTE, a hot, dry dust-bearing wind of Madeira resembling the Leveche (*q.v.*). It is usually not experienced in summer, but at any other season it may strike the islands from directions varying between N.E. and S.E. and may reduce the relative humidity locally to below 20%.

L'ESTRANGE, SIR ROGER (1616–1704), English pamphleteer on the royalist and court side during the Restoration epoch, was born at Hunstanton, Norfolk, on Dec. 17, 1616. He was a zealous Cavalier, and spent four years in Newgate on a charge of espionage. He was pardoned by Cromwell in 1653, and lived in retirement until the Restoration, when he was appointed licenser of the press. In 1663 (*see* NEWSPAPERS) he commenced the publication of the *Public Intelligencer* and the *News*, from which eventually developed the *London Gazette* in 1665. In his *Observator* (1679) he discredited the Popish Plot. In 1687 he discontinued the *Observator* from his unwillingness to advocate James II.'s Edict of Toleration, although he had previously gone all lengths in support of the measures of the court. The Revolution cost him his office as licenser. He died in 1704. L'Estrange translated Josephus, Cicero, Seneca, Quevedo and other standard authors.

LE SUEUR, EUSTACHE (1616–55), one of the founders of the French Academy of painting, was born on Nov. 19, 1616, at Paris, where he passed his whole life, and where he died on April 30, 1655. He was the son of Cathelin Le Sueur, a turner and sculptor in wood, who placed his son with Vouet. Admitted at an early age into the guild of master-painters, he left them to take part in establishing the academy of painting and sculpture, and was one of the first 12 professors of that body. Some paintings, illustrative of the Hypnerotomachia Polyphili, which were reproduced in tapestry, brought him into notice, and his reputation was further enhanced by a series of decorations (Louvre) in the mansion of Lambert de Thorigny, which he left uncompleted. He also painted many pictures for churches and convents, some of which are now in the Louvre. His most important works are "St. Paul preaching at Ephesus" (Louvre), painted for the goldsmith's corporation in 1649; and his famous series of the "Life of St. Bruno" (Louvre), executed in the cloister of the Chartreux. These last have more personal character than anything else which Le Sueur produced, and much of the originals survives in spite of injuries and restorations and removal from the wall to canvas. The Louvre also possesses many fine drawings, chiefly executed in black and white chalk. His pupils, who aided him much in his work, were his wife's brother, Th. Goussé, and three brothers of his own, as well as Claude Lefebvre and Patel the landscape painter.

He was a charming draughtsman. His graceful facility in composition was always restrained by a very fine taste. He had too frequent recourse to conventional types, and he rarely saw colour except with the cold and clayey quality proper to the school of Vouet; though his art was the work of a sincere and sentimental disposition.

See L. Vitet, *Eustache Le Sueur* (1853).

LESUEUR, JEAN FRANÇOIS (1760–1837), French musical composer, was born on Jan. 15, 1760 at Drucat-Plessiel, near Abbeville. He was a choir boy in the cathedral of Amiens, and then became musical director at various churches. In 1786 he obtained by open competition the musical directorship of Notre-Dame, Paris, where he gave performances of sacred music with a full orchestra. This post he resigned in 1787; and, after a retirement of five years in a friend's country house, he produced *La Caverne* and two other operas at the Théâtre Feydeau in Paris. At the foundation of the Paris Conservatoire (1795) Lesueur was appointed one of its inspectors of studies, but was dismissed in 1802, owing to his disagreements with Méhul. Lesueur succeeded G. Paisiello as *Maestro di cappella* to Napoleon, and produced (1804) his *Ossian* at the Opéra. He also composed for the emperor's coronation a mass and a Te Deum. Louis XVIII., who had retained Lesueur in his court, appointed him (1818) professor of composition at the Conservatoire. He died on Oct. 6, 1837. Lesueur composed eight operas and several masses, and other sacred music. All his works are written in a style of rigorous simplicity.

See O. Fouqué, *J. F. Lesueur, précurseur de Berlioz* (1883), and monographs by W. Busch Kötter (1912) and F. Lamy (1912).

LESZNO, a town of Poland in the province of Poznan, near the Prussian frontier. The chief buildings are the palace, the mediaeval town hall, the four churches and the synagogue. Its manufactures consist chiefly of shoes, machinery, liqueurs and tobacco; its also possesses a large steam flour mill, and carries on a brisk trade in grain and cattle.

Leszno was formerly the seat of the family of Leszczynski, and owes its fame to the settlement there of a band of Moravian Brothers in the 16th century. Their settlement received municipal rights in 1561, and, reinforced by fresh refugees during the Thirty Years' War, became an important commercial and cultural centre and the chief seat of the Moravians in Poland. John Amos

Comenius was long rector of the celebrated Moravian school there.

See Voigt, *Aus Lissas erster Blütezeit* (Lissa, 1905), and Sanden, *Geschichte der Lissaer Schule* (Lissa, 1905).

LE TELLIER, MICHEL (1603–1685), French statesman, was born in Paris on April 19, 1603. In 1677 he was made chancellor of France and he was one of those who influenced Louis XIV. to revoke the Edict of Nantes. He died on Oct. 30, 1685, a few days after the revocation had been signed. Le Tellier, who amassed great wealth, left two sons, one the famous statesman Louvois and another who became archbishop of Reims. His correspondence is in the Bibliothèque nationale in Paris.

See L. Caron, *Michel Le Tellier, intendant d'armée au Piémont* (Paris, 1881).

LETHABY, WILLIAM RICHARD (1857–), English architect, was born at Barnstaple in 1857. In 1879 he won the Soane travelling studentship of the R.I.B.A.; and soon afterwards entered the office of Norman Shaw, remaining with him for 12 years. In 1892 he started a practice on his own account. The influence of Shaw, William Morris and Philip Webb shaped and coloured Lethaby's design and work. In 1906 he was appointed surveyor to the fabric of Westminster Abbey. With Sir G. Frampton he was responsible, on behalf of the London County Council, for the establishment of the Central School of Arts and Crafts, of which he was principal from 1893 to 1911. He was professor of design at the Royal College of Art from 1900 to 1918.

His many publications include *Mediaeval Art*, based on a study of French cathedrals (1908); *Greek Buildings, represented by fragments in the British Museum* (1908); *Architecture, an introduction to the history and theory of the Art* (1912); *National Architecture and Modernism* (1918–21).

LETHARGY, drowsiness, torpor. In medicine the term is used of a morbid condition of deep and lasting sleep from which the sufferer can be with difficulty and only temporarily aroused. The term Negro or African lethargy was formerly applied to the disease now generally known as "sleeping sickness" (*q.v.*). (*See* also ENCEPHALITIS LETHARGICA.)

LETHE, "Oblivion," in Greek mythology, the daughter of Eris (Hesiod, *Theog.* 227). Lethe is also the name of a river (or plain, Aristophanes, *Frogs*, 186) in the infernal regions. Orphism (*see* the Petilia tablet, Kern, *Orphic. frag.*, 32) distinguished a spring of memory and one of oblivion, and near Lebadeia, at the oracle of Trophonius, which was counted an entrance to the lower world, the two springs Mnemosyne and Lethe were shown (Pausanias ix. 39. 8).

LETO (Latin, *Latona*), a Titaness, the daughter of Coeus and Phoebe, and mother of Apollo and Artemis. The chief seats of her legend were Delos and Delphi, and the generally accepted tradition is a union of the legends of these two places. Leto, pregnant by Zeus, sought a place of refuge to be delivered. After long wandering she reached the barren isle of Delos, which, according to Pindar (Frag. 87, 88), was a wandering rock borne about by the waves till it was fixed to the bottom of the sea for the birth of Apollo and Artemis. In the oldest forms of the legend Hera is not mentioned; but afterwards the wanderings of Leto are ascribed to the jealousy of that goddess, enraged at her amour with Zeus. The foundation of Delphi follows immediately on the birth of the god; and on the sacred way between Tempe and Delphi the giant Tityus offers violence to Leto and is immediately slain by the arrows of Apollo and Artemis (*Odyssey*, xi. 576–81; Apollodorus i. 23). Such are the main facts of the Leto legend in its common literary form, which is due especially to the two Homeric hymns to Apollo. But Leto is a real goddess, not a mere mythological figure. She has been plausibly identified with the Lycian goddess Lada, and in Lycia graves are frequently placed under her protection, and she is also known as a goddess of fertility and as *Kourotrophos* ("rearer of youths"). It is to be observed that she appears far more conspicuously in the Apolline myths than in those which grew round the great centres of Artemis worship, the reason being that the idea of Apollo and Artemis as twins is one of later growth on Greek soil.

See Wilamowitz-Moellendorf, *Apollo* (Oxford, 1908), p. 31.

LE TRÉPORT, a maritime town of northern France in the department of Seine-Inférieure, on the English Channel, at the mouth of the Bresle, 114 m. N.N.W. of Paris on the Northern railway. Pop. (1926) 5,352. Le Tréport (the ancient *Ulterior Portus*) was a port of some note in the middle ages and suffered from English invasions. It is a favourite watering-place of the Parisians. The mouth of the Bresle forms a small port, comprising an outer tidal harbour and an inner dock accessible to vessels drawing from 13 to 16 feet. The fisheries with their dependent industries, shipbuilding and glass-making, are the chief industries. There is general trade. The church of St. Jacques (16th cent.) has finely carved vaulting. About 1 m. N.E. of Le Tréport is the small bathing resort of Mers. The Eu-Tréport canal, uniting the two towns, has a length of about 2 m., and is navigable by vessels drawing 11 to 12 feet.

LETTER, a character or symbol expressing any one of the elementary sounds into which a spoken word may be analysed, one of the members of an alphabet (through Fr. *lettre* from Lat. *littera* or *litera*, letter of the alphabet; the origin of the Latin word is obscure). As applied to things written, the word follows mainly the meanings of the Lat. plur. *litterae*, the most common being that of an epistle (*q.v.*). For transmission of letters *see* POST AND POSTAL SERVICE. The word is also applied to many legal and formal documents, as in letters patent, letters rogatory and dismissory, etc. "Letters," in the sense of literature (*q.v.*) or learning, also follows the Latin use.

LETTERKENNY, a market town of Co. Donegal, Ireland, 23 m. W. by S. of Londonderry by rail. Pop. (1926) 2,308. It has a harbour at Port Ballyrane, 1 m. distant on Lough Swilly. In the market square a considerable trade in grain, flax and provisions is prosecuted. Rope-making and shirt-making are industries. The Roman Catholic cathedral for the diocese of Raphoe contains carving from Rome, glass from Munich and a pulpit of Irish and Carrara marble. It was consecrated in 1901. Its name signifies the "hill of the O'Cannanans," a family who lorded over Tyrconnell before the rise of the O'Donnells.

LETTER OF MARQUE. The name given to the commission issued by a belligerent state to a private shipowner giving him leave to employ his vessel as a ship of war. A ship so used is termed a privateer. At the Congress of Paris, 1856, all the Powers present agreed to a declaration (Art. I. of the Declaration of Paris) that "privateering is and remains abolished." This declaration bound only the Powers then present, or those who subsequently agreed to it, but privateering became obsolete with the framing at The Hague Convention of 1907 of international rules for the conversion of merchant ships into warships. (*See* INTERNATIONAL LAW; DECLARATION OF PARIS.)

LETTER OR BILL OF CREDIT, a written order from a banker to his agent abroad, or a banker in one country to a banker in another, authorizing payment, to the person named in the document, of a definite sum of money or of amounts not greater than a definite sum named. A letter of credit is not a negotiable instrument and can only be honoured on the personal presentation of the one named in it.

A letter of credit is either general or special. It is general when addressed to merchants or other persons in general, requesting an advance to a third person, and special when addressed to a particular person by name requesting him to make such an advance. When a letter of credit is given for the purchase of goods, the letter of credit usually states the particulars of the merchandise against which bills are to be drawn, and shipping documents (bills of lading, invoices, insurance policies) are usually attached to the draft for acceptance.

LETTERS PATENT. It is here proposed to consider only the characteristics of letters patent generally. The law relating to letters patent for inventions is dealt with under the heading PATENTS; *see* also MONOPOLY.

Letters patent (*litterae patentes*) are letters addressed by the sovereign "to all to whom these presents shall come," reciting the grant of some dignity, office, monopoly, franchise or other privilege to the patentee. They are not sealed up, but are left open (hence the term "patent"), and are recorded in the patent rolls

in the Record Office, or in the case of very recent grants, in the Chancery Enrolment office, so that all subjects of the realm may read and be bound by their contents. In this respect they differ from certain other letters of the sovereign directed to particular persons and for particular purposes, which not being proper for public inspection, are closed up and sealed on the outside, and are thereupon called *writs close* (*litterae clausae*) and are recorded in the close rolls. Letters patent are used to put into commission various powers inherent in the Crown—legislative powers, as when the sovereign entrusts to others the duty of opening parliament or assenting to bills, judicial powers, *e.g.*, of gaol delivery; executive powers, as when the duties of treasurer and lord high admiral are assigned to commissioners of the Treasury and Admiralty (Anson, *Const.* ii. 211). Letters patent are also used to incorporate bodies by charter, to grant a *congé d'élire* to a dean and chapter to elect a bishop, or licence to convocation to amend canons, and to confer certain offices and dignities. No exemption from income tax, etc., can be effectively granted by letters patent to any city, borough or town (Income Tax Act, 1918, s. 213). Among grants of offices, etc., made by letters patent the following may be enumerated: offices in the Heralds' college; the dignities of a peer, baronet and knight bachelor; the appointments of custos rotulorum of counties, judge of the high court or lord justice of appeal (Supreme Court of Judicature Consolidation Act, 1925, s. 11), king's counsel, Crown livings; the offices of attorney and solicitor-general. The fees payable in respect of the grant of various forms of letters patent are fixed by orders of the lord chancellor, dated June 20, 1871, July 18, 1871, and Aug. 11, 1881. (These orders are set out at length in the *Statutory Rules and Orders Revised* [ed. 1904], vol. ii. *tit,* "Clerk of the Crown in Chancery," pp. i. *et seq.*) Formerly each colonial governor was appointed and commissioned by letters patent under the great seal of the United Kingdom. But since 1875, the practice has been to create the office of governor or governor-general in each colony or dominion by letters patent, and then to make each appointment to the office by commission under the Royal Sign Manual and to give to the governor so appointed instructions in a uniform shape under the Royal Sign Manual. The letters patent, commission and instructions, are commonly described as the Governor's commission (*see* Jenkyns, *British Rule and Jurisdiction beyond the Seas,* p. 100; the forms now in use are printed in App. iv.; also the *Statutory Rules and Codes Revised,* ed. 1904, and subsequent years, under the title of the colony to which they relate). The following modern instances may be given: letters patent of Sept. 11, 1913 (Mauritius); Dec. 6, 1922 (Irish Free State); Jan. 28, 1924 (Sierra Leone); April 9, 1924 (Windward Islands); June 6, 1924 (Trinidad and Tobago); Aug. 18, 1924 (Straits Settlements). The Colonial Letters Patent Act, 1863, provides that letters patent shall not take effect in the colonies or possessions beyond the seas until their publication there by proclamation or otherwise (s. 2), and shall be void unless so published within nine months in the case of colonies east of Bengal or west of Cape Horn, and within six months in any other case. Colonial officers and judges holding offices by patent for life or for a term certain, are removable by a special procedure—"amotion"—by the governor and council, subject to a right of appeal to the king in council (Leave of Absence Act, formerly cited as "Burke's Act," 1782); see *Montagu* v. *Governor of Van Diemen's Land,* 1849, 6 Moo. P.C. 491; *Willis* v. *Gipps,* 1846, 6 St. Trials (N.S., 311).

The construction of letters patent differs from that of other grants in certain particulars: (i.) Letters patent, contrary to the ordinary rule, are construed in a sense favourable to the grantor (viz., the Crown) rather than to the grantee; although this rule is said not to apply so strictly where the grant is made for consideration, or where it purports to be made *ex certâ scientiâ et mero motu.* (ii.) When it appears from the face of the grant that the sovereign has been mistaken or deceived, either in matter of fact or in matter of law, as, *e.g.,* by false suggestion on the part of the patentee, or by misrecital of former grants, or if the grant is contrary to law or uncertain, the letters patent are void, and may still, it would seem, be cancelled (except as regards letters patent for inventions, which are revoked by a special procedure regulated by ss. 24–27 of the Patents Act, 1907), by the procedure known as *scire facias,* an action brought against the patentee in the name of the Crown with the fiat of the attorney-general.

See Bacon's *Abridgment* ("Prerogative," F.); Chitty's *Prerogative;* Hindmarsh on *Patents* (1846); Anson, *Law and Custom of the Const.* ii. (3rd ed., Oxford and London, 1907–08). (A. W. R.)

LETTISH LANGUAGE. The Lettish language is very closely related to Lithuanian (*q.v.*). Their phonetic systems are the same, except that Lettish has undergone some changes in which Lithuanian has had no share. Lettish has two systems of orthography; in the older one, the language is written as if it were German (the Letts learned writing from the Teutonic Knights); in the newer one (the result of several successive reforms), most of the letters have the same values as in Lithuanian. Books and newspapers continue for the most part to be printed in the old orthography, with the same ("Gothic") fount of type as German books and newspapers, to which a few new letters have had to be added. For manuscript the Letts use only the Latin alphabet. Long vowels are indicated in the old orthography by the addition of *h,* e.g., *mahte* and *māte* are respectively the old and the new spellings of the word for "mother" (pronounced *māte,* with *ā* as in English *far* and *e* as *ay* in *outlay,* but short). In the old orthography *ee* is pronounced *ia* or *ie* (somewhat as in English *dear*), and in both orthographies *o* is pronounced *uo* or *ua* (*cf.* English *poor*). The following are the chief phonetic differences from Lithuanian. The Indo-European *ā* (*e.g.,* Lat. *māter*) is not changed to *ō,* as in Lithuanian *motē,* but remains *ā* (Lett *mate*). Where Lithuanian has *š* and *ž,* Lettish has *s, z* (as in Eng *so, zero*): *e.g.,* Lithuanian *šimtas* "a hundred," Lettish *simts;* Lithuanian *žemē* "country," Lettish *zeme.* Before *e* and *i* Lettish changes *k* into *c* (pronounced *ts*) and *g* into *dz, e g.,* Lithuanian *sakyti* "to say," Lettish *sacīt;* Lithuanian *gerti* "to drink," Lettish *dzert.* Lithuanian short vowels in end-syllables disappear in Lettish (except *u*): Lithuanian *akis* "eye," Lettish *acs* (pronounced *ats*); Lithuanian long vowels in end-syllables become short in Lettish: Lithuanian *sakō* "he says," Lettish *saka.* The nasal *n* cannot stand before a consonant in Lettish: Lithuanian *pinti* "to weave," *jungas* "yoke," *ranka* "hand," and *bendras* "comrade," become Lettish *pīt, jūgs, roka* (pronounced *ruoka*) and *biedrs* (in the old orthography *beedrs*). The consonant *j* (=Eng. *y* in *you*) coalesces with a preceding consonant, but the result is not the same as in Lithuanian: *svetjā* (Lith. *svečio* "of a guest") becomes Lettish *sveša; medjā* (Lith. *medžio* "of a tree") becomes Lettish *meža.* Some other consonants suffer similar changes, as a result of which Lettish possesses a set of palatal consonants, denoted in the old orthography by crossed forms of k, ģ, ŗ, ļ, ņ, and in the new by ķ, ģ, ŗ, ļ, ņ. The declensions and conjugations are on much the same lines as in Lithuanian. The dual is almost, but not quite, obsolete. In the conjugations Lettish makes a more extended use of auxiliary verbs.

The stress is on the first syllable of every word. In addition there are distinctions of intonation, but their effect on the ear is not the same as in Lithuanian. Lettish, for instance, has in certain syllables the glottal catch (the Danish *Stödton,* heard also in the Scotch dialect pronunciation of *butter—bu'er*), which is not heard in Lithuanian. Analysis has, however, revealed the principles according to which the Lettish intonations correspond to the Lithuanian, even when not identical with them, and in this way Lettish has become an important witness in questions of Baltic accentuation.

Lettish is spoken in numerous dialects, which for many years have been dying out owing to the general adoption of a common form of Lettish, based on a single dialect.

The oldest Lettish text is a translation of the *Catechismus Catholicorum* (1585) which was found in 1911 in Uppsala university library. A translation of Luther's Catechism was printed in 1586.

The Lettish vocabulary differs considerably from the Lithuanian. From the common stock of Baltic words the two languages have sometimes made a different selection, *e.g.,* the *ox* is called Lettish *govs* (*cf.* Lat. *bos,* Grk. *bous,* Engl. *cow*), but Lithuanian

jautis (*cf.* Skt. *yauti* "he yokes"); a *son* is Lettish *dēls* (*cf.* Lat. *filius*), Lithuanian *sūnus* (*cf.* Skt. *sūnus*). Sometimes a suffix common to the two languages has acquired a different meaning in each, *e.g.*, Lithuanian *-okas*=English *-ish* (*gerokas*=*goodish*), but Lettish *-āks* is the ending of the Comparative (Lett. *labāks*=*better*). Loan-words have passed into Lettish from German, (chiefly Middle Low German words borrowed from the Teutonic Knights, whose influence on the Letts was much stronger than on the Lithuanians, but also in later times High German words), from Russian (part of the church terminology, *e.g.*, *krusts* "cross" from Old Russian *křstŭ*, dates from the time, before the Teutonic influence, when the Letts were almost converted to Greek Christianity), and from Livonian, a Finno-Ugrian language once widely spoken in Livonia and Kurland, but now spoken only by some 800 persons on the headland to the west of Riga. The German words are very numerous, the Russian and Livonian words rarer, but some of the commonest words are Livonian, *e.g.*, *vajaga* "it is necessary, one must," *maksāt* "to pay," *pestīt* "to free," *puisis* "lad," *sulainis* "servant." The Finnish languages do not tolerate a group of consonants at the beginning of a word (*e.g.*, Old Norse *straumr* "stream" on Finnish lips became *rauma*). When, therefore, we find in Lettish an initial *s-* unexpectedly prefixed to another consonant, as in *stopzegelis* "topsail" (borrowed from Low German), such words owe their *s-* to Livonian speakers who failed to distinguish in foreign words between *st-* and *t-*, *sp-* and *p-*, etc. The Finno-Ugrian influence on Lettish continues at the present day, the northern neighbours of the Letts being the Esthonians, who speak a Finno-Ugrian language closely related to Livonian and to Finnish itself.

BIBLIOGRAPHY.—A. Bielenstein, *Die Lettische Sprache* (1863–64); J. Endzelin, *Lettische Grammatik* (Heidelberg, 1923) (comparative, with full data about dialects, and bibliography); J. D. Prince, *Practical Grammar of the Lettish Language* (London and Toronto, 1925) (short, with exercises); C. C. Ulmann, *Lettisch-deutsches Wörterbuch* (Riga, 1872); a much larger dictionary (K. Mühlenbach-J. Endzelin, *Latviešu valodas vārdnīca*) is in course of publication at Riga. There is a small Lettish-German dictionary by the students of the Riga Polytechnic (*Latweeschu-Wahzu Wahrdniza*, Riga, 1914). The German and Russian loan-words are discussed by J. Sehwers in the *Zeitschrift fur vergleichende Sprachforschung*, vol. 54 (1926–27).

The few surviving Old-Prussian texts will be found, together with a grammar and etymological vocabulary, in R. Trautmann, *Die Altpreussischen Sprachdenkmäler* (Göttingen, 1910). Some special researches are contained in N. van Wijk, *Altpreussische Studien* (Haag, 1918). The proper names contained in charters, etc., are collected in G. Gerullis, *Die Altpreussischen Ortsnamen* (Berlin-Leipzig, 1922), and R. Trautmann, *Die Altpreussischen Personennamen* (Göttingen, 1925). (R. McK.)

LETTISH LITERATURE: *see* LITHUANIAN AND LETTISH LITERATURE.

LETTOW-VORBECK, PAUL VON (1870–), German general, was born at Saarlouis on March 20, 1870, the son of General Paul von Lettow-Vorbeck (1832–1919). He took part in the China expedition in 1900 and in 1904 in German South-West Africa; in 1911 he was appointed commander of the colonial troops in Cameroon, and in 1914 to the corresponding command in German East Africa. There he conducted a four years' struggle against the British forces, earning general admiration by the remarkable way in which he contrived to move his men and to elude his adversary through tropical jungles and regions which had only been partially explored. The remainder of his force finally withdrew to Portuguese East Africa. In 1919 he returned to Germany, and was made leader of the corps which bore his name in the organization of the *Reichswehr* before the disarmament clauses of the Treaty of Versailles were fully enforced. He finally left the service in March 1920. He published in 1919 *Meine Erinnerungen aus Deutsch-Ostafrika.*

See A. Schirge, *Mit Lettow-Vorbeck durch Ostafrika 1914–19* (1919); L. Deppe, *Mit Lettow-Vorbeck durch Afrika* (1919).

LETTRES DE CACHET. Considered solely as French documents *lettres de cachet* may be defined as letters signed by the king of France, countersigned by one of his ministers, and closed with the royal seal (*cachet*). They contained an order emanating directly from the king, and executory by himself. In the case of organized bodies *lettres de cachet* were issued for the purpose of enjoining members to assemble or to accomplish some definite act; the provincial estates were convoked in this manner, and it was by a *lettre de cachet* (called *lettre de jussion*) that the king ordered a parlement to register a law in the teeth of its own remonstrances. The best-known *lettres de cachet*, however, were those by which the king sentenced a subject without trial and without an opportunity of defence to imprisonment in a State prison or an ordinary gaol, confinement in a convent or a hospital, transportation to the colonies, or relegation to a given place within the realm.

The power thus exercised was recognized by old French law, and can be traced to a maxim which furnished a text of the *Digest* of Justinian: "Rex solutus est a legibus." This meant that when the king intervened directly in the administration proper, or in the administration of justice, by a special act of his will, he could decide without heeding the laws, and even in a sense contrary to the laws. In early times the order in question was simply verbal; thus some letters patent of Henry III. of France in 1576 state that François de Montmorency was "prisoner in our castle of the Bastille in Paris by verbal command" of the late king Charles IX. But in the 14th century the principle was introduced that the order should be written, and hence arose the *lettre de cachet.* The *lettre de cachet* belonged to the class of *lettre closes*, as opposed to *lettres patentes*, which expressed the legal and permanent will of the king and were sealed by the chancellor with the seal of State. The *lettres de cachet* were signed simply by a secretary of State for the king; they bore merely the imprint of the king's privy seal, from which circumstance they were often called, in the 14th and 15th centuries *lettres de petit signet* or *lettres de petit cachet*, and were entirely exempt from the control of the chancellor. While serving the government as a silent weapon against political adversaries or dangerous writers, and as a means of punishing culprits of high birth without the scandal of a trial, the *lettres de cachet* had other uses. They were employed by the police in dealing with prostitutes, and on their authority lunatics were shut up. They were also often used by heads of families as a means of correction, *e.g.* for protecting the family honour from the disorderly or criminal conduct of sons; wives, too, used them to curb the profligacy of husbands and vice versa. They were issued by the intermediary on the advice of the intendants in the provinces and of the lieutenant of police in Paris. In reality, the secretary of State issued them in a completely arbitrary fashion, and in most cases the king was unaware of their issue. In the 18th century the letters were often issued blank, *i.e.* without containing the name of the person against whom they were directed; the recipient, or mandatary, filled in the name in order to make the letter effective.

Protests against the *lettres de cachet* were made continually by the parlement of Paris and by the provincial parlements, and often also by the States General. It was not, however, until the reign of Louis XVI. that a reaction against this abuse became clearly perceptible. At the beginning of that reign Malesherbes during his short ministry endeavoured to infuse some measure of justice into the system, and in March 1784 the baron de Breteuil, a minister of the king's household, addressed a circular to the intendants and the lieutenant of police with a view to preventing its abuses. In Paris, in 1779, the *Cour des Aides* demanded their suppression, and in March 1788 the parlement of Paris made some energetic remonstrances. The crown, however, in a declaration to the States General in the royal session of June 23, 1789 (art. 15) did not renounce it absolutely. *Lettres de cachet* were abolished by the Constituent Assembly, but Napoleon re-established their equivalent by a political measure in the decree of March 9, 1801. This was one of the acts brought up against him by the *sénatus-consulte* of April 3, 1814, which pronounced his fall "considering that he has violated the constitutional laws by the decrees on the State prisons."

See Honoré Mirabeau *Les Lettres de cachet et des prisons d'état* (Hamburg, 1782), written in the dungeon at Vincennes into which his father had thrown him by a *lettre de cachet*, one of the ablest and most eloquent of his works, which had an immense circulation, and was translated into English with a dedication to the duke of Norfolk in 1788; André Chassaigne *Les Lettres de cachet sous l'ancien régime* (1903); Frantz Funck-Brentano, *Les Lettres de cachet à Paris* (1904)

and *Les Lettres de Cachet* (1926). (J. P. E.)

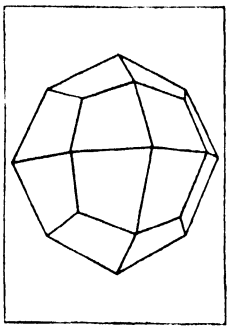
LETTUCE, known botanically as *Lactuca sativa* (family Compositae), a hardy annual, highly esteemed as a salad plant. It is generally believed to have arisen from the wild species *F. scariola* which grows wild in Europe, Canary Isles, Madeira, Algeria, Abyssinia and Eastern Asia, and has become naturalized in the United States. The market-gardeners round London prepare for the first main crop of Cos lettuces in the open ground early in August, a frame being set on a shallow hotbed, and, the stimulus of heat not being required, this is allowed to subside till the first week in Oct., when the soil, consisting of leaf-mould mixed with a little sand, is put on 6 or 7 in. thick, so that the surface is within 4½ in. of the sashes. The best time for sowing is found to be early in Oct. When the seeds begin to germinate the sashes are drawn quite off in favourable weather during the day, and put on, but tilted, at night in wet weather. Very little watering is required, and the aim should be to keep the plants gently moving till the days begin to lengthen. In Jan. a more active growth is encouraged, and in mild winters a considerable extent of the planting out is done, but in private gardens the preferable time would be February. The ground should be light and rich, and well manured below, and the plants put out at 1 ft. apart each way with the dibble. Frequent stirring of the ground with the hoe greatly encourages the growth of the plants. Young lettuce plants should be thinned out in the seed-beds before they crowd or draw each other, and transplanted as soon as possible after two or three leaves are formed. Some cultivators prefer that the summer crops should not be transplanted, but sown where they are to stand, the plants being merely thinned out; but transplanting checks the running to seed, and makes the most of the ground.

There are four races of the lettuce, the Cos lettuce, with erect oblong heads, and the Cabbage lettuce, with round or spreading heads—the former generally crisp, the latter soft and flabby in texture—the Asparagus lettuce with narrow lanceolate basal leaves, the Cut-leaved lettuce with the leaves deeply cut at the edges.

Lactuca virosa, the strong-scented lettuce, contains an alkaloid which has the power of dilating the pupil and may possibly be identical with hyoscyamine. No variety of lettuce is now used for any medicinal purpose, though there is probably some slight foundation for the belief that the lettuce has faint narcotic properties.

LEU, the monetary unit of Rumania, divided into 100 bani. At par it is equivalent to a franc, being worth 19.295 cents; 25.22 lei equal one pound sterling.

At the end of 1927 it stood at about 0.6 cents. *See* RUMANIA.



LEUCADIA or **LEUCAS,** the ancient name of one of the Ionian islands, now called Santa Maura, and of its chief town, now called Hamaxichi. By some authorities Leucas is identified with the Homeric Ithaca. *See* SANTA MAURA.

LEUCIPPUS, Greek philosopher, born at Miletus (or Elea), founder of the Atomistic theory, contemporary of Zeno, Empedocles and Anaxagoras. His very existence was denied by Epicurus (Diog. Laërt. x. 7), followed in modern times by E. Rohde. Epicurus, however, distinguishes Leucippus from Democritus, and Aristotle and Theophrastus expressly credit him with the invention of Atomism.

See DEMOCRITUS. On the Rohde-Diels controversy as to the existence of Leucippus, *see* F. Lortzing in Bursian's *Jahresbericht,* vol. cxvi. (1904); also J. Burnet, *Early Greek Philosophy* (3rd ed., 1920); T. Gomperz, *Greek Thinkers,* vol. i. (Eng. trans., 1901); H. Diels, *Die Fragmente der Vorsokratiker,* Bd. 2 (4th ed., 1922). Full bibliography in Überweg, *Grundriss der Gesch. der Phil.,* Bd. 1 (1926).

LEUCITE, a rock-forming mineral composed of potassium and aluminium metasilicate $KAl(SiO_3)_2$. Crystals have the form of cubic icositetrahedra {211}, but, as first observed by Sir David Brewster in 1821, they are not optically isotropic. They consist of a complex intergrowth of orthorhombic or monoclinic individuals, which are optically biaxial and repeatedly twinned, giving rise to twin-lamellae and to striations on the faces. When the crystals are raised to a temperature of about 500° C they become optically isotropic, the twin-lamellae and striations disappearing, reappearing, however, when the crystals are again cooled. This pseudo-cubic character of leucite is exactly the same as that of the mineral boracite (*q.v.*).

The crystals are white (hence the name from λευκός) or ash-grey in colour, and are usually dull and opaque, but sometimes transparent and glassy; they are brittle and break with a conchoidal fracture. The hardness is 5½, and the specific gravity 2·5. Enclosures of other minerals, arranged in concentric zones, are frequently present in the crystals.

A LEUCITE CRYSTAL, SOMETIMES KNOWN AS THE LEUCITOHEDRON

Since leucite contains a considerable amount of potash (H_2O 21·5%), many attempts have been made to extract potash commercially from this mineral, and in Italy the crude mineral is used as a fertilizer. (L. J. S.)

LEUCITE ROCKS. Igneous rocks bearing leucite, though quantitatively scarce are of wide distribution, and occur in every quarter of the globe, apparently excepting Britain. Taken collectively they exhibit a considerable variety of type and are of great petrographic importance. Their principal developments are of Tertiary or Recent age and include those of the Roman region and the East Indies (Java, Celebes, Borneo). In pre-Tertiary rocks leucite is uncommon, since it readily undergoes change to other products as analcime, zeolites, etc. The majority of leucite-bearing rocks are surface lavas or thin dykes; plutonic rocks carrying leucite are known from only two or three localities. In these latter types the instability of leucite, cooled slowly under deep-seated conditions, is seen in the frequent occurrence of pseudo-leucite, a paramorph consisting of aggregates of orthoclase and nepheline, or its alteration products (muscovite, sodalite, etc.). This transformation may be chemically expressed in the equation:

$$2[(KNa)AlSi_2O_6] = KAlSi_3O_8 + NaAlSiO_4.$$

Nepheline, sodalite, nosean, haüyne, melanite-garnet and melilite are frequent associates of leucite, but with rare exceptions it is not found together with free silica. The mineral is readily recognized by the trapezohedral character of its crystals, its colour and rough cleavage. Leucite rocks belong chemically to a potash-rich suite of rocks which includes potash syenites, monzonites, shonkinites and latites; in contrast to the sodic Atlantic and calcic Pacific suites, this group is sometimes referred to as the Mediterranean suite, from their relative abundance in the Italian region bordering the Mediterranean.

Formation.—The conditions governing the formation of leucite in rocks are still obscurely understood. Some are chemically identical with certain potassic lamprophyres, while others correspond closely in composition to nepheline syenites. It is not improbable that, provided sufficient potash be present, the water content of the magma and the physical condition of pressure may be controlling factors. The escape of this volatile constituent from a magma enriched in orthosilicate mica molecules may result in a concentration of the metasilicate molecule sufficient to precipitate leucite. Such a condition may be produced by extrusion of the magma on the surface. It is well known that mica, fused in an open crucible, yields leucite as a transformation product. Here may, perhaps, be discovered the reason for the rare occurrence of deep-seated leucite-bearing rocks, the leucite molecule being desilicified to the orthosilicate molecule in the presence of water under cover. The recently demonstrated incongruent melting of orthoclase with separation of leucite is clearly, too, of special petrographic importance, for the occurrence of leucite in comparatively silica-rich glasses or in ground masses containing free silica is thus comprehended. (*See* PETROLOGY.)

Plutonic Rocks Bearing Leucite.—The rare coarse-grained or plutonic rocks carrying leucite are practically limited to occurrences in Arkansas, Montana and Brazil, or occur as cognate xenoliths in leucite lavas, as in those of the Roman region. These rock types include leucite-syenite, leucite-shonkinite, arkite and missourite. The first consists of leucite (or pseudo-leucite), ortho-

clase, nepheline, diopside and aegirine-diopside, melanite and biotite. Leucite-shonkinite, a melanocratic type known from the Highwood mountains, Mont., and in ejected blocks from Monte Somma, consists of augite, orthoclase and leucite, while arkite and missourite are almost felspar-free rocks in which the chief constituents are leucite-nepheline, aegirine-diopside and melanite (arkite), and leucite, olivine augite and biotite (missourite). The former occurs at Magnet Cove, Ark., and the latter in the Highwood mountains. Hypabyssal rocks carrying leucite belong to the tinguaite and monchiquite groups. The leucite tinguaites are usually pale grey or green and consist principally of nepheline, alkali-felspar and aegirine, together with leucite. Rocks of this group are known from the Laacher See and Kaiserstuhl districts, Serra de Monchique (Portugal), north-west Madagascar, Umptek (Russia), Magnet Cove (Ark.), Bear Paw mountains (Mont.), Alaska, Greenland and Rio de Janeiro. Leucite monchiquites are fine-grained dark rocks consisting of olivine, titaniferous augite and iron oxides, with a glassy ground-mass in which small rounded crystals of leucite are scattered. They are known from Czechoslovakia (Bohemian Mittelgebirge) and the Kaiserstuhl (Baden).

Lavas Bearing Leucite.—The lavas are the most abundant of the igneous rocks bearing leucite. They include leucite trachytes and phonolites, and leucitophyres, leucite basanites and tephrites, leucite basalts and leucitites.

The leucite trachytes and phonolites carry sanidine in abundance; they are common in the vicinity of Rome (L. Bracciano, L. Bolsena) and in the tuffs in the region of Naples, and occur in north-west Madagascar (Bezavona mass), the Celebes and Alaska.

In the leucitophyres sanidine is in subordinate amount, these rocks being the effusive equivalents of the leucite syenites. They often contain much nepheline, which is typically absent in the leucite phonolites. Haüyne, nosean, melanite and aegirine also occur. Leucitophyres are known from various parts of the volcanic districts of the Rhine (Eifel, Kaiserstuhl), and from São Paulo, Brazil, where they are of Carboniferous age.

The leucite basanites and tephrites are basaltic lavas carrying leucite, plagioclase and augite, the former with olivine, the latter olivine-free. Leucite is often present in two sets of crystals, porphyritic and as a constituent of the ground mass. The pyroxene is usually titaniferous and aegirine is uncommon. Accessory minerals include biotite, brown hornblende and haüyne. Melanite and nepheline may also occur. The leucite basalts and leucitites are free from plagioclase felspar. The former contain olivine and the latter are olivine-free. Otherwise they resemble the basanites and tephrites. Melilite may be an abundant constituent, as in the leucitite of Capo di Bove, near Rome. In this rock the melilite forms irregular tetragonal plates enclosing many small rounded crystals of leucite. The volcanic region of central Italy provides the finest and best known examples of basaltic lavas carrying leucite. In the Roman region leucite tephrites and leucitites occur in the Alban hills, south of Rome, and in southern Etruria, north of Rome, at Lake Bracciano, Viterbo and Lake Bolsena. In the Neapolitan area these rocks are represented at Roccamonfina, Monte Vulture, Phlegrean Fields (and Islands) and at Vesuvius Leucite basanites also occur in these districts. The tephrites and basanites are also known from Sardinia, Czechoslovakia, in East Africa, at Kilimanjaro, and other places, in the Celebes and Java. Leucitites occur also in the East Indies, Montana, and the Kimberley district of Western Australia. In East Africa they are the products of the volcanoes Wissoke, Mikeno, Niragongo, etc., and of the volcano Etinde in the Cameroons. The more basic leucite basalts rich in olivine occur in great force in the Eifel, in Czechoslovakia, and accompany tephrites or leucitites in the Celebes, Java, Montana and Sardinia. Leucite basalt occurs at the Gaussberg (Antarctica) and in the western plains of New South Wales. A small group of leucite-bearing rocks is recorded from the Philippines, and from Utsuryôtô, in the Sea of Japan, a variety of leucite tephrite has been recently described. Peculiar leucitic lavas of lamprophyric affinities occur in the Leucite hills of Wyoming and at Jumilla, Murcia Province (Spain). The Wyoming lavas carry phlogopite, diopside and katophorite, with or without sanidine felspar, and constitute the rocks known as orendite and wyomingite.

As a constituent of pyroclastic rocks, leucite is abundant in the ashes and tuffs known as "peperino" in the Roman region; this is externally quarried for building and paving purposes.

Composition.—The following analyses represent the composition of typical leucite-bearing rocks from various regions:

	SiO_2	Al_2O_3	Fe_2O_3	FeO	MgO	CaO	Na_2O	K_2O	TiO_2
1.	54·62	22·85	1·51	1·08	0·36	3·00	5·25	11·19	tr
2.	52·91	19·49	4·78	2·05	0·29	2·47	7·13	7·88	
3.	52·51	21·37	2·15	1·04	0·11	2 16	7·21	8·97	0·32
4.	45·99	16·56	4·17	5·38	5·30	10·47	2·18	8·97	0·37
5.	43·58	8·08	5 00	5·77	12 91	8 88	0·90	5·99	4·64
6.	51·85	19·08	4·25	2·69	1 48	5·81	4·46	6·61	0·66
7.	54·17	10·16	3·34	0·65	6·62	4·19	1·21	11·91	2·67

1. Leucite syenite, Monte Somma (Vesuvius).
2. Leucite tinguaite, Magnet Cove, Ark.
3. Leucitophyre, Olbrück Laacher. *See* EIFEL.
4. Leucitite, Capo di Bove, Rome.
5. Leucite basalt, El Capitan, New South Wales.
6. Leucite tephrite, Gillinan river, Mt. Mouriah, Java.
7. Orendite, North Table Butte, Wyoming. (C. E. T.)

LEUCTRA, BATTLE OF, 371 B. C. Leuctra, a village of Boeotia in the territory of Thespiae, is chiefly noticeable in the annals of general history for the battle fought in its neighbourhood in 371 B.C. between the Thebans and the Spartans and their allies. But in military history it is far more than noticeable—in fact, epoch-making. For here the "oblique order" was born which came to maturity under Alexander the Great, and was resurrected in modern times with equally startling success by Frederick the Great. And apart from its originality, at Leuctra Epameinondas's manoeuvre was in some ways more unconventional in its execution than those of his more famous successors. This is the more remarkable when we judge him by the criterion of his time, and remember that he was flagrantly breaking with the tradition of centuries of warfare.

A Peloponnesian army, about 10,000 strong, which had invaded Boeotia from Phocis, was confronted by a Boeotian levy of perhaps 6,000 soldiers under Epaminondas (*q.v.*). In spite of inferior numbers and the doubtful loyalty of his Boeotian allies, Epameinondas offered battle on the plain before the village.

The Peloponnesian army formed up in the traditional manner, with the Spartans on the right under their king, Cleombrotus, who was in command of the whole. Instead of following suit and placing his best on the right, Epameinondas not merely reversed this procedure but massed a 50-deep column of Theban infantry on his left wing, with the famous Sacred Band at its head and cavalry protecting its flank. He sent forward this body in advance of his centre and right wing, thus by "refusing" the latter, saving it from the otherwise inevitable overlapping which would have occurred on contact with the enemy. After a cavalry engagement in which the Thebans drove their opponents off the field, the decisive issue was fought out between the Theban and Spartan foot. The latter, though fighting well, could not sustain in their 12-deep formation the cumulative impact of their opponents' column, and were hurled back with a loss of about 2,000 men, of whom 700 were Spartan citizens, including the king Cleombrotus. Seeing their right wing beaten, the rest of the Peloponnesians retired and left the enemy in possession of the field. Owing to the arrival of a Thessalian army under Jason of Pherae, whose friendship they did not trust, the Thebans were unable to exploit their victory. But the battle is none the less of great significance in Greek history. Its political effects were far-reaching, for the loss in material strength and prestige which the Spartans here sustained deprived them for ever of their supremacy in Greece. But by its influence on tactics it was still more far-reaching, for it was to affect vitally the outcome of the struggle between Greece and Persia and both indirectly and directly the destiny of modern Europe. It is the first known instance of a deliberate concentration of strength against a vital point of the enemy's formation as a means, first, to offset an inferiority on the whole front by a local superiority at the decisive point, and, secondly, to obtain a decision by dislocating

instead of merely wearing down the enemy's body. This is the true art of war. And it is specially significant that Epameinondas directed his concentration against the enemy's command, the moral objective, because the seat of his will to victory.

See Xenophon, *Hellenica*, vi. 4, 3–15; Diodorus xi. 53–56; Plutarch, *Pelopidas*, ch. 20–23; Pausanias ix. 13, 2–10; H. Delbrück, *Geschichte der Kriegskunst* (1900), i. 130 *ff.*

LEUK (Fr. *Loèche Ville*), an ancient little town in the Swiss canton of the Valais. It is built above the right bank of the Rhone, and is about 1 m. from the Leuk-Susten station (15½ m. E. of Sion and 17½ m. W. of Brig) on the Simplon railway. In 1920 it had 1,885 inhabitants, all but wholly German-speaking and Catholics. About 10½ m. by a narrow gauge railway N. of Leuk, and near the head of the Dala valley, at a height of 4,629 ft. above the sea-level, and overshadowed by the cliffs of the Gemmi Pass (7,641 ft.; *q.v.*) leading over to the Bernese Oberland, are the Baths of Leuk (*Leukerbad or Loèche les Bains*). They have only 562 permanent inhabitants, but are frequented in summer by visitors (largely French and Swiss) attracted by the hot mineral springs, which have a temperature from 117°–124°. The village is exposed to avalanches, by which it was destroyed in 1518, 1719 and 1756, but it is now protected by a strong embankment from a similar catastrophe.

LEUTHEN, a village of Prussian Silesia, 10 m. W. of Breslau, memorable as the scene of Frederick the Great's victory over the Austrians on December 5, 1757. The high road from Breslau to Lüben crosses the marshy Schweidnitz Water at Lissa, and immediately enters the rolling country about Neumarkt. Leuthen itself stands some 4,000 paces south of the road, and a similar distance south again lies Sagschütz, while Nypern, on the northern edge of the hill country, is 5,000 paces from the road. On Frederick's approach the Austrians took up a line of battle resting on the two last-named villages. Their whole position was strongly garrisoned and protected by obstacles, and their artillery was numerous though of light calibre. A strong outpost of Saxon cavalry was in Borne to the westward. Frederick had the previous day surprised the Austrian batteries at Neumarkt, and his Prussians, 33,000 to the enemy's 82,000, moved towards Borne and Leuthen early on the 5th. The Saxon outpost was rushed at in the morning mist, and, covered by their advanced guard on the heights beyond, the Prussians wheeled to their right. Prince Charles of Lorraine, the Austrian commander-in-chief, on Leuthen Church tower, could make nothing of Frederick's movements, and the commander of his right wing (Lucchesi) sent him message after message from Nypem and Gocklerwitz asking for help, which was eventually despatched. But the real blow was to fall on the left under Nadasdy. While the Austrian commander was thus wasting time, the Prussians were marching against Nadasdy in two columns, which preserved their distances with an exactitude which has excited the wonder of modern generations of soldiers; at the due place they wheeled into line of battle obliquely to the Austrian front, and in one great *échelon*,—the cavalry of the right wing foremost, and that of the left "refused,"—Frederick advanced on Sagschütz. Nadasdy, surprised, put a bold face on the matter and made a good defence, but he was speedily routed, and, as the Prussians advanced, battalion after battalion was rolled up towards Leuthen until the Austrians faced almost due south. The fighting in Leuthen itself was furious; the Austrians stood, in places, 100 deep, but the disciplined valour of the Prussians carried the village. For a moment the victory was endangered when Lucchesi came down upon the Prussian left wing from the north, but Driesen's cavalry, till then "refused," charged him in flank and scattered his troopers in wild rout. This stroke ended the battle. The retreat on Breslau became a rout almost comparable to that of Waterloo, and Prince Charles rallied, in Bohemia, barely 37,000 out of his 82,000. Ten thousand Austrians were left on the field, 21,000 taken prisoners (besides 17,000 in Breslau a little later), with 116 cannon. The Prussian loss in all was under 5,500.

See Carlyle, *Frederick*, bk. xviii. cap. x.; V. Ollech, *Friedrich der Grosse von Kolin bis Leuthen* (Berlin, 1858); Kutzen, *Schlacht bei Leuthen* (Breslau, 1851); and bibliography under SEVEN YEARS' WAR.

LEUTZE, EMANUEL (1816–1868), American artist, was born at Gmünd, Württemberg, on May 24, 1816, and as a child was taken by his parents to Philadelphia, where he early displayed talent as an artist. At the age of 25 he had earned enough to take him to Düsseldorf to study at the Royal Academy. In 1860 he was commissioned by the U.S. Congress to decorate a stairway in the Capitol at Washington, for which he painted a large composition, "Westward the Star of Empire takes its Way." His best-known work, popular through engraving, is "Washington crossing the Delaware," a large canvas containing a score of life-sized figures; it is now owned by the Metropolitan Museum of Art, New York. He died at Washington, D.C., on July 18, 1868.

LEVA, the monetary unit of Bulgaria, equivalent at par to a franc, being worth 19.295 cents; 25.22 leva equal one pound sterling.

The leva is based upon gold, a gold currency being adopted in 1893. Notes are issued by the Bulgarian national bank, and early in the current century were maintained on a par with gold. Defeat in the World War caused the collapse of the leva. It fell rapidly until 1924, and when the rout was stopped it was worth 0.725 cents. It remained at that level until the end of 1927.

The note issue expanded in conjunction with the leva's fall in value. In 1913, 189,000,000 leva were outstanding. By 1920, the volume had risen to 3,354 millions, and by 1924 to 4,530 millions. With *de facto* stabilization, a contraction followed to 3,902 millions at the end of 1927, but to effect *de jure* stabilization an external loan was needed and negotiations for this broke down early in 1928.

LEVANT, a name for the Mediterranean coastlands of Asia Minor and Syria, sometimes including the coast line from Greece to Egypt (from the Fr. participle of *lever*, to rise, meaning the East). In the 16th and 17th centuries the term "High Levant" was used of the Far East.

LEVANTER (occasionally confused with the Leveche), the name for a steady easterly wind experienced at Gibraltar and other parts of South Spain. A more general term for the wind is *Solano*.

LEVASSEUR, PIERRE EMILE (1828–1911), French economist, geographer and statistician, was born in Paris on Dec. 8, 1828. Educated in Paris, he taught in various high schools until 1872, when he was appointed professor of geography, history and statistics in the Collège de France; later he became also professor at the Conservatoire des arts et métiers and at the École libre des sciences politiques. Levasseur was one of the founders of the study of commercial geography, and became a member of the council of public instruction, president of the French society of political economy and honorary president of the French geographical society. He died on July 10, 1911. He wrote a series of important works on the history of the French working-classes.

LEVECHE, the Spanish local name for the *sirocco* (*q.v.*). It is a hot, dry wind varying from south-east to south-west and is chiefly experienced along the south-east coast from Valencia to Malaga; its worst effects usually extend some 10 m. inland.

LEVÉE, a reception or assembly held by the British sovereign or his representative in the forenoon or early afternoon, at which men only are present. (Fr. *lever*, to rise.) Under the *ancien régime* in France the *lever* of the king was regulated, especially under Louis XIV., by elaborate etiquette, and the various divisions of the ceremonial followed the stages of the king's rising from bed. The *petit lever* began when the king had washed and said his daily offices, to this were admitted the princes of the blood and certain high officers of the household; then followed the *première entrée*, to which came the secretaries and other officials and those having the *entrée;* these were received by the king in his dressing-gown. Finally, at the *grand lever*, the remainder of the household, the nobles and gentlemen of the court were received; the king by that time was shaved, had changed his linen and was in his wig.

The word is also applied to a natural or artificial embankment which keeps a river in its channel. *See* RECLAMATION OF LAND; RIVER ENGINEERING; and MISSISSIPPI RIVER.

LEVELLERS, an important political party in England during the period of the Civil War and the Commonwealth. The germ of the Levelling movement must be sought for among the Agitators (q.v.), men of strong republican views. The name Leveller first appears in a letter of Nov. 1 1647: "They have given themselves a new name; viz., Levellers, for they intend to sett all things straight, and rayse a parity and community in the kingdom."

The Levellers first became prominent in 1647 during the protracted and unsatisfactory negotiations between the King and the Parliament, and while the relations between the latter and the army were very strained. They were mainly found among soldiers; they were opposed to the existence of kingship, and they feared that Cromwell and the other Parliamentary leaders were too complaisant in their dealings with Charles. Led by John Lilburne (q.v.) they presented a manifesto, *The Case of the Army truly stated,* to the commander-in-chief, Lord Fairfax, in Oct. 1647. In this they demanded a dissolution of Parliament within a year and substantial changes in the constitution of future Parliaments, which were to be regulated by an unalterable "law paramount." In a second document, *The Agreement of the People,* they expanded these ideas, which were discussed by Cromwell, Ireton, and other officers on the one side, and by John Wildman, Thomas Rainsborough, and Edward Sexby for the Levellers on the other. But no settlement was made, and in Nov. 1647, just after Charles's flight from Hampton Court to Carisbrooke, the Levellers were responsible for the mutiny of two regiments at Corkbush Field, near Ware, which was promptly suppressed by Cromwell.

Early in 1649, just after the death of the King, the Levellers renewed their activity. In a pamphlet, *England's New Chains,* Lilburne asked for the dissolution of the council of State and for a new and reformed parliament. He followed this up with the *Second Part of England's New Chains;* his writings were declared treasonable by Parliament, and in March 1649 he and three other leading Levellers, Richard Overton, William Walwyn and Prince were arrested. The discontent which was spreading in the army was fanned when certain regiments were ordered to proceed to Ireland, and in April 1649 there was a meeting in London; but this was quickly put down by Fairfax and Cromwell, and its leader, Robert Lockyer, was shot. Risings at Burford and at Banbury were also suppressed without any serious difficulty, and the trouble with the Levellers was practically over. The distinguishing mark of the Leveller was a sea-green ribbon.

Another form of the same movement was the assembling of about 50 men on St. George's Hill near Oatlands in Surrey. In April 1649 these "True Levellers" or "Diggers," as they were called, took possession under the direction of Winstanley of some unoccupied ground which they began to cultivate. They were, however, soon dispersed, and their leaders were arrested and brought before Fairfax, when they took the opportunity of denouncing landowners.

In 1724 there was a rising against enclosures in Galloway, and a number of men who took part therein were called Levellers or Dykebreakers (A. Lang, *History of Scotland,* vol. iv.). The word was also used in Ireland during the 18th century to describe a secret revolutionary society similar to the Whiteboys.

LEVELLING: *see* SURVEYING.

LEVEN, ALEXANDER LESLIE, 1ST EARL OF (*c.* 1580–1661), Scottish general, was the son of George Leslie, captain of Blair-in-Athol. He fought under Sir Horace Vere in the Low Countries, and afterwards (1605) under Charles IX. and Gustavus Adolphus of Sweden. In 1626 Leslie had risen by merit to the rank of lieutenant-general, and had been knighted by Gustavus. In 1628 he defended Stralsund against Wallenstein, and in 1630 seized the island of Rügen in the name of the king of Sweden. Leslie was present at Gustavus's last battle at Lützen. Leslie cherished his old commander's memory to the day of his death. He continued as a general officer in the Swedish army for some years, was promoted in 1636 to the rank of field marshal, and continued in the field until 1638, when events recalled him to his own country. He had married long before this—in 1637 his eldest son was made a colonel in the Swedish army—and he had managed to keep in touch with Scottish affairs.

As the foremost Scottish soldier of his day he was naturally nominated to command the Scottish army in the impending war with England, a post which, resigning his Swedish command, he accepted with a glad heart, for he was an ardent Covenanter and had caused "a great number of our commanders in Germany subscryve our covenant" (Baillie's *Letters*). On leaving Sweden he brought back his arrears of pay in the form of cannon and muskets for his new army. One of his first exploits was to take the castle of Edinburgh by surprise, without the loss of a man. He commanded the Scottish army at Dunse Law in May of that year, and in 1640 he invaded England, and defeated the king's troops at Newburn on the Tyne, which gave him possession of Newcastle and of the open country as far as the Tees.

At the treaty with the king at Ripon, Leslie was one of the commissioners of the Scottish parliament, and when Charles visited Edinburgh Leslie entertained him magnificently. Charles created him, by patent dated Holyrood, October 11, 1641, earl of Leven and Lord Balgonie, and made him captain of Edinburgh Castle and a privy councillor. The parliament recognized his services by a grant, and, on his resigning the lord generalship, appointed him commander of the permanent forces. Leven used his great influence in support of a proposal to raise a Scottish army to help the elector palatine in Germany, but the Ulster massacres gave this force, when raised, a fresh direction, and Leven himself accompanied it to Ireland as lord general. He did not remain there long, for the Great Rebellion (*q.v.*) had begun in England, and negotiations were opened between the English and the Scottish parliaments for mutual armed assistance. Leven accepted the command of the new forces raised for the invasion of England.

The military operations preceding Marston Moor are described under GREAT REBELLION, and the battle itself under its own heading. After the battle the allied forces separated, Leven bringing the siege of Newcastle to an end by storming it. In 1645 the Scots were less successful, though their operations ranged from Westmorland to Hereford. Leven's difficulties became pronounced when in 1646 Charles took refuge with the Scottish army. The king remained with Leven until he was handed over to the English parliament in 1647, and Leven constantly urged him to take the covenant and to make peace. Leven was now old and infirm, and though retained as nominal commander-in-chief saw no further active service. When he did resign he was appointed lord general of all new forces that might be raised for the defence of Scotland. The occasion soon came, for Cromwell annihilated the Scottish invaders at Preston and Uttoxeter, and thereupon Argyll assumed political and Leven military control at Edinburgh. But he resigned the effective command to his subordinate (*see* NEWARK, DAVID LESLIE), in whom he had entire confidence.

After the execution of Charles I. the war broke out afresh, and this time the "godly" party acted with the royalists. Leven at last fell into the hands of a party of English dragoons in August 1651, and with some others was sent to London. He remained incarcerated in the Tower for some time, till released on finding securities for £20,000, upon which he retired to his residence in Northumberland. While on a visit to London he was again arrested, for a technical breach of his engagement, but by the intercession of the queen of Sweden he obtained his liberty. He was freed from his engagements in 1654, and retired to his seat at Balgonie in Fifeshire, where he died at an advanced age in 1661.

See Sir W. Fraser, *The Melvilles, Earls of Melville, and the Leslies, Earls of Leven* (1890); and the *Leven and Melville Papers,* edited by the Hon. W. H. Leslie-Melville for the Bannatyne Club (1843).

LEVEN, a town in Fifeshire, Scotland. Pop. (1921) 7,180. It is situated on the Firth of Forth, at the mouth of the Leven, 5¼ m. E. by N. of Thornton Junction by the L.N.E. railway. The old town cross has been erected in the grounds of the peoples' institute. The industries are numerous, comprising flax-spinning, paper-making, seed-crushing and rope-making, besides salt-works, engineering works, a saw-mill and a bone-dust mill. The town is a holiday resort, and the golf-links extending for 2 m. to Lundin are among the best in Scotland. There are collieries in the neigh-

bourhood. Innerleven, on the opposite side of the Leven, is combined in a burgh with Buckhaven and Methil. Two miles N.E. is Lundin Mill and Drumochie, usually called LUNDIN, at the mouth of Kiel Burn, with a station on the Links. Early occupation is suggested by three fine monoliths, and in the vicinity are the remains of an old house of the Lundins, dating from the reign of David II. One mile east of Lundin lies LARGO (pop. of parish 3,214), consisting of Upper Largo, or Kirkton of Largo, and Lower Largo. A statue of Alexander Selkirk, or Selcraig (1676–1721), the prototype of "Robinson Crusoe," who was born here, was erected in 1886. Sir John Leslie (1766–1832), the natural philosopher, Admiral Sir Philip Durham, commander-in-chief at Portsmouth from 1836 to 1839, and Sir Andrew Wood, who sailed the "Great Michael," the largest ship of its time, were natives of Largo. When the last named was past active service he had a canal cut from this house to the parish church, to which he was rowed every Sunday in an eight-oared barge.

LEVEN, LOCH, a lake of Kinross-shire, Scotland. It is 3⅔ m. long and 2⅔ m. broad, and is situated near the south and east boundaries of the shire, 350 ft. above sea-level. The mean depth is less than 15 ft., with a maximum of 83 ft., the lake being thus one of the shallowest in Scotland. It drains the county and is itself drained by the Leven. It is famous for the Loch Leven trout. The loch contains seven islands. Upon St. Serf's, the largest, which commemorates the patron saint of Fifeshire, are the ruins of the Priory of Portmoak—so named from St. Moak, the first abbot—the oldest Culdee establishment in Scotland. Some time before 961 it was made over to the bishop of St. Andrews, and shortly after 1144 a body of canons regular was established on it in connection with those at St. Andrews. On Castle Island is a castle, dating from the 13th century and occasionally used as a royal residence, which is said to have been in the hands of the English for a time, from whom it was delivered by Wallace. It replaced a still earlier stronghold.

After successfully withstanding Edward Baliol's siege in 1335, it was granted by Robert II. to Sir William Douglas of Lugton and was the prison at various periods of Robert II.; of Alexander Stuart, earl of Buchan, "the Wolf of Badenoch"; Archibald, earl of Douglas (1429); Patrick Graham, archbishop of St. Andrews (who died, still in bondage, on St. Serf's island in 1478), and of Mary, queen of Scots. She signed her abdication within its walls on July 4, 1567, and effected her escape on May 2, 1568. The keys of the castle, which were thrown into the loch during her flight, were found and are preserved at Dalmahoy in Midlothian. Support of Mary's cause had involved Thomas Percy, 7th earl of Northumberland (b. 1528). He too was lodged in the castle in 1569, and after three years' imprisonment was handed over to the English, by whom he was beheaded at York in 1572. The proverb that "Those never got luck who came to Loch Leven" sums up the history of the castle. The causeway connecting the isle with the mainland was long submerged too deeply for use, but reclamation operations in 1826–36 almost brought it into view again.

LEVEN AND MELVILLE, EARLS OF. The family of Melville which holds these two earldoms is descended from Sir John Melville of Raith, Fifeshire, who was executed for high treason on Dec. 13, 1548; he left with other children a son Robert (1527–1621), who in 1616 was created a lord of parliament as Lord Melville of Monymaill. Melville had represented Mary, queen of Scots, at the English court, and he had filled several important offices in Scotland under her son James VI. George (*c.* 1634–1707), 4th lord, was implicated in the Rye House plot, took refuge in the Netherlands in 1683, but returned to England after the revolution of 1688 and was appointed secretary for Scotland by William III. in 1689, being created earl of Melville in the following year. He was president of the Scottish privy council, but he was deprived of his office by Anne. His son David, 2nd earl of Melville (1660–1728), fought for William at Killiecrankie and elsewhere, and as commander-in-chief of the troops in Scotland he dealt promptly and effectively with the attempted Jacobite rising of 1708. In 1712, however, his office was taken from him, and he died on the 6th of June 1728

LEVER, CHARLES JAMES (1806–1872), Irish novelist of English descent, second son of James Lever, a Dublin architect and builder, was born in the Irish capital on Aug. 31, 1806. His escapades at Trinity college, Dublin (1823–28), whence he took the degree of M.B. in 1831, form the basis of that vast cellarage of anecdote from which all the best vintages in his novels are derived. The inimitable Frank Webber in *Charles O'Malley* (spiritual ancestor of Foker and Mr. Bouncer) was a college friend, Robert Boyle, later on an Irish parson. Lever and Boyle sang ballads of their own composing in the streets of Dublin, after the manner of Fergusson or Goldsmith, filled their caps with coppers and played many other pranks embellished in the pages of *O'Malley, Con Cregan* and *Lord Kilgobbin.* Before seriously embarking upon the medical studies for which he was designed, Lever visited Canada as an unqualified surgeon on an emigrant ship, and has drawn upon some of his experiences in *Con Cregan, Arthur O'Leary* and *Roland Cashel.* Arrived in Canada he plunged into the backwoods, was affiliated to a tribe of Indians and had to escape at the risk of his life, like his own Bagenal Daly.

Back in Europe, he travelled in the guise of a student from Göttingen to Weimar (where he saw Goethe), thence to Vienna; he loved the German student life with its beer, its fighting and its fun, and several of his merry songs, such as "The pope he loved a merry life" (greatly envied by Titmarsh), are on *Student-lied* models. His medical degree admitted him to an appointment from the Board of Health in Co. Clare and then as dispensary doctor at Port Stewart, but the liveliness of his diversions as a country doctor seems to have prejudiced the authorities against him. In 1833 he married his first love, Catherine Baker, and in Feb. 1837, after varied experiences, he began running *The Confessions of Harry Lorrequer* through the pages of the recently established *Dublin University Magazine.* Before *Harry Lorrequer* appeared in volume form (1839), Lever had settled on the strength of a slight diplomatic connection as a fashionable physician in Brussels (16, Rue Ducale). *Lorrequer* was merely a string of Irish and other stories good, bad and indifferent, but mostly rollicking, and Lever, who strung together his anecdotes late at night after the the serious business of the day was done, was astonished at its success. "If this sort of thing amuses them, I can go on for ever." Brussels was indeed a superb place for the observation of half-pay officers, such as Major Monsoon (Commissioner Meade), Captain Bubbleton and the like, who terrorized the *tavernes* of the place with their endless peninsular stories, and of English society a little damaged, which it became the specialty of Lever to depict. He sketched with a free hand, wrote, as he lived, from hand to mouth, and the chief difficulty he experienced was that of getting rid of his characters who "hung about him like those tiresome people who never can make up their minds to bid you good night." Lever had never taken part in a battle himself, but his next three books, *Charles O'Malley* (1841), *Jack Hinton* and *Tom Burke of Ours* (1843), written under the spur of the writer's chronic extravagance, contain some of the most animated battle-pieces on record. Condemned by the critics, Lever had completely won the general reader from the Iron Duke himself downwards.

In 1842 he returned to Dublin to edit the *Dublin University Magazine,* and gathered round him a typical coterie of Irish wits (including one or two hornets) such as the O'Sullivans, Archer Butler, W. Carleton, Sir William Wilde, Canon Hayman, D. F. McCarthy, McGlashan, Dr. Kenealy and many others. At his house at Templeogue he entertained Thackeray, and the Waterloo episode in *Vanity Fair* is said to have been suggested by the conversation there. But the "Galway pace," the display he found it necessary to maintain at Templeogue, the stable full of horses, the cards, the friends to entertain, the quarrels to compose and the enormous rapidity with which he had to complete *Tom Burke, The O'Donoghue* and *Arthur O'Leary* (1845), made his native land an impossible place for Lever to continue in. In 1845 he resigned his editorship and went back to Brussels, whence he started upon an unlimited tour of Central Europe in a family coach. Now and again he halted for many months, and entertained to the limit of his resources in some ducal castle

or other which he hired for an off season. Thus at Riedenburg, near Bregenz, in Aug. 1846, he entertained Charles Dickens and his wife and other well-known people. Like his own *Daltons* or *Dodd Family Abroad* he travelled continentally, from Carlsruhe to Como, from Como to Florence, from Florence to the Baths of Lucca and so on, and his letters home are the litany of the literary remittance man, his ambition now limited to driving a pair of novels abreast without a diminution of his standard price for serial work ("£20 a sheet"). In the *Knight of Gwynne*, a story of the Union (1847), *Con Cregan* (1849), *Roland Cashel* (1850) and *Maurice Tiernay* (1852) we still have traces of his old manner; but he was beginning to lose his original joy in composition.

Lever's *fond* of sadness began to cloud the animal joyousness of his temperament. Formerly he had written for the happy world which is young and curly and merry; now he grew fat and bald and grave. But, depressed in spirit as he was, his wit was unextinguished; he was still the delight of the *salons* with his stories, and in 1867, after a few years' experience of a similar kind at Spezia, he was cheered by a letter from Lord Derby offering him the more lucrative consulship of Trieste. "Here is six hundred a year for doing nothing, and you are just the man to do it." The six hundred could not atone to Lever for the lassitude of prolonged exile in a place he came to dislike heartily. He had unscrupulous friends who assured him that his last efforts were his best. They include *The Fortunes of Glencore* (1857), *Tony Butler* (1865), *Luttrell of Arran* (1865), *Sir Brooke Fosbrooke* (1866), *Lord Kilgobbin* (1872) and the table-talk of *Cornelius O'Dowd*, originally contributed to Blackwood His depression, partly due to incipient heart disease, was confirmed by the death of his wife (April 23, 1870), to whom he was tenderly attached. He died at Trieste on June 1, 1872.

Trollope praised Lever's novels highly when he said that they were just like his conversation. He was a born raconteur, and had in perfection that easy flow of light description which without tedium or hurry leads up to the point of the good stories of which in earlier days his supply seemed inexhaustible. With little respect for unity of action or conventional novel structure, his brightest books, such as *Lorrequer, O'Malley* and *Tom Burke*, are in fact little more than recitals of scenes in the life of a particular "hero," unconnected by any continuous intrigue. The type of character he depicted is for the most part elementary. His women are mostly rouées, romps or Xanthippes; his heroes have too much of the Pickle temper about them and fall an easy prey to the serious attacks of Poe or to the more playful gibes of Thackeray in *Phil Fogarty* or Bret Harte in *Terence Deuville*. This last is a perfect bit of burlesque. Terence exchanges 19 shots with the Hon. Captain Henry Somerset in the glen. "At each fire I shot away a button from his uniform. As my last bullet shot off the last button from his sleeve, I remarked quietly, 'You seem now, my lord, to be almost as ragged as the gentry you sneered at,' and rode haughtily away." And yet these careless sketches contain such haunting creations as Frank Webber, Major Monsoon and Micky Free, "the Sam Weller of Ireland." Falstaff is alone in the literature of the world; but if ever there came a later Falstaff, Monsoon was the man. As for Baby Blake, is she not an Irish Di Vernon? The critics may praise Lever's thoughtful and careful later novels as they will, but *Charles O'Malley* will always be the pattern of a military romance.

The chief authorities are the *Life*, by W. J. Fitzpatrick (1879), and the *Letters*, ed. in 2 vols. by Edmund Downey (1906), neither of which, however, enables the reader to penetrate below the surface. *See* also Dr. Garnett in *Dict. Nat. Biog*; *Dublin Univ. Mag.* (1880), 465 and 570; Anthony Trollope's *Autobiography* (1883); *Blackwood* (Aug. 1862); *Fortnightly Review*, vol. xxxii.; Andrew Lang, *Essays in Little* (1892); W. E. Henley, *Views and Reviews* (1890), Hugh Walker, *Literature of the Victorian Era* (1910); *The Bookman Hist. of English Literature* (1906), p. 467; *Bookman* (June 1906; portraits). A library edition of the novels in 37 vols. appeared 1897–99 under the superintendence of Lever's daughter, Julie Kate Neville. (T. S.; X.)

LEVER, a mechanical device for raising bodies (*see* MECHANICS).

LEVER BROTHERS LIMITED. This British joint stock soap manufacturing company was founded by the late William Hesketh Lever, first Viscount Leverhulme (*q.v.*).

In 1887 Lever bought 52ac. of land near Birkenhead and founded Port Sunlight. In 1889 manufacture was begun in the first soapery, a comparatively small factory; in 1928 the Port Sunlight works covered an area of 287ac. and employed about 7,000 people.

In 1928 Lever Brothers and their associated companies did much more than manufacture soap. Their interests were divided into three main parts: (1) the production of soap of many kinds and allied products; (2) the production of raw materials, including the produce of tropical plantations and whaling stations and oil and cake mills at home and abroad; (3) edible produce, including fish, canned goods and margarine.

It had been an early ambition of the founder of the business to make it independent of outside sources of raw materials, and a first step towards this position was taken in 1905 with the acquisition of 300,000 acres of land in the British Solomons for the cultivation of the coco-palm. In 1911, a concession was granted by the Belgian Government for the development of several million acres of the Belgian Congo; and the consolidation of the company's interests in West Africa was completed in 1920 by the purchase of the historic Niger Company, Limited The re-organization of the soap trade in Great Britain began with the purchase in 1906 of Hodgson & Simpson, Limited, of Wakefield, and of the Vinolia Company, Limited, of London, and, in 1908, of R. S. Hudson, Ltd. of Liverpool and West Bromwich. Between that year and the World War the following British soap-making firms were added to the list of Lever Brothers' associated companies: Edward Cook & Co. Ltd., of London; Barrington & Sons Ltd, of Dublin; Ogston & Tennant Ltd of Aberdeen and Renfrew; Christopher Thomas & Brothers Ltd, of Bristol; Wilkie & Soames Ltd, of London; and A. & F. Pears Ltd

During 1917–1924 a number of other companies were acquired, including such important firms as Joseph Crosfield & Sons Ltd; the Erasmic Co. Ltd.; William Gossage & Sons Ltd; Joseph Watson & Sons Ltd.; John Knight Ltd; and the International Icilma Trading Co. Ltd. Outside the soap industry, war-time and post-war developments have included the establishment of the margarine business of Planters Foods Ltd. at Bromborough, Cheshire, the fishing and fish distributing business of MacFisheries Limited, and the acquisition of the chocolate manufacturing business of Delecta Ltd., of Watford, Hertfordshire.

The paid-up capital of the company (1928) was £56,627,546, and in addition there was £7,461,577 of debenture stock. Taking into account investments in certain associated companies, the total capital employed in the business is more than £70,000,000. The turnover is between £70,000,000 and £80,000,000 a year

(L. C. M.)

LEVERET: *see* HARE.

LEVERHULME, WILLIAM HESKETH LEVER, 1ST VISCOUNT (1851–1925), British man of business born at Bolton, Lancs, on Sept. 19, 1851, was the son of James Lever, a grocer. His education, received at the Bolton Church Institute, was cut short in 1867 when he went into his father's wholesale warehouse as an apprentice In 1877, having foreseen that important economies in transport of goods could be effected by opening a branch of the business in Wigan, he established a centre there, which ultimately became more profitable than the Bolton headquarters. By 1884 this had ceased to interest him; the fact that he chose soap for his activities was an accident of his early upbringing; salesmanship in itself was what interested him He leased a small and unsuccessful soapworks at Warrington, and turned it into a nation-wide business His success was largely due to widespread advertising and a flair for the requirements of the consumer, whose point of view he never forgot He found a site for the necessary expansion of the business near Bebington, Cheshire, where on Bromborough Pool Mrs. Lever on March 3, 1888, cut the first sod for the foundations of Port Sunlight, the now famed model industrial village, a conspicuous example of successful town planning.

The firm's expansion overseas has become world-wide by his system of associated companies, which in 1925 numbered 250

Through Bromborough Pool and the Mersey, Lord Leverhulme had from Port Sunlight secured access by water to London and to British ports generally for home trade, and to the waterways of the world for his exports, as well as to the sources of the raw materials for soap manufacture. Mr. Lever and his brother, before they moved to Port Sunlight, had determined that their employees should share in their prosperity. The prosperity sharing pledge was primarily redeemed in the creation of Port Sunlight village with its abundant amenities, in the spaciousness of the factory area and in the arrangements now comprehended in the term "factory workers' welfare." Those who lived in the village further enjoyed "prosperity-sharing rents," based on the cost of maintenance repairs and renewals, the interest on the capital expended being a charge on the company's profits. The same principle was applied to works welfare expenses, beginning with a pensions scheme called the Employes' Benefit Fund, long service awards, cottage hospital, holiday club, but including in later days the co-partnership scheme and the many benefits flowing from it, *e.g.*, free insurance policies, unemployment and sickness benefits, staff college training and scholarships.

In 1906 an attack was directed by a powerful Press organization against an arrangement made by Mr. Lever with some other soap makers, which was mistakenly denounced as a soap trust. Legal action was taken, and the imputations withdrawn. In 1906 he became Liberal M P. for Wirral.

In 1909 Lever launched his scheme of co-partnership with employees. This scheme was typical of the man, and perhaps hardly a practicable model for general use. The complete autocrat, his generosity stopped short of any share in management. The scheme amounted to an annual gift out of his own pocket as sole ordinary shareholder. In 1911 he was made a baronet; in 1913 Lady Lever died; she is commemorated by the Lady Lever Memorial art gallery.

He was raised to the peerage in 1917 as Baron Leverhulme of Bolton-le-Moors. He received a viscounty in 1922.

In 1918 Lord Leverhulme advocated the running of machinery in factories in double shifts of six hours in order to absorb the unemployed and to increase production at a lower cost. (*See* his book *The Six-Hour Day and Other Industrial Questions.*) He now bought from Col. Duncan Matheson the Island of Lewis, acquiring later North and South Harris also. He spent large sums in a sincere effort to extend and develop the fishing industry and to help the islanders in other ways, but lack of support led to the abandonment of his schemes as far as Lewis was concerned; and he gave the town of Stornoway, including Lewis Castle and its grounds, to the people of Stornoway. He continued his developments in Harris, where more local appreciation was shown, until his death One of Leverhulme's personal enterprises for the economic development of his Hebridean properties was the opening or acquisition in 1919 of numerous retail fish shops, to serve as an outlet for the fishing industry of Lewis and Harris.

He died on May 7, 1925.

See *Viscount Leverhulme,* by his son (1925).

LEVERRIER, URBAIN JEAN JOSEPH (1811–1877), French astronomer, was born at St. Lô in Normandy on March 11, 1811. His father made great efforts to send him to Paris, where a brilliant examination gained him, in 1831, admittance to the École Polytechnique. The distinction of his career there was rewarded with a free choice amongst the departments of the public service open to pupils of the school. He selected the administration of tobaccos, and gave striking proof of ability in two papers on the combinations of phosphorus with hydrogen and oxygen, published in *Annales de Chimie et de Physique* (1835 and 1837). The place of teacher of astronomy at the École Polytechnique falling vacant in 1837, it was offered to and accepted by Leverrier, who, "docile to circumstance," instantly abandoned chemistry, and directed the whole of his powers to celestial mechanics. Pursuing the investigations of Laplace, he demonstrated with greater rigour the stability of the solar system, and calculated the limits within which the eccentricities and inclinations of the planetary orbits vary. This remarkable début excited much attention, and, on the recommendation of F. Arago, he took in hand the theory of Mercury, producing, in 1843, vastly improved tables of that planet. The perturbations of the comets discovered, the one by H. A. E. A. Faye in 1843, the other by Francesco de Vico a year later, were minutely investigated by Leverrier. Recalled once more, by the summons of Arago, to planetary studies, he was this time invited to turn his attention to Uranus. Step by step he advanced to the great discovery which has immortalized his name. Carefully sifting all the known causes of disturbance, he showed that one previously unknown had to be reckoned with, and on Sept. 23, 1846, the planet Neptune was discerned by J. G. Galle (d. 1910) at Berlin, within one degree of the spot Leverrier had indicated. (*See* NEPTUNE.)

This memorable achievement was greeted with an outburst of public enthusiasm. Academies vied with each other in enrolling Leverrier among their members; the Royal Society awarded him the Copley medal; the king of Denmark sent him the order of the Dannebrog; he was named officer in the Legion of Honour, and preceptor to the comte de Paris; a chair of astronomy was created for his benefit at the Faculty of Sciences; he was appointed adjunct astronomer to the Bureau of Longitudes. On Jan. 30, 1854, he succeeded Arago as director of the Paris observatory. The institution had fallen into a state of inefficiency and Leverrier placed it on a totally new footing. His uncompromising measures and unconciliatory manner of enforcing them raised a storm only appeased by his removal on Feb. 5, 1870. On the death of his successor Delaunay (1816–1872), he was reinstated by Thiers, but with authority restricted by the supervision of a council. In the midst of these disquietudes, he executed a task of gigantic proportions. This was nothing less than the complete revision of the planetary theories, followed by a laborious comparison of results with the most authentic observations, and the construction of tables representing the movements thus corrected. Three weeks after he had affixed his signature to the printed sheets of the theory of Neptune he died at Paris on Sept. 23, 1877. Leverrier's aim was the elaboration of the scheme of the heavens traced out by Laplace in *Mécanique céleste,* and the discovery of Neptune with which his name is popularly identified was only incidental. He twice received the gold medal of the Royal Astronomical Society, London (1868, 1876).

The *Annales de l'Observatoire de Paris,* the publication of which was set on foot by Leverrier, contain, in vols. i.–vi. (*Mémoires*) (1855–61) and x.–xiv. (1874–77), his theories and tables of the several planets. In vol. i. will be found, besides his masterly report on the observatory, a general theory of secular inequalities, in which the development of the disturbing function was carried further than had previously been attempted. His planetary and solar tables were adopted by the *Nautical Almanac,* as well as by the *Connaissance des temps.*

The memoirs and papers communicated by him to the Academy were summarized in *Comptes rendus* (1839–76), and the more important published in full either separately or in the *Conn. des temps* and the *Journal des mathématiques.* That entitled *Développemens sur différents points de la théorie des perturbations* (1841), was translated in part xviii. of Taylor's *Scientific Memoirs.*

LEVERTIN, OSCAR IVAN (1862–1906), Swedish poet and man of letters, was born of Jewish parents at Norrköping on July 17, 1862. He received his doctorate in letters at Upsala in 1887, and was subsequently *docent* at Upsala, and later professor of literature at Stockholm. He began by being an extreme follower of the naturalist school, but on his return in 1890 from a two years' residence in Davos he wrote, in collaboration with the poet C. G. Verner von Heidenstam (b. 1859) a novel, *Pepitas bröllop* (1890), which was a direct attack on naturalism. His later volumes of short stories, *Rococonoveller* and *Sista noveller,* are fine examples of modern Swedish fiction. The lyrical beauty of his poems, *Legender och visor* (1891), placed him at the head of the romantic reaction in Sweden. In his poems entitled *Nya Dikter* (1894) he drew his material partly from mediaeval sources, and a third volume of poetry in 1902 sustained his reputation. His last poetical work (1905) was *Kung Salomo och Morolf,* poems founded on an eastern legend. As a critic he first attracted attention by his books on the Gustavian age of Swedish letters: *Teater*

och drama under Gustaf III. (1889), etc. At the time of his death (Sept. 22, 1906) he was working on his *Linné*, posthumously published, a fragment of a great work on Linnaeus.

LEVI, SYLVAIN (1863–), French orientalist, was born in Paris on March 28, 1863. Educated at the University of Paris, in 1886 he was appointed a lecturer at the school of higher studies in Paris. As special lecturer in Sanskrit he taught at the faculty of letters from 1889 to 1894 when he was appointed to a professorship at the Collège de France. In 1897 and 1898 he made tours of scientific research in India and Japan, and from 1921 to 1923 he travelled in India, Indo-China, Japan, Korea, Siberia and Russia. Prof. Levi became a director at the school of higher studies and a member of numerous societies, including the Royal Asiatic Society, the Linguistic Society and the Society of Jewish Studies. His works include *Le théâtre indien* (1890); *La doctrine du sacrifice dans les Brahmanas* (1898); *Le Népal* (1905–08); *Dans l'Inde* (1925); *L'Inde et le monde* (1925).

LEVIATHAN, the Hebrew name of a gigantic animal, apparently the sea or water equivalent of behemoth (*q.v.*). In Job xli. 15 it would seem to represent the crocodile, in Isaiah xxvii. 1 it is a crooked and piercing serpent, the dragon of the sea; *cf.* Psalms civ. 26. Apart from its scriptural usage, the word is applied to any gigantic marine animal. Hobbes adopted the name as the title of his principal work, applying it to "the multitude so united in one person . . . called a commonwealth. . . ."

LEVICO, town, province of Trento, Italy, 25 m. east of the town of Trento by rail, 1,660 ft. above sea level. Pop. (1921) 4,546 (town) 6,709 (commune). It is in the valley of the Brenta, which is known as the Val Sugana. Arsenical springs for both drinking and bathing rise on the Monte Fronte, 4,700 feet above sea level, and are brought down by pipes. Six m. E. is Roncegno with similar springs. Both places lie in beautiful surroundings: they were damaged during the World War, but have been rebuilt.

LEVIRATE. In ancient Hebrew usage when a man died without sons, his brother was required to marry the widow and get a son by her, who was counted the son of the dead man and so carried on the line. An analogous custom existed in Vedic times for it appears clearly "in the burial ritual of the Rigveda, that the brother-in-law of the dead man should marry the widow, probably only in cases where the dead had left no son and it was therefore imperative that steps should be taken to secure him offspring; for the Rigveda recognizes to the full the keen desire of the Vedic Indian for a child to perform his funeral rites" (*Cambridge History of India,* vol. i., p. 89, A. B. Keith, 1922). In the view of Sir James Frazer, the levirate is complementary to the sororate (*q.v.*), and originated in a particular form of group marriage, namely, in the marriage of a group of brothers to a group of sisters, but survived and assumed a different character in changed surroundings. (*Folklore of the Old Testament,* vol. ii. p. 339.) This view has been examined by Professor Westermarck who admits that it is very widespread but is so easily explained by existing conditions that it ought not to be regarded as a survival at all, for wives are inherited like other belongings. This is in accord with the view of people practising the custom: and in the beliefs attached to the importance of male issue, both on religious and on social grounds, we may find the explanation and the justification of the custom, without hypothetical reconstructions of the social history of mankind from the distorted, imperfectly understood and even, it is feared, inaccurately recorded customs of backward peoples whose chequered history is hid from us.

See Westermarck, *History of Human Marriage,* vol. iii. (1921).

LÉVIS (formerly Pointe Levi), the chief town of Lévis county, Quebec, Canada, situated on the precipitous south bank of the St. Lawrence, opposite Quebec city. Pop. (1921) 10,470. It is on the Canadian National railway. It contains the Lorne dock, a Dominion government graving dock, 445 ft. long, 100 ft. wide, with a depth on the sill of 26½ and 20½ ft. at high water, spring and neap tides respectively. It is an important centre of the river and transatlantic trade, and is connected by steam ferries with the city of Quebec. It is named after the maréchal duc de Lévis, the last commander of the French troops in Canada.

LEVITATION, the raising of a body in the air without mechanical means. The tradition of the levitation of the human body is ancient and wide-spread. In the *Puranas* of India there is an exact Sanskrit equivalent, *laghiman* (from *laghu,* light, Lat. *levis*), defined as "the preternatural power of making oneself light at will." The Buddhist *Suttas* describe a similar power. Salverte, in *The Philosophy of Magic,* says: "The enthusiastic disciples of Iamblichus (d. at Chalcis, *c.* A.D. 333) affirmed that when he prayed he was raised to the height of ten cubits from the ground." The most remarkable modern report of levitation is the story of Joseph of Cupertino (1603–1663), so named from a village in S. Italy between Brindisi and Otranto. After he was admitted to the Franciscan order it was said of him that "frequently he would be raised from his feet and remain suspended in the air. Since such occurrences in public caused much admiration and also disturbance in a community, Joseph for 35 years was not allowed to attend choir, but was ordered to remain in his room, where a private chapel was prepared for him." He practised extreme mortification and fasting. Of Daniel Dunglas Home (1833–1886) Mr. (later Sir William) Crookes F.R.S. writes in the *Quarterly Journal of Science* (Jan. 1874), of which he was editor: "On three separate occasions have I seen him raised completely from the floor of the room. . . . There are at least a hundred recorded instances of Home's rising from the ground, in the presence of as many separate persons, and I have heard from the lips of the three witnesses to the most striking occurrence of this kind (the Earl of Dunraven, Lord Lindsay and Captain C. Wynne) their own most minute accounts of what took place. . . . The accumulated testimony establishing Mr. Home's levitations is overwhelming." This striking occurrence took place at Ashley house, London, on Dec. 16, 1868. Home, believed to be in a trance, was carried out through one window and into another seven feet away, and 70 feet from the ground. Dr. R. Chambers and Dr. Lockhart Robinson were also convinced.

The appearance of levitation has been imitated by many stage magicians, Robert-Houdin among others, but obviously under wholly different conditions.

LEVITES, or sons of Levi (son of Jacob by Leah), a sacred caste in ancient Israel, the guardians of the temple service at Jerusalem.

Place in Ritual.—In the developed hierarchical system the ministers of the sanctuary are divided into distinct grades. All are "Levites" by descent, and are thus correlated in the genealogical and other lists, but the true priesthood is confined to the sons of Aaron, while the mass of the Levites are subordinate servants who are not entitled to approach the altar or to perform any strictly priestly function. All access to the Deity is restricted to the one priesthood and to the one sanctuary at Jerusalem; the worshipping subject is the nation of Israel as a unity, and the function of worship is discharged on its behalf by divinely chosen priests. The ordinary individual may not intrude under penalty of death; only those of Levitical origin may perform service, and they are essentially the servants and hereditary serfs of the Aaronite priests (*see* Num. xviii). But such a scheme finds no place in the monarchy; it presupposes a hierocracy under which the priesthood increased its rights by claiming the privileges which past kings had enjoyed; it is the outcome of a complicated development in Old Testament religion in the light of which it is to be followed (*see* HEBREW RELIGION).

We may distinguish three stages in this development. (*a*) An early period in which there was no *tribal* restriction on the priesthood or on offices connected with the sanctuary. Thus we find Micah consecrating one of his own sons as priest (Jud. xvii. 5), and Samuel seems to have been an Ephraimite by birth. The more menial offices connected with Solomon's temple were performed by the royal body-guard or by slaves especially dedicated ("Nethinim")—usually foreigners. At the same time there is evidence which suggests a distinct preference for Levites (*cf.* Jud. xvii. 13).

(*b*) A period in which all Levites, and Levites only, were eligible for the priesthood. This is represented in the literature of the Old Testament by Deuteronomy and Ezekiel. Both use the phrase "the priests, the Levites," though Ezekiel makes a distinction

between those who had ministered at the local sanctuaries (to him, as a Jerusalem priest, an illicit cult), and the sons of Zadok who were the proper attendants of the sanctuary at Jerusalem. The former are condemned to menial offices, while the higher duties are reserved for the latter (Ezek. xliii. 19, xliv. 10, 15). This is the position which would naturally follow on the centralisation of sacrifice in Jerusalem. Though we have no direct evidence to prove that Ezekiel's attempt to limit the priesthood proper to the family of Zadok succeeded, it is quite possible that this condition persisted till the promulgation of P.

(*c*) The last stage, in which the priesthood was confined to the family of Aaron. This is usually traced back to the time of Ezra, and was certainly the rule for the whole of the Greek and Roman periods. The term "Levite" now includes (through some fictitious genealogy) the former menial attendants, and the whole body of non-Aaronic Levites is now placed on the same level.

Origin of the Levites.—Biblical tradition is practically unanimous in tracing back the Levites to the third son of Jacob and Leah. But the earliest reference to the tribe as a tribe is found in Gen. xlix. 5–7, where, along with Simeon (*q. v.*), it is condemned as bloodthirsty and cruel. To the same traditional element probably belongs the story of the slaughter of the Shechemites by these two brothers (Gen. xxxiv. 25–30), and the language of Gen. xlix. 7 suggests that the tribe disappeared in the same way as Simeon. Further, certain Minaean inscriptions have been found in north Arabia (at El-Öla) in which the cognate word *lawi'a* (together with a feminine form) occurs in the simple sense of "priest." It has, then, been conjectured that the term originally implied occupation and not descent

At the same time the tradition of a common descent is so persistent that it is difficult to disregard it, and the Minaean parallel may be accidental. There seems no real reason to doubt the tradition which makes Moses and Aaron members of this tribe, and its special devotion to Yahweh, the God introduced by Moses to Israel, is illustrated by the story of the vengeance they took on the calf-worshippers at Sinai (Ex. xxxii. 26 *sqq.*). Since Moses seems to have derived his knowledge of the cult of Yahweh, not in Israel, but among the tribes of the north of the Sinai peninsula (Midianites, Kenites, etc.), it has been suggested that the Levites, as a tribe, belonged to a group which entered the country from the south, along with the Kenites and Danites, independently of the great invasion of the Israelites under Joshua. It accords with this theory that the first mention of a Levitical sanctuary in the north connects its establishment with the migration of the tribe of Dan

(S.A.C.; T.H.R.)

LEVITICUS, in the Bible, the third book of the Pentateuch. The name is derived from that of the Septuagint version (*τὸ λευ[ε]ιτικόν*) (*sc. βιβλιον*), though the English form is due to the Latin rendering *Leviticus* (sc. *liber*). As a descriptive title *Leviticus,* "the Levitical book," is not inappropriate to the contents of the book, which exhibits an elaborate system of sacrificial worship. In this connection, however, the term "Levitical" is used in a perfectly general sense, since there is no reference in the book itself to the Levites themselves.

The book of Leviticus presents a marked contrast to the two preceding books of the Pentateuch in that it is derived from one document only, viz., the Priestly Code (P), and contains no trace of the other documents J, E, or D (*see* BIBLE: *Old Testament,* "Higher and Historical Criticism") The dominant interest is priestly, and the contents are almost wholly legislative, not historical. But they are by no means homogeneous, and the occurrence of repetitions and divergencies, the variations of standpoint and practice, and, at times, the linguistic peculiarities, point no less clearly to diversity of origin.

I. **The Laws of Sacrifice.** Chap. i.–vii. This group of laws clearly formed no part of the original narrative of P since it interrupts the connection of chap. viii. with Exod. xl. This conclusion does not necessarily involve a late date for the laws themselves, many of which have the appearance of great antiquity, though their original form has been considerably modified. The collection falls into two divisions, (*a*) i.–vi. 7 (Heb. v. 26) and (*b*) vi. 8 (Heb. vi. 1)–vii., the former being addressed to the people and the latter to the priests. The laws contained in (*a*) refer to (1) burnt-offerings, i.; (2) meal-offerings, ii.; (3) peace-offerings, iii.; (4) sin-offerings, iv.; (5) trespass-offerings, v. 14–vi. 7 (Heb. v. 14–26). The laws in (*b*) cover practically the same ground, with the addition of certain regulations as to the shares of the priests. Originally the two groups must have been independent, for (*a*) the order is different, and (*b*) the laws in vi. 8–vii. are regularly introduced by the formula "This is the law of . . ." Most probably the second group was excerpted by the editor of chaps. i.–vii. from another collection for the purpose of supplementing the laws of i.–v., more especially on points connected with the functions and dues of the officiating priests. Both groups of laws, however, contain heterogeneous elements and their present form is the result of a long process of development.

Chaps. viii.–x. form the original sequel to Exod. xl. They describe (*a*) the consecration of Aaron and his sons, a ceremony which lasted seven days (viii.), and (*b*) the public worship on the eighth day, at which Aaron and his sons officiated for the first time as priests (ix.); then follow (*c*) an account of the death of Nadab and Abihu for offering strange fire (x. 1–5); (*d*) various regulations affecting the priests (12–15), and (*e*) an explanation, in narrative form, of the departure in ix. 15 from the rules for the sin-offering given in vi. 30 (16–20).

Chap. ix. describes the first solemn act of worship after the consecration of Aaron and his sons. The ceremony consists of (*a*) the offerings for Aaron, and (*b*) those for the congregation; then follows the priestly blessing (*v.* 22), after which Moses and Aaron enter the sanctuary, and on reappearing once more bless the people. The ceremony terminates with the appearance of the glory of Yahweh, accompanied by a fire which consumes the sacrifices on the altar. Apart from a few redactional glosses the chapter as a whole belongs to P. The punishment of Nadab and Abihu by death for offering "strange fire" (x. 1–5) forms a natural sequel to chap. ix. To this incident a number of disconnected regulations affecting the priests have been attached, of which the first, viz., the prohibition of mourning to Aaron and his sons (*vv.* 6, 7), alone has any connection with the immediate context. The second passage (*vv.* 8, 9), which prohibits the use of wine and strong drink to the priest when on duty, is clearly a later addition. In x. 16–20, we have an interesting example of the latest type of additions to the Hexateuch. According to ix. 15 (*cf.* v. 11) the priests had burnt the flesh of the sin-offering which had been offered on behalf of the congregation, although its blood had not been taken into the inner sanctuary (*cf.* iv. 1–21, vi. 26). Such treatment, though perfectly legitimate according to the older legislation (Exod. xxix. 14), seemed to a later redactor to demand an explanation, and this is furnished in the present section.

II. **The Laws of Purification.**—Chaps. xi.–xv. This collection of laws comprises four main sections relating to (1) clean and unclean beasts (xi.), (2) childbirth (xii.), (3) leprosy (xiii., xiv.), and (4) certain natural secretions (xv.). These laws, or *tōrōth,* are so closely allied to each other by their contents and literary form that they must originally have been one collection. The collection, however, has clearly undergone more than one redaction before reaching its final form. For chap. xii. which in *v.* 2 presupposes chap. xv. must originally have followed after that chapter, while the contents of the different sections exhibit clear traces of repeated revision. At the same time, it seems, like chaps. i.–vii., xvii.–xxvi., to have been formed independently of P and to have been added to that document by a later editor; for in its present position it interrupts the main thread of P's narrative, chap. xvi. forming the natural continuation of chap. x.; and, further, the inclusion of Aaron as well as Moses in the formula of address (xi. 1, xiii. 1, xiv. 33, xv. 1) is contrary to the usage of P.

Chap. xi. consists of two main sections, of which the first (*vv.* 1–23, 41–47) contains directions as to the clean and unclean animals which may or may not be used for food, while the second (*vv.* 24–40) treats of the defilement caused by contact with the carcasses of unclean animals (in *v.* 39 contact with clean animals after death is also forbidden), and prescribes certain rites of purification. Many scholars maintain that the first section is a mis-

placed portion of the Law of Holiness, but the evidence only justifies the assignment of *vv.* 43–45 to that code. The close resemblance of xi. 2–23 to Deut. xiv. 4–20 is best explained on the theory that both passages were derived separately from an earlier source. Chap. xii. prescribes regulations for the purification of a woman after the birth of (*a*) a male and (*b*) a female child. It has already been pointed out that this chapter would follow more suitably after chap. xv., with which it is closely allied in regard to subject-matter. The closing formula (*v.* 7) shows clearly that, as in the case of *vv.* 7–13 (*cf.* i. 14–17), the concessions in favour of the poorer worshipper are a later addition. In chaps. xiii., xiv., the regulations concerning leprosy fall readily into four main divisions: (*a*) xiii. 1–46*a*, an elaborate description of the symptoms common to the earlier stages of leprosy and other skin diseases; (*b*) xiii. 47–59, a further description of different kinds of mould or fungus-growth affecting stuffs and leather; (*c*) xiv. 1–32, the rites of purification to be employed after the healing of leprosy; and (*d*) xiv. 33–53, regulations dealing with the appearance of patches of mould or mildew on the walls of a house.

It may be regarded as certain that chap. xvi. consists of three main elements, only one of which was originally connected with the ceremonial of the Day of Atonement, and that it has passed through more than one stage of revision. The chapter consists of three independent sections: (1) *vv.* 1–4, 6, 12, 13, 34*b* (probably *vv.* 23, 24 also form part of this section), regulations to be observed by Aaron whenever he might enter "the holy place within the veil." These regulations are the natural outcome of the death of Nadab and Abihu (x. 1–5), and their object is to guard Aaron from a similar fate; the section thus forms the direct continuation of chap. x.; (2) *vv.* 29–34*a*, rules for the observance of a yearly fast day, having for their object the purification of the sanctuary and of the people; (3) *vv.* 5, 7–10, 14–22, 26–28, a later expansion of the blood ritual to be performed by the high priest when he enters the Holy of Holies, with which is combined the strange ceremony of the goat which is sent away into the wilderness to Azazel. No mention is made of the Day of Atonement in the pre-exilic period, and it is a plausible conjecture that the present law arose from the desire to turn the spontaneous fasting of Neh. ix. 1 into an annual ceremony; in any case directions as to the annual performance of the rite must originally have preceded *vv.* 29 *seq.* Possibly the omission of this introduction is due to the redactor who combined (1) and (2) by transferring the regulations of (1) to the ritual of the annual Day of Atonement. At a later period the ritual was further developed by the inclusion of the additional ceremonial contained in (3).

III. **The Law of Holiness.**—Chaps. xvii.–xxvi. The group of laws contained in these chapters has long been recognized as standing apart from the rest of the legislation set forth in Leviticus. For, though they display undeniable affinity with P, they also exhibit certain features which distinguish them from that document. The most noticeable of these is the prominence assigned to certain leading ideas and motives, especially to that of *holiness*. The idea of holiness, indeed, is so characteristic of the entire group that the title "Law of Holiness," first given to it by Klostermann (1877), has been generally adopted. The term "holiness" in this connection consists positively in the fulfilment of ceremonial obligations, and negatively in abstaining from the defilement caused by heathen customs and superstitions, but it also includes obedience to the moral requirements of the religion of Yahweh. On the literary side also the chapters are distinguished by the paraenetic setting in which the laws are embedded and by the use of a special terminology, many of the words and phrases occurring rarely, if ever, in P (for a list of characteristic phrases *cf.* S. R. Driver, *Lit. of O.T.*, p. 49). Further, the structure of these chapters, which closely resembles that of the other two Hexateuchal codes (Exod. xx. 22–xxiii. and Deut. xii.–xxviii.), may reasonably be adduced in support of their independent origin. All three codes contain a somewhat miscellaneous collection of laws; all alike commence with regulations as to the place of sacrifice and close with an exhortation. Lastly, some of the laws treat of subjects which have already been dealt with in P (*cf.* xvii. 10–14 and vii. 26 f., xix. 6–8 and vii. 15–18). It is hardly doubtful also that the group of laws which form the basis of chaps. xvii.–xxvi., besides being independent of P, represent an older stage of legislation than that code. For the sacrificial system of H (=Law of Holiness) is less developed than that of P, and in particular shows no knowledge of the sin- and trespass-offerings; the high priest is only *primus inter pares* among his brethren, xxi. 10 (*cf.* Lev. x. 6, 7, where the same prohibition is extended to all the priests); the distinction between "holy" and "most holy" things (Num. xviii. 8) is unknown to Lev. xxii. (Lev. xxi. 22 is a later addition). On the other hand the points of resemblance with P which this code presents us are mainly due to the compiler who combined H with P. But though it may be regarded as certain that H existed as an independent code, it cannot be maintained that the laws which it contains are all of the same origin or belong to the same age. The evidence rather shows that they were first collected by an editor before they were incorporated in P. Thus there is a marked difference in style between the laws themselves and the paraenetic setting in which they are embedded; and it is not unnatural to conjecture that this setting is the work of the first editor. It is generally recognized that H, in its present form, is incomplete. The original code must, it is felt, have included many other subjects now passed over in silence. These, possibly, were omitted by the compiler of P, because they had already been dealt with elsewhere, or they may have been transferred to other connections. Several other sections of P have, in fact, been assigned by scholars to H, but, with the exception of xi. 43 ff. and Num xv. 37–41, the evidence is not sufficient to warrant their inclusion in that collection.

The exact relation of H to Deuteronomy is hard to determine. That chaps. xvii.–xxvi. display a marked affinity to Deuteronomy cannot be denied. Like D, they lay great stress on the duties of humanity and charity both to the Israelite and to the stranger (Deut. xxiv.; Lev. xix.; compare also laws affecting the poor in Deut. xv.; Lev. xxv.), but in some respects the legislation of H appears to reflect a more advanced age than that of D, *e.g.*, the rules for the priesthood (chap. xxi.), the feasts (xxiii 9–20, 39–43), the Sabbatical year (xxv. 1–7, 18–22), weights and measures (xix. 35 f.). It must be remembered, however, that these laws have passed through more than one stage of revision and that the original regulations have been much obscured by later glosses and additions; it is, therefore, somewhat hazardous to base any argument on their present form, and, on the whole, it is more probable that the two codes are independent of one another. The relation of H to Ezekiel is also remarkably close, the resemblances between the two being so striking that many writers have regarded Ezekiel as the author of H. Such a theory, however, is excluded by the existence of even greater differences of style and matter, so that the main problem to be decided is whether Ezekiel is prior to H or vice versa. The following considerations undoubtedly suggest the priority of H: (1) there is no trace in H of the distinction between priests and Levites first introduced by Ezekiel; (2) Ezekiel xviii., xx., xxii., xxiii., appear to presuppose the laws of Lev. xviii–xx ; (3) the calendar of Lev. xxiii. represents an earlier stage of development than the fixed days and months of Ezek. xlv.; (4) the sin- and trespass-offerings are not mentioned in H (*cf.* Ezek. xl. 39, xlii. 13, xliv. 29, xlvi. 20); (5) the parallels to H, which are found especially in Ezek. xviii., xx., xxii., include both the paraenetic setting and the laws; and lastly, (6) a comparison of Lev. xxvi. with Ezekiel points to the greater originality of the former.

Chap. xvii. comprises four main sections which are clearly marked off by similar introductory and closing formulae: (1) *vv.* 3–7, prohibition of the slaughter of domestic animals, unless they are presented to Yahweh; (2) *vv.* 8, 9, sacrifices to be offered to Yahweh alone; (3) *vv.* 10–12, prohibition of the eating of blood; (4) *vv.* 13, 14, the blood of animals not used in sacrifice to be poured on the ground. The chapter as a whole is to be assigned to H. At the same time it exhibits many marks of affinity with P, a phenomenon most easily explained by the supposition that older laws of H have been expanded and modified by later

hands in the spirit of P. What remains after the excision of later additions, however, is not entirely uniform, and points to earlier editorial work on the part of the compiler of H. Chap. xviii. contains laws on prohibited marriages (*vv.* 6–18) and various acts of unchastity (*vv.* 19–23) embedded in a paraenetic setting (*vv.* 1–5 and 24–30), the laws being given in the 2nd pers. sing., while the framework employs the 2nd pers. plural. Chap. xix. is a collection of miscellaneous laws, partly moral, partly religious, of which the fundamental principle is stated in *v.* 2 ("Ye shall be holy"). The various laws are clearly defined by the formula "I am Yahweh," or "I am Yahweh your God," phrases which are especially characteristic of chaps. xviii.–xx. The first group of laws (*vv.* 3 f.) corresponds to the first table of the decalogue, while *vv.* 11–18 are analogous to the second table. Chap. xx. prohibits Molech worship, *vv.* 2–5, witchcraft, *vv.* 6 and 27, unlawful marriages and acts of unchastity, *vv.* 10–21. As in chap. xviii., the main body of laws is provided with a paraenetic setting, *vv.* 7, 8 and 22–24; it differs from that chapter, however, in prescribing the death penalty in each case for disobedience.

Chaps. xxi., xxii. contain a series of laws affecting the priests and offerings, viz., (1) regulations ensuring the holiness of (*a*) ordinary priests, xxi. 1–9, and (*b*) the chief priest, *vv.* 10–15; (2) a list of physical defects which exclude a priest from exercising his office, *vv.* 16–24; (3) the enjoyment of sacred offerings limited to (*a*) priests, if they are ceremonially clean, xxi. 1–9, and (*b*) members of a priestly family, *vv.* 10–16; (4) animals offered in sacrifice must be without blemish, *vv.* 17–25; (5) further regulations with regard to sacrifices, *vv.* 26–30, with a paraenetic conclusion, *vv.* 31–33. The fact that these chapters exhibit many striking points of context with P and the later strata of P can be best explained by the supposition that we have here a body of old laws which have been subjected to more than one revision. The nature of the subjects with which they deal is one that naturally appealed to the priestly schools, and owing to this fact the laws were especially liable to modification and expansion at the hands of later legislators who wished to bring them into conformity with later usage. Signs of such revision may be traced back to the compiler of H, but the evidence shows that the process must have been continued down to the latest period of editorial activity in connection with P.

Chap. xxiii., a calendar of sacred seasons, consists of two main elements which can easily be distinguished from one another, the one being derived from P and the other from H. To the former belongs the fuller and more elaborate description of *vv.* 4–8, 21, 23–28; to the latter, *vv.* 9–20, 22, 39–44. Characteristic of the priestly calendar are (1) the enumeration of "holy convocations," (2) the prohibition of all work, (3) the careful determination of the date by the day and month, (4) the mention of "the offerings made by fire to Yahweh," and (5) the stereotyped form of the regulations. The older calendar, on the other hand, knows nothing of "holy convocations," nor of abstinence from work; the time of the feasts, which are clearly connected with agriculture, is only roughly defined with reference to the harvest (*cf.* Exod. xxiii. 14 *sqq.*, xxxiv. 22; Deut. xvi. 9 *sqq.*). The calendar of P comprises (*a*) the Feast of Passover and the Unleavened Cakes, *vv.* 4–8; (*b*) a fragment of Pentecost, *v.* 21; (*c*) the Feast of Trumpets, *vv.* 23–25; (*d*) the Day of Atonement, *vv.* 26–32; and (*e*) the Feast of Tabernacles, *vv.* 33–36, with a subscription in *vv.* 37, 38. With these have been incorporated the older regulations of H on the Feast of Weeks, or Pentecost, *vv.* 9–20, which have been retained in place of P's account (*cf. v.* 21), and on the Feast of Tabernacles, *vv.* 39–44, the latter being clearly intended to supplement *vv.* 33–36.

Chap. xxiv. affords an interesting illustration of the manner in which the redactor of P has added later elements to the original code of H. For the first part of the chapter, with its regulations as to (*a*) the lamps in the Tabernacle, *vv.* 1–4, and (*b*) the Shewbread, *vv.* 5–9, is admittedly derived from P, *vv.* 1–4, forming a supplement to Exod. xxv. 31–40 and Num. viii. 1–4, Num. viii. 1–4, and *vv.* 5–9 to Exod. xxv. 30. The remainder of the chapter contains old laws (*vv.* 15*b*–22) which are derived from H on blasphemy, manslaughter and injuries to the person, to which the redactor has added an historical setting (*vv.* 10–14, 23) as well as a few glosses. Chap. xxv. lays down regulations for the observance of (*a*) the Sabbatical year, *vv.* 1–7, 19–22, and (*b*) the year of Jubilees, *vv.* 8–18, 23, and then applies the principle of redemption to (1) land and house property, *vv.* 24–34, and (2) persons, *vv.* 35–55. The rules for the Sabbatical year (*vv.* 1–7) are admittedly derived from H, and *vv.* 19–22 are also from the same source. Their present position after *vv.* 8–18 is due to the redactor who wished to apply the same rules to the year of Jubilee. But though the former of the two sections on the year of Jubilee (*vv.* 8–18, 23) exhibits undoubted signs of P, the traces of H are also sufficiently marked to warrant the conclusion that the latter code included laws relating to the year of Jubilee, and that these have been modified by R^P and then connected with the regulations for the Sabbatical year. Both on historical and on critical grounds, however, it is improbable that the principle of restitution underlying the regulations for the year of Jubilee was originally extended to *persons* in the earlier code. For it is difficult to harmonize the laws as to the release of Hebrew slaves with the other legislation on the same subject (Exod. xxi. 2–6; Deut. xv.), while both the secondary position which they occupy in this chapter and their more elaborate and formal character point to a later origin for *vv.* 35–55. Hence these verses in the main must be assigned to R^P. In this connection it is noticeable that those passages which show the characteristic marks of H bear no special relation to the year of Jubilee, but merely inculcate a more humane treatment of those Israelites who are compelled by circumstances to sell themselves either to their brethren or to strangers. It is probable, therefore, that they form no part of the original legislation of the year of Jubilee, but were incorporated at a later period. The present form of *vv.* 24–34 is largely due to R^P who has certainly added *vv.* 32–34 (cities of the Levites) and probably *vv.* 29–31.

Chap. xxvi. The concluding exhortation. After reiterating commands to abstain from idolatry and to observe the Sabbath, *vv.* 1, 2, the chapter sets forth (*a*) the rewards of obedience, *vv.* 3–13, and (*b*) the penalties incurred by disobedience to the preceding laws, *vv.* 14–46. The discourse, which is spoken throughout in the name of Yahweh, is similar in character to Exod. xxiii. 20–33 and Deut. xxviii., more especially to the latter. That it forms an integral part of H is shown both by the recurrence of the same distinctive phraseology and by the emphasis laid on the same motives. At the same time it is hardly doubtful that the original discourse has been modified and expanded by later hands, especially in the concluding paragraphs. It must be admitted that Ezekiel has many striking parallels with chap. xxvi. and in particular makes use, with that chapter, of several expressions which do not occur elsewhere in the Old Testament But there are also points of difference both as regards phraseology and subject-matter, and in view of these latter it is impossible to hold that Ezekiel was either the author or compiler of this chapter.

Chap. xxvii. On the commutation of vows and tithes. The chapter as a whole must be assigned to a later stratum of P, for while *vv.* 2–25 (on vows) presuppose the year of Jubilee, the section on tithes, *vv.* 30–33, marks a later stage of development than Num. xviii. 21 *sqq.* (P).

LEVOČA, a town in Slovakia, Czechoslovakia, on a tributary of the Hernad. Founded by Saxon colonists in the 13th century it was under Hungarian rule until 1920. It acquired considerable local importance by the 16th century but suffered greatly at the hands of the Transylvanian princes. Its interests are confined to bee-keeping, the raising of garden produce, tanning and spirit-distilling. Pop. (1923), 7,477.

LÉVY-BRÜHL, LUCIEN (1857–), French philosopher and ethnologist, was born in Paris on April 10, 1857. Since

1899 he has been professor of philosophy at the Sorbonne. His chief publications are *Mills Lettres inédites . . . à A. Comte* (1899); *Hist. of Modern Philosophy in France* (Eng. trans. 1899); *La Philosophie d'Auguste Comte* (1900, Eng. trans. 1903); *Les Fonctions mentales dans les Sociétés inférieures* (1910, Eng. trans. 1926); *La Mentalité primitive* (1922, Eng. trans. 1923) and *L'Âme primitive* (1927).

LEWALD, FANNY (1811–1889), German author, was born at Königsberg in East Prussia on March 24, 1811, of Jewish parentage. When 17 years of age she embraced Christianity, and after travelling in Germany, France and Italy, settled in 1845 at Berlin. Here, in 1854, she married the author, Adolf Wilhelm Theodor Stahr (1805–1876), and removed after his death in 1876 to Dresden, where she died on Aug. 5, 1889. Fanny Lewald is famous as one of the earliest German feminists and for her scathing satire on the sentimentalism of Ida Hahn-Hahn, whose work she parodied in *Diogena, Roman von Iduna Gräfin H. . . . H. . . .* (2nd ed., 1847). The best of her many novels are: *Klementine* (1842); and *Jenny* (1834); in the latter she describes her own struggle between religion and love. Her feminist writings include: *Osterbriefe für die Frauen* (1863) and *Für und wider die Frauen* (1870) are conspicuous.

See her autobiography, *Meine Lebensgeschichte* (6 vols., 1861–62); K. Frenzel, *Erinnerungen und Strömungen* (1890).

LEWANIKA (*c.* 1860–1922), paramount chief of the Barotse and subject tribes occupying the greater part of the upper Zambezi basin, was the 22nd of a long line of rulers, whose founder invaded the Barotse valley about the beginning of the 17th century, and according to tradition was the son of a woman named Buya Mamboa by a god. Lewanika was born on the upper Kabompo, where his father—Letia, a son of a former ruler—lived in exile during the interregnum of a foreign dynasty (Makololo), which remained in possession from about 1830 to 1865, when the Makololo were practically exterminated in a night by a well-organized revolt. Once more masters of their own country, the Barotse invited Sepopa, an uncle of Lewanika, to rule over them. Eleven years of brutality and licence resulted in the tyrant's expulsion and subsequent assassination, his place being taken by Ngwana-Wina, a nephew. Within a year abuse of power brought about this chief's downfall (1877), and he was succeeded by Lobosi, who assumed the name of Lewanika in 1885. The early years of his reign were also stained by many acts of blood, until in 1884 the torture and murder of his own brother led to open rebellion, and it was only through extreme presence of mind that the chief escaped with his life into exile.

Lewanika's cousin, Akufuna or Tatela, was then proclaimed chief. It was during his brief reign that François Coillard, the missionary, arrived at Lialui, the capital. The following year Lewanika, having collected his partisans, deposed the usurper and re-established his power. Ruthless revenge not unmixed with treachery characterized his return to power, but under the influence of Coillard he ruled tolerantly from 1887 onward. In 1890 Lewanika concluded a treaty with the British South Africa Company, acknowledging its supremacy and conceding to it certain mineral rights. In 1897 R. T. Coryndon took up his position at Lialui as British agent, and the country to the east of 25° E. was thrown open to settlers, that to the west being reserved to the Barotse chief. In 1905 the king of Italy's award in the Barotse boundary dispute with Portugal deprived Lewanika of half of his dominions. In 1902 Lewanika attended the coronation of Edward VII. as a guest of the nation. His recognized heir was his eldest son Letia.

See BAROTSE, and the works there cited, especially François Coillard, *On the Threshold of Central Africa* (1897); also D. E. C. R. Stirke, *Barotseland: eight years among the Barotse* (1922).

LEWES, CHARLES LEE (1740–1803), English actor, son of a London hosier, found his first important part as "Young Marlow" in *She Stoops to Conquer* in 1773, when he delivered an epilogue specially written for him by Goldsmith. He remained a member of the Covent Garden company till 1783, appearing in many parts, among which were "Fag" in *The Rivals*, which he "created," and "Sir Anthony Absolute" in the same comedy. In 1783 he removed to Drury Lane, where he assumed the Shakespearian rôles of "Touchstone," "Lucio" and "Falstaff." For a short time in 1792 Lewes assisted Stephen Kemble in the management of the Dundee theatre; in the following year he went to Dublin, but he was financially unsuccessful and suffered imprisonment for debt. He employed his time in compiling his *Memoirs*. Lewes died on July 23, 1803.

See John Genest, *Some Account of the English Stage* (Bath, 1832).

LEWES, GEORGE HENRY (1817–1878), British philosopher and literary critic, was born in London, the grandson of Charles Lee Lewes, the actor. He was educated in London, Jersey, Brittany, and finally at Dr. Burney's school in Greenwich. Between 1841 and 1850 he appeared several times on the stage, but finally devoted himself to literature, science and philosophy. In 1838 he went to Germany, probably with the intention of studying philosophy. In 1840 he married a daughter of Swynfen Stevens Jervis and during the next ten years contributed to various reviews on a wide variety of subjects, notably on the drama. His essays on this subject were collected as *The Spanish Drama* (1846) and *Actors and Acting* (1875). Other works of this period are his *Biographical History of Philosophy* (1845–46), two novels, and a series of papers contributed to the *Leader* founded in 1850.

In 1851 he became acquainted with Marian Evans (George Eliot) and in 1854 left his wife. For his happy life with George Eliot *see* ELIOT, GEORGE.

Lewes's best known work is his excellent *Life of Goethe* (1855, published in the Everyman Series, 1908), which is a biographical classic. He also wrote many popular works on science, which contain valuable suggestions. They are *Seaside Studies* (1858), *Physiology of Common Life* (1859), *Studies in Animal Life* (1862), and *Aristotle, a Chapter from the History of Science* (1864). He developed the doctrine of the functional indifference of the nerves, and suggested that what are known as the specific energies of the optic, auditory and other nerves are simply differences in their mode of action due to the differences of the peripheral structures or sense-organs with which they are connected. His final conclusions were given in *The Problems of Life and Mind*, possibly the crowning work of his life. His sudden death on Nov. 28, 1878 cut short the work, yet it is complete enough to allow us to judge of the author's matured conceptions on biological, psychological and metaphysical problems.

Lewes's views in psychology, partly opened up in the earlier volumes of the *Problems*, are more fully worked out in the last two volumes (3rd series). He claims against Comte and his followers a place for introspection in psychological research. In addition to this subjective method there must be an objective, which consists partly in a reference to nervous conditions and partly in the employment of sociological and historical data. Biological knowledge, or a consideration of the organic conditions, would only help us to explain mental *functions*, as feeling and thinking; it would not assist us to understand differences of mental *faculty* as manifested in different races and stages of human development. The idea of dealing with mental phenomena in their relation to social and historical conditions is probably Lewes's most important contribution to psychology.

LEWES (lū′wĕz or lōō′wĕs), a market-town and municipal borough and the county town of Sussex, England, 50 m S. from London by the S.R. Pop. (1921) 10,797.

Stone and bronze implements and numerous tumuli and earthworks found around Lewes indicate its remote origin. Lewes was in the Saxon royal demesne and received the privilege of a market. Aethelstan established two royal mints there, and by the reign of Edward the Confessor, and probably before, Lewes was a borough. William I. granted the whole barony of Lewes, including the revenue arising from the town, to William de Warenne, who converted an already existing fortification into a place of residence. His descendants continued to hold the barony until the beginning of the 14th century. It then passed to the earl of Arundel, with whose descendants it remained until 1439, when it was divided between the Norfolks, Dorsets and Abergavennys. In the 11th century it was important as a port and a market town. A guild merchant is first mentioned in a charter of Reginald de Warenne,

about 1148, by which he restored to the burgesses the privileges they had enjoyed in the time of his grandfather and father, but of which they had been deprived. In 1595 a "Fellowship" took the place of the old guild and in conjunction with two constables governed the town until the beginning of the 18th century. The borough seal probably dates from the 14th century Lewes was incorporated by royal charter in 1881. The town returned two representatives to parliament from 1295 until deprived of one member in 1867. It became part of a county-division in 1885. Fairs and markets have been held since 1066. In 1792 the fair-days were May 6, Whit-Tuesday, July 26 (for wool), and Oct. 2. The market-day was Saturday. Fairs are now held on May 6 for horses and cattle, July 20 for wool, and Sept. 21 and 28 for Southdown sheep. A corn-market is held every Tuesday, and a stock-market every alternate Monday. The trade in wool has been important since the 14th century.

Lewes is situated on the slope of a chalk down falling to the river Ouse. Ruins of the old castle, supposed to have been founded by King Alfred and rebuilt by William de Warenne shortly after the Conquest, rise from the height. There are two mounds which bore keeps, an uncommon feature. The castle guarded the pass through the downs formed by the valley of the Ouse. In one of the towers is the collection of the Sussex Archaeological Society. St. Michael's church contains old brasses and monuments; St. Anne's church is a transitional Norman structure; St. Thomas-at-Cliffe is Perpendicular; St. John's, Southover, of mixed architecture, preserves some early Norman portions, and has some relics of the Warenne family. In the grounds of the Cluniac priory of St. Pancras, founded in 1078, the leaden coffins of William de Warenne and Gundrada his wife were dug up during an excavation for the railway in 1845. There is a free grammar school dating from 1512. The industries include the manufacture of agricultural implements, brewing, iron and brass founding, printing and market gardening.

The Battle of Lewes.—Lewes was the scene of the battle fought on May 14, 1264, between King Henry III. and the rebel barons under Simon de Montfort, earl of Leicester. While London was the "keep" of the baronial party, they held important "outworks" in the Midland towns of Northampton, Leicester and Nottingham. Led by the king and his son, the future Edward I., the royalists moved from Oxford against these centres and subdued them in turn. Then, however, instead of moving against London when his enemies' morale was depressed, the king passed round it in a wide sweep to relieve the royal garrison in Rochester. Thence he marched southward through Kent and along the coast west into Sussex, halting at Lewes, a stronghold of his brother-in-law, Earl de Warenne. His army had been weakened by arduous marching and by the harassing of its rear by the foe. Meanwhile, reinforced by a large body of Londoners, de Montfort quitted London and reached Fletching, a village and clearing in the dense forest of the Weald on May 13. Efforts at reconciliation having failed he led his army by an indirect route against the town, which he hoped to surprise, early on the following day. His plan was to direct his main attack against the priory of St. Pancras, which sheltered the king and his brother Richard, earl of Cornwall, king of the Romans, while causing the enemy to believe that his principal objective was the castle, where Prince Edward was. But the surprise was not complete and the royalists rushed from the town to form up and meet the enemy in the open field. Edward led the right "battle" against the baronial left composed of Londoners, put them to flight, pursued them for several miles, and killed a great number of them. He also captured the standard of Montfort which with its escort was behind the baronial army. Montfort's ruse, however, had been successful. He was not with his standard as his foes thought, but with a fourth "battle" which he seems to have held in rear as a reserve. His centre and right "battles," reinforced by his own "battle," overthrew their opponents, and took prisoner both the king and his brother. Before Edward returned from his chase the earl was in possession of the town. In its streets the prince strove to retrieve his fortunes, but in vain. Many of his men perished in the river, but others escaped, one band, consisting of Earl Warenne and others, taking refuge in Pevensey Castle. The fortunes of the day were settled entirely by the mounted men, and the foot seem merely to have been a target. It was to be left for Edward himself, who here by his impetuosity was the cause of defeat, from the experience of his Welsh War to endow them with a weapon—the bow which changed the balance of mediaeval military supremacy. Edward himself took sanctuary and on the following day peace was made between the king and the earl. For its sequel *see* EVESHAM, BATTLE OF.

LEWES, a town of Sussex county, Delaware, U.S.A., in the south-eastern part of the State, on Delaware bay; a port of entry in the Philadelphia customs district. It is served by the Maryland and Delaware Coast and the Pennsylvania railways. The population was 2,074 in 1920. On Cape Henlopen, 2m. east, is a steel-framed lighthouse, erected in 1925 to replace one of the oldest lighthouses of the country, which had become unsafe through the receding of the coast line and finally toppled into the ocean on April 13, 1926. The first settlement in Delaware by Europeans was made near Lewes in 1631, by Dutch colonists led by Peter Heyes, sent by a company organized by David Pieterszen de Vries and others. They called the place Zwaanendael. The colony was soon entirely destroyed by Indians, but it was important because it prevented the English from uniting the Delaware country with Maryland. In 1658 the Dutch established an Indian trading post, and in 1659 erected a fort at Zwaanendael. After the region passed into the hands of William Penn (1682) the settlement received its present English name. It was pillaged by French pirates in 1698; was the scene of one of the last naval battles of the Revolutionary War, on April 8, 1782; and in March 1813, was bombarded by a British frigate.

LEWIS, SIR GEORGE CORNEWALL, BART. (1806–1863), English statesman and man of letters, was born in London on April 21, 1806. Young Lewis was educated at Eton and at Christ Church, Oxford. He then entered the Middle Temple, and was called to the bar in 1831. In 1835 he published an *Essay on the Origin and Formation of the Romance Languages* (re-edited in 1862), the first effective criticism in England of Raynouard's theory of a uniform romance tongue, represented by the poetry of the troubadours.

In 1836 he accompanied John Austin to Malta, to examine the condition of the island and frame a code of laws. On his return to England Lewis succeeded his father as one of the principal poor-law commissioners. In 1844 Lewis married Lady Maria Theresa Lister, sister of Lord Clarendon, and settled in London at Kent House, Knightsbridge. In 1847 Lewis resigned his office. He was then returned for the county of Hereford, and Lord John Russell appointed him secretary to the Board of Control, but a few months afterwards he became under-secretary to the Home Office. He introduced two important bills, one for the abolition of turnpike trusts and the management of highways by a mixed county board, the other for the purpose of defining and regulating the law of parochial assessment. In 1850 he succeeded Hayter as financial secretary to the treasury.

On the dissolution of parliament which followed the resignation of Lord John Russell's ministry in 1852, Lewis was defeated for Herefordshire and then for Peterborough. Excluded from parliament he accepted the editorship of the *Edinburgh Review*, and remained editor until 1855. During this period he served on the Oxford commission, and on the commission to inquire into the government of London. But its chief fruits were the *Treatise on the Methods of Observation and Reasoning in Politics*, and the *Enquiry into the Credibility of the Early Roman History*, in which he vigorously attacked the theory of epic lays and other theories on which Niebuhr's reconstruction of that history had proceeded. In 1855 Lewis succeeded his father in the baronetcy. He was at once elected member for the Radnor boroughs, and Lord Palmerston made him chancellor of the exchequer. He had a war loan to contract and heavy additional taxation to impose, but his industry, method and clear vision carried him safely through. After the change of ministry in 1859 Sir George became home secretary under Lord Palmerston, and in 1861, much against his wish, he succeeded Sidney Herbert (Lord Herbert of Lea) at

the War Office. The closing years of his life were marked by increasing intellectual vigour. His later works include: *Essay on Foreign Jurisdiction and the Extradition of Criminals* (1859), and *Dialogue on the Best Form of Government* (1863). He died in April 1863.

A reprint from the *Edinburgh Review* of his long series of papers on the *Administration of Great Britain* appeared in 1864, and his *Letters to various Friends* (1870) were edited by his brother Gilbert, who succeeded him in the baronetcy.

LEWIS, SIR GEORGE HENRY, 1ST BART. (1833–1911), English solicitor, was born at Ely Place, Holborn, on April 21, 1833. Educated at University College, London, he was articled in 1856 and became head of the firm of Lewis and Lewis. He was engaged in many famous cases, including the Bravo poisoning case, the Hatton Garden diamond robbery, and the Overend-Gurney and other banking prosecutions. He was solicitor (1887) for Parnell and the Irish party in the Parnell Commission Lewis was for many years the most prominent man in his profession, and had a unique practice, especially in advising on difficult family affairs. He died in London on Dec. 7, 1911.

LEWIS, HENRY CARVILL (1853–1888), American geologist, was born in Philadelphia Nov. 16, 1853. Educated in the University of Pennsylvania he took the degree of M.A. in 1876. He became attached to the geological survey of Pennsylvania in 1879, serving for three years as a volunteer member. During his term he became greatly interested in the study of glacial phenomena. In 1880 he was chosen professor of mineralogy in the Philadelphia academy of Natural Sciences, and in 1883 was appointed to the chair of geology in Haverford College, Pa. In 1884 his *Report on the Terminal Moraine in Pennsylvania and New York* was published: a work containing much information on the limits of the North American ice-sheet. In Britain he sought to trace in like manner the southern extent of the terminal moraines formed by British ice-sheets, but before his conclusions were matured he died at Manchester July 21, 1888. The results of his observations were published in 1894, entitled *Papers and Notes on the Glacial Geology of Great Britain and Ireland,* edited by Dr. H. W. Crosskey.

See "Prof. Henry Carvill Lewis and his Work in Glacial Geology," by Warren Upham, *Amer. Geol.,* vol. ii. (Dec. 1888), p. 371, with portrait.

LEWIS, ISAAC NEWTON (1858–), American soldier and inventor, was born at New Salem, Pa., on Oct. 12, 1858. On graduating from the U.S. military academy, in 1884, he was given a commission in the artillery. From 1894 to 1898 he was a member of the board on the regulation of coast artillery fire in New York harbour. In 1898 he became recorder of the board of ordnance and fortification in Washington, and in the same year made a study of ordnance in Europe which led to the rearmament of the U.S. field artillery. He is the inventor of a number of range-finding and other mechanical and electrical instruments used for artillery fire control purposes in U.S. coast defences.

From 1904 to 1911 he was instructor and director of the coast artillery school at Ft. Monroe, becoming lieutenant-colonel in 1911. In 1913 he retired from active service with rank of colonel. The same year a machine-gun of his invention (the Lewis gun) was accepted by the British, French and Belgian Governments after it had been rejected in America. Throughout the World War the Lewis machine-gun was one of the most effective weapons possessed by the Allies and was constantly in use by thousands in their aeroplanes, in their armoured tanks and with the fighting troops on both land and sea. After the United States entered the war the Lewis gun was manufactured and issued to U.S. troops. Col. Lewis declined to accept the royalties due to him for these guns, and returned them to the Treasury of the United States.

LEWIS, MATTHEW GREGORY (1775–1818), English romance-writer and dramatist, often referred to as "Monk" Lewis, was born in London on July 9, 1775. He was educated for a diplomatic career at Westminster school and at Christ Church, Oxford, spending most of his vacations abroad in the study of modern languages; and in 1794 he proceeded to The Hague as attaché to the British embassy. His stay there lasted only a few months, but was marked by the composition, in ten weeks, of his famous romance *Ambrosio, or the Monk* (1795). About a year after its appearance an injunction to restrain its sale was moved for and a rule *nisi* obtained. Lewis published a second edition from which he had expunged, as he thought, all the objectionable passages. The work is described by Byron in *English Bards and Scotch Reviewers:*

> Wonder-working Lewis, Monk or Bard,
> Who fain would'st make Parnassus a churchyard;
> Even Satan's self with thee might dread to dwell,
> And in thy skull discern a deeper hell.

The Castle Spectre (1796, a musical drama of no great literary merit, but which enjoyed a long popularity on the stage), *The Minister* (a translation from Schiller's *Kabale u Liebe*), *Rolla* (1797, a translation from Kotzebue), with numerous other operatic and tragic pieces, appeared in rapid succession. *The Bravo of Venice,* a romance translated from the German, was published in 1804; next to *The Monk* it is the best known work of Lewis By the death of his father he succeeded to a large fortune, and in 1815 embarked for the West Indies to visit his estates; in the course of this tour, the *Journal of a West Indian Proprietor,* published posthumously in 1833, was written. A second visit to Jamaica was undertaken in 1817, in the hope of ameliorating the condition of the slave population; he died of fever on the homeward voyage on May 14, 1818

See *The Life and Correspondence of M. G. Lewis* (2 vols., 1839).

LEWIS, MERIWETHER (1774–1809), American explorer, was born near Charlottesville, (Va.), on Aug. 18, 1774. A militiaman in the "Whisky Insurrection," officer under Gen. Anthony Wayne, and from 1801 to 1803 the private secretary of President Jefferson, he became famous as leader of the first American expedition overland to the Pacific. Preparations for this were pushed by Jefferson before the Louisiana Purchase, but the actual leadership was vested in Lewis and his old friend and army comrade, Lieut. William Clark. Late in 1803 they and their subordinates went into winter quarters near St. Louis. On May 14, 1804, the party "hoisted Sail and Set out in high Spirits for the Western Expedition," and by Nov. 2 they had made the difficult ascent of the Missouri to a site near the present Bismarck, where, among the Mandan Indians, they passed the second winter. Early in April 1805 the ascent of the Missouri was continued as far as the three forks of the river, the stream they named the Jefferson being followed to its source in the south-western part of what is now the State of Montana. Procuring a guide and horses from the Shoshone Indians, the party pushed westward through the Rocky Mountains and embarked in canoes on a tributary of the Columbia river, the mouth of which they reached on Nov. 15 They had travelled upwards of 4,000m. from their starting-point, had encountered various Indian tribes never before seen by whites, had made valuable scientific collections and observations, and were the first explorers to reach the Pacific by crossing the continent north of Mexico. After spending the winter on the coast they started on March 23, 1806, on their return journey, and, after crossing the divide, Lewis with one party explored Maria's river, and Clark with another the Yellowstone. They reunited near the junction of the Yellowstone and the Missouri, and on Sept. 23 reached St. Louis. In spite of exposure, hardship and peril only one member of the party died, and only one deserted. Few feats of exploration excel this in romantic interest. The expedition was commemorated by the Lewis and Clark Centennial Exposition at Portland (Ore.), in 1905. The leaders and men of the exploring party were rewarded with grants of land from the public domain, and in March 1807 Lewis was made governor of the northern part of the Louisiana Territory. His death near Nashville (Tenn.), on Oct. 11, 1809, has remained shrouded in mystery, suicide and more plausibly foul play being advanced as explanations for it.

BIBLIOGRAPHY.—Jefferson's *Message from the President of the United States, Communicating Discoveries . . .* (1806), contains the reports sent back by the explorers in 1804–05. Patrick Gass's *Journal* (1807) has been ably edited by J. K. Hosmer (1904). Biddle and

Allen's *History of the Expedition under the Command of Captains Lewis and Clark* (1814) is a condensation of the original journals. The best reprint is that of Elliott Coues (1893). As a final authority consult R. G. Thwaites (ed.), *The Original Journals of the Lewis and Clark Expedition* (1904–05) and the journals of Lewis and Sergeant Ordway edited by M. M. Quaife (*Wisconsin Historical Collections*, xxii.). For popular accounts *see* W. R. Lighton, *Lewis and Clark* (1901); O. D. Wheeler, *The Trail of Lewis and Clark* (1904); and Noah Brooks, *First across the Continent* (1901).

LEWIS, SINCLAIR (1885–), American author, was born at Sauk Center, Minn., on Feb. 7, 1885. He graduated from Yale university in 1907, and was for a time a reporter, afterward serving in an editorial capacity for several publishing houses and magazines. At this time he began to write fiction, but his work, in spite of the promise of *Our Mr. Wrenn* (1914), the *The Trail of the Hawk* (1915), attracted little attention. His reputation was made by *Main Street* (1920), a novel satirizing both the narrowness of life in the Main streets of the Middle West and the hollowness of a superficial intellectualism that despised Main street without having anything better to offer. *Main Street* was born of the new mood of national self-consciousness which followed the World War, and became a text for attacks upon provincialism from coast to coast. In 1922, Lewis published *Babbitt*, a study of the complacent American, whose individuality had been sucked out of him by rotary clubs, business ideals and general conformity. The name Babbitt promptly passed into general usage, and it is probable that this novel had more effect upon public consciousness than any other written in English in this decade. *Babbitt* is not only Lewis's most important novel, but it is, so far, his best.

He followed this success with *Arrowsmith* (1924), a satiric study of the medical profession, with emphasis upon the frustration of five scientific ideals. His next book, *Elmer Gantry* (1927), was more violent, a pamphleteering attack upon the ignorant, gross and predatory leaders who had crept into the Protestant Church. It is perhaps a reflection of the animosity aroused in many American minds by the enforcement of prohibition and the political manoeuvering by religious bodies that accompanied it. While it aroused wide controversy, it is far less successful as a work of art and as sheer story than the earlier books. *The Man Who Knew Coolidge* (1928) is a return to the theme of Babbitt in a series of pointed monologues *Dodsworth* (1929) concerns the experiences of a retired American automobile manufacturer and his wife on a European tour and offers Lewis a chance to present effectively the contrasting values and manners of Europe and America and study the reactions on the very different temperaments of the man and his wife.

Sinclair Lewis is primarily a satirist of the people. His subject and his theme of attack is the bourgeoisie of a democracy, with their characteristic vices. He is better at caricature than at character, and his style, while vigorous, is seldom beautiful or refined. He has remarkable powers of observation and a gift of mimicry in dialogue that recalls Dickens whom, in other ways except in humour, he often resembles Essentially he is a pamphleteer of genius, like H. G. Wells, but his creation of figures, instantly recognized as summaries of their period, as in the case of Babbitt, gives him a claim upon literature not to be denied. In spite of his deficiencies in art, as a novelist he is one of the important figures of the early 20th century. (H. S. C.)

LEWISBURG, a borough in the central part of Pennsylvania, U.S.A., 50m. N. of Harrisburg, on the west branch of the Susquehanna river; the county seat of Union county. It is served by the Pennsylvania and the Reading railways. The population was 3,204 in 1920 (98% native white). It has a large chair factory and sundry other manufacturing industries, and is the seat of Bucknell university (Baptist). Lewisburg was founded in 1785 by Ludwig Derr, a German, and was called Derrstown until about 1805. It was incorporated as a borough in 1812.

LEWIS GUN: *see* SMALL ARMS.

LEWISHAM, a south-eastern metropolitan borough of London, England. Pop. (1921) 174,194. It includes the districts of Blackheath and Lee, Hither Green, Catford and Brockley, Forest Hill and part of Sydenham. In the residential districts last named hills rise above 300 feet. Medicinal springs were discovered in 1640, on Sydenham Common. The principal pleasure grounds are Blackheath, Hilly Fields (46 ac.) and Ladywell Recreation Grounds (46 ac.). At Sydenham (but outside the boundary of the county of London) is the Crystal Palace. Among institutions are the Horniman Museum, Forest Hill; Morden's College, on the south of Blackheath, founded at the close of the 17th century by Sir John Morden for Turkey merchants who were received as pensioners. The parliamentary borough of Lewisham returns two members. Some metal working and furniture making is carried on, but the most important occupation is gardening.

LEWISITE: *see* CHEMICAL WARFARE.

LEWISTON, a city on the western boundary of Idaho, U.S.A., 750 ft. above sea-level (the lowest point in the state), at the head of navigation on the Snake river; the county seat of Nez Perce county. It is on Federal highways 95, 195 and 410; and is served by the Northern Pacific and the Union Pacific railways, and by river steamers to the mouth of the Columbia. The population was 6,574 in 1920 (91% native white), and was estimated locally at 9,000 in 1928. It is the commercial centre of a wheat and fruit-growing, lumbering and mining (gold, silver and lead) region, and the seat of the Lewiston State Normal school (established 1893). The State agricultural colleges of Idaho and Washington are at Moscow and Pullman, 40 m. N. and 30 m. N.W. respectively.

Lewiston is built on the site where Lewis and Clark camped in 1805 and in 1806. It was founded in 1861, following the discovery of placer gold in the Clearwater district, and was organized as a town in 1862. The Spalding mission, established in 1836 and continued until 1860, was 12 m east of Lewiston.

LEWISTON, city, Androscoggin county, Maine, U.S.A., on the east bank of the Androscoggin river, opposite Auburn, 35m. above Portland. It is on federal highway 100, and is served by the Grand Trunk and the Maine Central railways, and by three interurban electric lines. The population was 31,791 in 1920 (32% foreign-born white) and was estimated locally at 37,000 in 1928. Within the city limits is the 73ac. campus of Bates college, established by the Free Baptists in 1864 (on the foundation of a seminary chartered in 1855), and named for a cotton manufacturer of Boston whose gifts made it possible. Lewiston is the seat of the Central Maine General hospital (1888), and has an armoury (completed 1927) which houses the largest auditorium in the State. Industrially the two cities (Lewiston and Auburn) are practically one community. They have one of the largest potential water-powers in New England, and with the completion in 1927 of the Gulf Island hydro-electric development 60,000 h.p. was available. In Lewiston the textile industry predominates, with many plants making blankets, suitings, damask, ginghams, yarns, sheeting, bed spreads and rayon goods. The aggregate output of its factories in 1925 was valued at $21,865,691. Its banks have resources amounting to $36,002,300, and the assessed valuation of property in 1927 was $33,218,050. The surrounding country is hilly and picturesque, and numerous streams and lakes afford good fishing. On Lake Auburn, 3m. above the city, is the State fish hatchery. Lewiston was settled in 1770, incorporated as a town in 1795, and chartered as a city in 1861.

LEWISTOWN, a city in the central part of Montana, U.S.A., 30 m. N. of the Snowy mountains, at an altitude of 3,960 ft., with the Judith mountains to the east and the Belt mountains to the west; the county seat of Fergus county. It is on Federal highway 87E and on the Chicago, Milwaukee, St. Paul and Pacific and the Great Northern railways. The population was 1,096 in 1900; 6,120 in 1920; and was estimated locally at 7,000 in 1928. Lewistown is the trading and shipping centre for a large wheat region (originally a buffalo range, and later devoted to cattle and sheep-grazing), and for the oil-fields and mines (coal, gold and silver and gypsum) in the vicinity. There are oil refineries in the city and sundry other manufacturing industries. About 50 m. W. is one of the greatest sapphire mines in the world. The city was founded in 1898 and incorporated in 1899.

LEWISTOWN, a borough of south-central Pennsylvania, U.S.A., on the Juniata river, 60m. N.W. of Harrisburg, the county seat of Mifflin county. It is on Federal highways 22 and 522, and

is served by the Pennsylvania railroad. The population was 9,849 in 1920 (97% native white), and was estimated locally at 14,000 in 1928. It is picturesquely situated in a narrow valley of the Allegheny mountains. There are large silk and artificial silk mills, steel and iron plants, machine shops, and tool works specializing in axes. Lewistown was one of the pioneer iron-manufacturing centres of the State. It was founded in 1762, and was named for William Lewis, one of the early iron-masters. Two miles west of the city is a stone marker on the site of Ft. Granville, built by the Scotch-Irish settlers in the region before the town was established, and destroyed by the French and Indians in 1756. Lewistown was incorporated as a borough in 1795.

LEWIS-WITH-HARRIS, sometimes called the Long Island, the most northerly island of the Outer Hebrides, Scotland, 24 m. from the mainland, from which it is separated by The Minch strait. It is 60 m. long, its extreme breadth is 28 m., and average breadth 15 miles. It is divided by a line roughly drawn between Loch Resort on the west and Loch Seaforth on the east, of which the larger or more northerly portion, known as Lewis, belongs to the county of Ross and Cromarty and the lesser, known as Harris, to Inverness-shire. Area 492,800 ac. or 770 sq.m., of which 368,000 ac. belong to Lewis. Pop. of Lewis (1921) 28,378; of Harris 3,905, or 32,283 for the island, of whom 15,103 spoke Gaelic only, and 25,134 Gaelic and English.

There is communication with Glasgow, Mallaig and Kyle of Lochals by steamer via Stornoway and weekly with Belfast, Leith and Liverpool. The coast is deeply indented, the principal sea-lochs in Harris being East and West Loch Tarbert; and in Lewis, Loch Seaforth, Loch Erisort and Broad Bay on the east coast and Loch Roag and Loch Resort on the west. The mainland is dotted with fresh-water lakes. Most of Harris is hilly, there being more than 30 summits above 1,000 ft. high. Lewis is comparatively flat, save in the south-east, where Ben More reaches 1,750 ft., and in the south-west, where Mealasbhal is the highest point. The rivers are small and unimportant. The principal capes are the Butt of Lewis, in the extreme north, where the cliffs are crowned with a lighthouse; Tolsta Head, Tiumpan Head and Cabag Head, on the east; Renish Point, in the extreme south; and, on the west, Toe Head and Gallon Head.

The following are inhabited islands in the Inverness-shire division: Bernera, Ensay, Killigray and Pabbay, Scarp, Tarrensay (141), Scalpa (616). Belonging to the county of Ross and Cromarty are Great Bernera and the Shiant Isles. The south-eastern base of Broad Bay is formed by the peninsula of Eye, attached to the mainland by a very narrow isthmus. Much of the surface of Lewis and Harris is of peat and swamp; there are scanty fragments of an ancient forest.

There is little cultivable land. Sir James Matheson (1796–1878), who purchased the island in 1844, spent nearly £350,000 in reclamation and improvements. Lord Leverhulme, who bought it in 1918, also made efforts to introduce modern methods of fishing and agriculture with small success. Subsequently he offered Lewis as a gift to the crofters, but it was declined owing to the heavy taxation, with the exception of the Stornoway section. The larger part of the island was again put up for sale in 1924, but only a small part was bought, and the rest was afterwards managed by the Lewis Islands Crofters Ltd. In Harris Lord Leverhulme's schemes for development met with more success.

Barley and potatoes are the chief crops. Black cattle are reared and some sheep-farming is carried on. Harris has obtained great reputation for tweeds made by the crofters. The fisheries are the principal mainstay of the people. Most of the crofters still live in poor huts. The island affords good sporting facilities. Many streams abound with salmon and trout; otters, seals, deer and hares, game birds and water-fowl are plentiful. Whaling is carried on from Harris.

There are many antiquarian remains, including duns, megaliths, ruined towers and chapels. At Rodel is a church, the remains of an Augustinian monastery. The foundation is Norman and the superstructure Early English. On the towers are curious carved figures and in the interior several tombs of the Macleods, the most remarkable being that of Alastair (Alexander), son of William Macleod of Dunvegan, dated 1528. Stornoway (*q.v.*), pop. 4,079, is the chief town. At Callernish, 13 m. W. of Stornoway, are several stone circles, one of them consisting of twelve huge monoliths with a pillar 17 ft. high in the centre. There are also an avenue and two single lines of stones branching from the circle.

At Carloway there is a fine example of a broch, or fort. Rory, the blind harper who translated the Psalms into Gaelic, was born in the village. Port of Ness, where there is a harbour, is engaged in the ling fishery. Loch Seaforth gave the title of earl to a branch of the Mackenzies, but in 1716 the 5th earl was attainted for Jacobitism and the title forfeited. In 1797 Francis Humberston Mackenzie (1754–1815), chief of the Clan Mackenzie, was created Lord Seaforth and Baron Mackenzie of Kintail.

LEWKOWITSCH, JULIUS (1857–1913), British chemist, was born at Ostrovo in Prussian Silesia in 1857. He studied at Breslau, the Berlin agricultural high school and Heidelberg University. About 1888 he became a naturalized British subject. He devoted much time to stereo-chemistry and to developing the industrial technology of fats and oils, becoming the first living authority in that branch of chemistry. He died at Chamonix on Sept. 18, 1913. His most important work is: *Chemical Technology and analysis of oils, fats and waxes* (5th ed. rewritten and enlarged, 3 vols. 1913–15), the standard work on the subject.

LEXICON, a dictionary (*q.v.*) (Gr. λεξικόν, *sc.* βιβλίον, a word-book). Lexicon, rather than dictionary, is used of word-books of the Greek language, and sometimes of Hebrew.

LEXINGTON, BARON, a title borne in the English family of Sutton from 1645 to 1723. Robert Sutton (1594–1668), son of Sir William Sutton of Averham, Nottinghamshire, was elected M.P. in 1625 and in 1640. He supported Charles I. during the Civil War with funds and personal service, and in 1645 the king created him Baron Lexington (a variant of the Nottinghamshire village of Laxton). His estate suffered during the Commonwealth. He died on Oct. 13, 1668. His only son, Robert, 2nd baron (1661–1723), was employed by William of Orange on diplomatic business, and is chiefly known as the British envoy during the negotiations for the Treaty of Ryswick at Vienna, and the treaty of Utrecht at Madrid. He died on Sept. 19, 1723. His letters from Vienna were published as the *Lexington Papers* (ed. H. M. Sutton, 1851).

LEXINGTON, a city in the heart of the "blue grass" region of Kentucky, U.S.A., 75m. S. of Cincinnati; the county seat of Fayette county. It is on Federal highways 25, 27, 60 and 68, and is served by the Chesapeake and Ohio, the Louisville and Nashville, and the Southern railways. The population was 41,534 in 1920 (30% negroes) and was estimated locally at over 60,000 in 1928. It is the largest loose-leaf tobacco market and the largest bluegrass-seed market in the country; the headquarters for many coal producers of eastern Kentucky; and the chief centre in America for the breeding of thoroughbred horses. It has a large wholesale and retail trade. Before the establishment of national prohibition it was famous for its Bourbon whiskey. Natural gas and hydro-electric power are available. The city has a commission form of government. Bank debits in 1926 amounted to $281,024,000, and the assessed valuation of property in 1927 was $72,052,958. There are two race-tracks (for running and for trotting) and the semi-annual horse shows and race meets are brilliant events. Man-o'-War and many other noted racers were bred and raised on the celebrated stock-farms roundabout. Lexington is the see of a Protestant Episcopal bishopric. It is the seat of the Eastern Kentucky hospital for the insane (established 1815; a State institution since 1824); the State reform schools for girls and for boys; Transylvania college (established 1783), the oldest institution for higher education west of the Alleghenies; and the University of Kentucky (1865), which in 1926–27 had an enrolment of 2,485. Lexington was named by a party of hunters who were encamped here in 1775 when news of the battle of Lexington reached them. Permanent settlement (largely from Virginia and North Carolina) began in 1779. The town was incorporated in 1782 and was chartered as a city in 1832. The first newspaper published west of the mountains, the *Kentucky Gazette,* was established here in 1787, to further the movement for the separation

of Kentucky from Virginia. The first State legislature convened here in 1792. Lexington was the home of Henry Clay from 1797 until his death in 1852. His estate, "Ashland," is one of many beautiful homesteads in the environs.

LEXINGTON, a town of Middlesex county, Massachusetts, U.S.A., on the Boston and Maine railroad, 11 m. N.W. of Boston. The population in 1925 was 7,785. It is primarily a spot of historic interest and a residential town. Truck-gardening and dairying are the principal industries, and there are a few factories. It was on the green of the village of Lexington that the first armed conflict of the Revolution took place (April 19, 1775). A monument was erected by the State in 1799, and a large boulder marks the position of the minute-men when they were fired upon by the British. In the old burying-ground (with stones dated as far back as 1690) are the graves of Captain John Parker and other patriots. The Hancock-Clarke house (built in part in 1698), where Paul Revere warned John Hancock and Samuel Adams, is now the museum of the historical society. The Buckman tavern (1690) and the Munroe tavern (1695), headquarters respectively of the Americans and the British, are still standing, and several other houses antedate the Revolution. Lexington was settled as part of Cambridge as early as 1642. It was organized as a parish in 1691 and became an independent town in 1713. The first public training-school for teachers in the United States (now the State normal school at Framingham) was opened here in 1839.

See Charles Hudson, *History of the Town of Lexington* (Boston, 1868); revised and continued to 1912 by the Lexington Hist. Soc. (Boston, 1913).

LEXINGTON, a city of Missouri, U.S.A., 43m. E. of Kansas City, on the south bank of the Missouri river; the county seat of Lafayette county. It is on Federal highway 24 and is served by the Missouri Pacific railroad. The population was 4,695 in 1920 (21% negroes). Lexington is in a rich agricultural region and there are many coal mines in the vicinity, employing over 1,000 men. Hand-made handkerchiefs are made here for shops in the principal cities of the country. Lexington was founded in 1819, laid out in 1832, and chartered as a city in 1845. It succeeded Sibley as the eastern terminus of the Santa Fe trade, and was in turn displaced by Independence. At the opening of the Civil War it was the most important town on the Missouri river between Saint Louis and Saint Joseph, and commanded the approach by water to Ft. Leavenworth.

After the Confederate success at Wilson's Creek (Aug 10, 1861), Gen. Sterling Price advanced northward, and with about 15,000 men arrived in the vicinity of Lexington on Sept. 12. Here he found a Federal force of about 2,800 men under Col. James A. Mulligan throwing up intrenchments on Masonic College hill, an eminence adjoining Lexington on the north-east. An attack was made on the same day and the Federals were driven within their defences, but at night Gen. Price withdrew to the Fair-grounds not far away and remained there five days waiting for his wagon train and for reinforcements. On the 18th the assault was renewed, and on the 20th the Confederates, advancing behind movable breastworks of water-soaked bales of hemp, forced the besieged, now long without water, to surrender. The losses were: Confederate, 25 killed and 75 wounded; Federal, 39 killed and 120 wounded. At the end of September Gen. Price withdrew in face of Fremont's approach with 40,000 men, leaving a guard of only a few hundred in the town, and on the 16th of the next month a party of 220 Federal scouts under Maj. Frank J. White surprised this guard, released about 15 prisoners and captured 60 or more Confederates. Another Federal raid on the town was made in December of the same year by Gen. John Pope's cavalry. Again, during Gen. Price's last raid into Missouri in 1864, there was some fighting on Oct. 19 about 4m. S. of the town.

LEXINGTON, a city in the Piedmont region of North Carolina, U.S.A., at an altitude of 780ft., 35m. W. of Greensboro; the county seat of Davidson county. It is on Federal highways 70 and 121, and is served by the Southern and the Winston-Salem Southbound railways. The population was 5,254 in 1920 (82% native white) and was estimated locally at 11,500 in 1928. It has important manufacturing industries, which include furniture factories, and also cotton mills which in 1928 had 100,000 spindles. Ten new plants were established in 1927–28. The city was settled about 1750 and incorporated in 1827.

LEXINGTON, a town of western Virginia, U.S.A., near the headwaters of the beautiful Shenandoah valley, 1,050ft. above sea-level; the county seat of Rockbridge county. It is on the Lee highway, and is served by the Baltimore and Ohio and the Chesapeake and Ohio railways. The population was 2,870 in 1920 (33% negroes). Natural Bridge is 15m. S.W., and there are mineral springs at several near-by points. Lexington is the seat of Washington and Lee university and of the Virginia military institute, each of which has a long and eventful history. The two campuses, connected by a short avenue, lie on a ridge above the town. In the valley 90ft. below flows the North river, a small tributary of the James. The university grew out of an academy founded in 1749, which took Washington's name in 1798 (in recognition of a gift), became a college in 1813, and a university under its present name in 1871. Gen. Robert E. Lee was the president from the close of the Civil War until his death in 1870, and he is buried in the crypt of the Lee Memorial Chapel on the campus. The Virginia military institute was established by the State in 1839, to provide a garrison for the State arsenal at Lexington, and has been an important training centre ever since. Over 2,000 officers in the World War had been cadets at the institute. From 1851 to the outbreak of the Civil War Gen. "Stonewall" Jackson was a professor here. A fine statue of him by Sir Moses Ezekiel stands on the grounds, silhouetted against the southern sky, and his tomb is in the Lexington cemetery. The first permanent settlement at Lexington was made about 1778. The town was occupied by Federal troops in 1864.

LEYDEN or **LEIDEN,** a city in the province of South Holland, the kingdom of the Netherlands, on the Old Rhine, and a junction station 18 m. by rail S.S.W. of Haarlem. It is connected by steam tramway with Haarlem and The Hague respectively, and with the seaside resorts of Katwyk and Noordwyk. There is also regular steamboat connection with Katwyk, Noordwyk, Amsterdam and Gouda. The population of Leyden which, it is estimated, reached 100,000 in 1640, had sunk to 30,000 between 1796 and 1811, and in 1926 was 69,781.

Leyden is an ancient town. Its early name was Leithen, and it was governed until 1420 by burgraves, the representatives of the courts of Holland. The most celebrated event in its history is its siege by the Spaniards in 1574. Besieged from May until October, it was at length relieved by the cutting of the dikes, thus enabling ships to carry provisions to the inhabitants of the flooded town. The weaving establishments (mainly broadcloth) of Leyden at the close of the 15th century were very important, and after the expulsion of the Spaniards Leyden cloth, Leyden baize and Leyden camlet were familiar terms. These industries afterwards declined, and in the beginning of the 19th century the baize manufacture was altogether given up. Linen, carpets and woollen (blankets) manufactures and printing, are now the most important industries, while there is a considerable transit trade in butter and cheese.

Katwyk, or Katwijk, 6 m. N.W. of Leyden, is a popular seaside resort and fishing village. Close by are the great locks constructed in 1807 by the engineer, F. W. Conrad (d. 1808), through which the Rhine (here called the Katwyk canal) is admitted into the sea at low tide. The shore and the entrance to the canal are strengthened by huge dikes. In 1520 an ancient Roman camp known as the Brittenburg was discovered here. It was square in shape, each side measuring 82 yds., and the remains stood about 10 ft. high. By the middle of the 18th century it had been destroyed and covered by the sea.

The two branches of the Rhine which enter Leyden on the east unite in the centre of the town. There is a large open space, the Van der Werf park, named after the burgomaster, Pieter Andriaanszoon van der Werf, who defended the town against the Spaniards in 1574. This open space was formed by the accidental explosion of a powdership in 1807, hundreds of houses being demolished, including that of the Elzevir family of printers. At the junction of the two arms of the Rhine stands the old castle (De Burcht), a circular tower built on an earthen mound in Roman or

Saxon times. Of Leyden's old gateways only two—both dating from the end of the 17th century—are standing. The Hooglandsche Kerk, or the church of St. Pancras, was built in the 15th century and restored in 1885–1902. The most interesting buildings are the town hall (Stadhuis), a 16th century Dutch building; the Gemeenlandshuis van Rynland (1596, restored 1878); the weighthouse built by Pieter Post (1658); the former court-house, now a military storehouse; and the ancient gymnasium (1599) and the so-called city timber-house (Stads Timmerhuis) (1612), both built by Lieven de Key (*c.* 1560–1627).

In spite of a certain industrial activity and the periodical bustle of its cattle and dairy markets, Leyden remains essentially an academic city. The university was founded by William of Orange in 1575 as a reward for the heroic defence of the previous year. Originally located in the convent of St. Barbara, the university was removed in 1581 to the convent of the White Nuns, the site of which it still occupies, though that building was destroyed in 1616. The presence within half a century of the date of its foundation of such scholars as Joseph Scaliger, Hugo Grotius, Jacobus Arminius and Daniel Heinsius at once raised Leyden university to the highest European fame, a position which the learning and reputation of Jacobus Gronovius, Hermann Boerhaave, Tiberius Hemsterhuis and David Ruhnken, among others, enabled it to maintain down to the end of the 18th century. Among the institutions connected with the university are the national institution for East Indian languages, ethnology and geography; the fine botanical gardens, founded in 1587; the observatory (1860); the natural history museum; the museum of antiquities (Museum van Oudheden), with valuable Egyptian and Indian departments; a museum of Dutch antiquities from the earliest times; and three ethnographical museums, of which the nucleus was P. F. von Siebold's Japanese collections. The university has now five faculties, of which those of law and medicine are the most celebrated, and is attended by about 1,200 students.

The municipal museum, founded in 1869 and located in the old cloth-hall (Laeckenhalle) (1640), contains a varied collection of antiquities connected with Leyden, as well as some paintings. Jan van Goyen, Gabriel Metsu, Gerard Dou and Rembrandt were natives of this town. The Thysian library occupies an old Renaissance building of the year 1655

LEYDEN JAR. A device for storing quantities of static electricity discovered accidentally by P. van Musschenbroek of the University of Leyden in 1745, and, independently, by von Kleist of Kammin in Pomerania about the same time. The name appears to have originated in the writings of the Abbé Nollet. In its earliest form the Leyden jar consisted of a glass phial, partly filled with water, whose orifice was closed by a cork pierced by a wire or nail which dipped into the water. To charge the jar the phial was held in the hand and the exposed end of the wire brought into contact with the prime conductor of an electrical machine. On removing the phial from the machine and touching the wire with the other hand a violent shock was experienced. Improvements in the construction were made by Benjamin Wilson, John Bevis and Sir William Watson. In its present form the jar is made of thin flint glass of high dielectric strength, coated for part of its height, inside and out, with tinfoil. The outer coating is connected to earth and contact is made with the inner coating through a central brass rod which projects beyond the mouth of the jar. For further details see the article entitled CONDENSER.

LEYGUES, GEORGES (1858–), French politician, was born at Villeneuve-sur-Lot, on Nov. 28, 1858, and educated at Toulouse and Bordeaux. He was minister of public instruction in the Dupuy Government of 1894, and in the Waldeck-Rousseau Government of 1899–1902. He held office under Sarrien (1906) and Clemenceau (1917). In 1920–21 he was prime minister, retaining for himself the portfolio of foreign affairs. In the Briand cabinets of Nov. 1925 and March 1926, he was minister of marine. Leygues, in his early days, was a member of the Parnassian group of poets; he also published some historical works.

LEYS, HENDRIK, BARON (1815–1869), Belgian painter, was born at Antwerp on Feb. 18, 1815. He studied under Wappers at the Antwerp Academy. In 1835 he went to Paris where he was influenced by the Romantic movement. Leys was an imitative painter in whose works may rapidly be detected the schools which he had been studying. In 1862 Leys was created a baron. At the time of his death, which occurred on August 26, 1869, he was engaged in decorating with fresco the large hall of the Antwerp Hôtel de Ville.

See Muther, *Hist. of Modern Painting*, I. xv.

LEYSIN (4,418 ft.), a town in the canton of Vaud, Switzerland, 7 m. S E. of Montreux. It is a famous health resort for the treatment of tuberculosis, sheltered from the north winds, and is reached by a rack railway from Aigle. It is a centre for winter sports and has 3,186 French-speaking inhabitants, the majority Protestants.

LEYTON, an urban district forming one of the north-eastern suburbs of London, England, in Essex. Pop. (1921) 107,485. It lies on the left bank of the Lea. The church of St. Mary is mainly a brick reconstruction. Leyton is in the main a residential as distinct from a manufacturing locality. Some metal working, and also manufacture of textiles, leather, food and paper are carried on as well as printing, bookbinding, furniture and coach building. Its name is properly Low Leyton, and the parish includes the district of Leytonstone to the east. Roman remains have been discovered here, but no identification with a Roman station by name has been made with certainty.

LHASA, the capital of Tibet. It lies in 29° 39′ N., 91° 5′ E., 11,830 ft. above sea-level. Owing to the inaccessibility of Tibet and the political and religious exclusiveness of the lamas, Lhasa was long closed to European travellers, all of whom during the latter half of the 19th century were stopped in their attempts to reach it. It was popularly known as the "Forbidden City." But its chief features were known by the accounts of the earlier Roman Catholic missionaries who visited it and by the investigations, in modern times, of native Indian secret explorers, and others, and the British armed mission of 1904. (*See* TIBET.)

Site and General Aspect.—The city stands in a tolerably level plain, which is surrounded on all sides by hills. Along its southern side, about ½ m. south of Lhasa, runs a considerable river called the Kyichu (Ki-chu) or Kyi, flowing here from the east-north-east, and joining the great Tsangpo (or upper course of the Brahmaputra) some 38 m. to the south-west. The hills round the city are barren. The plain, however, is fertile, though in parts marshy. There are gardens scattered over it round the city, and these are planted with fine trees. The city is screened from view from the west by a rocky ridge, lofty and narrow, with summits at the north and south, the one flanked and crowned by the majestic buildings of Potala, the chief residence of the Dalai lama, the other by the temple of medicine. Groves, gardens and open ground intervene between this ridge and the city itself for a distance of about 1 m. A gate through the centre of the ridge gives access from the west; the road thence to the north part of the city throws off a branch to the Yutok sampa or turquoise-tiled covered bridge, one of the noted features of Lhasa, which crosses a former channel of the Kyi, and carries the road to the centre of the town.

The city is nearly circular in form, and less than 1 m. in diameter. It was walled in the latter part of the 17th century, but the walls were destroyed during the Chinese occupation in 1722. The chief streets are fairly straight, but generally of no great width. There is no paving or metal, nor any drainage system, so that the streets are dirty and in parts often flooded. The inferior quarters are unspeakably filthy, and are rife with evil smells and large mangy dogs and pigs. Many of the houses are of clay and sun-dried brick, but those of the richer people are of stone and brick. All are frequently white-washed, the doors and windows being framed in bands of red and yellow. In the suburbs there are houses entirely built of the horns of sheep and oxen set in clay mortar. This construction is in some cases very roughly carried out, but in others it is solid and highly picturesque. Some of the inferior huts of this type are inhabited by the Ragyaba or scavengers, whose chief occupation is that of disposing of corpses according to the practice of cutting and exposing them to the dogs and birds of prey. The houses generally

are of two or three storeys. Externally the lower part generally presents dead walls (the ground floor being occupied by stables and similar apartments); above these rise tiers of large windows with or without projecting balconies, and over all flat broad-eaved roofs at varying levels. In the better houses there are often spacious and well-finished apartments, and the principal halls, the verandahs and terraces are often highly ornamented in brilliant colours. In every house there is a kind of chapel or shrine, carved and gilt, on which are set images and sacred books.

Temples and Monasteries.—In the centre of the city is an open square which forms the chief market-place. Here is the great temple of the "Jo" or Lord Buddha, called the Jokhang, regarded as the centre of all Tibet, from which all the main roads are considered to radiate. This is the great metropolitan sanctuary and church-centre of Tibet, the St. Peter's or Lateran of Lamaism. It is believed to have been founded by the Tibetan Constantine, Srong-tsan-gampo, in 652, as the shrine of one of those two very sacred Buddhist images which were associated with his conversion and with the foundation of the civilized monarchy in Tibet. The exterior of the building is not impressive; it rises little above the level of other buildings which closely surround it, and the effect of its characteristic gilt roof, though conspicuous and striking from afar, is lost close at hand.

GATEWAY TO LHASA, UNTIL 1890 CLOSED TO FOREIGNERS. IN FOREGROUND IS THE CHORTEN, OR SHRINE, WHICH FORMS ENTRANCE TO THE CITY, AND ON THE HILL IS THE POTALA, FORTRESS PALACE OF THE DALAI LAMA

The main building of the Jokhang is three storeys high. The entrance consists of a portico supported on timber columns, carved and gilt, while the walls are engraved with Chinese, Mongolian and Tibetan characters, and a great prayer-wheel stands on one side. Massive folding doors, ornamented with scrollwork in iron, lead to an antehall, and from this a second gate opens into a courtyard surrounded by a verandah with many pillars and chapels, and frescoes on its walls. On the left is the throne of the grand lama, laid with cushions, together with the seats of other ecclesiastical dignitaries, variously elevated according to the rank of their occupants. An inner door with enclosed vestibule gives access to the quadrangular choir or chancel, as it may be called, though its centre is open to the sky. On either side of it are three chapels, and at the extremity is the rectangular "holy of holies," flanked by two gilded images of the coming Buddha, and screened by lattice-work. In it is the shrine on which sits the great image of Ṣakya, set about with small figures, lamps and a variety of offerings, and richly jewelled, though the workmanship of the whole is crude. In the second and third storeys of the temple are shrines and representations of a number of gods and goddesses. The temple contains a vast accumulation of images, gold and silver vessels, lamps, reliquaries and precious bric-à-brac of every kind. The daily offices are attended by crowds of worshippers, and a sacred way which leads round the main building is constantly traversed by devotees who perform the circuit as a work of merit, always in a particular direction. The temple was found by the members of the British mission who visited it to be exceedingly dirty, and the atmosphere was foul with the fumes of butter-lamps.

Besides the convent-cells, halls of study and magazines of precious lumber, buildings grouped about the Jokhang are occupied by the civil administration, *e.g.*, as treasuries, customs office, courts of justice, etc., and there are also private apartments for the grand lama and other high functionaries. No woman is permitted to pass the night within the precinct.

In front of the main entrance to the Jokhang, in the shadow of a sacred willow tree, stands a famous monument, the Doring monolith, which bears the inscribed record of a treaty of peace concluded in 822 (or, according to another view, in 783) between the king of Tibet and the emperor of China. Before this monument the apostate from Lamaism, Langdharma, brother and successor of the last-named king, is said to have been standing when a fanatic recluse, who had been stirred by a vision to avenge his persecuted faith, assassinated him.

Potala.—The famous Potala hill, covered by the palace of the Dalai lama, forms a majestic mountain of building; with its vast inward-sloping walls broken only in the upper parts by straight rows of many windows, and its flat roofs at various levels, it is not unlike a fortress in appearance. At the south base of the rock is a large space enclosed by walls and gates, with great porticoes on the inner side. This swarms with lamas and with beggars. A series of tolerably easy staircases, broken by intervals of gentle ascent, leads to the summit of the rock. The whole width of this is occupied by the palace. The central part of this group of buildings (for the component parts of Potala are of different dates) rises in a vast quadrangular mass above its satellites to a great height, terminating in gilt canopies similar to those on the Jokhang. Here on the lofty terrace is the grand lama's promenade, and from this great height he looks down upon the crowds of his votaries far below. This central member of Potala is called the red palace from its crimson colour, which distinguishes it from the rest. It contains the principal halls and chapels and shrines of past Dalai lamas. There is in these much rich decorative painting, with jewelled work, carving and other ornament, but the interior of Potala as a whole cannot compare in magnificence with the exterior. Among the numerous other buildings of note on or near Potala hill, one is distinguished by the Chinese as one of the principal beauties of Lhasa. This is a temple not far from the base of the hill, in the middle of a lake which is surrounded by trees and shrubberies. This temple, called Lu-kang, is circular in form, with a *loggia* or portico running all round and adorned with paintings. Its name, "the serpent house," comes from the tradition of a serpent or dragon, which dwelt here and must be propitiated lest it should cause the waters to rise and flood Lhasa.

Another great and famous temple is Ramo-ché, at the north side of the city. This is also regarded as a foundation of Srong-tsan-gampo, and is said to contain the body of his Chinese wife and the second of the primeval palladia, the image that she brought with her to the Snow-land; whence it is known as the "small Jokhang." This temple is noted for the practice of magical arts. Its buildings are in a neglected condition.

Another monastery within the city is that of Moru, also on the north side, remarkable for its external order and cleanliness. Though famous as a school of orthodox magic, it is noted also for the printing-house in the convent garden. This convent was the temporary residence of the regent during the visit of the British mission in 1904. Other monasteries in or near the city are the Tsamo Ling or Chomoling at the north-west corner; the Tangyä Ling or Tengyeling at the west of the city; the Kundä Ling or Kundeling about 1 m. west of the city, at the foot of a low isolated hill called Chapochi. Three miles south, beyond the river, is the Tsemchog Ling or Tsecholing. These four convents are known as "The Four Ling." From their inmates the Dalai lama's regent, during his minority, was formerly chosen. The temple of medicine, as already stated, crowns the summit (Chagpa) at the end of the ridge west of the city, opposite to that on which stands the Potala. It is natural that in a country possessing a religious system like that of Tibet the medical profession should form a branch of the priesthood. "The treatment of disease, though based in some measure upon a judicious use of the commoner simple drugs of the country, is, as was inevitable amongst so superstitious a people, saturated with absurdity" (Waddell, *Lhasa and its Mysteries*).

The three great monasteries in the vicinity of Lhasa, all claiming to be foundations of Tsongkhapa (1356–1418), the medieval

reformer and organizer of the modern orthodox Lama Church, "the yellow caps," are the following:—

1. **Debung** (written *'Bras spungs*) is 6 m. west of Lhasa at the foot of the hills which flank the plain on the north. It is one of the largest monasteries in the world, having some 8,000 monks. In the middle of the convent buildings rises a kind of pavilion, brilliant with colour and gilding, which is occupied by the Dalai Lama when he visits Debung once a year and expounds to the inmates. The place is frequented by the Mongol students who come to Lhasa to graduate, and is known in the country as the Mongol convent; it has also been notorious as a centre of political intrigue. Near it is the seat of the chief magician of Tibet, the Nachung Chos-kyong, a building picturesque in itself and in situation.

2. **Sera** is 3 m. north of the city on the acclivity of the hills and close to the road by which pilgrims enter from Mongolia. From a distance the crowd of buildings and temples, rising in amphitheatre against a background of rocky mountains, forms a pleasing picture. In the recesses of the hill, high above the convent, are scattered cells of lamas adopting the solitary life. The chief temple of Sera, a highly ornate building, has a special reputation as the restingplace of a famous *Dorjē, i.e.*, the *Vajra* or Thunderbolt of Jupiter, the symbol of the strong and indestructible, which the priest grasps and manipulates in various ways during prayer. The emblem is a bronze instrument, shaped much like a dumbbell with pointed ends, and it is carried solemnly in procession to the Jokhang during the New Year's festival.

The hill adjoining Sera is believed to be rich in silver ore, but it is not allowed to be worked. On the summit is a spring and a holy place of the Lhasa Mohammedans, who resort thither. Near the monastery there is said to be gold, which is worked by the monks. "Should they . . . discover a nugget of large size, it is immediately replaced in the earth, under the impression that the large nuggets . . . germinate in time, producing the small lumps which they are privileged to search for" (Nain Singh).

3. **Galdan.**—This great convent is some 25 m. east of Lhasa, on the other side of the Kyichu. It is the oldest monastery of the "Yellow" sect, having been founded by Tsongkhapa and having had him for its first superior. Here his body is said to be preserved with miraculous circumstances; here is his tomb, of marble and malachite, with a great shrine said to be of gold, and here are other relics of him, such as the impression of his hands and feet.

Samyé is another famous convent intimately connected with Lhasa, being said to be used as a treasury by the government, but it lies some 36 m. south-east on the left bank of the great Tsangpo. It was founded in 770, and is the oldest extant monastery in Tibet. It is surrounded by a very high circular stone wall, 1½ m. in circumference, with gates facing the four points of the compass. On this wall Nain Singh, who was here on his journey in 1874, counted 1,030 votive piles of brick. One very large temple occupies the centre, and round it are four smaller but still large temples. Many of the idols are said to be of pure gold, and the wealth is very great. The interiors of the temples are covered with beautiful writing in enormous characters, which the vulgar believe to be the writing of Ṣakya himself.

Population and Trade.—The total population of Lhasa is estimated at 15,000 to 20,000, mostly members of religious orders. The permanent population embraces, besides Tibetans, settled families of Chinese (about 2,000 persons), as well as people from Nepal, from Ladak, and a few from Bhotan and Mongolia. The Ladakis and some of the other foreigners are Mohammedans, and much of the trade is in their hands. Desideri (1716) speaks also of Armenians and even "Muscovites." The Chinese have a crowded burial-ground at Lhasa, tended carefully after their manner. The Nepalese (about 800) supply the mechanics and metal-workers. There are among them excellent gold- and silversmiths; and they make the elaborate gilded canopies crowning the temples. The chief industries are the weaving of a great variety of stuffs from the fine Tibetan wool; the making of earthenware and of the wooden porringers (varying immensely in elaboration and price) of which every Tibetan carries one about with him; also the making of certain fragrant sticks of incense much valued in China and elsewhere.

As Lhasa is not only the nucleus of a cluster of vast monastic establishments, which attract students and aspirants to the religious life from all parts of Tibet and Mongolia, but is also a great place of pilgrimage, the streets and public places swarm with visitors from every part of the Himalayan plateau, and from all the steppes of Asia between Manchuria and the Balkhash Lake. Naturally a great traffic arises quite apart from the pilgrimage. The city thus swarms with crowds attracted by devotion and the love of gain, and presents a great diversity of language, costume and physiognomy; though, in regard to the last point, varieties of the broad face and narrow eye greatly predominate. Much of the retail trade of the place is in the hands of the women. The curious practice of the women in plastering their faces with a dark-coloured pigment is less common in Lhasa than in the provinces.

During December especially traders arrive from western China by way of Tachienlu bringing every variety of silk-stuffs, carpets, china-ware and tea; from Siningfu come silk, gold lace, Russian goods, carpets of a superior kind, semi-precious stones, horse furniture, horses and a very large breed of fat-tailed sheep; from eastern Tibet, musk in large quantities, which eventually finds its way to Europe through Nepal; from Bhotan and Sikkim, rice; from Sikkim also tobacco; besides a variety of Indian and European goods from Nepal and Darjeeling, and *charas* (resinous exudation of hemp) and saffron from Ladakh and Kashmir. The merchants leave Lhasa in March, before the setting in of the rains renders the rivers impassable.

The tea importation from China is considerable, for tea is an absolute necessary to the Tibetan. The tea is of various qualities, from the coarsest, used only for "buttered" tea (a sort of broth), to the fine quality drunk by the wealthy. This is pressed into bricks or cakes weighing about 5½ lb., and often passes as currency. The quantity that pays duty at Tachienlu is about 10,000,000 lb., besides some amount smuggled. No doubt a large part of this comes to Lhasa.

Lhasa Festivities.—The greatest of these is at the new year. This lasts fifteen days, and is a kind of lamaic carnival, in which masks and mummings, wherein the Tibetans take especial delight, play a great part. The celebration commences at midnight, with shouts and clangour of bells, gongs, chank-shells, drums and all the noisy repertory of Tibetan music; whilst friends exchange early visits and administer coarse sweetmeats and buttered tea. On the second day the Dalai Lama gives a grand banquet, at which the Chinese and native authorities are present, whilst in the public spaces and in front of the great convents all sorts of shows and jugglers' performances go on. Next day a regular Tibetan exhibition takes place. A long cable, twisted of leather thongs, is stretched from a high point in the battlements of Potala slanting down to the plain, where it is strongly moored. Two men slide from top to bottom of this huge hypothenuse, sometimes lying on the chest (which is protected by a breastplate of strong leather), spreading their arms as if to swim, and descending with the rapidity of an arrow-flight. Occasionally fatal accidents occur in this performance, which is called "the dance of the gods"; but the survivors are rewarded by the court, and the Grand Lama himself is always a witness of it. This practice occurs more or less over the Himalayan plateau, and is known in the neighbourhood of the Ganges as *Barat*. It is employed as a kind of expiatory rite in cases of pestilence and the like. Exactly the same performance is described as having been exhibited in St. Paul's Churchyard before King Edward VI., and again before Philip of Spain, as well as, about 1750, at Hertford and other places in England. (*See* Strutt's *Sports*, etc., 2nd ed., p. 198.)

The most remarkable celebration of the new year's festivities is the great jubilee of the *Monlam* (*sMon-lam*, "prayer"), instituted by Tsongkhapa himself in 1408. Lamas from all parts of Tibet, but chiefly from the great convents in the neighbourhood, flock to Lhasa, and every road leading thither is thronged with troops of monks on foot or horseback, on yaks or donkeys,

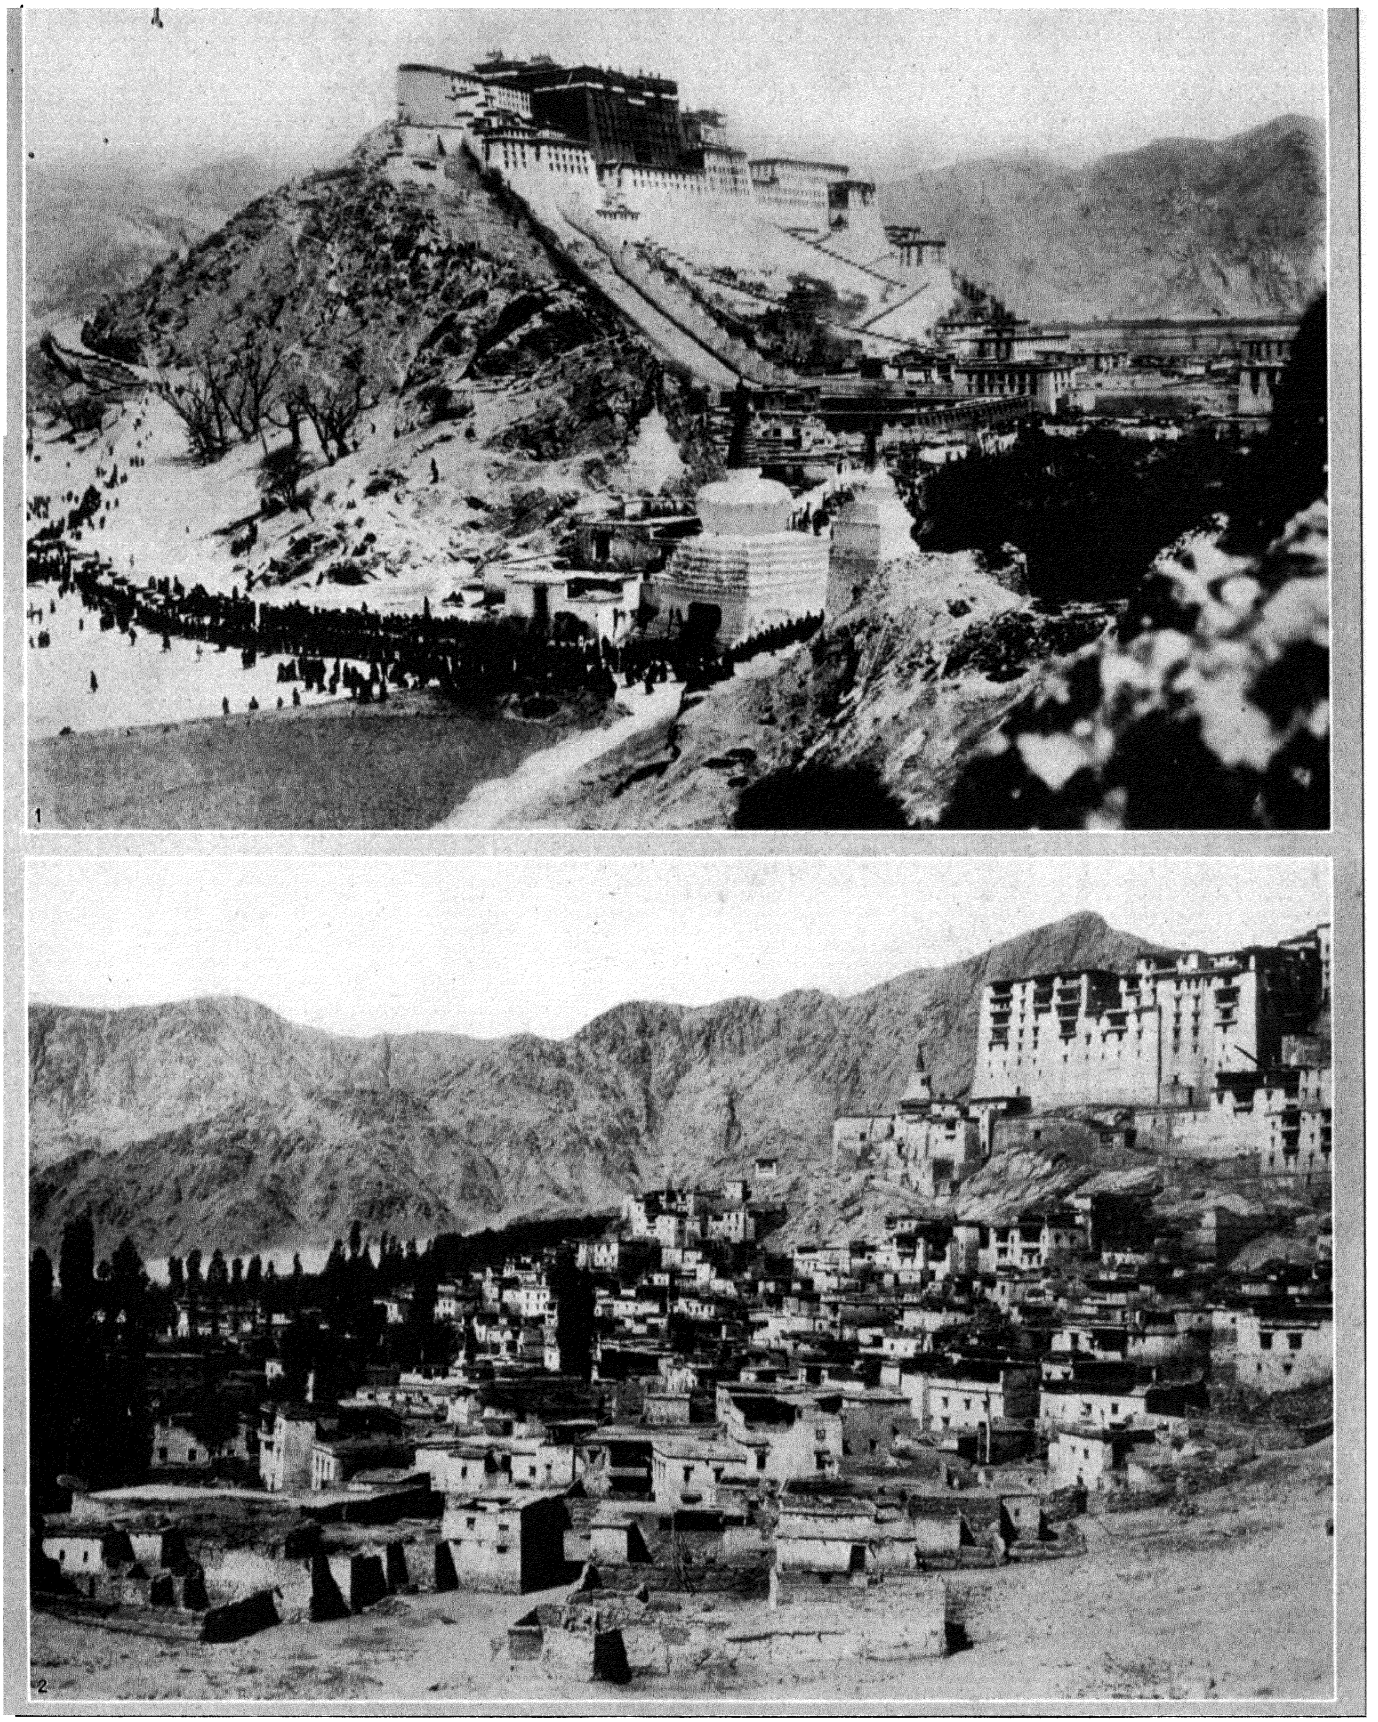
carrying with them their breviaries and their cooking-pots. Those who cannot find lodging bivouac in the streets and squares, or pitch their little black tents in the plain. The festival lasts six days, during which there reigns a kind of saturnalia. Unspeakable confusion and disorder reign, while gangs of lamas parade the streets, shouting, singing and coming to blows. The object of this gathering is, however, supposed to be devotional. Vast processions take place, with mystic offerings and lama-music, to the Jokhang and Moru convents; the Grand Lama himself assists at the festival, and from an elevated throne beside the Jokhang receives the offerings of the multitude and bestows his benediction.

On the 15th of the first month multitudes of torches are kept ablaze, which lighten up the city to a great distance, whilst the interior of the Jokhang is illuminated throughout the night by innumerable lanterns shedding light on coloured figures in bas-relief, framed in arabesques of animals, birds and flowers, and representing the history of Buddha and other subjects, all modelled in butter. The figures are executed on a large scale, and, as described by Huc, who witnessed the festival at Kunbum on the frontier of China, with extraordinary truth and skill. These singular works of art occupy some months in preparation, and on the morrow are thrown away. On other days horse-races take place from Sera to Potala, and foot-races from Potala to the city. On the 27th of the month the holy *Dorjē* is carried in solemn procession from Sera to the Jokhang, and to the presence of the lama at Potala.

Of other great annual feasts, one, in the fourth month, is assigned to the conception of Sakya, but appears to connect itself with the old nature-feast of the entering of spring, and to be more or less identical with the *Hūlī* of India. A second, the consecration of the waters, in September-October, appears, on the confines of India, to be associated with the Dasehra.

On the 30th day of the second month there takes place a strange ceremony, akin to that of the scapegoat (which is not unknown in India). It is called the driving out of the demon. A man is hired to perform the part of demon (or victim rather), a part which sometimes ends fatally. He is fantastically dressed, his face mottled with white and black, and is then brought forth from the Jokhang to engage in quasi-theological controversy with one who represents the Grand Lama. This ends in their throwing dice against each other (as it were for the weal or woe of Lhasa). If the demon were to win the omen would be appalling; so this is effectually barred by false dice. The victim is then marched outside the city, followed by the troops and by the whole populace, hooting, shouting and firing volleys after him. Once he is driven off, the people return, and he is carried off to the Samyé convent. Should he die shortly after, this is auspicious; if not, he is kept in ward at Samyé for a twelvemonth.

Nain Singh, whose habitual accuracy is attested by many facts, mentions a strange practice of comparatively recent origin, according to which the civil power in the city is put up to auction for the first twenty-three days of the new year. The purchaser, who must be a member of the Debung monastery, and is termed the *Jalno*, is a kind of lord of misrule, who exercises arbitrary authority during that time for his own benefit, levying taxes and capricious fines upon the citizens.



History.—The seat of the princes whose family raised Tibet to a position among the powers of Asia was originally on the Yarlung river, in the extreme east of the region now occupied by Tibetan peoples. It was transplanted to Lhasa in the 7th century by the king Srong-tsan-gampo, conqueror, civilizer and proselytizer, the founder of Buddhism in Tibet, the introducer of the Indian alphabet. On the three-peaked crag now occupied by the palace-monastery of the Grand Lama this king is said to have established his fortress, while he founded in the plain below temples to receive the sacred images, brought respectively from Nepal and from China by the brides to whom his own conversion is attributed.

Tibet endured as a conquering power some two centuries, and the more famous among the descendants of the founder added to the city. This-rong-de-tsan (who reigned 740–786) is said to have erected a great temple-palace of which the basement followed the Tibetan style, the middle storey the Chinese, and the upper storey the Indian—a combination which would aptly symbolize the elements that have moulded the culture of Lhasa. His son, the last of the great orthodox kings, in the next century, is said to have summoned artists from Nepal and India, and among many splendid foundations to have erected a sanctuary (at Samyé) of vast height, which had nine storeys, the three lower of stone, the three middle of brick, the three uppermost of timber. With this king the glory of Tibet and of ancient Lhasa reached its zenith, and in 822, a monument recording his treaty on equal terms with the T'ang emperor of China was erected in the city. There followed dark days for Lhasa and the Buddhist church in the accession of this king's brother Langdharma, who has been called the Julian of the lamas. The king rejected the doctrine, persecuted and scattered its ministers, and threw down its temples, convents and images. It was more than a century before Buddhism recovered its hold and its convents were rehabilitated over Tibet. The country was then split into an infinity of petty states, many of them ruled from the convents by warlike ecclesiastics; but, though the old monarchy never recovered, Lhasa seems to have maintained some supremacy, and probably never lost its claim to be the chief city of that congeries of principalities, with a common faith and a common language, which was called Tibet.

The Arab geographers of the 10th century speak of Tibet, but without real knowledge, and none speaks of any city that we can identify with Lhasa. The first passage in any Western author in which such identification can be probably traced occurs in the narrative of Friar Odoric of Pordenone (*c.* 1330). This remarkable traveller's route from Europe to India, and thence by sea to China, can be traced satisfactorily, but of his journey homeward through Asia the indications are very fragmentary. He speaks, however, on this return journey of the realm of Tibet, which lay on the confines of India proper: "The folk of that country dwell in tents made of black felt. But the chief and royal city is all built with walls of black and white, and all its streets are very well paved. In this city no one shall dare to shed the blood of any, whether man or beast, for the reverence they bear a certain idol that is there worshipped. In that city dwelleth the *Abassi, i.e.*, in their tongue the pope, who is the head of all the idolaters, and has the disposal of all their benefices such as they are after their manner."

We know that Kublai Khan had constituted a young prince of the Lama Church, Mati Dhwaja, as head of that body, and tributary ruler of Tibet, but besides this all is obscure for a century. This passage of Odoric shows that such authority continued under Kublai's descendants, and that some foreshadow of the position since occupied by the Dalai Lama already existed. But it was not till a century after Odoric that the strange heredity of the dynasty of the Dalai Lamas of Lhasa actually began. In the first two centuries of its existence the residence of these pontiffs was rather at Debung or Sera than at Lhasa itself, though the latter was the centre of devout resort. A great event for Lhasa was the conversion, or reconversion, of the Mongols to Lamaism (*c.* 1577), which made the city the focus of sanctity and pilgrimage to so vast a tract of Asia. It was in the middle of the 17th century that Lhasa became the residence of the Dalai Lama. A native prince, known as the Tsangpo, with his seat at Shigatse, had made himself master of southern Tibet, and threatened to absorb the whole. The fifth Dalai Lama, Nagwang Lobzang, called in the aid of a Kalmuck prince, Gushi Khan, from the neighbourhood of the Koko-nor, who defeated and slew the Tsangpo and made over full dominion in Tibet to the lama (1641). The latter now first established his court and built his palace on the rock-site of the fortress of the ancient monarchy, which apparently had fallen into ruin, and to this he gave the name of Potala.

The founder of Potala died in 1681. He had appointed as "regent" or civil administrator (*Deisri*, or *Deba*) one supposed to be his own natural son. This remarkable personage, Sangye Gyamtso, of great ambition and accomplishment, still renowned in Tibet as the author of some of the most valued works of the native literature, concealed the death of his master, asserting

that the latter had retired, in mystic meditation or trance, to the upper chambers of the palace. The government continued to be carried on in the lama's name by the regent, who leagued with Galdan Khan of Dzungaria against the Chinese (Manchu) power. It was not till the great emperor Kang-hi was marching on Tibet that the death of the lama, sixteen years before, was admitted. A solemn funeral was then performed, at which 108,000 lamas assisted, and a new incarnation was set up in the person of a youth of fifteen, Tsangs-yang Gyamtso. This young man was the scandal of the Lamaist Church in every kind of evil living and debauchery, so that he was deposed and assassinated in 1701. But it was under him and the regent Sangye Gyamtso that the Potala palace attained its present scale of grandeur, and that most of the other great buildings of Lhasa were extended and embellished.

(H. Y.; L. A. WA.)

L'HÔPITAL (or L'HOSPITAL), **MICHEL DE** (*c.* 1505–1573), French statesman, was born near Aigueperse in Auvergne (now Puy-de-Dôme). His father, who was physician to the constable Charles of Bourbon, sent him to study at Toulouse, whence at the age of eighteen he was driven, a consequence of the evil fortunes of the family patron, to Padua, where he studied law and letters for about six years. On the completion of his studies he joined his father at Bologna, and afterwards, the constable having died, went to Rome in the suite of Charles V. For some time he held a position in the papal court at Rome, but about 1534 he returned to France, and becoming an advocate, his marriage, in 1537, procured for him the post of counsellor to the parlement of Paris. This office he held until 1547, when he was sent by Henry II. on a mission to Bologna, where the council of Trent was at that time sitting; after sixteen months of inactivity there, he was by his own desire recalled. L'Hôpital was now chancellor to the king's sister, Margaret, duchess of Berry. In 1553, on the recommendation of the Cardinal of Lorraine, he was named master of the requests, and afterwards president of the chambre des comptes. In 1559 he accompanied the princess Margaret, now duchess of Savoy, to Nice. In 1560 he was chosen to succeed François Olivier (1487–1560) as chancellor of France.

One of his first acts was to cause the parlement of Paris to register the edict of Romorantin, of which he is sometimes, but erroneously, said to have been the author. Designed to protect heretics from the secret and summary methods of the Inquisition, it certainly had his sympathy and approval. In accordance with his consistent policy of inclusion and toleration he induced the council to call the assembly of notables, which met at Fontainebleau in August 1560 and agreed that the States General should be summoned, all proceedings against heretics being meanwhile suppressed, pending the reformation of the church by a general or national council. The States General met in December; the edict of Orleans (January 1561) followed and finally, after the colloquy of Poissy, the edict of January 1562, the most liberal, except that of Nantes, ever obtained by the Protestants of France. Its terms, however, were not carried out, and during the war which was the inevitable result of the massacre of Vassy in March, L'Hôpital, whose dismissal had been for some time urged by the papal legate Hippolytus of Este, retired to his estate at Vignay, near Étampes, whence he did not return until after the pacification of Amboise (March 19, 1563).

It was by his advice that Charles IX. was declared of age at Rouen in August 1563, a measure which really increased the power of Catherine de' Medici; and it was under his influence also that the royal council in 1564 refused to authorize the publication of the acts of the council of Trent, on account of their inconsistency with the Gallican liberties. In 1564–1566 he accompanied the young king on an extended tour through France; and in 1566 he promulgated an important edict for the reform of abuses in the administration of justice. The renewal of the religious war in September 1567, however, diminished the influence of L'Hôpital, and in February 1568 he obtained his letters of discharge. Henceforward he lived in seclusion at Vignay, his only subsequent public appearance being by means of a *mémoire* which he addressed to the king in 1570 under the title *Le but de la guerre et de la paix, ou discours du chancelier l'Hospital pour exhorter Charles IX. à donner la paix à ses sujets.* He died either at Vignay or at Bellébat on March 13, 1573.

After his death Pibrac, assisted by De Thou and Scévole de Sainte-Marthe, collected a volume of the *Poemata* of L'Hôpital, and in 1585 his grandson published *Epistolarum seu Sermonum libri sex.* The complete *Oeuvres de l'Hôpital* were published for the first time by P. J. S. Dufey (5 vols., Paris, 1824–25). They include his "Harangues" and "Remonstrances," the *Epistles,* the *Mémoire* to Charles IX., a *Traité de la réformation de la justice,* and his will. *See* also A. F. Villemain, *Vie du Chancelier de l'Hôpital* (Paris, 1874); R. G. E. T. T. Atkinson, *Michel de l'Hospital* (London, 1900), containing an appendix on bibliography and sources; A. E. Shaw, *Michel de l'Hospital and his Policy* (London, 1905); and Eugène and Émile Haag, *La France protestante* (2nd ed., 1877 *seq.*).

LIADOV, ANATOL (1855–1914), Russian composer, was born at St. Petersburg (Leningrad) on May 11, 1855. He came of a family of professional musicians and his early training was given him by his father. He then entered the Petersburg conservatoire and became a pupil of Rimsky-Korsakoff. Later he was appointed professor there and also at the Imperial chapel. During his tour as an official collector of folk-songs for the Imperial Geographical society he discovered many treasures of traditional melody, many of which he has arranged with admirable effect. His best work is to be found in his short pieces for piano, which are like delicate miniatures in their fine finish and piquancy. One of these, *A Musical Snuff-box,* has become widely known through its adoption by the Russian Ballet. The most important of Liadov's collections is his three-volume edition of 120 national songs. He also wrote choral and orchestral pieces. He died at Novgorod on Aug. 18, 1914.

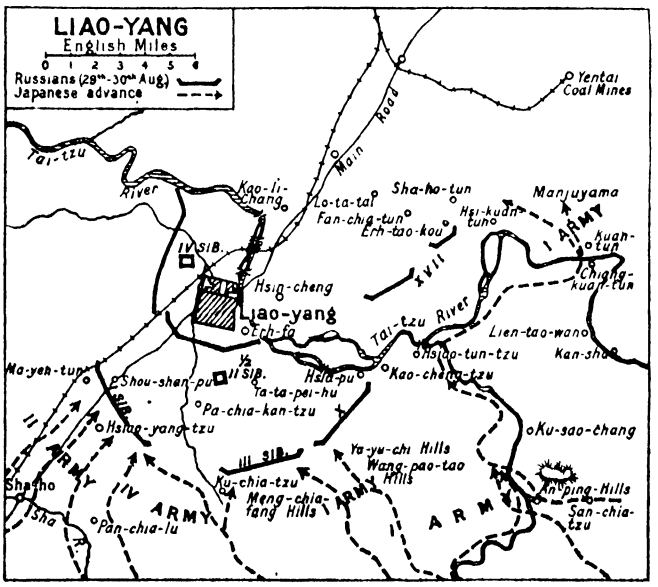
LIANES or **LIANAS,** a term applied originally to the climbing plants—often of great size and with massive stems—of tropical forests. Schimper extended the term to include all climbing plants wherever occurring; the ivy, the honeysuckle and the traveller's joy (*Clematis vitalba*) of the English hedges would thus all fall into this class. The term is still, however, mainly used in its restricted sense and applied to tropical climbers. Climbing plants as a whole are those which take advantage of some other structure (other plant, wall, etc.) for the purpose of support, with the result of economy in the production of strengthening material in the stem; more material is thus available for the production of foliage and so for the production of food supplies. Plants differ very much in the degree of adaptation to this mode of life. Some may be described as ramblers since they merely scramble over the surrounding vegetation. Good examples of this class are the bramble or blackberry (*Rubus fructicosus*) and cleavers or goose grass (*Galium Aparine*) which raise themselves on plants associated with them in hedges. They are aided thereto by the thorns or prickles they possess which prevent the stem being pulled back once it has pushed itself upwards.

Others are root climbers. These are not very common in the European flora but ivy (*Hedera Helix*) is a familiar example. Large numbers of roots (adventitious in nature) are produced on the non-illuminated side of the shoot. These roots are not sensitive to gravity and are negatively phototropic (*see* PLANTS: *Physiology*); as a result they penetrate any crevices in the wall and the bark of the tree on which they may be growing. These roots are "anchoring" roots; they do not, as is commonly held, suck any nourishment from the tree on which they grow; they may absorb a little rain water when they are young but they soon lose this power and become mere mechanical supports. Many members of the family Araceae and species of *Ficus, Hoya, Norantea, Piper, Tecoma* are root climbers.

Another form may be described as twining plants. These climb by winding their stems round suitable supports which must not be very thick nor too smooth, and must not be too far removed from the vertical position. Twiners generally possess long and thin stems and large internodes, and they show marked *circum-*

nutation, i.e., the apex of the stem, owing to regular cyclic variation in the rate of growth of its different sides, executes a circling movement in the air under the influence of gravity. Such a wide circling movement increases the chances of meeting a suitable support. When such a support is found the circumnutation causes the plant to wind round it in loose coils. Later the coils become tightened, *i.e.,* their diameter is decreased, by the elongation of the stem. The spiral formed may be right- or left-handed according to the plant. It is best defined as "clockwise" or "counter-clockwise," *i.e.,* whether, when seen from *above,* the tip of the stem twists round in the same or opposite direction as the hands of a clock. In the British flora twiners are found in *Humulus* (hop), *Tamus* (black bryony), *Calystegia* (convolvulus), *Lonicera* (honeysuckle), *Solanum* (bittersweet).

STEMS OF LIANES HANGING FROM A TALL TREE IN FRENCH GUIANA. NOTE THE MAN ON HORSEBACK



Another form is seen in the tendril climbers. These plants climb by means of slender whip-like organs known as tendrils which are sensitive to contact and sometimes extremely so. If the tendril of vine (*Vitis*) or bryony (*Bryonia*) or *Passiflora* is lightly stroked on the lower side it will in a minute or two curve towards this lower side. As a result of this sensitiveness to a contact-stimulus (haptotropism as it is called) the growth rate on the side touched is decreased and that on the other side increased, and so the tendril winds round the support if of appropriate thickness, the act of winding bringing fresh surfaces into contact. Later strong mechanical tissue (sclerenchyma) develops in the tendrils, but only in those which have attached themselves to a support. The portion of the tendril between the support and its point of attachment to the plant frequently becomes coiled, the direction of the twist being reversed in the middle. This coil acts like a spring and renders the plant less liable to be torn from its support by a storm.

Tropical Climbers or Lianes.—Climbing plants reach their extreme development in the rain forests of the tropics where the high temperature and the high saturation of the air are eminently suitable for rapid growth. Furthermore the shade in these forests is very great and climbing on tree trunks is the most economical way of reaching the light above the forest canopy. It is thus not surprising to find that tropical climbers are very numerous; the number has been estimated at 2,000 or more. Certain botanical families, as Leguminosae, Bignoniaceae, Malpighiaceae, Menispermaceae and Sapindaceae, are peculiarly rich in species which are climbers. The behaviour of tropical climbers is well described by A. R. Wallace in his *Tropical Nature* (1878). "Next to the trees themselves the most conspicuous and remarkable feature of the tropical forests is the profusion of woody creepers and climbers that everywhere meet the eye. They twist around the slender stems, they droop down pendent from the branches, they stretch tightly from tree to tree, they hang looped in huge festoons from bough to bough, they twist in great serpentine coils or lie entangled in masses on the ground. Some are slender, smooth, and root-like; others are rugged or knotted; often they twine in veritable cables; some are flat like ribbons, others are curiously waved and indented. . . . They pass overhead from tree to tree, they stretch in tight cordage like the rigging of a ship from the top of one tree to the base of another, and the upper regions of the forest often seem full of them. . . . In the shade of the forest they rarely or never flower, and seldom even produce foliage, but when they have reached the summit of the trees that support them they expand under the genial influence of light and air, and often cover their foster parent with blossoms not its own."

These lianes usually have thick woody stems and as the stems wind round their supports they also twist on their own axes. Associated with this we find that secondary thickening of the wood frequently occurs in an anomalous way. Instead of a single ring of cambium developing a continuous cylinder of secondary wood we have irregular layers of cambium developing irregular masses of wood. The stem may be flattened with bands of wood in the form of arcs of a circle or the stem may be composed of a number of rounded strands of wood. Climbers generally, owing to the narrowness of the cross section of the stem compared with its length, have large and wide wood vessels to facilitate water transport. This reaches its height in the lianes of the tropics, which show in their wood the widest and largest vessels known. *Calamus* (the rattan) and *Desmoncus* among the palms are typical tropical ramblers or scramblers. Their stems are usually thin and reed-like but the leaves possess spines. These spines act like the smaller hooks of the bramble and hold the stem in position among the surrounding plants. The stem of *Calamus* may reach the enormous length of 600 feet and the plants are a serious bar to progress in a tropical forest.

(Jena, 1922–3); G. Haberlandt, *Eine botanische Tropenreise* (Leipzig, 1893); A. F. W. Schimper, *Plant Geography upon a Physiological Basis* (1903); E. Warming, *Ecology of Plants* (1909); M. Skene, *The Biology of Flowering Plants* (1924). (V. H. B.)

LIANG SHIH-YI (1869–), Chinese statesman, was born in Samshui, near Canton, and, unlike many other Chinese leaders of his time, was educated wholly in China and knew no other language than his own. Graduating with honours in classics, he was appointed secretary to Tang Shao-yi when that statesman led a mission to India in 1906, and then began a successful career in the civil service. He was appointed director of railways and assistant director of the Chiao T'ung Bank in 1907, acting director of Imperial Chinese Posts in 1911, acting minister of communications in 1912, acting vice-minister of finance in 1913, and a member of the council of state and director-general of customs and taxes in 1915. The failure of Yuan Shih-kai's monarchical *coup d'état,* of which he was one of the supporters, compelled him to resign, but in 1918 he became Speaker of the Senate. Throwing in his lot with Chang Tso-lin in the contest between the latter and Wu Pei-fu, he became Prime Minister on Dec. 24, 1921. The defeat of Chang, however, resulted in his fall, and he left Peking in 1922 to escape Wu's vengeance and retired from active politics.

LIAO-YANG, a city of China, formerly the chief town of the province of Liao-tung (southern Manchuria). It is 35 m. S. of Mukden, situated in a rich cotton district in the fertile valley

of the Liao river. Pop. (est.) 100,000.

Battle of Liao-Yang.—This was the first of the three great battles which marked the main advance of the Japanese armies in Manchuria during the RUSSO-JAPANESE WAR, and is described under the latter heading. It lasted from Aug. 25 to Sept. 2, 1904, when it ended in a Japanese victory that narrowly missed being decisive.

LIAPTCHEFF, ANDREA (1866–), Bulgarian statesman, was born on Nov. 30, 1866, in the town of Ressen, Macedonia. He received his secondary education at Monastir, Salonika and Philippopolis and his university education at Zürich, Berlin and Paris. He took a prominent part in the movement for the unification of Northern Bulgaria and Eastern Roumelia of 1885. (*See* BULGARIA.) After editing jointly with D. Risoff the papers *Christo Boteff* and *Young Bulgaria*, A. Liaptcheff founded and edited the *Reforms*, a paper expounding the cause of Macedonia. In 1896 he joined the staff of the *Zname* and later on that of the *Priaporetz*, the organ of the Democratic party, of which he eventually became editor.

An eminent economist and financier, Andrea Liaptcheff took particular interest in the co-operative movement of which he was a pioneer, and was regularly elected to the post of president of the Supreme National Co-operative Council. For many years, until his appointment as prime minister in 1926, he was also president of the Union of the Popular Co-operative banks.

A. Liaptcheff sat in parliament almost uninterruptedly since 1908. He held successively the posts of minister of agriculture and commerce and minister of finance in the Malinoff Democratic cabinet of 1908–11. The treaty of Bulgaria's independence was signed by him at Constantinople in 1908; he also concluded the armistice at Salonika in 1918 after the collapse of the Bulgarian front in Macedonia. After occupying for several months the Finance Ministry, he took in Nov. 1918 the Ministry of War, being the first civilian in Bulgaria to hold that post. He was imprisoned by Stamboliiski in 1922, together with many other statesmen of pre-war days, whose elimination from political life was aimed at. His release from prison came with the *coup d'état* of June 9, 1923.

Andrea Liaptcheff became chairman of the Governmental majority in the parliament elected after the downfall of Stamboliiski. On Jan. 3, 1926, he succeeded Prof. Tsancoff as premier. He shared with his predecessor and Atanas Bouroff the leadership of the Democratic union, the party founded after June 9, by fusion of several party groups.

The policy of appeasement and conciliation in internal and Balkan politics pursued by Liaptcheff inspired confidence in Bulgaria abroad and helped to secure financial assistance from the League of Nations for the settlement of the refugees and for the financial and economic reconstruction of Bulgaria.

LIAPUNOV, ALEXANDER MIKHAILOVICH (1857–1918), Russian mathematician, was born April 25 (old style) 1857. In 1901 he was made a member of the Russian academy of science and later was appointed professor at Kharkov university. He died Oct. 31, 1918 in Odessa. His mathematical research belongs mainly to hydrodynamics and his chief work is *Sur les figures d'équilibre peu différentes des ellipsoïdes d'une masse liquide homogène douée d'un mouvement de rotation* (1909–12). He made important advances in this subject and his voluminous investigations are of great value to specialists.

LIBANIUS (A.D. 314–393), Greek sophist and rhetorician, was born at Antioch, the capital of Syria. He studied at Athens, and spent his earlier manhood in Constantinople and Nicomedia. His private classes at Constantinople were more popular than those of the public professors, who had him expelled *c.* 346 on the charge of studying magic. He removed his school to Nicomedia, where he remained five years. After another attempt to settle in Constantinople, he finally retired to Antioch (354). Though a pagan, he enjoyed the favour of the Christian emperors. Among his pupils were John Chrysostom, Basil (bishop of Caesarea) and Ammianus Marcellinus. His works, consisting chiefly of orations (including an autobiography), declamations on set topics, letters, life of Demosthenes, and arguments to all his orations are voluminous. He devoted much time to the classical Greek writers, and had a contempt for all things Roman. His speeches and letters throw considerable light on the political and literary history of the age.

Editions: Orations and declamations, J. J. Reiske (1791–97); letters, J. C. Wolf (1738); two additional declamations, R. Förster (*Hermes*, ix. 22, xii. 217), who has published in the Teubner series a complete edition 12 vols. (1903–22); *Apologia Socratis*, Y. H. Rogge (1891). *See* also E. Monnier, *Histoire de Libanius* (1866); L. Petit, *Essai sur la vie et la correspondance du sophiste Libanius* (1866); G. R. Sievers, *Das Leben des Libanius* (1868); R. Förster, *F. Zambeccari und die Briefe des Libanius* (1878). *See* further J. E. Sandys, *Hist. of Classical Scholarship* (3rd ed., 1921).

LIBATION, a drink offering, the pouring out of a small quantity of wine, milk or other liquid as a ceremonial act (Lat. *libatio*, from *libare*, to taste, to pour out as offering). Such an act was performed in honour of the dead, in making of treaties (Gr. σπονδή, σπένδειν, *libare*, whence σπονδαί, treaty), and particularly in honour of the gods. Such libations to the gods were made as part of the daily ritual of domestic worship, or at banquets or feasts to the Lares (*q.v.*) or to special deities, as by the Greeks to Hermes, the god of sleep, when going to rest.

LIBAU: *see* LIEPAJA.

LIBEL and SLANDER. The law recognizes in every man the right to have his reputation unassailed by false and defamatory imputations. A defamatory imputation is one which tends to lower a man in the estimation of right-thinking men, or cause him to be shunned or avoided, or expose him to hatred, contempt, or ridicule. Such imputation, if conveyed by written or printed words, or by picture or effigy, is called libel; if conveyed by mere spoken words, or by significant looks, signs or gestures, is called slander.

The difference, then, between libel and slander is to be found in the medium through which the defamatory imputation is conveyed to the mind of the reader or hearer. It is transitory in slander; it is more or less permanent in libel. The difference is important, for an action for libel will lie without proof of special damage, whereas an action for slander will not lie unless special damage can be proved, except in the four following cases: (1) where the words impute a crime punishable corporally, *e.g.*, by imprisonment; (2) where the words impute a contagious or infectious disease; (3) where the words are spoken of, and reflect on, a man in the way of his office, profession or trade; (4) where the words impute unchastity or adultery to a woman or girl (Slander of Women act, 1891). Unless the plaintiff can bring his case within one of these four heads he can only maintain an action if he can prove that he has suffered special damage, *i.e.*, actual loss—the loss of some material or temporal advantage which is either pecuniary or capable of being estimated in money—as the direct and natural and reasonable result of the slander, and this is so however disgraceful the imputation may be, and however certain it is that it will injure his reputation. A striking example of this rule is afforded by the decision in *Jones* v. *Jones & Wife* (1916) 2 A.C. 381, where it was held that a schoolmaster could not (in the absence of special damage) maintain an action for a verbal imputation of immorality, as the imputation was not in any way connected with his calling as a schoolmaster, and this although the jury found that the words imperilled the retention of his office and imputed that he was unfit for it.

It is not easy to discover why the law makes this distinction between an action for libel and an action for slander. The origin of the distinction is to be found in the different histories of the remedies for the two wrongs. The reason usually advanced for the distinction is that a greater degree of mischief is probable in the case of a libel than in the case of a slander owing to the more durable publicity of libel and the fact that it can be more easily disseminated. But the soundness of this reasoning was disputed by Lord Mansfield over 100 years ago, and may well be disputed with even greater force in these days of world-wide broadcasting.

It is immaterial whether the defamatory imputation is conveyed by words of assertion or suggestion, or whether it is conveyed by words used in a declarative or interrogative form. In-

sinuation may be as defamatory as direct assertion, and sometimes even more mischievous. The effect, the tendency of the language used, not its form, is the criterion. The libeller cannot defame and escape the consequences by any dexterity of style. It is, however, often very difficult to determine whether a given statement is defamatory. It may depend entirely on circumstances known to the persons who heard or read it. In slander, it may depend on the manner in which the words were pronounced. Accent, emphasis, intonation, gesture may all have an influence in determining the meaning. There are no words, however serious on the face of them, which may not be explained away by evidence that in the particular circumstances of the case they were not understood in a defamatory sense, but by way of jest, or in a secondary and innocent meaning. Conversely, words in themselves apparently innocent, may, with reference to certain circumstances and to persons knowing those circumstances, be shown to have been understood in a secondary and defamatory meaning. For example, the statement that Smith is "no better than his father" is on the face of it not defamatory. But if Smith's father is known by the persons to whom the words were used to have been a criminal the words would convey to them the meaning that Smith also is a criminal. In such cases the plaintiff must make the defamatory sense clear by an averment in his pleading, called an innuendo, and must prove the facts necessary to satisfy the jury that the words were understood in the defamatory sense averred.

It is for the jury, not the judge, to determine whether the words are defamatory. Libel or no libel is of all questions peculiarly one for a jury. It is the duty of the judge to tell the jury what in law is a libel, and then leave it to them to decide whether the particular words complained of fall within that definition or not. Where, however, the judge is of opinion that the words are incapable of any defamatory meaning, it is his duty to direct the jury as a matter of law to find that there is no libel. (*Capital and Counties Bank* v. *Henty* [1882] 7 app. cas. 741). But he should only do this when he is satisfied that a finding by the jury that the words are defamatory would be set aside as wholly unreasonable (*per* Kelly, C. B., in *Cox* v. *Lee* [1869] *L.R.* 4 *Ex.* 284, at p. 288).

It is immaterial whether or not the defendant intended the words to be defamatory. The question is, not what the defendant intended the words to mean but what reasonable men, knowing the circumstances in which the words were published, would understand to be their meaning. (*Hankinson* v. *Bilby* [1847] 16 M. and W. 492). Libel consists in using language which others knowing the circumstances would reasonably think to be defamatory of the person complaining and injured by it. A person charged with libel cannot defend himself by showing that he intended in his mind not to defame, although he may properly urge such fact in mitigation of damages. A striking illustration of this rule is to be found in the Scottish case of *Morrison* v. *Ritchie & Co.* (1902) 4 Fraser 645, where damages were recovered against the proprietors of a newspaper who in all innocence had announced in the paper that a lady, who had in fact been married only a month, had given birth to twins.

It is also immaterial whether or not the defendant intended to refer to the plaintiff. The question is: Would the words be understood by reasonable people who knew the plaintiff to refer to him? If so, they are published of and concerning the plaintiff no matter what the intention of the defendant may have been (*Hulton & Co.* v. *Jones* [1910] A C. 20).

An action cannot be maintained for libel unless there has been a "publication," *i e.,* a making known of the defamatory matter to some person other than the person of whom it is written. A communication of the defamatory matter only to the person defamed,cannot injure his reputation though it may wound his self-esteem. A man's reputation is not the good opinion he has of himself but the estimation in which others hold him. So in the case of slander the words must be uttered in the presence and hearing of some third person. If they are uttered in the presence and hearing of the person slandered only there is no publication, and therefore no action will lie.

It is not, however, necessary in every case to prove directly that the defamatory matter was brought to the actual knowledge of some third person. If facts are proved from which such inference can be reasonably drawn a primâ facie case will be established. For example, proof that a letter was posted is sufficient primâ facie evidence that it reached the addressee, and of a publication to him. Similarly, if a libel be written on the back of a postcard and then sent through the post there is evidence of a publication, for the writing is necessarily visible to every person through whose hands the postcard passes, and the court will presume, in the absence of evidence to the contrary, that others beside the person to whom the postcard is addressed, *e.g.,* employees of the post office, will read, and have in fact read, it. (*Huth* v. *Huth* [1915] 3 K.B. 32). There is also evidence of publication if the libel is contained in a telegram, for the contents of a telegram is necessarily communicated to the clerk and telegraph operators whose duty it is to transmit it. (*Williamson* v. *Freer* [1874] L.R. & C.P. 393).

If A writes a letter defamatory of B and sends it to B and the letter is opened and read by C, A is not responsible for the publication to C unless it can be proved that A knew that the letter would be likely to be opened and read by some person other than B, *e.g.,* that A knew that B was blind or could not read. (*Powell* v. *Gelston* [1916], 2 K.B. 615).

A husband is civilly liable for a libel or slander published by his wife, even though she is living apart from him under a deed of separation. But he is not liable for a libel or slander published by her after the granting of a decree of divorce or judicial separation. A master is civilly liable for a libel or slander published by his servant in the course of his authorized employment, even though he was expressly forbidden to publish any defamatory matter. (*Citizens' Life Assurance Co.* v *Brown* [1904] A.C. 423).

Every re-publication of defamatory matter gives rise to a fresh cause of action. It is no defence to the re-publisher of a libellous letter that he received the letter from another and believed the statements contained in it to be true, though the fact that he disclosed the name of the person from whom he received the letter at the time when he re-published it may mitigate the damages. So in the case of a slander it is no defence to a person who has repeated a slander that he did not originate it, but only repeated what some other person had told him. The existence of a slanderous rumour is no justification for repeating it.

A person who utters a slander or publishes a libel is not responsible for any mischief caused by its repetition or re-publication save in the following cases: (1) where he authorized or intended the person to whom he published the words to repeat or re-publish them; (2) where the repetition or re-publication of the words was the natural and probable result of the original publication; (3) where the person to whom the words were published was under a legal or moral duty to repeat or re-publish them. (*Speight* v. *Gornay* [1891] 60 L.J., Q B. 231).

Where a libel is contained in a newspaper the author of the libel, and the proprietor, printer, publisher, editor and vendor of the newspaper are prima facie liable for the damage caused by it, and any or all of them can be made defendants in one action. The vendor, however, will escape liability if he can prove that he did not know that the newspaper—and the same rule applies in the case of a book—contained, or was of a character likely to contain, a libel, and that such ignorance was not due to any negligence on his part. But the burden of proving this fact lies strictly on him, and the question of publication or non-publication in such a case is one for the jury. In the case of a book the jury may rightly infer that the vendor was negligent in not knowing that the book contained libellous matter from the title or general nature of the book itself, or from the recognized propensity of the author or publisher to publish libellous matter. But in the absence of such evidence the mere fact that the vendor did not have the book read through before he offered it for sale is not in itself evidence of negligence. (*Welldon* v. *Times Book Club Ltd.* [1911] 28 T.L.R. 115).

The plaintiff in an action for libel or slander need not prove that the words are false, for the law presumes this fact in his

favour. Nor need he prove malice on the part of the defendant. When a man says or writes anything defamatory of another he is assumed to do so maliciously. The law presumes malice from the defamatory nature of the statement, unless the occasion on which it is made is what is termed a privileged occasion, in which case the plaintiff must, in order to succeed, prove that the defendant was actuated by malice (see *infra*). Nor need the plaintiff prove that he has suffered any damage as the result of the words complained of—except in the case of slander not falling within one of the four heads above-mentioned—for the law presumes such damage without proof.

There are several defences open to a defendant in an action for libel or slander. He may contend that there has been no publication of the words, or that the words published are not defamatory, or do not refer to the plaintiff. Where special damage is an essential element of the action—as in the case of slander not falling within one of the above four heads—he may contend that no such damage has been suffered by the plaintiff, or that such damage, if any, is too remote. He may also rely on one or other of the following defences.

Justification.—To succeed in this defence the defendant must prove that the words used are substantially true. A slight inaccuracy as to some detail will not prevent his succeeding if such inaccuracy in no way alters the character of the imputation (*Edwards* v *Bell* [1824] 1 Bing. 403). But if the words which the defendant cannot prove to be true materially aggravate the main imputation or insinuate some further charge in addition to it, the plaintiff will be entitled to a verdict (*Morrison* v. *Harmer* [1837]) The test always is: Would the words as published have a different effect on the mind of the reader from that which the actual truth would have produced? (*Alexander* v. *North-Eastern Railway Co.* [1865] 6 B. & S. 340).

Fair Comment.—In order to establish this defence the defendant must prove (1) that the words are the expression of an opinion (not the allegation of a fact); (2) that they are the fair and honest expression of an opinion based on true facts; and (3) that the subject commented on is one of public interest, *e g.*, the public conduct of a man who holds some public office, or a book issued to the general public, or a work of art publicly exhibited, or a play publicly performed. It should be noted that the comment must be *both* fair *and* honest. (*McQuire* v *Western Morning News* [1903] 2 K.B. 100, 110). The word fair refers to the language employed. The word honest refers to the mind of the critic. The defendant will fail in his defence, even though the language used by him does not in itself exceed the limits of fair criticism, if it can be shown that he was not expressing his honest opinion but was writing from some indirect motive, *e g.*, in the case of a play, with the intention of injuring the author or the producer (*Thomas* v. *Bradbury, Agnew & Co.* [1906] 2 K.B. 627).

Absolute Privilege.—There are certain occasions on which public policy and convenience require that a man should be free from responsibility for the publication of defamatory words, even though he knew them to be false and spoke or wrote them with the express intention of injuring the plaintiff. Parliamentary, judicial and State proceedings are occasions of absolute privilege. No action will lie against a member of either house of parliament for defamatory statements made by him in the course of any parliamentary debate or proceeding, however injurious they may be. Statements contained in a petition addressed to parliament, or made by a person when giving evidence before a parliamentary committee, are absolutely privileged. Parliamentary papers published by the authority of either house are protected by a special statute, and the court will at once stay any proceedings commenced in respect of defamatory matter contained therein upon delivery of a certificate, properly verified by affidavit, setting forth that they were published by the authority of parliament (Parliamentary Papers act, 1840). No action will lie for defamatory statements made by any judge, juror, counsel, party or witness in the course of any proceedings before a court of justice, nor for defamatory statements contained in any pleading, affidavit, proof of a witness, or other document properly used in the course of such proceedings. An absolute privilege also attaches to defamatory statements contained in any newspaper report of judicial proceedings provided that such report is both fair and accurate and was published contemporaneously with such proceedings (Law of Libel Amendment Act, 1888, s. 1). A similar immunity, resting also on grounds of public policy, is accorded to official statements made, and official letters written, by an officer of State in the course of the performance of his official duties, and to all acts of State and the official notification thereof in the *London Gazette*.

Qualified Privilege.—There is a much larger class of occasions on which the interests of society require that a man should be protected in stating what he believes to be the truth about another, but only if he makes the statement honestly and not for any indirect or wrong motive. Such occasions are called occasions of qualified privilege, for the defendant is only entitled to protection if he uses the privileged occasion for the purpose for which it arose. He is not entitled to the protection of the privilege if he uses the occasion for some indirect or improper motive, *e.g.*, to gratify his spite against the plaintiff. The law makes the motive with which the occasion is used the true test of the defendant's liability.

The guiding principle by which occasions of qualified privilege may be ascertained was laid down by Lord Atkinson, in *Adam* v. *Ward* (1917) A.C. 309, as follows: "A privileged occasion is an occasion where the person who makes a communication has an interest or a duty, legal, social or moral, to make it to the person to whom it is made, and the person to whom it is made has a corresponding interest or duty to receive it. This reciprocity is essential"

A common illustration of privilege under this head is the character of a servant. It is the moral duty of a master on enquiry being made as to the character, fitness or capacity of a servant who has been in his employ to state all that he knows either for or against the servant, and if he does so honestly and without malice towards the servant his answer will be privileged, for the intending employer has clearly an interest in the subject-matter of the enquiry. There is a reciprocal duty and interest.

The privilege which attaches to information given in answer to an enquiry as to a servant's character applies to every answer to an enquiry of a confidential nature made by a person who has an interest in the subject-matter thereof, *e g.*, an answer to the enquiry of a tradesman with regard to the credit or solvency of a person with whom the tradesman proposes to deal The person, however, who makes the enquiry must have a legitimate interest in the subject-matter thereof, not merely an interest which springs from idle curiosity. It is no part of a man's duty to go into the confessional to every chance person who may choose to ask impertinent questions about another.

There are some cases in which it is the moral duty of a man, unasked and of his own accord, to give information to another, *e g.*, where a confidential relationship exists between them. For instance, a father or near relative of a woman may warn her about the character of a man whom she proposes to marry. And even though no confidential relationship exists between the parties information given may nevertheless be privileged. The rule at the present day may be broadly stated as follows: a person who has information materially affecting the interests of another is entitled to tell that other what he knows with the honest purpose of protecting his interests, and if he does so with that honest purpose and in the full belief that his information is true, such communication, though volunteered and made to a complete stranger, is privileged (*Stuart* v. *Bell* [1891] 2 Q.B. 341).

Statements made by a man in the bona fide protection of his own interests, or in answer to an attack made upon him, are privileged, provided they are fairly relevant to the matter in hand (*Adam* v. *Ward* [1917] A.C. 309). And where two or more persons have a legitimate common interest in any matter any communication passing between them in reference to that matter is privileged, *e.g.*, communications between directors of the same company or ratepayers of the same parish (*Hunt* v. *Great Northern Railway Co.* [1891] 1 Q.B. 601).

The scope of the defamatory matter must not exceed the exigency of the occasion. If a person on a privileged occasion goes into matters not in any reasonable sense germane to the subject-matter of the occasion no privilege will attach to his statement in so far as such matters are concerned (*Adam* v. *Ward*, p. 993). And so where a man wrote a letter to the manager of some property in which he and A were jointly interested, principally about the property and the conduct of A in reference thereto, but also containing a charge against A of ill conduct towards his mother, it was held that, although the part of the letter about A's conduct as to the property was privileged, such privilege did not extend to that part of the letter which reflected on A's conduct to his mother, for the manager of the property could have nothing to do with that (*Warren* v. *Warren* [1834] 2 Cr. M. & R. 250).

Similarly the sphere of publication must not extend beyond the exigency of the occasion. If a person transmits by telegram defamatory matter which would have been privileged if sent by letter the privilege is lost, for the defamatory matter is necessarily published to the clerks through whose hands the telegram passes and such publication is wholly unnecessary (*Williamson* v. *Freer* [1874] L.R. 9 C.P. 393). It would be otherwise if transmission by telegram was the necessary or reasonable course to adopt in the circumstances (*Edmondson* v. *Birch & Co.* [1907] 1 K.B. 371). So where a slanderous charge is unnecessarily made in the presence of persons who have no interest in the matter no privilege will attach thereto. But where a man, in making a statement on a privileged occasion, as a reasonable precaution and in order to protect his own interests calls in some third person to hear what he says, the presence of such third person will not destroy the privilege. And so where a master, who was about to dismiss a servant for dishonesty, called in a friend to hear what passed it was held that the presence of such third party did not destroy the privilege, for it was material to the master's interest that a third person should be present who could bear witness to the dissolution of the contract, and so safeguard the master against any imputation of having dismissed the servant for reasons other than those he then gave (*Taylor* v. *Hawkins* [1851] 16 Q.B. 308).

Privileged Reports.—A report of judicial proceedings is privileged if it is fair and accurate and not published maliciously, although such report may contain matter defamatory of an individual. It is of great importance to the public that the proceedings of courts of justice should be universally known. The general advantage to the community in having such proceedings made public more than counterbalances the inconvenience to the private persons whose conduct may be the subject of such proceedings. It is not necessary that the report should be verbatim; an abridged report will be privileged, provided it gives a correct and just impression of what took place in court. But if the report is garbled so as to produce misrepresentation, or by suppression of some portion of the evidence has the effect of giving an entirely false impression to the prejudice of one of the parties concerned, it will not be privileged.

A report of the proceedings of either house of parliament is privileged, provided that it is fair and accurate and is not published maliciously.

At common law no reports other than reports of judicial and parliamentary proceedings were privileged; but by s. 4 of the Law of Libel Amendment act, 1888, a report published in a newspaper of the proceedings of a public meeting, or (except where neither the public nor any newspaper reporter is admitted) of any meeting of a vestry, town council, school board, board of guardians, board or local authority constituted by act of parliament, is privileged unless it is proved that such report was published maliciously. It is, however, provided that this section shall not protect (*a*) a defendant who was requested, and who has refused or neglected to insert in his newspaper a reasonable letter or statement by way of contradiction or explanation of such report; (*b*) the publication of any blasphemous or indecent matter; (*c*) the publication of any matter not of public concern, and the publication of which is not for the public benefit.

Apology.—An apology is no defence to an action for libel or slander, but may be given in evidence in mitigation of damages. To be effectual, an apology should not only be made promptly, but should amount to a full and frank withdrawal of the charges or suggestions conveyed, and contain an expression of regret that such charges or suggestions were ever made. It should be given a publicity equal to that of the libel. If the libel appeared in a newspaper, the apology should be inserted in the same newspaper in as large a type and in as conspicuous a position as the libel, so as plainly to attract the attention of readers to it.

In any action for libel contained in a newspaper, it is a good defence that such libel was inserted without actual malice and without gross negligence, and that before the commencement of the action, or at the earliest opportunity afterwards, the defendant inserted in such newspaper a full apology for the libel, or, if the newspaper in which the libel appeared was published at intervals exceeding one week, that he offered to publish the apology in any newspaper selected by the plaintiff. This defence must be accompanied by the payment of a sum of money into court by way of amends, otherwise it will be deemed a nullity.

Criminal Law.—Libel is not only an actionable wrong: it is also a criminal offence punishable with fine and imprisonment. Slander is not a criminal offence, though the words uttered may come within the criminal law as being blasphemous, seditious or obscene.

But although libel is a criminal offence as well as an actionable wrong, a man whose private character has been attacked should not institute criminal proceedings unless the words are of a kind calculated to provoke a breach of the peace. If he does so, the judge will direct the grand jury to throw out the bill of indictment and leave the prosecutor to pursue his civil remedy.

In a civil action the person defamed must, as we have seen, prove a publication to some third person, as without that there is no injury to his reputation. But in criminal proceedings this is not essential; it is sufficient to prove a publication to the actual person defamed provided the words might reasonably tend to provoke him to a breach of the peace (*R.* v. *Adams* [1888] 22 Q.B.D. 66). Again, as we have seen, the truth of the matters charged is a complete defence to a civil action for libel. But in criminal proceedings, until 1843, the fact that the words were true was regarded as wholly irrelevant. No evidence was admitted of the truth of the matters charged, not even in mitigation of sentence. But now, by s. 6 of Lord Campbell's Libel act, 1843, the defendant is entitled to give evidence of the truth of the matters charged, but such evidence will not amount to a defence to the indictment unless it was for the public benefit that the matters charged should be published. If the defendant is convicted, the court, in pronouncing sentence, will consider whether his guilt is aggravated or mitigated by his plea of justification and by the evidence given to prove or disprove the plea.

In accordance with the principle of English law that a master is liable for all acts of his servant done in the ordinary course of the servant's employment, the proprietor of a newspaper is civilly liable for any libel which appears in its columns, even though the libel may have been published in his absence, without his knowledge and contrary to his express orders, for the editor is his servant and it is within the scope of the editor's employment to send to the printers of the paper whatever matter he thinks ought to be published. But the proprietor of a newspaper is not liable to criminal proceedings in respect of any libel which appears in its columns if he can prove that such publication was made without his authority, consent or knowledge, and did not arise from want of due care or caution on his part (Lord Campbell's Libel act, 1843, s. 7). The mere fact that he has given the editor a general authority to publish what he thinks proper is not in itself evidence that he authorized or consented to the publication of the libel (*R.* v. *Holbrook & Others* [1877] 3 Q.B.D. 35).

Criminal proceedings will sometimes lie where an action will not. Thus it is a crime, though not actionable, to write and publish defamatory words of a deceased person, provided it is done with intent to injure and bring contempt on his posterity, and so provoke them to a breach of the peace (*R.* v. *Topham* [1791] 4

Term R. 126). So it is a crime, though not actionable, to write and publish words injurious to the reputation of any class or body of persons (*e.g.*, the Durham police), provided that the words tend to excite the angry passions of the class or body libelled, or of the general public against the class or body libelled, and so lead to a breach of the peace (*R.* v. *Osborne* [1732] 2 Swanst. 503, n.).

Scots Law.—The Scots law of defamation differs in many respects from the English law in so far as questions of procedure and pleading are concerned. To take one example: in Scottish practice the question of libel or no libel, in so far as it is a question for the court only, is not left to be raised at the trial but is decided at the stage when the issues are adjusted by the lord ordinary. In so far, however, as the substantive law is concerned, the only differences between the two systems are that in Scotland (1) the law makes no distinction between written and oral defamation; (2) publication is not essential to found an action: a defamatory letter sent to the person defamed, or a slander uttered in his presence only, entitle him to that element, at least, of damages which is called *solatium;* (3) a husband is not liable for defamatory words published by his wife; (4) there is no criminal remedy for defamation.

American Law.—American law differs in very few respects from that of England. In so far indeed as the common law is concerned they may be said to be substantially identical. In some jurisdictions, *e g.*, Delaware, Florida, Nebraska and Louisiana, the fact that a libel is true is in itself no defence; the defendant must go further and show that it was published under such circumstances as justify the conclusion that he acted with good motives and for justifiable ends. In Massachusetts the fact that a libel is true is a complete defence unless a malicious intention on the part of the defendant can be proved. These statutory provisions do not apply to slander.

See generally Gatley, *Law and Practice of Libel and Slander;* Fraser, *Law of Libel.* For the early history of the law of defamation *see* F. Carr, "The English Law of Defamation, with especial reference to the distinction between Libel and Slander," *Law Quarterly Review,* vol. xviii, pp. 255, 388; W. S. Holdsworth, "Defamation in the Sixteenth and Seventeenth Centuries," *ibid.* vol. xl., pp. 302, 397, and vol. xli. p. 13. (C. GA.)

LIBELLATICI, the name given to a class of persons who, during the persecution of Decius, A.D. 250, evaded the consequences of their Christian belief by procuring documents (*libelli*) which certified that they had satisfied the authorities of their submission to the edict requiring them to offer incense or sacrifice to the imperial gods.

See E. W. Benson, *Cyprian* (London, 1897); and art. NOVATIANS.

LIBERALE, ANTONIO (*c.* 1445–1526), Italian painter of the Veronese school. He was educated as a miniature painter. Leaving Verona soon after 1465, he worked three years at Monte Oliveto, near Siena, on the illustration of liturgical books. These are now preserved at Chiusi. From 1470 to 1476 he was employed on similar work for the cathedral of Siena. He was back in Verona in 1488 and worked there until his death. His earliest known picture is the "Madonna with Saints," in the Berlin gallery. It is dated 1489 and is the only signed work of the master extant. In 1490 he completed the "Adoration of the Magi" for the Cathedral of Verona. Another early work is the predella with the "Nativity," the "Epiphany" and the "Death of the Virgin" in the bishop's palace at Verona. These works are executed in the style of miniature painting, both as regards line and colour. Other notable works are: St. Anthony of Padua in S. Fermo, Verona, and the St. Jerome in the Museo Civico. Of three or four versions of "Christ entombed," the fresco in S. Anastasia at Verona, and the altar-piece in S. Leo at Venice are the most impressive. The Munich Pinakothek contains a "Pietà" full of genuine pathos. The master's delight in architecture is displayed in the "St. Sebastian," standing against the background of a Venetian canal, in the Brera gallery, and in the "Dido on the Pyre" surrounded by Renaissance arcades in the National Gallery, London. Especially notable among the many and varied peculiarities of his style are his strongly defined outline and the rounded character of his contours. His figures are inspired with intense emotion. Liberale's position in the school of Verona is similar to that of Mantegna in the school of Padua, of Cosimo Tura in that of Ferrara; like these masters he was at the head of a large body of pupils and disciples.

See Vasari, *Vite* (Milanese ed.); Crowe and Cavalcaselle, *History of Painting in North Italy* (2nd ed., 1912); J. P. Richter, *Old Masters of the Italian School, Villa Doccia, Fiesole* (1907). (I. A. R.)

LIBERAL PARTY, in Great Britain the lineal successor of the historic Whig Party (*See* WHIG AND TORY.) The change of name represented a widening of scope, due to the association with the aristocratic Whigs of new elements, forces and ideas which rose into prominence during the first three decades of the 19th century. The democratic movement stimulated by the French Revolution, the new political philosophy of the Benthamite school, the teachings of the economists who developed the ideas of Adam Smith, and the emergence of new social classes and new problems, all led to demands for a far-reaching reconstruction and gave birth to a radicalism that was widely different from, though not incompatible with, the Whigs' sedate loyalty to their traditional creed of "civil and religious liberty." Soon after Waterloo the word "Liberal" began to be used to express all this movement of change. At first it had a foreign tinge: it was used by hostile critics of the English movement to suggest its kinship with the revolutionary movements of France and Spain, as when Southey (1816) used the Spanish form, speaking scornfully of "the British *Liberales";* or as when Scott (1826) described the Canningites as "a mitigated party of *Liberaux.*" During the '20s the word passed into current use, but not yet as the official designation of a party. In 1822 Leigh Hunt called his ill-fated paper *The Liberal;* in 1825 Hazlitt described Byron as "a Liberal in politics"; in 1827 Macaulay wrote of "the Liberal parties on both sides of the House." When in 1830 the Radicals joined with the Whigs in the agitation for the Reform bill, and, still more, when in 1832 a host of spokesmen of the new ideas found their way into the House of Commons and ranged themselves behind the Whig Ministry, it became necessary to find a common designation for Whigs and Radicals, each of whom hated the others' name. The need became more obvious when in 1834 the Whigs were weakened by the secession of Stanley, Graham and others, and had to cultivate their Radical allies. In that year Greville wrote of "Reformers and Liberals of all denominations" sinking their differences in a common hostility to the Tories. Lord John Russell, leader of the discordant party in the Commons, seems to have been responsible for the official adoption of the new name. In 1839 he repeatedly refers to "the Liberal Party" in his daily letters to Queen Victoria. From that date it may fairly be said that "the Liberal Party" was the official designation of one of the two great parties in the State—the only term that covered all the supporters of the Whig Governments. But the real beginning of the party (as distinct from its name) should be assigned to 1832, when the Whigs were reinforced by an army of industrialists, nonconformists (emancipated by the repeal of the Test Act in 1828), Benthamites and economists. The Whig aristocrats still manned the ministries but the driving force of the reform movement came from these new elements; they were further strengthened by the triumphs of the Anti-Corn Law League (1839–46); and another modifying element was introduced with the gradual absorption of the Peelite intellectuals who for a time denominated themselves "Liberal-Conservatives." With the death of Palmerston (1865) and the succession of Gladstone to leadership, the transformation from Whiggism to Liberalism was completed. Thereafter the word "Whig" was largely used as a term of reproach. In the 83½ years between the formation of the Whig Government in 1830 and the outbreak of the World War (which opened a new epoch in British politics) Liberal Governments held office for 52½ years, under nine prime ministers, among whom Melbourne and Russell each held office for 6½ years, Palmerston for 9½ years, Gladstone for 12½ years and Asquith for 7½ years.

There has never been an authoritative definition of the doctrine or aims of Liberalism. The party has always included various schools of thought, united only by a desire for progress in the

direction of emancipation. For this reason it has, at all stages in its career, been far more subject to dissensions than the Conservative Party. The following definition or description, however, probably covers all the shades of Liberal opinion: Liberalism is a belief in the value of human personality, and a conviction that the source of all progress lies in the free exercise of individual energy; it produces an eagerness to emancipate all individuals or groups so that they may freely exercise their powers, so far as this can be done without injury to others; and it therefore involves a readiness to use the power of the State for the purposes of creating the conditions within which individual energy can thrive, of preventing all abuses of power, of affording to every citizen the means of acquiring mastery of his own capacities, and of establishing a real equality of opportunity for all. These aims are compatible with a very active policy of social reorganization, involving a great enlargement of the functions of the State. They are not compatible with Socialism, which, strictly interpreted, would banish free individual initiative and responsibility from the economic sphere.

The Whig Period: 1830–1865.—The history of the Liberal Party between 1830 and the World War may be divided into three periods. In the first (1830–65), which may be called the Whig period, the Whig aristocracy still filled all the cabinets, but the driving force came from other elements, notably the Benthamites (the Mills, Chadwick, Place, Parkes, etc.), the radical imperialists (Durham, Wakefield, Molesworth, etc.), and the Manchester industrialists (Cobden, Bright, etc.). The foreign policy of this period was marked by a warm sympathy with the liberal and nationalist movements on the Continent, and a spirited opposition to the repressive policy still maintained by the monarchies of Eastern Europe. Palmerston was the chief representative of this view. In imperial affairs the period was of supreme importance; it completely transformed the character of the British empire. The English-speaking colonies were systematically settled, they were also equipped with the full machinery of self-government. India was thrown open to western traders, teachers and missionaries (1833), the bar against the employment of Indians in responsible positions was removed, and a system of western education was introduced. Slavery was abolished throughout the empire (1833); and in the government of backward peoples the principle was established that the first duty of administration was to protect the rights of native populations and safeguard them against exploitation. In fiscal policy the agitation of the Anti-Corn-Law League brought about the establishment of free trade, which was completed by the budgets of Gladstone. In the political sphere the Reform Act of 1832 was followed by the creation of elected municipalities (1835) and boards of guardians (1834), as well as many other *ad hoc* local bodies. In the social sphere the foundations of the factory code were laid by the act of 1833, which set up a body of factory inspectors whose reports led to later acts—mostly passed by Liberal Governments. The State regulation of education was begun (1839), and systematic provision for public health began with the Public Health Act of 1848. The new municipalities were given large social duties. The press was freed and the penny post established. The railway monopolies were brought under control; joint-stock companies were regulated; savings-banks were instituted, and friendly societies and other thrift organizations brought under State supervision.

The Gladstone Period: 1865–1895.—The second period (1865–95) was the Gladstonian era, so completely dominated by the personality of Gladstone that Liberalism almost became Gladstonianism. In this period the catchword "peace, retrenchment and reform" pre-eminently expresses the character of Liberal policy. Gladstone was profoundly pacific: in a famous speech at West Calder (1878) he laid down the principles of foreign policy in terms that almost anticipated the ideas of the League of Nations. He and his foreign ministers strove to avoid foreign entanglements, and "splendid isolation" became the note of British foreign policy. Nevertheless Gladstone retained a passionate sympathy with struggling nationalities (*e.g.*, in the Balkans). He had little interest in imperial affairs and distrusted the school of radical imperialists, represented in this period by Forster, Dilke and Chamberlain. He disliked imperial expansion; held aloof from the race for African possessions; adopted a magnanimous but misunderstood policy of withdrawal in South Africa; and though he was drawn into Egypt, hated the entanglement and bungled the situation. In India, under Ripon and Lansdowne, the first steps were taken towards a system of self-government. Gladstone's main interests lay in finance, where he established exacting standards of economy under Treasury control, and in constitutional reform. From 1868 to 1894 he was preoccupied with Ireland, where he strove to heal an age-long sore. This crusade aroused intense bitterness and severed from the Liberal Party most of the Whig aristocracy who had hitherto clung to it; but Gladstone has been justified by the later course of events. One aspect of his Irish policy—the Land Acts—involved a very sweeping departure from *laissez-faire* in the establishment of rent-fixing courts. The period of his dominance also saw the establishment of a national system of education (1870); an extension of democracy by the introduction of ballot-voting (1872) and the enfranchisement of the agricultural labourers (1884); the legalization of trade unions (1871); a reconstruction of the army and the abolition of purchase of commissions; a complete reorganization of the judicial system; and the abolition of religious tests in the universities.

Before the end of the Gladstonian regime the long ascendancy of the Liberal Party was waning. Apart from the short and embarrassed Ministry of 1892–95, there was a continuous period of Conservative government from 1886 to 1905. A fresh inspiration was needed. An educated democracy was beginning to resent its position in the industrial order. The service of liberty demanded not merely the removal of restrictions, but the creation of the positive conditions in which the healthy development of individual faculty would be possible. The stir of ideas led, on the one hand, to a revival of Socialism and to the organization of the Labour Party. On the other hand, it brought about a steady change in the orientation of the Liberal Party; and the third period in the history of Liberalism (1895–1914) was pre-eminently a period of social reorganization.

1906–1914.—In 1906—largely as a result of Chamberlain's challenge to free trade—the Liberals returned to power with an overwhelming majority, and the next eight years were perhaps the most strenuous in the history of British politics. The whole period was overhung by the menace of Germany; and though Grey strove resolutely for peace, Britain was forced out of her traditional isolation and drawn into the vortex of European politics. At the same time a remarkable reorganization of the navy and the army was carried out—not without misgiving among the pacifist elements of the party. Without Haldane's work in the creation of the expeditionary force, of the territorial army, of the imperial general staff, and of the officers' training corps, Britain could not have played her part in the coming struggle. In imperial affairs the action of Campbell-Bannerman (who first gave currency to the phrase "British commonwealth of nations") in granting autonomy to the Boer States, made possible the Union of South Africa and healed an ancient sore; in India the Morley-Minto reforms marked a long advance towards self-government. The self-governing members of the empire were drawn closely together—and in the series of conferences which began in 1907 their representatives were for the first time admitted to the arcana of foreign policy and imperial defence, and helped to reorganize their military system, with results that were of the highest importance during the World War. But in spite of these preoccupations, the main work of these years was one of social reorganization in a series of novel enactments which implied the adoption of a new view of the functions of the State. These enactments included universal workmen's compensation, a system of old age pensions, State insurance against sickness and unemployment, the establishment of a network of labour exchanges, the institution of trade boards for the fixation of wages in sweated trades, the creation of a large system of small holdings, the conferment upon municipalities of large powers and duties for housing and town-planning. The means for carrying out these reforms were formed by a system of progressive taxation of the rich,

through graduated income-tax, super-tax and death-duties, which involved a substantial redistribution of wealth. These financial methods are now a part of the established system of British government. But they aroused bitter opposition, which culminated when the budget of 1909 not only tightened the screw at many points, but threatened an attack upon the existing land-system through taxes on land values. The rejection of this budget by the House of Lords led to an acute constitutional crisis, which (after two general elections in 1910) brought about the destruction of the Lords' veto by the Parliament Act (1911). The first use made of this act was to pass a Home Rule bill, against fierce opposition. At the same time a huge land-campaign was in preparation. The whole character of the legislation of these strenuous years shows that the outlook of the Liberal Party had undergone a great change. It had never been more confident or more militant than in 1914.

Post-war Period.—The war and the events which followed it shattered the party. This sudden *débâcle* is not difficult to explain. The party was hopelessly split when, in 1916, Lloyd George displaced Asquith from the premiership, and when at the election of 1918 those who stood aloof from Lloyd George were displaced by the "coupon." The small remnant of Independent Liberals were so obsessed by their grievance that they made themselves appear a querulous and negative party; they had no constructive policy to preach; and this was a grave weakness at a time when millennial expectations were being created and immense promises made to the electorate. After the break-up of the coalition in 1922, there were for a time two mutually distrustful Liberal groups in parliament. They reunited in 1923, to resist a new attack upon free trade, and returned as a solid body of 150. But they were substantially smaller than the Labour Party, and the tactical blunder of putting that party into office without conditions involved a dilemma, which ended in the disaster of the election of 1924 What was worse, their internal dissensions were redoubled. On the occasion of reunion, Lloyd George was urged to put into a common fund the large financial resources separately acquired by the coalition Liberals in the previous years. He refused to go so far. On this subject a bitter feud raged. It was intensified when in 1926 a difference between Lord Oxford (formerly H. H. Asquith) and Lloyd George in regard to the general strike of that year led to a formal excommunication of the latter, which the bulk of the party refused to accept. These dissensions seemed to make a revival of Liberalism all but impossible But the party has refused to accept sentence of death. Ever since the war, and especially since 1924, important elements in the party have been at work upon a series of enquiries into the various problems of the post-war period. Their reports—*Coal and Power* (1924), *The Land and the Nation* (1925), *Towns and the Land* (1926) and, most notable of the series, *Britain's Industrial Future* (1928)—amount to a restatement of the Liberal position. In 1924 the party polled 3,000,000 votes, though candidates were only put up in little more than half of the constituencies; if the seats won had been in proportion to the votes cast, the Liberal Party in the Commons would number 110 instead of 40. Since 1927 a systematic reorganization has been undertaken.

The organization of the party is as follows. In each active constituency there is an association, and usually also separate organizations for women and young people. The local associations select their own candidates, and in many cases maintain an agent. Some of them are self-supporting; others are helped by the candidate or by headquarters. The number of self-supporting associations has been considerably increased in the last few years. The associations are federated into ten districts in England and Wales: Scotland maintains a separate organization. They are all also combined in the National Liberal Federation, which holds at least one annual conference; and resolutions adopted at these conferences are held to constitute the official policy of the party. The executive of the National Liberal Federation is composed of delegates from the districts. With the addition of representatives of the parliamentary party and some others, it constitutes the supreme administrative committee of the party, and controls all the party funds. It appoints a small organization committee, the chairman of which (in 1928 Sir Herbert Samuel) is the working head of the party machine, and shares the functions of leadership with the leaders of the party in the two houses. (R. MU.)

LIBER AND LIBERA, a pair of deities of uncertain origin, worshipped in Italy. The name Liber is probably connected with the adj., *liber,* free, less likely with the root of *libare,* to pour drink-offering. Both etymologies were current in antiquity. Modern authorities differ. The name cannot be a mere translation of Λύσιος or Ἐλευθέριος, well-known epithets of Dionysus (*q.v.*), for the Liberalia is of the oldest cycle of Roman festivals, and therefore older than Greek influence; but the resemblance may have helped to identify the two gods. The question cannot be considered decided whether he is an offshoot of Iuppiter Liber (so Wissowa), or an originally independent deity (so Preller and others). At all events, he was identified with Dionysus, and the triad Ceres, Liber and Libera represent in Rome, from fairly early times, but always under Greek influence, the Eleusinian Demeter, Iacchus-Dionysus and Persephone. At the Liberalia, held at Rome on March 17, we know that the *toga virilis* was commonly assumed for the first time, with appropriate ceremonial, by boys who were of age to do so; that cakes (*liba*) were provided by old women in the service of Liber who sat in the streets and sacrificed on behalf of anyone who chose to buy their wares; and that meals were taken in the open air. At Lavinium a whole month was consecrated to Liber, and at this and other country towns a festival was held, comprising a procession, the garlanding of a phallus, and all manner of songs and jokes were used; all this was supposed to make the seeds grow. It closely resembles Greek ritual, but may be a parallel Italian development.

See Preller-Jordan, *Romische Mythologie* (vol. ii., 1883), p. 47 ff.; G. Wissowa, *Religion und Kultus,* 2nd ed., p. 298 ff.; Roscher's *Lexikon, s v.*

LIBER DIURNUS ROMANORUM PONTIFICUM or "Journal of the Roman Pontiffs," the name given to a collection of formulae used in the papal chancellery in preparing official documents, such as the installation of a pope, the bestowal of the pallium and the grant of papal privileges. For politic reasons the papal authorities would not allow it to be published, as the book asserted the superiority of a general council over the pope. It was, however, published in France by the Jesuit, Jean Garnier, in 1680, and other editions quickly followed

The best modern editions are one by Eugène de Rozière (Paris, 1869) and another by T E. von Sichel (Vienna, 1889), both of which contain critical introductions.

LIBEREC, a town of north-east Bohemia, Czechoslovakia, lies on the right bank of the Neisse in an upland region. It is a very important manufacturing centre, whose staple industries are largely dependent upon local water power and include the manufacture of cloth, the spinning, weaving and dyeing of wool and cotton and printing, and has wide commercial interests as a market for cotton goods. The cloth industry was introduced in 1579 and the town reflects its centuries of prosperity in a wealth of fine buildings, notably the 16th century Erzdekanatskirche, the 17th century castle, the cloth-workers' hall and the 19th century Protestant church and town hall. Pop. (1923) 34,985, of whom 27,929 were Germans.

LIBERIA, a negro republic in West Africa, extending along the coast of northern Guinea, between the British colony of Sierra Leone on the north-west, and the French colony of the Ivory Coast on the south-east. It has a coast line of some 350 m., its greatest depth is 170 m. and the area is about 40,000 sq. miles. Population uncertain; probably something over 1,500,000, consisting of a few thousand Liberians and many indigenous tribes (*see* p. 1003, sec. *History*).

It is at the southern extremity of Liberia, Cape Palmas, that the West African coast turns somewhat abruptly eastwards and faces the Gulf of Guinea. As the coast of Liberia thus fronts the sea route from Europe to South Africa it possesses a certain degree of strategical importance. The coast, however, is unprovided with a single good harbour. The anchorage at Monrovia, the capital, is safe, and harbours could be made at Grand Basa and other places.

Physical Features.—Liberia is a plateau country—with a general level of 1,500 ft., and is in large part densely forested. It is traversed by a number of rivers, mostly with a south-west direction, and is everywhere well watered. The coast has many small indentations and a good deal of the seaboard is dangerous, by reason of sharp rocks which lie near the surface. The whole of this part of Africa, from Cape Palmas north-west to the Senegal, suggests a sunken land. In all probability the western projection of Africa was connected by a land bridge with Brazil as late as the Eocene period. The Liberian coast has few lagoons compared with the adjoining littoral of Sierra Leone or that of the Ivory Coast. The coast, in fact, rises in some places rather abruptly from the sea. Cape Mount (on the northern side of which is a large lagoon —Fisherman lake) at its highest point is 1,050 ft. above sea level. Cape Mesurado is about 350 ft., Cape Palmas about 200 ft. above the sea. Although little of the coast belt is actually swampy, a kind of natural canalization connects many of the rivers near their mouths with each other.

Going from north to south the chief rivers are the Mano, the Lofa, St. Paul's (which runs through the centre of the country), St. John's, Cestos (in its upper course called Nuon) and Kavalli (Cavalla). The Kavalli and other rivers rise (in French territory) in the Nimba mountains. The Kavalli is navigable from the sea for some 80 m. and after a long series of rapids is again navigable. But there is a bad bar at its mouth. None of the other rivers, owing to rapids near their mouths, are navigable from the sea.

The climate and rainfall over the coast region for about 120 m. inland are equatorial, the rainfall in the western half of the country being about 150 in. per annum, and in the eastern half about 100 inches. The dry season lasts from mid-November to the end of March. Further inland the climate is not quite so rainy, and the weather is much cooler during the dry season.

The settlements of the Liberians are along the coast belt and the rising ground beyond, where the clayey soil is suitable for coffee cultivation. The forest begins at the foot of the mountains and covers the rest of the country, except where the natives have cleared the land for cultivation. In many districts the land has been cleared and cultivated and then abandoned, and has relapsed into scrub and jungle which is gradually returning to the condition of forest. The densest forest of all would seem to be that known as Gora, which is almost uninhabited and covers about 6,000 sq.m. between the Pō hills (which run west of the St. Paul's river), and the frontier of Sierra Leone. There is another very dense forest stretching with little interruption from the eastern side of the St. Paul's river nearly to the Cavalla. The Nidi forest is noteworthy for its magnificent growth of *Funtumia* rubber trees. It extends between the Duobe (a western tributary of the Cavalla) and the Kavalli. In the main Liberia is the forest country *par excellence* of West Africa.

The fauna of Liberia offers certain peculiarities, at least as regards vertebrates. It is probable that the Liberian chimpanzee may offer one or more distinct varieties; there is an interesting local development of the Diana monkey, sometimes called the bay-thighed monkey (*Cercopithecus diana ignita*) on account of its brilliant orange-red thighs. One or more species of bats are peculiar to the country—*Vespertilio stampflii* and perhaps *Roussettus buttikoferi;* two species of shrew (*Crocidura*), one dormouse (*Graphiurus nagtglasii*); the pygmy hippopotamus (*H. liberiensis*)—differing from the common hippopotamus by its much smaller size and by the reduction of the incisor teeth to a single pair in either jaw, or occasionally to the odd number of three; and two remarkable *Cephalophus* antelopes peculiar to this region so far as is known—these are the white-shouldered duiker, *Cephalophus jentinki,* and the zebra antelope, *C. doriae,* a creature the size of a small goat, of a bright bay brown, with broad, black zebra-like stripes.

Among birds there is the interesting white-necked guineafowl *Agelastes;* one peculiar species of eagle owl (*Bubo lettii*) and a very handsome sparrow-hawk (*Accipiter büttikoferi*); a few sunbirds, warblers and shrikes are peculiar to the region. The other birds are mainly those of Senegambia and of the West African forest region generally.

As regards reptiles, there are at least seven poisonous snakes—two cobras, two puff-adders and three vipers. The brilliantly coloured red and blue lizard (*Agama colonorum*) is found in the coast region of eastern Liberia. There are three species of crocodile, at least two chameleons, the large West African python (*P. sebae*) and a rare Boine snake (*Calabaria*). On the sea coast there is the leathery turtle (*Dermochelis*) and also the green turtle (*Chelone*). In the rivers and swamps there are soft-shelled turtle (*Trionyx* and *Sternothaerus*). The land tortoises chiefly belong to the genus *Cynyxis.* The fresh-water fish seem in their affinities to be nearly allied to those of the Niger and the Nile. As regards invertebrates, few species or genera are peculiar to Liberia. The gigantic scorpions (*Pandinus imperator*)— more than 6 in. long—are a common feature in the forest.

Nowhere, perhaps, does the flora of West Africa attain a more wonderful development than in Liberia and in the adjoining regions of Sierra Leone and the Ivory Coast. This is partly due to the equatorial position and the heavy rainfall. The most striking trees in the forest region are in the basin of the Kavalli; the giant *Funtumia elastica,* which grows to an altitude of 200 ft.; various kinds of *Parinarium, Oldfieldia* and *Khaya;* the bombax or cotton tree, giant dracaenas, many kinds of fig; *Borassus* palms, oil palms, the climbing *Calamus* palms, and on the coast the coconut. The most important palm of the country, perhaps, is the *Raphia vinifera,* which produces the piassava fibre of commerce. There are about 22 different trees, shrubs and vines producing rubber of more or less good quality. Coffee of several species is indigenous and grows wild. The best known is the celebrated *Coffea liberica.* The kola tree is also indigenous. Large edible nuts are derived from *Coula edulis* of the order *Olacineae.* The country is exceedingly rich in aroids, ground orchids and tree orchids.

The cultivated trees and plants include, besides coffee, the manioc or cassada, the orange tree, lime, cacao, pineapple (which now runs wild over the whole of Liberia), sour sop, ginger, papaw, alligator apple, avocado pear, okra, cotton (*Gossypium peruvianum*—the kidney cotton) indigo, sweet potato, capsicum (chillie) bread-fruit, arrowroot (*Maranta*), banana, yam, "coco"-yam (*Colocasia antiquorum,* var. *esculenta*), maize, sorghum, sugar cane, rice and eleusine (*Eleusine*), besides gourds, pumpkins, cabbages and onions.

As to minerals, iron is widely distributed and is smelted and worked by most of the tribes; gold is reported to exist in many districts and diamonds have been found, small but of good colour. There is corundum in the eastern part of the country; copper, zinc and other metals are said to occur. Up to 1929, however, no systematic survey of the mineral resources of Liberia had been made.

Towns, Trade, etc.—Monrovia (pop. with the adjacent Krutown, about 10,000), the capital and chief port, is about midway along the Liberian coast. It has a few fairly good public buildings and business premises. Robertsport and Grand Basia (Buchanan), respectively north and south of Monrovia, are among the lesser ports of entry. There are no towns of any size in the interior. Up to the World War, Germans had fully two-thirds of the trade, which, however, in 1912, was worth altogether, imports and exports, little more than £500,000. British and Dutch firms had some footing; between the United States and Liberia, despite the sentimental connection between them, there was little commercial intercourse. Since the war the interests of the United States have been greatly developed. Coffee, rubber, piassava, palm nuts and palm oil are the chief exports. Rubber was first systematically exploited by Europeans in 1898. The imports are miscellaneous—largely cotton goods, salt and rice. Revenue is derived from customs (about ⅔ of the whole), a poll tax and taxes on rubber. Trade with and among the indigenous tribes was, as lately as 1927, by barter. Native "currency" consisted of brass kettles, cutlasses, kegs of gunpowder, tobacco and pieces of cloth. Some tribes are expert at cotton spinning and weaving; baskets and mats, pottery and wood-work are also native industries. There were, however, signs that Liberia might share in the economic development so marked in other regions of West Africa. There was promise of a cocoa industry. (H. H. J.; F. R. C.)

HISTORY

There is a tradition that the coast of what is now Liberia was reached by the Dieppois merchant-adventurers in the 14th century. It is a fact that in the 15th century Pedro de Sintra and other Portuguese navigators mapped the whole coast, and nearly all the prominent features—capes, rivers, islets—off that coast still bear Portuguese names. From the 16th century onwards English, Dutch, German, French and other European traders contested the commerce of this coast with the Portuguese and finally drove them away. In the 18th century France once or twice thought of establishing colonies here. At the end of the 18th century, when the tide was rising in favour of the abolition of slavery and the repatriation of slaves, the Grain Coast (so called from the old trade in the "Grains of Paradise" or *Amomum* pepper) was suggested once or twice as a suitable home for repatriated negroes. Sierra Leone, however, was chosen first on account of its possessing an admirable harbour. In 1821 Cape Mesurado was selected by the American Colonization Society as an appropriate site for the first detachment of American freed negroes, who had been driven away from a still slave-holding America through difficulties in regard to extending the suffrage in that country. From that date, 1821, onwards to the present day, negroes and mulattos—freed slaves or the descendants of such—have crossed the Atlantic in small numbers to settle on the Liberian coast. The "great" migrations took place during the first half of the 19th century, but by 1925 the Americo-Liberians did not number more than 20,000; and half of them lived in Monrovia.

The real founder of Liberia was Jehudi Ashmun, a white American, who at the request of the Colonization Society went out in 1822 to aid the infant settlement at Cape Mesurado (where Monrovia, the capital, is now). Ashmun inspired the colonists with courage, and fought and defeated the natives who molested them. He was joined for a time, in 1824, by the Rev. Robert Gurley (another white American), who invented "Liberia" as the name of the settlement. As the colony was seen to grow, other and independent settlements of negroes from the United States were made, and in 1833 the "independent African state of Maryland" was founded at Cape Palmas. Eventually, in 1857, it was by consent annexed to Liberia and is now known as Maryland county. Meanwhile, in 1836, Thomas Buchanan (a cousin of James Buchanan, sometime president of the United States) went to Liberia as governor and helped to consolidate the young state, which was trying to establish itself on lines totally at variance with those of the aborigines, with whom they were repeatedly in conflict. Buchanan, the last of the white governors of Liberia, died at Grand Basa in Sept. 1841. He was succeeded by Joseph Jenkins Roberts, an octoroon, from Virginia, U.S.A., and a man of much ability. Roberts enlarged the boundaries of the colony and improved economic conditions.

Republic Proclaimed.—When the American Colonization Society intimated that Liberia should now cease to be dependent upon it, Roberts decided that the only thing to do was to declare it an independent republic. He had had trouble both with his British and French neighbours, who had denied the right of the colonists to exercise sovereign power. Independence was proclaimed in 1847, and was recognized in 1848–49 by most of the Great Powers, though formal recognition by the United States did not come until 1862.

At the time independence was declared a constitution based on that of the United States was drawn up, but the attempt of the immigrants from America and their descendants—who then numbered fewer than 3,000—was not very successful. Some of the tribes of the coast region adopted the religion (Protestant forms of Christianity) and the language (English) of the Liberians, but most of the natives retained their paganism and their freedom. Roberts, who had been elected the first president of the republic, retained that office till 1856; it was during this period that the slave trade, hitherto illicitly carried on from various ports nominally Liberian, was at length ended by the activity of the British navy.

From about this time (1856) there was a notable growth of the "Whig party, which distrusted Europeans and sought development on "national" lines, and, later, co-operation with the natives, as against the liberals or republicans, who wished, broadly, for the co-operation of Europeans in the development of the state. In 1871 the first foreign loan was raised, being negotiated in London nominally for £100,000. The loan was unpopular, and still more unpopular was the president E. J. Roye, who was seemingly aiming at a dictatorship. Roye was deposed and imprisoned at Monrovia; he escaped, but in attempting to reach an English ship in the anchorage was drowned. The ex-president, J. J. Roberts, was called back to office. He served to the end of 1875, dying the following year.

Frontier Disputes.—After this the difficulties of the Liberians increased. British and other traders flouted their authority and dealt direct with the independent native tribes (chiefly in palm oil). There were constant frontier troubles with the French on the Ivory Coast and the British at Sierra Leone. The Liberians tried to extend their authority inland while still unable to control all the coast line they claimed. The Americo-Liberians, with mixed traditions of slavery, puritanism and Anglo-Saxon ideals of civilization, proved indeed hardly able to govern themselves. With the era of the partition of Africa an effort was made to end the frontier disputes, by treaties with Great Britain in 1885 and with France in 1892. In the event, Liberian territory was made continuous, with a coast line of some 350 miles from the Mano river on the west to the Kavalli (Cavalla) river on the east. By this time the wealth of rubber in the Liberian forests was being exploited, though the staple industry was the cultivation of coffee. In 1904 Arthur Barclay, a man of pure negro blood, born in Barbadoes, became president, and he initiated a policy of direct co-operation with the native tribes; he obtained in 1907 a loan from London and made real efforts at reform. His task was hard. The foreign debt was a burden, the Government was unable to control the regions in which it had granted concessions to foreigners; its authority indeed rarely extended more than 20 miles inland. The frontier regions adjoining French territory remained disturbed; in consequence malcontents took refuge in the Liberian forests and thence raided across the border. The French insisted on security and in 1910 an agreement was signed transferring to France some 2,000sq.m. of hinterland which Liberia had claimed but could not control.

U.S. Intervention.—It appeared as if the experiment of "running" the country by American negroes—as alien to the bulk of the natives as are white men—on the lines of the constitution of the United States would collapse. However, as on previous occasions of trouble, the intervention of the United States Government led to a financial reorganization which gave the Liberians a new start. Reports of territorial encroachments by France had aroused much sympathy with Liberia in the United States and had led to the appointment by President Roosevelt of a commission which in the summer of 1909 visited Liberia to investigate the condition of the country. There was some trouble with Germany in settling finances. The German Government energetically pressed its claims, the gunboat "Panther" being anchored for a month off Monrovia, with its guns trained on the executive mansion (1911). All difficulties were overcome, however, by June 1912, when an international loan of $1,700,000 (£340,000) was raised, the bonds to be issued for not fewer than 40 years. The customs duties and certain taxes were pledged as security for the loan, and are administered by an American receiver-general, who is also financial advisor to the Liberian Government. Thus, in effect, the control of finances is in the hands of the United States and expenditure is kept within the limits of the revenue. A frontier police force was also organized by officers of the United States army, and as a result Liberian authority was better maintained. During the World War the Germans, deprived by force of arms of their own colonies, found in Liberia their last foothold in West Africa. Here they rendered themselves very obnoxious and largely ignored the Liberian Government. But in Aug. 1917, coincident with the visit of a British warship to Monrovia, Liberia declared herself in a state of war and expelled the Germans. She was a signatory of the Treaty of Versailles, her representative at the peace conference in Paris being C. D. B. King. King was in 1920 chosen as president of Liberia and he was twice re-elected, beginning his

third term of office in 1928. He strove, with some success, to improve conditions in Liberia, continued President Barclay's policy of working with the natives, and was the originator of a system of road building which gave a prospect of opening up the interior. In 1925, too, the American firm of Firestone was given a concession of 1,000,000 ac. primarily for the establishment of rubber plantations. This concession involved the building of a harbour, railways and road, thus giving promise of much development. Up to that time the natural resources of Liberia had been largely neglected. The terms of the Firestone concession, including a loan to the Liberian Government, gave rise, however, to adverse criticism in the United States, the State being accused of aiding a private corporation to control Liberia. Meanwhile the bulk of the trade —which amounted to little more than £500,000 in 1923—was in the hands of British and German firms, the Dutch being next in importance. Friendly relations are maintained with Spain, as the Spanish plantations in Fernando Po are to a great extent worked by Liberian labour.

Native Races.—The indigenous population must be considered one of the assets of Liberia. The native inhabitants number perhaps as many as 1,500,000. Large areas appear to be uninhabited forest, but other parts are well populated, owing to the wonderful fertility of the soil. The native tribes belong more or less to the following divisions, commencing on the west, and proceeding eastwards: (1) Vai, Gbandi, Kpwesi, Mende, Buzi and Mandingo (the Vai, Mende and Mandingo are Mohammedans); all these tribes speak languages derived from a common stock. (2) In the densest forest region between the Mano and the St. Paul's river is the powerful Gora tribe of unknown linguistic affinities. (3) In the coast region between the St. Paul's river and the Kavilli (and beyond) are the different tribes of Kru stock and language family —Dē, Basā, Gibi, Kru, Grebo, Putu, Sikon, etc. The actual Kru tribe inhabits the coast between the river Cestos on the west and Grand Sesters on the east. It is known all over the Atlantic coasts of Africa, as it furnishes a large proportion of the seamen employed on men-of-war and merchant ships in these tropical waters. Many of the indigenous races of Liberia in the forest belt beyond 40m. from the coast practised cannibalism, at least as lately as 1910. In some of the forest tribes the women went naked well into the 20th century, but clothes of a Mohammedan type spread over the whole country except among those who adopted European style, after the manner of the Americo-Liberians. Some of the indigenous races are of very fine physique. In the Nidi country the women are generally taller than the men. Some of the Kru men and Mende people are coarse and ugly; but as a rule the indigenes of Liberia are handsome, well-proportioned negroes, and a number of the Mandingos have an almost European cast of feature.

(H. H. J.; F. R. C.)

LIBERIUS, pope from 352 to 366, the successor of Julius I., was consecrated according to the *Catalogus Liberianus* on May 22. His first recorded act was, after a synod had been held at Rome, to write to Constantius, then in quarters at Arles (353–354), asking that a council might be called at Aquileia with reference to the affairs of Athanasius; but his messenger Vincentius of Capua was compelled by the emperor to subscribe a condemnation of the orthodox patriarch of Alexandria. In 355 Liberius was one of the few who, along with Eusebius of Vercelli, Dionysius of Milan and Lucifer of Cagliari, refused to sign the condemnation of Athanasius, which had anew been imposed at Milan by imperial command upon all the Western bishops; the consequence was his relegation to Beroea in Thrace, Felix II. (antipope) being consecrated his successor. On his agreeing to give up the "homoousios," to abandon Athanasius, and to accept the communion of his adversaries, the emperor recalled him from exile; but, as the Roman see was officially occupied by Felix, a year passed before Liberius was sent to Rome. It was the emperor's intention that Liberius should govern the Church jointly with Felix, but on the arrival of Liberius, Felix was expelled by the Roman people. Neither Liberius nor Felix took part in the council of Rimini (359). After the death of the emperor Constantius in 361, Liberius annulled the decrees of that assembly, but, with the concurrence of SS. Athanasius and Hilarius, retained the bishops who had signed and then withdrawn their adherence. He died on Sept. 24, 366.

His biographers used to be perplexed by a letter purporting to be from Liberius, in the works of Hilary, in which he seems to write, in 352, that he had excommunicated Athanasius at the instance of the Oriental bishops; but the document is now held to be spurious. *See* Hefele, *Conciliengesch.* i. 648 *seq.*

(L. D.; X.)

LIBER PONTIFICALIS, or GESTA PONTIFICUM ROMANORUM (*i.e.*, Book of the Popes), consists of the lives of the bishops of Rome from the time of St. Peter to the death of Nicholas I. in 867. A supplement continues the series of lives almost to the close of the 9th century, and several other continuations were written later. A considerable part of it is obviously legendary. It assumes that the bishops of Rome exercised authority over the Christian Church from its foundation.

BIBLIOGRAPHY.—*The Liber*, which was used by Bede for his *Historia Ecclesiastica*, was first printed at Mainz in 1602. The best edition is by L. Duchesne, *Le Liber pontificalis: texte, introduction, commentaire* (Paris, 1884–92). *See* also the same writer's *Étude sur le Liber pontificalis* (Paris, 1877); and the article by A. Brackmann in Herzog-Hauck's *Realencyklopadie*, Band xi. (Leipzig, 1902).

LIBERTAD or **LA LIBERTAD,** a coast department of Peru bounded north by Lambayeque, Cajamarca and Amazonas, east by San Martín, south by Huánuco and Ancachs and west by the Pacific. Pop. (est.) 250,931; area 10,209 square miles. The Western Cordillera, parallel with the coast, divides it into two parts, the western consisting of an arid, sandy coast zone and western slopes of the Cordillera, and the eastern, a high, inter-Andine valley lying between the Central and Western Cordilleras through which flows the upper Marañón, which at one point is less than 100 m. in a straight line from the Pacific Ocean. The coast zone is traversed by several short streams, fed by melting snows of the Cordillera and extensively used for irrigation. These are, from north to south, the Jequetepeque (Pacasmayo), in whose valley rice is an important crop, the Chicama, in whose valley the sugar plantations are among the largest and best in Peru with up-to-date industrial equipment, the Moche, Virú, Chao and Santa, the last, with its northern tributary, the Tablachaca, forming part of the southern boundary of the department Cotton, coffee, rice and other crops as well as sugar are raised in several of these valleys. In the upland regions (*sierra*) with moderate rainfall and cool, healthy climate, agriculture is practised on a small scale, while sheep and especially cattle have been raised since early colonial times. The llama and alpaca were reared throughout the *sierra* long before the Spanish conquest and still are. Copper and silver mines are worked in the provinces of Otuzco, Huamachuco and Santiago de Chuco, gold mines in Pataz. Coal of excellent quality is mined on a small scale in Otuzco and Huamachuco. Libertad has about 250 m. of railway, with construction actively in progress. In the north, a line runs from Pacasmayo to Chilete (Cajamarca) with a branch to Guadalupe; another from Salaverry to Trujillo and beyond, to Ascope and other towns in the Chicama valley, while a short spur extends up the valley of the Moche. The motor highway along the coast is finished from the northern boundary to the Chao river. The most important line of penetration extends from Trujillo to the mining centre, Quiruvilca. The principal ports are Pacasmayo and Salaverry, others are open roadsteads. The capital of the department and chief city is Trujillo (pop. est. 15,000), situated about nine miles inland from the port of Salaverry. It is the seat of a university, a division of the supreme court and a bishopric Other towns in which there are industries, mostly of a primitive nature, are San Pedro, Otuzco, Huamachuco and Santiago de Chuco.

LIBERTARIANISM, in ethics, the doctrine which maintains the freedom of the will, as opposed to necessitarianism or determinism (*q.v.*) (Lat. *libertas*, freedom). It has been held in various forms. In its extreme form it maintains that the individual is absolutely free to choose this or that action indifferently (the

liberum arbitrium indifferentiae), but most libertarians admit that acquired tendencies, environment and the like, exercise control in a greater or less degree. (*See* FREE-WILL.)

LIBERTINES, the nickname, rather than the name, given to various political and social parties. The word seems first to have been applied, as a stigma, to Anabaptists in the Low Countries (Mark Pattison, *Essays*, ii. 38). It has become especially attached to the liberal party in Geneva, opposed to Calvin and carrying on the tradition of the Liberators in that city; but the term was never applied to them till after Calvin's death (F. W. Kampschulte, *Johann Calvin*). The Libertines against whom Calvin wrote were the Anabaptists above mentioned, whose doctrines he denounces as pantheistic and antinomian.

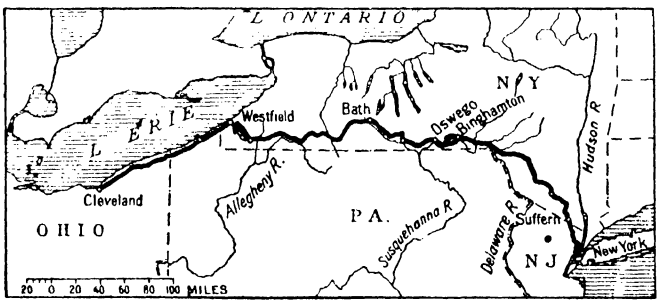
See Choisy in Herzog-Hauck's *Realencyklopadie* (1902).

LIBERTINES, SYNAGOGUE OF THE, a section of the Hellenistic Jews who attacked Stephen (Acts vi. 9). The structure of the sentence in the Greek most naturally suggests that one synagogue is referred to which was used in common by the Libertines, Cyrenians, Alexandrians and "them of Cilicia and Asia," though it is possible that Luke intended to distinguish the Jews of Cilicia and Asia from the preceding. Some hold that three synagogues are intended, corresponding to geographical distinctions, viz. (1) Rome and Italy, (2) north-east Africa, (3) Asia Minor. Then the synagogue of the Libertines would be the assembly of "the Freedmen" from Rome, descendants of Jews enslaved by Pompey (63 B.C.). If, however, "Libertines" is taken closely together with "Cyrenians and Alexandrians," the first name ought to have a geographical connotation, and Blass has suggested that Λιβυστῖνοι should be read "Libyans." In this case two synagogues are meant (1) that of the Libyans, Cyrenians and Alexandrians; (2) that of the Cilicians and Asiatics.

See Krauss, *Synagogale Altertümer*, Berlin, 1922, p. 201.

(G. H. B.)

LIBERTY, SIR ARTHUR LASENBY (1843–1917), knighted 1913, English merchant, was born at Chesham on Aug. 13, 1843, the son of a Nottingham lace manufacturer. In 1862 he became manager of the shop in Regent Street, London, which he developed into an important adjunct of the art world of the period. In 1875 he became independent and at once began to adapt Eastern art in waving and design to Western requirements, becoming famous both for his textiles and for his colourings. He died on May 11, 1917, at Great Missenden, Buckinghamshire.



LIBERTY, generally the state of freedom, especially opposed to subjection, imprisonment or slavery, or with such restricted or figurative meaning as the circumstances imply. In a more particular sense, a "libery" is the term for a franchise (*q.v.*), a privilege or branch of the Crown's prerogative granted to a subject, as, for example, that of executing legal process; hence the district over which the privilege extends. Such liberties are exempt from the jurisdiction of the sheriff and have separate commissions of the peace, but for purposes of local government form part of the county in which they are situated. Most liberties are now merged under the Liberties Act 1850 or some special subsequent act. (See *Halsbury*, xx., 798.) The exemption from the jurisdiction of the sheriff (*q.v.*) was recognized in England by the Sheriffs Act 1887, which provides that the sheriff of a county shall appoint a deputy at the expense of the lord of liberty, such deputy to reside in or near the liberty. The deputy receives and opens in the sheriff's name all writs, the return or execution of which belongs to the bailiff of the liberty, and issues to the bailiff the warrant required for the due execution of such writs. In the case of non-return of any writ, the sheriff will be ordered to execute the writ notwithstanding the liberty, and must cause the bailiff to attend before the high court of justice and answer why it was not executed. (*See* SANCTUARY; CLERGY, BENEFIT OF.)

In the United States the right of franchise is a "privilege," the term "liberty" not being used in such cases or in the general English exemptions.

In nautical phraseology various usages of the term are derived from its association with a sailor's leave on shore, *e.g.*, liberty-man, liberty-day, liberty-ticket.

See J. Mackinnon, *History of Modern Liberty* (1906–08); also Lord Acton's lectures, and such works as J. S. Mill's *On Liberty* and Sir John Seeley's *Introduction to Political Science*.

LIBERTY HIGHWAY, an American highway connecting New York city and Cleveland, O., a distance of 600 m. and the shortest way between these points. It is hard or paved throughout and skirts the southern boundary of New York State through a

LIBERTY HIGHWAY

beautiful hilly and rolling country to Lake Erie, which it follows within view of the lake to Cleveland. It passes through New Jersey to Suffern, N.Y., and thence to Westfield, N.Y., through Binghamton, Oswego and Bath.

LIBERTY LOANS, the name given to the four loans floated by the United States of America during the World War. A fifth loan, floated after the Armistice, was called officially the Victory Liberty Loan, but more generally the Fifth Liberty Loan. Between May 14, 1917, when the First Liberty Loan was offered to the public, and May 10, 1919, when the campaign for the fifth loan was brought to a close, the people of the United States subscribed $24,072,257,550. Of this amount, $21,435,370,600 was finally accepted by the secretary of the Treasury. The Fourth Liberty Loan, concluded Oct. 18, 1918, was the largest single loan issued by any of the belligerents, and realized a total of nearly seven thousand million dollars. The number of subscribers to this loan was more than 22,000,000, or more than one-fifth of the total population of the United States. Moreover, the Government was able to dispose of the Liberty bonds on very favourable terms: they were issued at par, the rate of interest varying from 3½% on the first loan to 4¼% on the fifth. There were a number of reasons for the favourable terms obtained. The United States was immensely wealthy, and had just passed through a period of great prosperity; its record for quick payment was unique; patriotic spirit was at a high pitch; advertising on an unexampled scale was undertaken; and the rate offered, while lower than those of European countries, was high as compared with the 3% and 2% paid in recent years on its government bonds.

When America entered the World War the Government realized that, in addition to the money needed to prosecute the war by the United States itself, large sums must be raised to relieve the already overstrained credit of the European allies. The total amount of these loans to foreign countries (not including later sales of war material) was $9,598,236,575. This money was part of the amounts raised in the Liberty Loans. The financial policy of the Government was to raise from one-fourth to one-third of the necessary funds from taxation, the remainder from loans. The Government strove also, not only to extend the debt over a period of years, but to distribute it as widely as possible. The success of the policy was indicated by the facts that 59·13% of the individual subscriptions for the fourth loan were for $50 bonds, and that approximately 25,000,000 persons were, at the end of the war, holders of Liberty Bonds. Before the United States entered the war it was estimated that there were only about 350,000 bond investors in the nation. Many who bought Liberty Bonds were not wealthy, but borrowed, often at high rates of interest, the money with which to pay for them.

Under the act of April 24, 1917, the secretary of the Treasury was authorized to issue bonds to the extent of $5,000,000,000 at a rate not to exceed 3½%, these bonds to be convertible into bonds of a higher rate if such should be issued before the end of the war. The secretary of the Treasury made the first issue, $2,000,000,000 and proceeded to create a war loan organization in the

Treasury Department. The 12 Federal Reserve banks were used as the central agencies in the 12 Federal Reserve districts, and each of these banks formed Liberty Loan committees. To each district a "quota" or proportional part of the whole issue was allotted, and the Treasury Department made use of every available means of publicity. As a result the first loan was over-subscribed by more than $1,000,000,000. In subsequent campaigns the methods employed in placing the first loan were developed and extended. In each city an organization known as Four-Minute Men was formed; these men visited places of public resort, including the theatres and cinemas, and spoke for four minutes on behalf of the loans. The Government assisted local authorities in organizing street parades in which men from the training camps participated; captured German war material was displayed; distinguished soldiers and other visitors from Great Britain, France and the other allied nations were given elaborate receptions. These campaigns were of great value as a means, not only of selling the war bonds, but of keeping up morale. The following are the figures of the estimated number of persons subscribing to each of the five Liberty Loans, the total of the amount asked for, the subscriptions and the final allotments:—

Loan.	Subscribers.	Amount asked.	Subscriptions.	Allotments.
		$	$	$
First (1917) .	4,000,000	2,000,000,000	3,035,226,850	1,989,455,550
Second (1917)	9,400,000	3,000,000,000	4,617,532,300	3,807,865,000
Third (1918) .	18,376,815	3,000,000,000	4,176,516,850	4,175,650,050
Fourth (1918)	22,777,680	6,000,000,000	6,993,073,250	6,964,581,250
Fifth (Victory, 1919) . .	11,803,895	4,500,000,000	5,249,908,300	4,497,818,750

(F. H. H.)

LIBERTY PARTY, the first political party organized in the United States to oppose the spread and restrict the political power of slavery, and the lineal precursor of the Free Soil and Republican Parties. It originated in the Old North-west. Its organization was preceded there by a long anti-slavery religious movement. James G. Birney (*q.v.*), to whom more than to any other man belongs the honour of founding and leading the party, began to define the political duties of so-called "abolitionists" about 1836; but for several years thereafter he, in common with other leaders, continued to disclaim all idea of forming a political party. In State and local campaigns, however, non-partizan political action was attempted through the questioning of Whig and Democratic candidates. The utter futility of seeking to obtain in this way any satisfactory concessions to anti-slavery sentiment was speedily and abundantly proved. There arose, consequently, a division in the American Anti-slavery society between those who were led by W. L. Garrison (*q.v.*), and advocated political non-resistance, and those who were led by Birney and advocated independent political action. The sentiment of the great majority of "abolitionists" was, by 1838, strongly for such action. Accordingly, the political abolitionists, in a convention at Albany, in April 1840, launched the "Liberty Party," and nominated Birney for the presidency. In the November election he received only 7,069 votes, or the support of probably less than one-tenth of the professed abolitionists.

After 1840 the attempt began in earnest to organize the Liberty Party thoroughly, and unite all anti-slavery men. The North-west was the most promising field, but though the contest of State and local campaigns gave morale to the party, it made scant political gains (in 1843 it cast hardly 10% of the total vote); it could not convince the people that slavery should be made the paramount question in politics. In 1844, however, the Texas question gave slavery precisely this pre-eminence in the presidential campaign and the Liberty men again nominated Birney. He received 62,263 votes—many more than enough in New York to have carried that State and the presidency for Clay, had they been thrown to his support. The Whigs, therefore, blamed the Liberty Party for Democratic success and the annexation of Texas; but—quite apart from the issue of political ethics—it is almost certain that though Clay's chances were injured by the Liberty ticket, they were injured much more outside the Liberty ranks, by his own quibbles. After 1844 the Liberty Party made little progress. Indeed, no party of one idea could hope to satisfy men who had been Whigs or Democrats. At the same time, anti-slavery Whigs and Democrats were segregating in State politics, and the issue of excluding slavery from the new territory acquired from Mexico afforded a golden opportunity to unite all anti-slavery men on the principle of the Wilmot Proviso (1846). The Liberty Party reached its greatest strength (casting 74,017 votes) in the State elections of 1846. Thereafter it rapidly became ineffective. In Oct. 1847, at Buffalo, was held the third and last national convention. John P. Hale—whose election to the United States Senate had justified the first successful union of Liberty men with other anti-slavery men in State politics—was nominated for the presidency. But the nomination by the Democrats of Lewis Cass shattered the Democratic organization in New York and the North-west; and when the Whigs nominated Gen. Taylor and showed hostility to the Wilmot Proviso, the way was cleared for a union of all anti-slavery men. The Liberty Party, then, abandoning its independent nominations, joined in the first convention and nominations of the Free Soil Party (*q.v.*), thereby practically losing its identity. The Liberty Party has the unique honour among third-parties in the United States of seeing its principles rapidly adopted and realized.

See T. C. Smith, *History of the Liberty and Free Soil Parties in the Northwest* (Harvard University Historical Studies, 1897), and lives and writings of all the public men mentioned above; also of G. W. Julian, J. R. Gidding and S. P. Chase. Consult also E. E. Robinson, *The Evolution of American Political Parties* (1924).
